# THE NEW SYDENHAM SOCIETY'S

# LEXICON

OF

# MEDICINE AND THE ALLIED SCIENCES.

(BASED ON MAYNE'S LEXICON.)

 ${\bf B} {\bf Y}$ 

HENRY POWER, M.B.,

AND
LEONARD W. SEDGWICK, M.D.

VOLUME I.

2972

LONDON:
THE NEW SYDENHAM SOCIETY.

MDCCCLXXXI.

# PREFATORY NOTE.

WE desire at the outset to declare the ends we have had in view in the changes that have been made in the Expository Lexicon of Dr. Mayne, which has been committed to us for correction and renewal; changes which, beyond large additions, have made it necessary to rewrite almost the whole book.

We have thought it expedient to retain nearly all the original words; for although many have become obsolete, and others have failed to obtain any general acceptance, we have felt that to those who consult the older authors, an explanation of unused terms would be of service. These have been carefully revised and verified.

As to the words at present in use, we have endeavoured to give complete and concise descriptions, not only of all purely medical terms, but also of those which are employed in the several ancillary sciences and subjects which form part of modern medical knowledge.

In regard to Medicine, Surgery, Midwifery, and Pathology, without writing encyclopædic accounts, we have attempted such an explanation of the several words and phrases in use in each of these subjects that the work shall be found to be of frequent service, and, in some degree, to supply the place of other and less accessible books.

In Therapeutics we have tried to afford accurate information concerning the drugs and preparations of the Indian and of the several Enropean pharmacopæias, with the doses and mode of administration, when the requisite data could be obtained; we have also given some account of the remedies in popular use in many countries. In this matter we desire to express our thanks to Dr. Waring for the loan of a very valuable manuscript upon drugs employed in India and South America.

In Biology we believe that all words will be found that are commonly employed, together with many that have fallen into disuse. The distinguishing characteristics of classes and orders are related, and the generic and specific descriptions of such animals and plants as appeared to possess some medical interest.

#### PREFATORY NOTE.

In Chemistry, in like manner, the philosophical terms are explained, and the great groups of substances described, as well as those individual compounds which have any bearing on Medical Science.

Considerable care has been bestowed by us upon the etymology and the synonymy of the several words; a work involving the expenditure of more time and labour than may perhaps at first sight appear proportionate to the result.

We are fully conscious that, in a work of this variety and magnitude, errors will escape observation; we shall be grateful to any reader who, when he meets with what appears to be a mistake, will bring it to our notice.

Finally, we should like to say that we are jointly responsible for each article; that we are faithfully striving to make the book as true and as full as we are able; and that we will do the best that as busy men we can do to effect the regular and speedy issue of the parts.

HENRY POWER, LEONARD W. SEDGWICK.

London; July, 1879.

# EXPOSITORY LEXICON

# MEDICINE AND THE ALLIED SCIENCES.

A. (Gr.) An inseparable prefix used before a consonant and giving to the root an opposite sense; sometimes an intensitive.

AA. Abbreviation of Ana (Gr.); signifying,

of each, an equal quantity.

AAA. Abbreviation of Amalgama.

Aa'bach, Bavaria, near Ratisbon. A cold alkaline spring; recommended in cases of dyspepsia, gont, and rheumatism.

Aabam. (Ar.) Plumbum, or lead. (R.) Aa'chen. Aix-la-Chapelle.

Aa'ez, Portugal. A spring containing sodinm sulphide. Temp. 25° C. (77° F.); recommended in chronic pulmonary diseases.

Aan'de. Breath. (D.)

Aarghees. The Greek name assigned in the Ulfar Udwiyeh to the root of the Barberry bush. Berberis. (Waring.)

Aaron. Arum maculatum.

Aarzii he, Switzerland, Canton of Berne. A warm spring containing sodium sulphide. Temp. 25° C. (77° F.); recommended in pulmonary and entaneous diseases.

Aas'mus. ('Aασμός, a breathing out.)

Term for Asthma.

A.B. Balneum arenosum, sand bath.
Ab. (L.ab, from.) Of this abs is a fuller, and
a a shorter, form. An inseparable prefix used

before a vowel and giving the root an opposite sense. **Ababil.** (Persian.) Term for Variola. **Abactinal.** (Ab, away from, ἀκτίς, a ray.) That surface of an Echinoderm which is free from spines.

**Abac'tio.** (Ab, from; ago, to remove. F. avortement; G. Abtroibung.) An abortion produced by art.

Abac'tus venter. (Belly emptied by force.) Abortion induced by art, according to Chambers and James.

**Ab'acus.** (L., from " $A\beta\alpha\xi$ , a mathematical table on which lines and figures were drawn.)  $\Lambda$ table used for preparations.

Aba'des. Cantharides.

Abairu'cu. The fruit of a species of Cynometra, Nat. Ord. Leguminosæ; Suborder, Cæsalpineæ. (L. and R.)

Abai'sir. See Spodium Abaisir. Abajoue. See Buccal pouch.

Abalienated. Applied to a part so destroyed as to require its extirpation (Scribonius Largus); also, to the decay of the internal and external senses; also, used by Celsus for cor-

Abaliena tion. (Ab, from; alieno, to cut off.) Decay either of the whole or part of the body; also the loss or failing of the senses, or of the mental faculties. (Scribonius Largus.)

Abanet. (Heb. Abanet, the girdle worn by Jewish priests.) A form of bandage. (T.)

Aban'ga. See Ady.

Aba'no, Italy, Venetia. A hot spring con-

taining sodium chloride and sodium bromide and iodide. Temp. 82°-84° C. (179-183° F.). Chiefly used as mud baths. Serviceable in gout and rheumatism, in certain forms of paralysis, white swellings, and scrofulous diseases.

**Abaptiston.** ('Αβάπτιστος, not immersed.) The crown of the old trepan, which was conical, or had some contrivance to prevent it from penetrating the cranium too suddenly, and so injuring the brain (Galen). Trepans which had a ring or knob a little above their point, as a similar protection, were, according to Panlus Ægineta (Adams' Transl. v. ii, p. 435), called Abaptista. Abaptis tum. The Latin form of Abaptis-

ton.

Abarthro'sis. Same as Diarthrosis. Abaremo-temo. A Brazilian tree, supposed to be a Mimosa; the decoction of its bark is applied, as an astringent, to ill-conditioned ulcers.

Abarnahas. (Ar.) The full moon; also magnesia. Used in the transmutation of metals.

Abartamen. (Ar.) Plumbum, or lead.
Abarticula/tion. (L., ab, from; articulatio, joint; Gr. άπάρθρωσις.) This last is used by Galen, and by Foësins, for a kind of articulation admitting of free motion.

Ab'as. (Supposed Ar.) Porrigo favosa, or scaldhead (Sorbait). Tænia, or tape-worm (Tur-

Abas Tuman. Cancasus. A town situated at an altitude of 4170 feet, in a beautiful district. Sulphuretted mineral waters. Temp. 40°C. (105°8°F.) to 40°C. (120°2°F.). Used in theumatism, articular and skin diseases, and in mercurial dyscrasia.

Abattoir. (F.; G. Schlachthaus; I. ammazatoio; S. matadero.) A slaughter-house.

Abax'ile. (Ab, from; axis, an axle.) A term applied to the embryo of a plant, when, as in Rumex, it has not the same direction as the axis of the seed.

Abbe'court, France, Seine-et-Oise, near Versailles. A cold carbonated spring containing magnesian and ferric sulphate. When taken internally, it is slightly purgative; used in cases of scrofula.

Abbe'ville, France, department of the Somme. A disused chaly beate spring.

#### ABBREVIATIONS—ABDOMEN.

#### Abbreviations-Continued.

#### Botanical, Zoological, and other Symbols-

- Monocarp. A plant which produces seed only once during its life. The symbol representing the sun.
- Annual. A monocarp which dies in  $A_{i}(1)$ the same year that it germinated, e. g. Mustard.
- Biennial. A monocarp which pro-duces leaves only the first year and  $B_{\bullet}$  (2) perfects its seed the next, e.g. Mul-lein.
  - Perennial. A plant which produces seed for an indefinite number of years, e.g. Apple.
  - Rhizocarp. A perennial the stems of which die down to the ground 2/ every year, e. g. Rhubarb, Mint. The symbol representing Jupiter, which has a period of revolution round the sun of 12 years.
  - Caulocarp. A perennial, the stems of which are persistent throughout the whole of its life, e.g. Apple. The symbol representing Saturn, the period of revolution of which round the sun is 30 years.
  - Herb. A plant, the stems of which H remain soft or succulent, e. g. Mint or Rhubarb.
- Shrub. A plant in which the stems S, S are woody, and which usually divide near the ground into numerous hranches and twigs, e.g. Lilac.
  - Under shrub, A small shrub; one that does not grow more than 3 feet in height, e.g. Gooseberry.
- Tree. A plant which grows to 20 feet T, \$ or more in height, having a woody stem forming a distinct trunk, e.g. Oak.
  - A climbing plant which follows the 0 sun, e.g. Hop.
  - A climbing plant which moves against the sun, e.g. Scarlet-runner.
  - Flowers having stamens only (unisexual, staminiferous, or male), e.g. male flowers of Box. The symbol representing Mars, the period of revolution of which is 2 years.
  - Flowers having pistils only (nni-sexual, pistillate, or female), e. g. female flowers of Box. The symbol representing Venus.
  - Flowers having both stamens and pistils (bisexual or hermaphrodite), e.g. Buttercup.
  - Abortive staminiferous flowers (nenter).
  - Abortive pistillate flowers (neuter), e.g. the florets of the ray in Daisy.
- Monœcions plants, producing male 3-2 and female flowers upon the same individual, e.g. Box.

- Diœcious plants, producing male and 8: 8 female flowers, but upon separate individuals, e.g. Willow.
- 232 Polygamous plants, which produce hermaphrodite and unisexual flowers upon the same or different individuals, e.g. Atriplex.
  - Indefinite in number; applied to stamens and other parts of flowers.
- $\bigcirc =$ Cotyledons accumbent, radicle lateral.
- 011 incumbent, dorsal. 0 ≫ conduplicate,
- 0111 twice folded 01111 thrice folded, ,,
  - Trimerous, applied to flowers when the whorls of the flower are multiples of three, as in most endogens.
  - Pentamerous, applied to flowers when the whorls of the flower are multiples of five, as in exogens generally.

Abdomen. (L. Abdere, to conceal. Gr. γαστήρ; F. ventre; G. Unterleib; I. addomine; S. abdomen; bajo ventre.)

The belly, venter, or lower cavity of the trunk, containing the greater part of the organs of digestion and of the urino-genital system. It is bounded above by the diaphragm; below by the floor of the perineum in front; and at the sides by the external and internal oblique, the rectus and transversalis muscles, and in part also by the ribs and intercostal muscles; behind by the vertebral column and the muscles connected with it. It is divisible into an upper part, or abdomen proper, and a lower part, the pelvis, which last is enclosed by the sacrum and ossa innominata. Its average vertical height is from seventeen to eighteen inches, and its transverse diameter about fourteen or fifteen inches. Its capacity is about ten or twelve pints. It is lined throughout hy a serons membrane termed the peritonenm. It is commonly subdivided for the purposes of clinical research into nine regions; the limits of these are formed by two vertical lines drawn from the junction of the seventh rib with its cartilage to the middle of Poupart's ligament on each side, and by two horizontal lines, the upper one of which is drawn through the ninth costal cartilages, and the lower one through the spines of the ilia. The following objects are found in each region :-

Right hypochondriac region .- Right lobe of liver, gall bladder, first part of duodennm. hepatic flexure of colon, right suprarenal capsule, part of

right kidney.

Right lumbar region.—Ascending colon, small intestine, second part of duodenum, head of pancreas, right kidney.

Right iliaeregion .- C:ceum coli, ureter, sperma-

tic vessels.

Epigastric region. - Stomach (central and pyloric portions), small part of right and greater part of left lobe of liver, third portion of duodenum and body of the panereas, coliac axis, abdominal aorta, vena cava, semilunar ganglia, receptaculum chyli, vena azygos.

Umbilical region .- Great omentum, transverse colon, upper part of small intestine, aorta, vens cava, and the mesenteric arteries and veins.

Hypogastric region.—Lower part of small intestine, apex of bladder in distension and in children, pregnant uterus, hifurcation of the aorta, and commencement of vena cava inferior.

Left hypochondriae region.—Stomach (cardiae portion), spicen, tail of pancreas, splenic flexure of colon, left suprarenal capsule, part of left kidnev.

Left lumbar region .- Descending colon, small

intestine, left kidney.

Left iliac region.—Sigmoid flexure of colon,

ureter, spermatic vessels.

A. pen'dulous. A condition frequent in advanced age, especially in women who bave borne many children, consisting in great increase of the subcutaneous fat, which is naturally abundant in this situation, with relaxation of the skin and abdominal muscles; sometimes troublesome by causing intertrigo.

Abdom'inal. Of, or pertaining to, the

abdomen.

A. aor'ta. See Aorta.

A. aponeuro'sis. The conjoined tendous of the obliquus internus and transversalis muscles of the abdomen.

A. ar'tery. The superior epigastric branch of the internal mammary artery.

A. belt. See Belt.

A. cavity. See Abdomen.

A. drop'sy. See Aseites. A. ganglia. Semi-lunar ganglia.

A. gestation. See Preynancy, extrauterine.

A. muscles. These muscles are six in number on each side, namely, the obliques externus, obliquus internus, transversalis, rectus, pyramidalis, and quadratus lumborum. The three first are thin planes of muscular fibre covering the sides of the abdomen, with broad tendinous expansions meeting in the middle line after forming a sheath for the rectus, their line of junction being termed the linea alba. The recti muscles extend from the ribs and sternum to the pelvis on either side of the median line in front, and the quadratus lumborum occupies a similar position behind. The pyramidalis is a small and not quite constant muscle situated in front of the lower part of the rectus.

The abdominal muscles support and compress the viscera, especially when the diaphragm is fixed in inspiration, bend and rotate the spine on the pelvis, and powerfully assist in the act of expiration, the force exerted having been shown by Dr. Huschinson to be sufficient under ordinary circumstances to raise a column of mercury two iuches and a half in height per square inch.

A. pari'etes. The walls of the abdomen.
A. phthi'sis. Tuhercular disease of mesenteric glands.

A. pore. A single or symmetrical opening in front of the anus existing in many fishes, through which, in some, the generative products escape after having been discharged into the peritoneal cavity; whilst in amphioxus it allows of the escape of the water which has passed through the branchial sac.

A. reservoir of birds. See Air sacs. A. respira'tion. A physiological difference exists between the man and the woman in regard to the mode in which the respiratory acts are performed. In the infant and adult man the action of the diaphragm predominates, and it is the vertical diameter of the chest which is chiefly increased; as a result of this the pressure exerted upon the viscera causes the walls of the abdomen to become prominent. Iu the woman the transverse diameter of the chest is increased in inspiration to a much greater extent than in man by the elevation of the ribs. In man the respiration is said to be abdominal, in woman, thoracic. The difference is associated with the reproductive functions of the female, since the costo-inferior and abdominal types of respiration would be interfered with by pregnancy.

A. rings. The two extremities of the in-

guinal canal.

A. ring, external. (F. anneau inguinal externe; G. acussere Leisten-ring.) The external abdominal ring is a triangular opening in the aponenrosis of the external oblique muscle of the ahdomen. The base corresponds to the crest of the pubes, the apex points upwards and outwards. It is about one inch in length and half an inch wide. It is bounded by two pillars; the external, thicker and lower one is formed by the lower part of Poupart's ligament, and is attached to the pubic spine; the internal and upper is thinner and straighter, and is attached to the front of the symphysis pubis. The intercolumnar fascia is given off from the margins of the opening. It transmits the spermatic cord and its coverings in the male, and the round ligament in the female.

A. ring, internal. (F. anneau inguinal interne; G. innere Leisten-ring.) The internal abdominal ring is an opening in the transversalis fascia situated midway between the symphysis pubis and the anterior superior spinous process of the ilium, and half an inch above Poupart's ligament. From the margins of the opening a thin faseia is given off. Arching over the aperture is the lower border of the transversalis muscle, which is fleshy in the outer, but tendinous in the inner half. Below it is bounded by Poupart's ligament. The epigastric vessels lie on the inner side. The space between the internal and external abdominal rings is termed the inguinal canal, and through it the intestine in oblique inguinal hernia descends.

A. sec'tion. See Casarean Section. A. typhus. Enterio fever.

Abdomina'lia. An order of the class Cirripedia. Carapace flask-shaped; body formed of one cephalic, seven thoracic, and three abdominal segments; the latter bearing three pairs of cirri, but the thoracie segments being without limbs. Mouth with the labrum greatly produced and movable. Larva, at first oval, without exterual limbs or an eye; afterwards binocular and resembling adult form.

A group of the suborder Malacopteri; Ord. Teleostei; Cl. Pisces. They have ventral fins,

which are abdominal in position.

Abdominos'copy. (Abdomen; σκοπέω. to observe.) The examination of the abdomen by percussion, mediate or immediate, by inspection, measurement, and palpation.

Abdom inous. (Abdomen.) Big-bellied.
Abdu cens. (Ab, from; dueo, to draw.)
Term applied to muscles or to nerves innervating muscles that draw the parts into which they are inserted from the median line of the body or of a limb.

A. oc'uli, mus'culus. See Rectus externus. A.oc'uli, ner'vus. (F. moteur oculaire externe.) The sixth pair of nerves, supplying the external recti muscles of the eye. Each arises, in common with the seventh, from a ganglion situated beneath the floor of the fourth ventricle above but in the same line with the hypoglossal, and also from the grey matter of the fasciculus teres; the fibres, which are about 2500 in unmber, form almost a loop with those of the portio dura, the loop enclosing the ganglion common to both. When paralysed a convergent squint with homonymous diplopia results.

A. o'ris. The levator anguli oris.

Abdu'cent. See Abducens.

Abducen'tes oc'uli. See Abducens oculi. Abduction. (L. Abduco; ab, from, and duco, to draw. F. Idem. It. abduction; Sp. abduccion; G. Abziehung.) That movement by which one part of the body, or a limb, is drawn away from another, or from the mesial line.

Applied to a fracture in which the bone is so divided transversely that its extremities recede from each other. Gr. anal. καυληδου κάταγμά, according to Galeu (Meth. med. vi), so called from

resemblance to a broken stem.

Applied also to a strain, and stated as our of the causes of sciatic and psoadic pains by Colius

Aurelianus, Morb. Chron. v. c. 1.

Abduction is, in philosophy, according to Aristotle, a syllegism of which the major premiss is certain and the minor only probable. Hence the conclusion, without being so certain as the major, is rendered as probable as the miuor. Aristotle gives this as an example: Major proposition certain-Science can be taught; minor proposition, more probable than the conclusion-Justice is a science; conclusion, more uncertain in itself than the minor, but becoming by the syllogism as prohable as it-Justice, therefore, can be taught. (Franck.)

**Abductor.** (Ab, from; duco, to lead or draw. F. abducteur; G. Abziehmuskel; It. abduttore; Sp. Idem.) Term applied to various muscles which either draw the limbs from the median line of the body, or, as in the case of the dorsal interessei, draw the digits from the median line of the limb.

A. au'ris. See Retrahens aurem. A. bre'vis al'ter. See A. pollicis. A. bre'vis pollicis. See A. pollicis.

A. dig'iti quin'ti. See A. minimi digiti. A. in dicis. (Fr. abducteur du doigt indicateur.) The first dorsal interossens muscle. It arises from the upper half of the uluar border of the first metacarpal bone and nearly the whole of the metaearpal bone of the index finger, and is inserted into the radial side of the first phalanx of the fore finger. The radial artery passes forwards between the two heads. It is supplied by the ulnar nerve.

A. long'us pol'licis. See Extensor ossis

metacarpi pollicis.

A. min'imi dig'iti (hand). (Fr. A. du petit doigt.) Arises from the pisiform bone and the tendon of the flexor earpi ulnaris, and is inserted into the ulnar side of the base of the first phalaux of the little finger. Supplied by the nlnar

A.min'imi dig'iti (foot). (Fr. A. du petit orteil.) Arises from the external or lesser tuberosity of the os calcis, from the fore part of the greater tuberele, and from the plantar faseia and intermuscular septum. It is inserted into the outer side of the base of the first phalanx of the little toe. It is supplied by a branch from the trunk of the external plantar nerve.

A. oc'uli. See Rectus externus.

A. os'sis metatar'si min'imi dig'iti. An occasional muscle arising from the external tnbercle of the os calcis, and inserted into the spine-like process of the fifth metatarsal bone beneath the outer margin of the plantar fascia.

A. pol'licis (hand). (Fr. A. court du pouce.) Arises from the ridge of the os trapezium and annular ligament. Insertion, radial side of the base of the first phalanx of the thumb. It is

supplied by the median nerve.

A. pol licis (foot). (Fr. A. du gros orteil.) Arises from the iuner tubercle of the os calcis, the internal lateral ligament, plantar fascia and intermuscular septum between it and the flexor brevis digitorum. It is inserted with the innermost tendon of the flexor brevis pollicis into the inner side of the base of the first phalanx of the great toe. It receives its nervous supply from the internal plantar nerve.

Abdu'men. See Abdomen. (D.) Abebæ'os. (å, neg.; βέβαιος, firm.) In-

firm; weak; unsteady.

Abecedaria. A circle, or ring, of letters, called an abccedary circle; one of the vulgar errors impugned by Dr. Browne was the notion that through the sympathy of two needles touched with the loadstone, and placed in the centre of two abecedary rings, friends at a distance could correspond with one another.

A. herba; also spelt abcedary. Spilanthus acmella, so called because the Ethiopiaus were believed to give it to their children to chew, in order to enable them to pronounce their letters.

Abele. The Populus alba.
Abelice'a. ('A, neg.; βέλος, a dart.)

Hæmatoxylon Campechianum, or logwood.

Abeliana. See Avellana.

Abelmeluch. Abelmoluch. Abelmo'luch. (Ar. Ab el moluk.) A kind of Ricinus; growing near Meeca, having

black oblong seeds, said to be violently earthartte. **Abelmos'chus.** Nat. ord. *Malvaceæ*, tribe *Hibisceæ*, having a gamosepalous ealyx, frequently torn irregularly at the base, and clongated capsular fruit, with projecting ribs.

A. esculen tus. (flind. Bhindi; Ramturi-Bhendi; Duk. Venday; Tam. Benda; Tel. Vendah, Beng. Dhenroos.) Cultivated near Constantinople and elsewhere-under the name of Okra-bendee or Gombo-for the sake of its fruit, leaves, and roots, which abound in mueilage; used in catarrh and dysuria. The fresh capsules (Bendi kai) form good emollient poultices, and are used economically to thicken somps, or, when young, as a pickle. The stem yields a strong silky fibre. (Drury.)

A. moschatus. (Ar. Ab el mosk, seed he musk. Tam. Kasturi-venday, Katheof the musk. Kasturi; Tel. Kasturi-benda; Mal. Katta-Kasturi; Beng. Mushak dana; Duk. Mushkbhendi.) Musk mallow. Habitat; Egypt, East and West Indies. An evergreen shrub yielding the seeds known as semina abel-moschi, alcem Ægyptiace, and grana moschata. The seeds are kidney-shaped, striated, and of a grevish-brown colour, with musk-like odour and warm spicy taste; considered stimulant and antispasmodic, and applied, both externally and internally, against snakebites; used to adulterate musk and to flavour coffee.

Abensbach. Bavaria. An alkaline carbonated spring; prescribed in cases of gout, rheumatism, gravel, and catarrh of the bladder. (Bouchut,)

A'bensberg. Bavaria. A sulphuretted

**Abepithym'ia.** (A, neg.;  $\dot{\epsilon}\pi\iota\theta\nu\mu\dot{\iota}u$ , lust, desire; also, that part of the soul which, according to Plato, resides in the abdomen.) A paralysis of the solar plexus, cutting off the communication between the cerebro-spinal nervous system and the abdominal viscera, and destroying life.

Abernethy, John. English Surgeon, b.

1764, d. 1831.

A.'s method of tying external iliac. The incision is commenced 1.5" to the inner side and a little above the anterior superior spine of the ilium, and earried in a curved direction to a point 1.5" above the middle of Poupart's ligament. After division of the skin and muscles, the lower border of the transversalis fascia where it gives passage to the spermatic cord, is cut through, and the peritoneum is detached from the iliac fossa until the artery is exposed.

Aberrant, Vas. See Aberrant duct.
Aberrant. (Ab, neg.; erro, to wander.
Fr. aberrant; G. abweichend.) Applied to species which differ widely from the type of the group or

family to which they belong.

A. arteries. Long slender vessels which arise either from the brachial or axillary artery, and end by joining one of the chief arteries of the

forearm or one of their branches.

A. duct of testis. Vas aberrans of Haller. A tube connected with the lower part of the epididymis, varying in length from one to twelve inches; sometimes free, and forming a lobule; often opening by both extremities into the canal of the epididymis, sometimes branched; sometimes multiple (two or three, Cooper); presenting the same structure as the vas deferens.

A. ducts of liver. Fine biliary duets ramifying in the lamella of the triangular ligament, and extending from thence to the under surface of the diaphragm; others are found in the connective tissue bridging over the sulcus for the vena cava.

Aberra'tio. (L. ab, from, erro, to wander.) A deviation from what is ordinary or natural.

A. lac'tis. Exerction of milk from other parts than the mammary gland.

A. lo'ci. An error in the position of parts.

A. men'suum. Vicarions menstruation.
A. tem'poris. An error in the time of the

production or action of parts.

Aberra'tion. (Fr. Idem; It. aberazione; G. Abweichung, Abirrung.) A malformation of feetal parts; a derangement of the mental faculties; a migration or diapedesis of leucocytes from their natural channels; a compensatory escape of blood; vicarious hæmorrhage.

A. chromatic. That dispersion of the rays of light which happens after their passage through a lens; the violet rays, being more refrangible than the red, are brought sooner to a focus, and hence a halo of colours is seen sur-

rounding the image.

A. distan'tial. Spherical aberration. A. of light. A small apparent displacement of the fixed stars, due in part to the circumstance that light takes time to travel through space, and in part to the motion of the earth.

A. Newto'nian. See A. chromatic. A. of refrangibility. Chromatic aber-

ration.

A. spherical. Designates the fact that when rays of light traverse a convex lens those rays that pass through it near its periphery are brought to a focus sooner than those which traverse it near its axis; hence the rays, instead of being collected into a single point, are extended over a small space, so that the image of the object is not sharply defined.

A. of spheric'ity. Spherical aberration. beryst'with. Wales; Cardiganshire. Aberyst with. A summer sea bathing place, protected by lofty bills. There is a chalybeate spring.

Abe'samum. The oxide which forms on

the iron of wheels; farmerly employed in medicine. (R. and J.) Abes'si. (Ar. Abes, filth.) Alvine excre-

ment. Also, arsenic bisulphide.

Abes'tus. See Asbestus. Abesum. Quicklime. (R. and J.)

**Abevacuation.** (Ab, from; evacuo, to empty.) Partial or incomplete evacuation, whether naturally or artificially produced. Evacuation which is effected by the passage of matter from

one organ into another. **Abhal.** (Ar.) The fruit of a species of cypress, said to be a powerful emmenagogue.

Abhel. Abhal.

Abie'cula (Dim. Abies, the fir-tree.) The dwarf fir-tree.

Abiegna. An oily liquid that, according to Piso, exudes from a species of Cecropia in the

Brazils. (Waring.)

Ab'ies. A name applied by the Romans to the Elate or date palm. (Pliny, Hist. Nat. lib. xii, cap. 62.)

Abies. Suborder Abietea; Nat. Ord. Coniferæ. Monceious. Males, Catkins solitary, not racemose; anthers hursting transversely. Females, Catkins simple; scales imbricated, thin at the apex, rounded, flat, not hollowed out for the seeds, as in Pinus; when ripe falling from the axes; leaves solitary in each sheath.

A. alba. See A. picea.
A. balsam'ea. (Fr. Baumier de Canada.) Balm of Gilead fir. An elegant tree, rising to 40 feet in height, with tapering trunk and numerous branches; leaves solitary, flat, emarginate, or entire, six or eight lines long, glaucous beneath, somewhat pectinate, subcreet above, recurved, spreading, inserted in rows on the sides and tops of the branches; cores large, cylindrical, erect, purplish; bracts abbreviate, obovate, conspicuously mucronate, subserrulate. An inhabitant of Canada, Nova Scotia, and Maine. Yields Canada balsam.

A. balsamif'era. See A. balsamea.
A. canaden'sis. The hemlock spruce of A. canaden'sis. The hemlock spruce of the United States and Canada. It rises to a height of 70-80 feet. Branches slender, and dependent at their extremities; the leaves numerons, six or eight lines long, flat, denticulate, and irregularly arranged in two rows; the strobiles ovate, little longer than the leaves, terminal, and pendulous. Yields Canada pitch and essence of spruce.

A. commu'nis. See A. execlsa.

A. dam'mara. See Dammara orientalis. A. excelsa. (Fr. epicea, pesse; Germ. Fichte, Rothtanne.) The Norway spruce. A lofty tree, rising 150 feet in height. The leaves, which stand thickly upon the branches, are short, obscurely four-cornered, often curved, of a dusky green colour, and shining upon the upper surface. The male amenta are purple and axillary, the female of the same colour and terminal. The fruit is in pendant, purple, nearly cylindrical strobiles, the scales of which are oval pointed and ragged at the edges.

A. gal lica. See A. picea.
A. la'rix. See Larix Europæa.
A. ni'gra. See Pinus nigra.
A. pectina ta. See A. picea.

A. picea. (Fr. sapin argenté; Germ. Weisstanne, Edeltanne.) The European silver fir; grows in the mountainous regions of Switzerland, Germany, and Siberia. Yields common turpentine, and a finer kind called Strasburgh turpentine. The leaf buds are made into beer, and are used in scurvy and rheumatism.

A. ru'bra. See A. excelsa. A. taxifolia. See A. picen.

A. virginia na. See A. canadensis. Ab'ietate. A salt of abietic acid.

Abiete a. A suborder of the Nat. Ord. Coniferæ. Ovules inverted, micropyle next the base of the carpel; pollen oval.

Abie tic acid. C<sub>20</sub>H<sub>30</sub>O<sub>2</sub>. The essential constituent of common resin. A monobasic acid, erystallising from alcohol in oval pointed plates, insoluble in water, soluble in alcohol, ether, and chloroform.

Abietine (L. Abies, a fir). An indifferent resinons substance, extracted by alcohol from the residue of the distillation of Strasburgh turpentine or Canada balsam with water. It possesses neither taste nor smell, is insoluble in water, but is soluble in alcohol and ether. It crystallises in

needles or in elongated pyramids. **Abietin ic Acid**. C<sub>44</sub>H<sub>64</sub>O<sub>5</sub>. One of several closely analogous resinous acids obtained from the fir and larch. It forms colourless crystals soluble in alcohol, wood spirit, chloroform, and carbon bisulphide. It is bibasic.

Abie'tis resina. See Resina.

**Ab** ietite.  $C_6\Pi_5O_3$ . An indifferent substance obtained from the needles of Abies picea. It closely resembles mannite, to which it bears

the same relation that ether does to alcohol. **Abiga.** (Abigo, to expel.) Teverium chamapitys, the ground-pine; so called from its supposed power of inducing abortion.

Abiogen'esis. ('A. neg.; βίος, life; γίγνομα, to generate.) Generatio æquivoca, Generatio primaria, Archigenesis, Archebiosis. The doctrine that living matter may be produced by not living matter. This subject has attracted much attention of late ways. Parabetic Formatter. much attention of late year. Pouchet in France, Häckel in Germany, and Bastian in this country, have been its most prominent supporters. The arguments in favour of it are, first, that there is no inherent improbability in the view that the lowest forms of animal life included under the head of Protista by Haeckel should be formed by the combination of their chemical elements without the intervention of antecedent life; secondly, that if the doctrine of special creation be put aside, the first animals must have arisen in this way; and, thirdly, that whatever pre-cautions may be taken to prevent the entrance of spores, low organisms make their appearance in infusions of dead matter, provided the conditions are otherwise favourable. On the other hand, the opponents of the doctrine of abiogenesis, who are also termed panspermists, argue that there is no reason for believing the mode of production of the lower and less known organisms to be entirely different from that of all the higher forms, and they also maintain that the atmosphere teems with particles that are either seeds or spores, or are capable of acting as seeds, and that the development of life in infusions of dead matter is due to the fact that such infusions afford conditions favourable to their growth. The most ingenious apparatus and modifications of experiments have been suggested by both sides to exclude the outer air, or, if admitted, to completely kill the germs supposed to exist in it. Unfortunately the evidence that one side regards as irrefutable is either entirely ignored or met with a direct denial by the other. The positive results of one experimenter are the negative ones of his opponent. If a heterogenist declare that living organisms have appeared in an infusion to which no germs can possibly have had access, the panspermists reply that the apparatus was not air-tight, or that the spores had not been killed by the treatment adopted. Whilst, when the panspermist declares that his infusions are barren, the heterogenist maintains that the conditions present are just those which render the appearance and maintenance of life impossible, or that if the fluid had been preserved a little longer life would have been developed. On the whole it may be said that no conclusive proof has been obtained of the occurrence of Abiogenesis.

Abionar'ce. (A, neg.; Βίος, life; νάρκη,

torpor.) Paralytic torpor. **Abio'sis.** ('A, neg.; βίωσις, life. F. abiose; G. Leblösigkeit.) Unfit for life; ineapable of living.

Abio tos. (' $A\beta i\omega \tau os$ , without life.) The hemlock plant, from its deadly qualities.

Abirritant. (Ab, from; irrito, to excite.) Soothing or calmative agents which cause diminution of irritation.

Abirritation. (Ab, neg.; irrito, to irritate.) Depressed condition of the vital phenomena in the various tissues, and, therefore, slightly distinct from Asthenia, which implies a more complete reduction of their powers.

Abir'ritative. (Same.) A term applied by Broussais to diseases caused by a lack of irri-

Abit. (Ar.) Cerussa, or lead carbonate. (R.) Ab kudoo-telkh. The juice of the bitter gourd, ranked by the Arabian physicians amongst emetics. (Waring.)

Ablacta/tion. (Ab, priv.; lacto, to give suck. Fr. ldcm; It. ablattazione; Germ. Entwolnung.) In the 'Dictionnaire des Termes de Méd. Chir., &c., 'this word is confined to cessation of suckling so far as regards the mother; for, as to the child (or weaning), it is ealled Sevrage. The more ordinary sense, though this is to some extent technical, is connected with the grafting of trees, by which the jnice of the parent tree is made to feed the graft till it unites.

Ablas tous. (A, neg.; Βλαστόs, a germ or bud. Fr. ablaste; Germ. ohne Keim; unfruchtbar.) Without germ or bud; unfruitful.

Abla'tion. (Aufero, to take away Fr. Idem; It. ablazione; Sp. ablacion; Germ. Abnahme.) The removing, or taking away, of any part of the body by mechanical means.

**Ableph'arous.** ('A, neg.; βλέφαρου, the cyclid. Fr. abléphare; Germ. ohne Augentieder.) Without eyelids.

**Ablep**'sia. ('Λ, neg.; βλέπω, to see.)

Blindness; ablep'sy.

Abluent. (Abluo, to wash away. abluant; Germ. abfahrend, reinigend.) Washing away; that which washes away, or earries off impurities. Gr. anal  $P \dot{\nu} \pi \tau o \nu \tau a$ , applied by Galen, de Simpl. fac., ii, 12, to abstergent medicines.

**Abluen'tia.** See Abluent and Abstergent. **Ablu'tion.** (Abluo, to wash away. Fr. Idem; It. ablazione; Sp. ablucion; Germ. Abwaschung.) The washing of the body, whole or in part. Applied in chemistry to the separation of extraneous matters by washing. A translation of the Greek ἀπονίψις, a term applied to an internal washing, which was accomplished by administering profuse libations of milk-whey, as mentioned by Galen, de sal. diæt ,t. 18.

**Abmortal.** (Ab, from; mortuus, dead.) One of the terms employed by Hermann ('Pflüger's Arebiv,' xvi, p. 193, 1878) to denote the various electric currents which may be observed in muscles. An ab-mortal current signifies the direction of a current in a mnscular fibre passing from a portion of the fibre which is dying to a portion which is living and at rest. Admortal similarly signifies a current passing from a portion of the fibre which is living and at rest to a portion which is dying. Ad-terminal signifies a current passing similarly in the fibre from some portion of the fibre to the natural tendinous termination of the fibre; and ab-terminal, one passing from the natural tendinous termination to some part of the fibre; the former might be called termino-petal, the latter termino-fugal.

Ad-nerval is similarly a current passing from a portion of the muscular fibre to the entrance of anerve fibre into the muscular fibre, and ab-nerval similarly a current passing from the entrance of the nerve fibre to some other portion of the muscular fibre.

Abnelecten. (Ar.) Alumen, or alum. (R.) Abner val. See Ab-mortal. Abnor mal. (Ab, priv.; norma, law.)

Contrary to the rule of nature; not in the natural condition; irregular.

Abnormality. (Abnormalis; ab, from; norma, rule.) Something exceptional, unusual, or anomalous; such as the transposition of the viscera, or the presence of six fingers on the hand

Abnor'mity. (Ab, neg.; norma, a rule. Fr. abnormité; Germ. Regelwidrigkeit.) An anomaly or deviation from the common rule.

Abnor'mous. See Abnormal. Abob'ra do Ma'to. A species of Bryony, Nat. Ord. Cacurbitaceae, growing in Chili, the resin of which in drachm doses is purgative.

**Aboit.** The same as Abit. **Abolit'ion.** (L. Abolitio; ab, priv., and olesco, to grow.) The destruction or utter removal of any useless substance, or part.

Abolit'io Pul'sus. Cessation of the

pulse. Asphyxia.

Aboma'sum. (Ab, away from; omasum, the paunch. F. eaillette; G. Labmagen.) The fourth or true stomach of the ruminant, ealled also the reed or rennet. In eapacity it stands next to the rumen or paunel. It is pear-shaped, and is situated behind the omasum, above the right sac of the rumen. Its base is connected with the omasum by a thick neek. Its apex is continuous with the duodenum. The mucous membrane is produced into lamellar folds, is soft, spongy, smooth, vascular, covered by a thin epithelinm, and provided with numerous glands for the secretion of gastric juice. In this stomach the essential process of digestion takes place. The rennet is used for coagulating the milk in the manufacture of cheese.

Abomina tion. (L. ab, or absit, let it be Loathing for food. (De away, and omen, sign.)

Caldera.)

Aborig'inal. (Ab, from; origo, the beginning. Fr. aborigene; Germ. ursprünglich.) Applied to plants, and to man and animals, which are supposed to be natives of the country they inhabit.

Abo'ral. **ral.** (Ab, away from ; os, the That face or pole of a Coelenterate or mouth.) Echinoderm which is opposite to the face or pole in the centre of which the mouth is placed.

**Abor'sus.** (Ab, priv., and ordior, to begin.) An abortion; miscarriage in the first or early montbs.

(Abortus, an avortum, Abortici'de. cædo, to kill. Fr. aborticide.) of the fætns in ntero to effect delivery.

Abortifa'cient. (Abortus, a misearriage; facio, to make. Germ. abtreibende Mittel.) Term applied to medicines, or other agents, which cause the pregnant nterus to contract and expel its contents. The chief drugs to which abortifacient properties have been attributed are cantharides, ergot, savine, and rue, in this country; the juice of hamboo, various enphorbias, calotropis, and plumbage, in India; extract of cotton root (gossypium), aetea racemosa, and digitalis in America. Mechanical means are often employed, and the introduction of styles, sounds, &c., has often been resorted to.

Abortion. (Abortio, 8 miscarriage. F. arortement; It. and Sp. aborto; G. Fruhgeburt. Fehlgeburt.) The term abortion is applied to the expulsion of a feetus before it is viable

Most writers adopt the end of the fifth or the beginning of the sixth month of pregnancy as the period separating an abortion from a premature labour; some restrict the term abortion to an expulsion occurring in the first sixteen weeks, and use miscarriage to designate one occurring in the following thirteen or fourteen weeks, after which

it is called premature labour.

The causes which may lead to abortion are very various. It may result from violent blows or falls on the abdomen, or other forms of external injury, from rupture of the membranes, from the action of powerful emmenagogues, from constitutional states of the mother, as from anæmia, plethora, variola, syphilis, from violent mental emotions, persistent vomiting, eough, constipation, or diarrhea; from death of the feetus, or degeneration of the parts belonging to it; from tumours in the pelvis, or adhesions consequent on inflammation; from separation of the placenta. Finally, it may result from hereditary predisposition, and occasionally seems to be an acquired habit.

In abortion occurring within the first three or four weeks, the symptoms are usually little more than an exaggeration of the ordinary sensations of a menstrual period; somewhat more pain, something substantial in the discharge. When occurring later on, there is usually a premonitory rigor, some little feverishness and nervous irritability, a feeling of coldness or weight in the hypogastrium, pain in the loins, and irritation of the bladder; by and by the pain increases, spreads to the nterine region and down the thighs, and becomes recurrent; hæmorrhage to a greater or less extent occurs; and in the end the uterus empties itself. If the pregnancy be only of a few weeks' duration, the ovum is often expelled entire; when more advanced, the membranes usually rupture first, the fœtus soon escapes, but a greater or less period may elapse before the placenta is separated. Inordinate hemorrhage and retention of the placenta are the chief sources of danger. The treatment may have for its object the averting of a threatened abortion, the hastening of its progress, or the cure or relief of the conditions favouring its occurrence. For the first object, absolute rest, coolness but not coldness, and opium, are sometimes sufficient. For the second object, ergot may be needed; if there be much hæmorrhage, internal astringents are not to be relied on; ice should be applied, and the uterus emptied as soon as possible; if the os be dilated this may be done by the finger, or by special forceps; sometimes it is sufficient to break down the ovular structures, hut it is well, if possible, to leave nothing behind; if the os be undilated, it may be plugged by a sea-tangle tent until the fingers can be introduced; it has been recommended that a large sponge soaked in vinegar, or some coagulating agent, be introduced into, the vagina until expulsive pains come on. If hamorrhage continue after the expulsion of the uterine contents, perchloride of iron in solution or water at a temperature of 50° C. (122° F.) may be injected into the uterine cavity. Sometimes the placenta is adherent and requires removal by the finger. The third object is to be fulfilled by a careful consideration of the cause of the abortion, and the treatment is to be directed towards its removal.

A. crim'inal. The administration of any poison or other noxious thing, or the use of any instrument or other means, with intent to procure the miscarriage of any woman, and also the use of any such means for that purpose by the woman herself, is a felony under the English law, whether the woman be or be not really pregnant. The supplying or procuring materials with the knowledge that they are to be used in the production of a miscarriage is a misdemeanour. Among the means which have been used are hot baths, violent exercise, mechanical compression of the abdomen, and even trampling on it, abortifacient medicines, instruments introduced into the uterus, as skewers, sticks, wires, clastic tubes, and inicetions.

A. embryon'ic. Abortion occurring between the twentieth and the ninetieth day.

A. foe'tal. Abortion occurring between the third and the sixth month.

A. indu'ced. See Premature labour, in-

duction of. A. o'vular. Abortion occurring before the

twentieth day of pregnancy.

A. provo'ked. See Premature labour, in-

duction of.

Abor'tion. In Botany, the suppression or non-development of some part or organ, as in the axis, of the stem; in the leaf, of the petiole or lamina; in the flower, of the calyx, corolla, andrecium, or gynecium, or of some segment of one of these whorls.

Abor'tive. Fr. abortif; G. abtreibend; It. abortivo. Applied to treatment of disease adopted with the view of preventing its further or

complete development.

Abortive smallpox, also called Varicelloid, is smallpox in which the cruption is limited to the vesicular stage.

For the use of this word in botany, see Abor-

Abortives. See Abortifacients. Abortiment. Abortion.

Abor'tus. An abortion. See Aborsus.
Abou'kir, Mineral Waters of.
Algeria. A spring containing sodic chloride,

Aboulaza. A tree of Madagasear, in use for diseases of the heart. (D.)

Abrabax. See Abraxas.

Abracadabra. A cabalistic or magic word, recommended by Serenus, in his 'Medicina Metrica,' c. 53, v. 9444, as a cure for semitertian fever, &e., according to Castellus. See Abracalan.

It was to be written on a piece of paper folded in the form of a cross, suspended by a strip of linen sufficiently long to allow it to rest on the pit of the stomach; to be worn for nine days, and then to be thrown over the shoulder into an eastward running stream. The letters of the word were to be written in the form of a triangle in one of these two ways-

ABRACADABRA ABRACADABR ABRACADAB ABRACADA ABRACAD ABRACA ABRAC ABRA ABR **A** B Α

ABRACADABRA BRACADABR RACADAB ACADA CAD

Abracalan. A magical or cabalistic word, to which the Jews attributed virtues equal to those of Abracadabra.

**Abra'chia.** ('Λ, neg.: βραχίων, the arm.) Λ variety of Agenesia, or imperfect development, consisting in the absence of the arms.

Abrachiocephalia. ('Aneg.; βραχίων, arm; κεφαλή, head. An anomaly characterised by the congenital absence of the head and

Abrakh. Hindustani name for Mica; used, when calcined, as a remedy in fevers.

Abranch'ia. Suborder of the order Opisthobranchiata, of the class Gasteropoda, dis-

tinguished by the absence of branchice.

Abranchia ta. ('A, neg.; βράγχια, the gills of a fish.) A term applied to the Sauropsida and Mammalia, in which the vascular plexus is never developed in such rudiments of the gill slits and arches as appear in the course of embryonic life; the term is equivalent to the Amniota of Haeckel, and to the Allantoidea of Milne Edwards.

Also one of the subdivisions of the order Oligochæta, class Chætopoda, group Annulata, sub-kingdom Vermes, which includes the terricolous forms, such as Lumbricus, the common earth-

Abrasax'as. See Abraxas.

**Abra'sion.** (Ab, priv., and rado, to rub.) Fr.ldem; G. abschaben, abschalen. Act, or result, of scraping, filing, shaving, chafing, fretting, or rubbing of any surface so as to expose the underlying parts, chiefly applied to the excoriation of the cutaneous and mucous tissues.

Abra'sum. (Abrado, to scrape off.) Abra-

Ab'rathan. A corruption of Abrotanum.

(Turton.) Abrax'as. (The Greek letters a, β, ρ, a, ξ,

a, s, which, as numerals, express 365.) A cabalistic term, said by some to be a name of the supreme deity of the Basilidians; by others to be that of the sun; and supposed to possess great protecting virtues; it was applied to small figures, or plates of metal, or stone, representing Egyptian deities, with Magian and Rahbinical symbols, and Coptie, Greek, Hebrew, Phænician, and Latin characters, which are believed to have been used as amulets.

Abreshain. (El-rey-sum of the Ulfar.) An Indian remedy, consisting of white silk cut up very fine; used as an aphrodisiae. (Waring.)

Abrest. France. An alkaline spring near Vichy and having the same properties.

Abrette. The seeds of Abelmoschus moschatus.

Abric. (Ar.) Sulphur, (R. and J.)

Abrodiæ'tus. ('Αβρός, delicate; δίαυτα, ode of hving.) Living delicately; applied mode of living.) to light or delicate dict.

Abro'ma angus'tum. Nat. Ord. Byttneriaceæ; Hab. Tropical Asia. The bark is mucilaginous.

Abrom'otoun. Ashantee name of an undetermined plant; the bruised leaves are used as a discutient in boils. (Waring.)

Abrong. A round grain, spotted with black and white, bitter, laxative, and vermifuge. It is said to have been brought from China. (Waring.)

Abronlaza. A tree of Madagasear; employed in that island in diseases of the heart.

(Waring.)

Abro'sia. ('A. neg.; βρῶσις, food.) Absti-

Abrot'anum. See Abrotonum.

A. cath'sum. Artemisia abrotonum. (D.) A. mas. Artemisia abrotonum.

Abrotoni'tes. (Gr. άβροτονίτης, abrotonum wine.) Wine in which abrotanum has been souked.

**Abroto'num.** ('Αβρότονον ; F. aurone.) This term was applied to two plants by the ancients, one of which was said to be male, the other female. The former has been identified with Artemisia abrotonum, or Southernwood, and the latter with Santolina chamæ cyparissus. Abrotonum was employed as a tonic, vermifuge, emmenagogue, alexipharmie, and antiperiodic; also as a cure for the bite of the scorpion. (Waring.)

Abrupt. (Abrumpo, to break off). Pixmorse, or truncated, applied to roots that appear

as though bitten off.

Abrup'tion. (ab, and rumpo, to break.) A term formerly used for the act of breaking, or state of being broken, or snapped asunder; applied to fractures synonymously with Abduction, which see.

Abrupt'ly pin'nate. (Fr. paripinné; G. paarige gefiedert.) Pinnate leaves are so-called when there is no central or terminal pinna, the

leaf ending with a pair of leaflets.

Ab'rus precato'rius. ('Aβρός, soft, from the tenderness of the leaves; preces, a prayer. F. Liane à reglisse; Sans. Gunja krishnala; Arab., Ghoonchee; Hind. Ghungchi Gunj; Dak. Gumchi; Gundu-mani, Kunri-mani; Tam. Tel. Guri-ginga, Gura-venda, Gulivinda; Mal. Kunni-Kuru'; Beng, Kunch Gunj, Nat. Ord. Legumi-nosæ. Wild or country, or Jamaica Liquorice. Hab. Java, Mysore, Hindostan, Assam. Root and leaves yield an extract like liquorice, but bitterish; leaves mixed with honey applied to swellings, and used to alleviate cough. In Jamaica, used instead Their juice of tea; in Java, as a demulcent. thought useful in aphtha. The seeds employed externally to allay heat in ophthalmia. There are five varieties of the A. precatorius, with scarlet, black, white, yellow, and blue seeds. The scarlet seeds have a black spot, and are used as weights, each weighing almost exactly one grain (Retti weights). Other names for the seeds are Lovepea, Angola seeds, and Pimble beads, and they are often strung as rosaries. In Egypt they are used as food (Prosmr alpinus). (Drury.) Barham (Hort. Amer., p 88) has used a ptisan of the leaves with success in colic.

Absac. France; Arrondissement of Confolens near Charente. A cold tonic spring containing sodie chloride. It is given with advantage

as a drink in intermittent fever.

Absce'dent. (L. abs and ccdo, to give way, yield, depart.) Applied formerly to those parts which, when the body is in its natural condition, are either united or contiguous to other parts, but when diseased no longer maintain their union or contact, as the bones, &c., in ulceration.

Abscess. (L. abscessus; abs, and cedo, to depart; Fr. abcis; It. ascesso; Sp. abccso; G. Geschwür and Eitergeschwulst.) A circumscribed collection of pus. The formation of an abscess is one of the terminations or events of inflammation; if the inflammatory process has been rapid it is named an acute or phlegmonous abscess; if slow, a chronic or cold abscess. In either case a large number of cells make their appearance in the connective tissue, many being leucocytes or

white corpuseles of the blood, whilst others are derived from the proliferation of the connective tisssue. The pressure of these cells, the requirements of their nutrition, and the nervous and vascular disturbance of the parts, lead to the atrophy and breaking up of the adipose and connective tissue. The tissues surrounding the central collection of pus become condensed by the exudation of plastic material, and subsequently form the sac of the abscess, which possesses but feeble powers of absorption; loops of vessels develop on this border by the coalescence of leucocytes, and the whole inner surface of the cavity of the abscess, in so far as regards the arrangement of its vessels, resembles a granulating surface folded up in the form of a sac. By degrees contraction takes place, and ultimately the only remains of the original mischief is a hard knot or cicatrix. Where no limiting membrane is present, as in the abscesses that form in erysipelas, the term puruleut infiltration is generally applied to the collection of matter.

The proximate cause of the suppuration of an inflaumatory exudation is due in many instances to an excessive supply of pabulum. The eutrance of septic ferments into a part, as in dissection wounds, or the existence of a septicæmic condition of the blood generally are conditions especially adapted to cause inflammation to pass into suppuration; certain diatheses appear to be exceptionally prone to the formation of abscesses.

The symptoms of an abseess are that after a period of variable duration, in the course of which the patient has experienced the usual signs of inflammation, sometimes with and sometimes without a rigor, a soft swelling appears, with or without discoloration of the surface, in which a more or less distinct sense of fluctuation can be perceived on palpation. Abscesses are found most commonly in the subcutaneous connective tissue, but are also frequently seen beneath the periosteum, and in many other parts, as the brain, lungs, liver, prostate, uterus, and lymphatic glands. Cold abscesses are seen in many syphilitic and tuberculous affections, and in inflammations of the glands and joints in lymphatic and scrofulous diatheses.

Abscesses, if left to themselves, generally make their way in the direction of least resistance, and burst through the skin or some mucous membrane, or their contents may, owing to the corpuscles undergoing fatty degeneration, be reabsorbed. In old-standing cases the cheesy matter entering the blood-vessels in a particulate form may give rise

to miliary tuberculosis.

In the treatment of impending absecss an attempt may in the first instance be made to arrest its formation, and with this object in view inflammation should be reduced by rest and cold. The blood-vessels should be relieved by position or removal of blood, and by pressure carefully applied; the infrication of mercurial oiutment may also be tried; when, however, the formation of matter is inevitable or has actually taken place, warm fomentations and poultices may be applied and the pus evacuated, either by making a free incision under the antisptic method, or by the use of an aspirator. This proceeding is especially important when the absecss is situated in regions like the ischio-rectal fossa or the manima, where it is likely to burrow, or where it is subjacent to dense fascic and aponeuroses.

When there is reason to believe the pus of an

when there is reason to believe the pus of an abscess has undergone decomposition, as, for ex-

ample, when a tympanitic sound is elicited on percussion, the opening should be free and the sac may be washed out with carbolic-aid lotion or chlorine water. In opening deep-seated abscesses in the neighbourhood of important parts, as in the neck, great circumspection and thorough knowledge of anatomy are required. Formerly caustics, as potash or Vienna paste, or even the actual cautery, were used, and are even now occasionally employed. In some instances, as in buboes, a cure may be effected by stabbing the abscess at several points with a needle, and good results have been obtained by passing a filliorm seton through the sac. Where abscesses are very large a drainage tube may be inserted, and the interior may be distended with warm water.

A. alve'olar. Abseess forming in the gum or

in the socket of a tooth.

A. bur'sal. Indomination and suppuration in a bursa mucosa.

A. chronic. (Fr. A. ganglionnaire.) An access developing slowly and without acute inflammatory symptoms in the connective tissue after simple periositis, or in or around an inflamed gland, or beneath scrofulous or syphilitic gummata.

A. cold. (Fr. Abe's froid.) An abscess developing slowly and without acute inflammatory symptoms, usually in scrofulous subjects, difficult to diagnose, often being mistaken for tumour.

A. conges tive. An abscess appearing at a distance from the place where the pus is formed; it usually results from disease of bone, the matter making its way along the sheaths of muscles.

A. constitutional. Abscess resulting from some general disorder of the blood, either of a specific or non-specific character; such are the boils that are so frequent in those living in bad hygienic conditions; scrofulous abscesses, and abscesses occurring in patients affected with venereal disease.

A. critical. Abscesses appearing in the course of an acute disease, and either leading to the remission of the symptoms, or increasing their gravity, as in the abscess of the parotids occurring in typhoid fever, and the abscesses seen in convalescence from smallpox.

A. diffuse. An abseess without well-

defined wall or sac.

A. dor'sal. An abscess occurring in the

dorsal region.

A. embol'ic. An abscess forming in the clot of an embolism, or in adjoining connective

tissue.

A. emphysem'atous. See A. tympa-

nitic.

A. fæ'cal. (Fr. Abcis stercoral; It. asc sso fecale; G. Kolhabsess.) An abseess developed in the connective tissue surrounding the large intestine or rectum, and communicating with its interior. The pus often possesses a peculiarly penetrating odour.

A. gang renous. A form of abscess attended with death of the adjoining parts.

A. idiopath'ic. An abscess originating without known cause, and appearing at the seat of the primary inflammation.

A. Il iac. Absess presenting in the iliac region. It is sometimes due to disease of the vertebre, at others, to disease of the kidney or to perityphitis.

A. infecting mitral. Abscesses resulting from emboli produced by the detachment of

particles of lymph deposited on the valves of the

aerta, in endocaiditis.

A. is'chio-rec'tal. An abseess occurring in the ischio-rectal fossa. It usually involves the whole of the fossa, laying bare the wall of the rectum, with the eavity of which it may communicate. It should be opened freely without cutting the wall of the gut, or enlarging any intestinal opening that may be present, and the cavity of the wound should be dressed with perchloride of iron or other antiseptic.

A. lacu'nar. Inflammation and suppuration is one of the lacunæ of the urethra; a complication of gonorrbeea.

A. lum'bar. See A. psoas.

A. lymphatic. See A. chronic.

A. mam'mary. (Fr. Abeis de la mammelle.) An abscess forming in the breast, often caused by injury or by inflammation of a galactophorous duct, especially in nursing women. It sometimes occurs in the child shortly after birth. The inflammatory symptoms are generally of great intensity. The abscess may be limited to the areola, or it may be subcutaneous or intramammary or submammary. In opening an intramammary abscess care should be taken to make the incision early, and in a radicting direction from the nipple, to avoid division of the milk ducts. Nursing should be interdicted.

A. metastat'ic. A term, now disnsed, for abscess resulting from embolism of arteries or

capillaries by particles derived from distant sources. See A. pyamic.

A. mil'iary. Term applied to abscesses existing in considerable numbers, and of small size, in any organ, generally resulting from embolism of the smaller vessels. See A. pyæmic.

A. milk. Abscess occurring in the breast of

a woman during lactation.

A. mul'tiple. These occur chiefly under the influence of three constitutional conditions the scrofulous, the syphilitic, and the puerperal.

A. pel'vic. An abscess occurring in the connective tissue of the pelvis.

A. per forating. An abscess in the cornea, bursting both externally and internally into the anterior chamber of the eye. Also, applied to an empyema when it penetrates the lung, the pus escaping through the bronchi. Also, generally applied to abscesses discharging themselves through the walls of adjoining cavities.

A. pericæ'cal. An abseess forming in the

connective tissue around the eæcum.

A. peri-larynge'al. An abseess forming in the connective tissue around the larynx.

A. perinæ'al. An abseess forming in the perincal region, usually resulting from escape of

nrine, after rupture of the urethra.

A. peri-nephritic. An absects occurring in the connective tissue around the kidney. After a rigor, febrile symptoms ocenr, with nausea, vomiting, constipation, pain in the region of the kidney, increased on straightening the body, and the appearance of a swelling near the centre of the crest of the ilium. It is liable to be confounded with caries of the vertebræ and hip disease. The contents of the sac may be removed with an aspirator.

A. periosteal. See Periosti'tis.

A. peri-pharynge'al. An abscess in the connective tissue surrounding the pharynx.

A. peri-rec'tal. An abscess in the connective tissue around the rectum. There is usually a communication with the bowel, and the pus is extremely feetid. It is often the cause of Fistula in ano. It should be opened early.

A. peri-typhlitic. Abscess in the conncetive tissue surrounding the excum. There is pain in the right iliac region, increased on pressure, and swelling with febrile symptoms. A grooved ncedle should be introduced through the abdominal parietes over the seat of the disease; and if the presence of pus be ascertained, the abscess should be opened by the antiscptic method, or the fluid may be removed with an aspirator.

A. peri-u'terine. Abscess in the connec-

tive tissue surrounding the uterus.

A. phleg monous. An abscess supervening in the course of a few days after a chill or rigor, with acute inflammatory symptoms, as pain, redness, heat, and swelling.

A. post-pharynge'al.

pharyngeal.

A. prostatic. Absecss occurring in or

around the prostate gland.

A. pso'as. A chronic collection of matter forming in the connective tissue of the loins behind the peritoneum, and descending in the course of the psoas muscle. The matter sometimes points above, sometimes below, Poupart's ligament, or, rarely, at the sacro-sciatic foramen. It is often the result of disease of the vertebræ. It is accompanied by pain, especially felt on straightening the leg on the body, and is most common in scrofulous subjects. It must be diagnosed from rheumatic affections, disease of the kidney, glandular swellings, and hernia. The matter may be withdrawn by an aspirator.

A. puer peral. A form of abscess has been described under this name in infants, in which nodules develop under the skin, which then reddens and becomes thinner and painful, The nodules, at first hard, rapidly soften, present fluctuation, and finally burst. Suppuration takes

place quickly.

A. pyæ'mic. Abscesses forming in patients suffering from pytemia. A good example is afforded by the pulmonary abscesses sometimes occurring after injuries or operations on bones. In such instances the capillaries are plugged with coagula, which, becoming detached, traverse the right heart, and pass along the pulmonary artery and its branches till they are arrested in the smaller vessels of the lung, where they occasion suppurative lobular pneumonia or metastatic mi-liary abscesses of the lung; similar conditions may occur in the liver, as a result of ulceration or suppuration, in or near to the intestine. Such abseesses usually run their course with rapidity.

A. resid'ual. A collection of matter forming in or around the remains of bygone inflam-

mation.

A. retro-pharynge'al. An forming in the connective tissue behind the pharynx. It is commonly due to inflammation of the post-pharyngeal lymphatic glauds, which are constantly present up to the third year of life. The abscess often forms a soft swelling below the jaw and under the sterno-mastoid muscle. The respiration is laboured and stertorous. Inspection is difficult, but palpation is readily effected. An opening may be made in the pharynx, or oceasionally through the skin. At the moment when the knife enters the abscess the tip of the left forefinger is used to depress the epiglottis and close the larvax, lest the pus should enter it and cause suffocation.

A. scrof'ulous. Suppuration in the lymphatic glands of children, or a chronic abscess in a serofulous person, is often thus named.

A. septicæ mic. A synonym of pyæmic abseess; also employed to denote an abseess following the direct introduction of some putrid

matter into the system.

(F. abcès en bouton de A. shirt-stud. chemise.) An abscess presenting two cavities, of which one is subepidermic, and the other subcutaneous; a communication usually exists between these, which may be enlarged when the superficial abscess is opened.

A. stercora ceous. A synonym of facal

abscess.

A. submam'mary. See A. mammary.
A. subpec'toral. An absess forming beneath the pectoral muscles.

A. subperios teal. An abscess forming

between the periosteum and the hone.

A. supra-mam'mary. See A. mammary. A. symptomatic. An abscess indicating the presence of some other affection, as when an abscess forms around necrosed bone, or as a result of extravasation of urine from rupture of the urethra.

A. the'cal. (F. abcès des gaines tendi-neuses; I. ascesso della vagine dei tendini; G. Sehnen- or Scheide-abscess.) Inflammation and suppuration in the sheaths of tendous, commonly associated with whitlow. It requires to be opened early.

A. tympanit'ic. An abseess which, in consequence of admission of air to, and putrefaction of, its contents, contains gas, which renders the

sac resonant upon percussion.

A. ure'thral. A collection of pus forming in or around the urethra; in the former case nsnally resulting from inflammation iu one of the

lacunæ of the urethra.

A. u'rinary. (F. A. urineux; I. ascesso orinario; G. Urinabseess.) A collection of matter resulting from the irritation excited by the escape of urine from some part of the urinary tract; accurate diagnosis and early opening are here of great importance.

Absces'sion. A synonym of Abscess. The Greek anal. ἀπόστασις is applied by Hippocrates to a solution of continuity, or contiguity; also to the transitiou of one fever into another, or to evacuations of any kind supervening on acute diseases, as where Galen, in Comm. writes ἀπόστασιν κατ' ἔκρουν, a defection by flowing ont.

Absces'sus. An abscess.
A. artic'uli. Suppurative arthritis.

A. cap'itis sanguin'eus neonato'rum. Caput succedancum. See Cephalhamatoma.

A. gangrænes'cens. Carbunele.

A. gangræno'sus. Carbuncle. A. gingiva'rum. See Parulis.

A. lac'teus. Abscess of the breast.

A. nuclea'tus. A boil, A. oc'uli. Hypopyon. A. pec'toris. Empyema.

A. spirituo'sus. Aneurism.
A. stercoro'sus. Fæcal abscess.

A. thora'cis. Empyema.
Abscis'sa, Vox. See Vox Abscissa.
Abscis'sæ. (F. abscisse; I. ascissa; G. Abscisse.) The transverse lines cutting vertical ones at right angles in diagrams in which the mutual connection of two series of facts is shown, as when the number of pulse beats, or the variations of temperature, are expressed in their relation to successive and equal periods of time.

**Abscis'sio infini'ti.** The cutting off of the infinite part. A process of exclusion whereby the position of an object in a system of classification is determined by successively comparing it with different classes of that system, and by the exclusion of those to which it does not belong.

Abscission. (Abscindo; ab, from, and scindo, to cut off.) The Gr. syn. ἀποκοπή, is used for the termination of a disease by death, before the occurrence of its decline (Galen); also for the loss or suppression of the voice (Dioscorides; Seribonius Largus).

Applied to a fractured bone when a part of it is cut off and removed, or to the cutting off of any soft part, as of a nerve, or the prepuce (Hipp.).

Also employed for a surgical operation by which a decayed part, or other degenerated substance, is removed by a cutting instrument. (Hildanus.)

A. of cornea. An operation performed for the purpose of reducing the size of the eye when staphylomatons, and thus enabling an artificial eye to be worn. The patient being rendered amesthetic, a speculum is introduced to separate the lids. Three or four curved needles, armed with earbolised silk or eatgut ligatures, are made to transfix, without being carried through, the base of the staphyloma, the points entering and emerging through healthy sclerotic; the staphyloma is then pricked with a knife near one of the needles, the point of a sharp pair of scissors inserted, and an elliptical piece removed. The needles are then drawn through, and the edges are brought accurately together by the sutures. Healing sometimes takes place rapidly and well, but at others, severe inflammation follows, with suppuration in the globe. There is some risk of sympathetic ophthalmia, but this appears to be slight. The after-treatment merely consists in the application of cold compresses. Some operators clear out the vitreous humour, retina, and choroid, leaving only the sclerotic. If no inflammation occur after the operation, an artificial eye may be inserted for a short period each day after the lapse of a month or six weeks.

Abscis'sus. (Same etymon.) Cut. off. Applied to the loss of voice. (Čelsus.)

Abscon'sio. (Abscondo, from abs, and condo, to conceal.) A cavity of bone which receives and hence conceals the head of another

Also a cavern, or sinus, or that which burrows or winds under the skin, and dilates under it.

Absinthe. (F. absinthe; G. Wermuthgeist.) The name of a liqueur, largely consumed in France, composed of au alcoholic tincture distilled from the Artemisia absinthium (wormwood) and Artemisia pontica, to which are added the roots of angelica and sweet flag, the seeds of staranise and cummin, the leaves of the Dictamnns of Crete, origanum, fennel, mint, and balm, with a little essence of cummin. For its injurious effects see Absinthism.

Absin'thic Acid. See Succinic Acid. with which it is believed to be identical.

Absin'thin. (F. absinthin ; G. Wermuthbitter.) bitter.)  $C_{16}H_{20}O_4 + H_2O$  (Luck); or,  $C_{40}\Pi_{56}O_8 + H_2O$  (Kromeyer.) A bitter principle in the leaves of Artemisia absinthium. It is a white imperfectly crystallising substance of intensely bitter taste; scarcely soluble in cold water, but dissolving readily in alcohol and ethers. It melts at 120° C. (248° Fahr.).

Absin'thism. An acute-or chronic disease of the meutal and hedily powers resembling alco-

holism, due to the abuse of absinthe, and attributed to the essential oil of that plant. It is characterised by restlessness at night, with disturbing dreams, snoring, nausea and vomiting, trembling, and general muscular debility, followed by epileptiform convulsions, and ultimately by acute delirium or mania, with general softening of the brain, or general paralysis.

Absinthites. Wine in which absinthium has been seaked.

Absin thium. ('A, neg., and yurdor, pleasure; doubtful derivation.) Nat. Ord. Compositæ. Used by the classical writers to denote strong bitters generally. The specific name of the common wormwood. There were several recognised varieties: the A. santonicum, the A. ponticum, which was the best of all, and the A. marinum or Scriphium (from the island Seriphos). See Artemisia.

A. mari'num. Artemisia maritima.

A. maritimum. Artemisia maritima. A. pon'ticum. Artemisia pontica.

A. roma'num. Artemisia pontica.

A. santon'icum. Artemisia santonica. A. vulga're. Artemisia absinthium.

Absin'thole. C<sub>10</sub>H<sub>16</sub>O. A liquid camphor obtained from the oil of wormwood. It boils at 195° C. (383° F.).

**Ab**'solute. (Ab and solvo, to loose.) Free from bond; positive.

A. alcohol. Alcohol as free from water as it can be obtained. Sp. gr. at 15.5° C. (59.9° F), 0.7938; and that of its vapour, referred to air, 1.613. It boils at 78.4° C. (173° F.). See Alcohol.

A. expan'sion. The apparent expansion

of a heated liquid corrected for the simultaneous expansion of the vessel in which it is heated.

A. mus'cular force. (G. Absolutkraft.) A term employed to indicate the maximum power of shortening that a muscle can display when the strongest stimulus is applied to it. The magnitude of the absolute muscular force, expressed in units of weight is dependent upon the area of its cross section, and is, therefore, expressed in relation to the unit area of the section. The transverse area of a muscle is obtained by dividing its length by its volume; and the volume is equal to the weight of the muscle divided by the specific weight of mus-cular tissue, which is 1058. The absolute force of a square centimeter of frog muscle lies between 2800 and 3000 grammes (43232-46230 grains); and of a square contimeter of human muscle between 6000 and 8000 grammes (86464 - 123,520 grains).

A. tem'perature. Term applied in physics to a scale, the zero of which is that purely imaginary temperature at which it is presumed that a gas would shrink to a mathematical point. The zero would be 273°C, below the freezing point, because gases contract 1-273rd of their volume with each degree of reduction. Temperatures reckoned on this scale are called absolute temperatures, and are 273° above the degrees of the centi-grade scale. The boiling point of water would consequently be marked 373° on this scale.

A. term. A term or name of a thing which has no evident and necessary relation to anything else, as contradistinguished from relative term. The word plant is an example of an absolute term, for nothing is essentially and invariably associated with it; whilst the word shepherd is an example of a relative term, inasmuch as sheep are necessarily connected with it.

A. zero. The zero of absolute temperature, which see.

Absorb'ent. (L. absorbeo; ab and sorbeo, to suck.) That which absorbs.

In botany, applied to vessels, formerly supposed to exist in the roots of plants, by which nutriment was taken up.

In therapenties, applied to medicines employed with the view of causing the absorption of any abnormal amount of secretion, whether in the intestinal caual or externally on the surface of nlcers or excoriations. For the most part they consist of alkaline earths, or substances of which chalk may he taken as a type. The orab's eyes, suail and oyster shells, and other inert calcareous substances, so much used in former times, acted only as absorbents. See also Antacids.

Absorb'ents. See Lacteals and Lymphatics.

Absorption. (Absorbeo, to consume by swallowing. F. absorption; I. assorzione; S. absorcion; G. Aufsaugung, Einsaugung.) The entrance, imbibition, or permeation of one body by another in such a way that whilst the absorbing body is not greatly altered, the absorbed body appears to vanish. The absorption of light and heat waves means their partial or complete extinction as such, the force expended reappearing in other forms. The absorption of gases by fluids may either be of a chemical or physical nature, or both combined. In the former case direct combination takes place, according to the law of equivalent proportions; but in the latter the amount varies with the temperature and pressure. When a fluid has absorbed the maximum amount it can take up in the given conditions, it is said to be saturated. The absorption-coefficient by weight is the number of parts of a gas hy weight that a given weight of the fluid can absorb. The absorption-coefficient by volume is the volume of a gas that a certain volume of the fluid can take up at 0° C. (32° Fahr.), and a constant pressure of 30 inches of mercury (760 mm.). With few exceptions a larger amount of gas is absorbed at a low than at a high temperature. Henry's law of absorption of gases by fluids is that the quantity of gas which a fluid can absorb at a given temperature is proportional to the pressure under which the gas exists. Dalton's law is that in a mixture of elastic fluid bodies each constituent is absorbed as if it were the only one in contact with the fluid under pressure equal to its partial pressure in the mixture.

Absorption of gases by solids. All solids condense gases and vapours on their surface in quantities peculiar to each body and gas, and always with evolution of heat. One of the most remarkable instances is that of palladium, which, when in the form of spongy metal at 200° C. (392° Fahr.) absorbs 686 times its volume. Hydrogen passes through solid platinum at a white heat like a sieve, as does carbonic oxide through glowing iron. Carbon in the form of charcoal has remarkable absorptive power for gases. Boxwood charcoal takes up 90 vol. of ammonia, 85 of hydrochloric acid gas, 55 of hydrogen sulphide, 35 of carbonic acid gas, 9.3 of oxygen, 7.5 of nitrogen,

and 1.75 of hydrogen. Absorption in physiology is the process by which food and other matters are taken up into the lymphatic or venous channels, either when introduced from without, as in ordinary digestion, or when produced by the disintegration of the

tissnes.

In pathology absorption is the process by which structures are interstitially removed.

In medicine absorption is the process by which deposits in the tissues are removed, either from natural causes or under the influence of drugs.

In ophthalmic surgery the term absorption is employed to indicate the process of solution and removal which occurs in the lens when it has

been broken up in the needle operation.

A. bands. Certain dark lines, first observed by Wollaston, and subsequently carefully described by Frannhofer and others, in the spectrum of the sun and stars. They indicate the presence of various gases. Physical research has shown that every gas and every vapour absorbs exactly those kinds of rays which it emits when in the glowing or incandescent condition, whilst it permits all other kinds of rays to traverse it with undiminished intensity. The sun, as Kirchoff maintains, may be regarded as an extremely hot mass, the photosphere, the glowing white-hot surface of which emits white light, and in and by itself would give a continuous spectrum. Outside of the photosphere and surrounding the rounding the sun is an atmosphere of glowing gases and vapours, which is called the chromosphere; and this, though of lower temperature than the photosphere, is still sufficiently hot to maintain many metals in the state of vapour. As the light of the photosphere before it reaches the earth must traverse the chromosphere, it is subjected to the absorptive action of the gases and vapours existing in it. It is to this absorption that the bands or lines of Fraunhofer owe their origin. The different colours of transparent solid and fluid bodies result from their peculiar capabilities of absorption. Thus, if the spectrum of solar light be allowed to pass through blood dilnted with water, not only will Fraunhofer's lines be visible, but two dark broad lines make their appearance near the yellow part of the spectrum, and the whole of the violet end vanishes; so that the red colour of the blood is not a simple colour, but a mixture of those colours which still remain in its spectrum.

The normal A. of disassimilation.

process by which used-up tissue is removed.

A. disjunctive. The absorptive process which accomplishes the detachment of a dead part.

A. lines. See A. bands.
A. progressive. The morbid process by which structures are removed as a result of inflammation or an effect of pressure.

Abstemious. (L. abstemius; abs, from, temetum, wine; F. absteme; I. astemo; G. enthaltsam.) Strictly, this word means abstinence from wine; but, as generally applied, it also means moderation, or temperance in diet.

Abstention. (L. abstentio; abstence, from abs and teneo, to hold.) Applied by Colius Aurelianus to retention, or suppression of the fæces, as a symptom usual in the disease Satyriasis.

Abster'gent. (L. abstergens; abstergeo, abs, and tergeo, to wipe. F. abstergent; I. astergente, astersivo; G. reinigend.) Cleansing; applied to medicines which cleanse, or clear from foulness, or sordes, and especially from sordes on the surface, and such medicines were properly termed Abstergentia, and Abluentia, as distinct from those which removed sordes impacted or embedded in the substance, which were more correctly called Detergentia.

Abster'sive. Detergent; purifying.

Abstinence, F. abstinence; I. astinence; G. Enthaltsamzeit. The habit of self-denial exercised in reference to those things in which the inclination would lead to indulgence, more especially applied to the refraining from, or the sparing use of, food and liquors. For the effects of constrained and total abstinence see Hunger, Thirst, Inanition, Starvation,

Abstract term. (L. abstraho, to draw away from; F. terme abstrait; I. termine astrato; G. allgemeine Begriff.) A term or word which is the expression of a property or condition of a thing or person, as lameness, which is the abstract word denoting the condition of the con-

crete, a lame man.

Abstraction. (L. abstraho; abs and traho, to draw; F. abstraction; I. astrazione; G. zerstreuung.) In logic and psychology applied in a general sense to that mental process by which attention is fixed upon one particular idea to the

exclusion of others.

In another point of view it is the correlative term to attention, for as attention is the concentration of the mental faculties upon a definite object, it involves withdrawal of consciousness from all other objects. This withdrawal is logically and etymologically abstraction, which is thus the negative side of attention, or, as Hamilton ex-presses it, the two processes form the positive and negative poles of the same mental act. Abstraction, again, is closely connected with the process of classification, for to abstract is to separate the qualities common to all individuals of a group from the peculiarities of each individual.

In surgery the term is applied to bloodletting; the abstraction of blood from a blood-vessel.

Abstractitious. Old term applied to spirit obtained from plants by distillation, as opposed to that produced by fermentation, according to Dan. Ludovicus, Pharmac., dissert. i. p. 457.

Abstrac'tive. See Abstractitious.
Ab'sus. A small Egyptian lotus; also, a

species of Cassia,

Abterm'inal. Sec Abmortal.
Abulia. ('A, priv.; βουλή, will. F. aboulie; G. Willenlosigkeit.) A form of insanity in which the power of exerting the will is defective.

Abuse. (L. ab, and utor, to use.) See Rape. Abuta. Nat. Ord. Menispermace. Flowers apetalous; sepals 6-12, in 2 or 4 series, the outermost small, innermost petaloid; stamens 6, sterile in the female flowers; carpels 3, with cylindrical styles; fruit consists of ovoid drupes. each having a thin vertical septum; seed with ruminate albumen.

A. ama'ra. A climbing plant of Guiana, called abouta or abuta by the natives. Aublet names it Pareira brava jaune, or yellow Pareira brava, and describes the root and twigs as being very bitter.

A. can'dicans. Hab. Cayenne, where it is called Liane amère, from its bitter taste.

A. in'dica. Hab. Cochin-China, where it is named Cây-sot and Cây-gam. The roots and leaves are febrifuge in decoction and powder. (Waring.)

A. rufes'cens. Cocculus rufescens. A climbing plant of Cayenne and French Guiana. The root, according to Aublet, constitutes the white Pareira brava. An infusion (3j ad Oj aquæ) is employed by the natives in some affections of the liver. The same authority states that the red Pareira brava is procured from a variety of which

the shoots and under surface of the leaves are covered with a rufous down. Martius (Mat. Med. Boruss., p. 42) states that in Brazil the root and bark are used as bitters in debility of the stomach, dyspepsia, intermittent fever, and asthenia.

Abutilon. (Ar. meaning yellow; Sammtpappel.) A genus of the Nat. Ord. Mal-

vacce.

A. esculen'tum. The Beugao de Deos of the Brazilians, by whom the boiled flowers are

used as an article of diet.

A. in'dicum. Country mallow. (Hind. Kanghi. Dak. Kangoi. Tam. Tatti-Perun-tutti. Tel. Tuttura-benda, Nugu-benda, Tuttiri-chettu. Mal. Pettaka-putti, Tutta, Uram.) These two plants are shrubs common throughout India, only differing in the size of the calyx, which is largest in the A, indicum. The leaves contain much mucilage, hence employed as an emollient fomentation; an infusion of the roots is given as a cooling drink in fevers.

Abvacua'tion. See Abevacuation.

Acacalis. ('Ακακαλίs, according to Gorræus.) A shrub growing in Egypt, believed to be a species of Tamarisk, the seeds of which, soaked in water, were said to be good for the eyes.

(Dioscorides.)

Also, the flowers of the narcissus. (Heyschius.) Aca cia. (Either from ἀκάζω, to sharpen or point, or from anakia, harmless, by antiphrasis, on account of its spines, or from the innocent nature of the gum. F. acacie: G. Akazie; I. *aeazia*.) A genus of plants belonging to the sub-class *Mimoseæ*. Nat. Ord. *Leguminoseæ*. Hermaphredite flowers; ealyx 5-toothed; corolla 5-cleft, stamens 4-100; pistil 1; legume bivalved. Male; calyx 5-toothed; corolla, 5-cleft, or formed of five petals; stamens 4-100.

A. Adanso'nii. Ilab. Senegambia, be-

lieved to yield Gonakié gum, a red and very bitter

variety.

A. adstrin'gens. The Struphnodendron Barbatemus,

A. al'bicans. A species growing in Brazil, and supplying the variety called Kuisache gum.

A.al'bida. A species yielding the variety termed Brittle gum; an inhabitant of Senegambia.

A. al'tera trifo'liata. The Spartium

spinosum of Linnaus.

A. ama'ra, Willd. A native of the Coromandel coast and other parts of India; bark astringent and tonic.

A. an'gico, Martius. Brazil, native name Angico. Supposed to yield one of the varieties of the astringent bark termed Barbatimão. The wood known in commerce as Angica and Inzica.

A. arab'ica, Willd. (Hind. Babool. Tam. Kuru-viylam. Tel. Nallatumma. Mal. Karuvelakam. Beng. Babal.) Hab. Egypt, Arabia, and India. A tree varying from a few feet to forty; spines in pairs; branches and petioles downy; punnæ in 4-6 pairs; leaflets 10-20 pairs, minute, smooth, oblong linear; a gland between the lowest pair of pinnæ; pods moniliform. Fnrnishes the red variety of gum arabic. The bark, Eabnt bark, is astringent and tonic. The brujsed leaves are applied to ulcers. The pods, Bablah, are used in coughs.

A. asiaticum. Hind. Coongoonic. Arab. Khebazie, Beng, Petarce, Burm, Tharma-Khyok, Cing, Annda, C. China Cay-koi-ray.)

Used as an emollient.

A. capen'sis. A synonym of A, horrida.

A. cat'echu, Willd. (Sans. Khadira. Hind. Khaer or Khayer. Beng. Khueraghach. Can. Kheirie. Cing. Khehiree. Coorg. Cayali. Tam. Wathalay. Tel. Podeclmann. Burm. Sha.) A tree inhabiting Assam, Bengal, Behar, Coromandel, and other parts of India, also Burmah and Ceylon. Stipules thorny; leaves bipinnate; leaflets auricled at base; petioles angular; calyx downy; corolla monopetalous 5-fid; yields Cate-

A. concin'na. (Beng. Recta. Tel. Reeta chikai. Burm. Ken-Cwon. Co. Ch. Cay-cherblen.) A climbing shrub, widely distributed in India. The legume (Tam. and Tel. Sheeakai) is in common use as a detergent for cleansing the hair. It is an expectorant; and acts as an

emetic in doses of 30 grs.

A. cochliocar'pa. (Don., Diet. ii, p. 422.) tree of Brazil (Barbatimao), the bark of which is imported into Europe under the name of Cortex Braziliensis (Guibourt, Drogues iii, p. 306). It is astringent and bitter, and has been employed in homorrhage, diarrhoa, and leucorrhea. The powdered bark has been applied to foul and cancerons ulcers, and is used in Portugal as a substitute for quinine. It is doubtful whether it is identical with Cortex astringens Braziliensis, as this is referred by Martius to Stryphnodendron Jurema, also a Brazilian species.

A. dealba'ta. The silver wattle. Fur-

nishes part of Australian gum arabic.

A. decurrens, Willd., Sp. Pl. A native of New Holland, about Port Jackson, from the bark of which is obtained an astringent extract similar in properties to catechu. It affords a gum.

A. Ehrenberg'ii. An Arabian species, producing a kind of gum arabic collected by the

Bedouins of the desert.

A. falca'ta, Willd. A tree of New South Wales, called Wee-tjellan by the natives, and Lignum vitæ by the colonists. The bark contains tannin, and is used by the natives to poison fish.

A. farnesia'na, Willd. (Beng. Gooya-babula. Sans. Urimeda, Sami. Hind. Rambabul. Burm. Kastoori-chettur. Coch. Chin. Hoa-zien-gai.) Hab. parts of India, Bengal, Seinde, Silhet, Assam, Nepaul; cult. in S. Europe, Cochin China. The bark is astringent, and produces a gum resembling gum arabic; the flowers on distillation yield a delicious perfume, said to possess stimulant properties. The creoles employ

possess stimulant properties. In electron company, the leaves in bladder diseases. See Balebahula.

A. ferrugin'ea, D.C., Prod. (Tam. Veloaylum. Tel. Wooduee, Tella Toomma.) Hab. mountainous regions of India. Bark powerfully astringent, used in decoction as a wash for the teeth; the natives prepare an intoxicating

liquor from it.

A. fis'tula. A variety of A. scyal.

A. floribun'da, Willd. A native of New Holland, yielding a gum resembling gum arabic. A. german'ica. The concrete gum exuding from several species of *Prunus*. Used as a sub-

stitute for gum acacia.

A. giraf'fa, Willd. A native of Central and Southern Africa, the favourite food of the giraffe. It yields a superior kind of gum arabic, which is eaten by the natives, by whom it is named Kamcel-doorn.

A. grave'olens. A native of India and Bengal, used as a bitter and diaphoretic.

A. gummif'era, Willd. Hab. Africa, near Mogador; yields a part of the Barbary gum, and perhaps some of the Sassa gum. A. gyrocar'pa. A synonym of A. albida. A. homoloph'ylla. An Australian tree

yielding gum arabio.

A. hor'rida, Willd. Hab. C. of Good Hope; the Dooruboom of the colonists; yields Cape gum. The wood is yellow and very hard, a substitute for box-wood. The bark is highly astringeut, and is applied to the same uses as that of the A. cochlicearpa.

A. in'dica. See Tamarindus indica.

A. jure'ma. See Stryphnodendron Jurema. A. karroo, Hayne. A Cape of Good Hope

species, said to yield Cape gum.

A. lebbek, Willd. Hab. Upper Egypt; cult. in E. and W. Indies for its scent and the beauty of its flowers; it is the Labach of the Arabians. The wood is the "bois noir" of the Mauritius; the leaves, in the form of fomentation and baths, are used to relieve rheumatic pains; the boiled seeds are said to be poisonous; it yields a kind of gum arabic.

A. leucophlœ'a, De C. (Hind. Kikar. Fam. Velvaylum. Tel. Tellatumma. Can. Carijali.) Hab. Coromandel, S. Mahratta, and other parts of India. Bark highly astringent. The

natives distil from it a strong spirituous liquor.

A. melanox'ylon, R. Brown. Hab. S. Australia and Tasmania. Bark astringent, yields

an extract resembling catechu.

A. mollis'sima, Willd. Hab. Tasmania.

Bark yields an astringent extract.

A. myrioph'ylla, Graham. Hab. Silhet, where a kind of beer is prepared from the bark.

A. nebou'ed. The Red Gum tree of

Adauson, found in the same localities as A. verek; yields a gum which makes a very thick mucilage.

A. nilotica, Delille. See A. arabica.
A. ni'ops, H. B. K., Nov. Gen. Amer.
Hab. S. America. The pods, joined with the flour of cassava and lime from the shell of a Helix, constitute a powerfully stimulant snuff, by means of which the Indiaus throw themselves into a peculiar state of intoxication approaching to frenzy. It is a powerful sternutatory.

A. nostras. A synonym of A. germanica. A. odoratis'sima, Willd. (Tam. Curru-vaga; Tel. Shinduga; Mal. Kaninthakara.) Hab. India, Assam, and Burmah, on the Malabar coast; the juice of the bark with lime juice and turmeric, boiled in cocoa-nut oil, is employed externally in leprosy and ehronic ulcers.

A. orfota, Lindley. Hab. Arabia, The leaves prevent fresh camel's milk becoming acid for several days; fumigation with the wood and resin is employed by the Arabs in epilepsy.

A. pycnan'tha. An Australian tree producing gum arabio.

A. sen'egal. A small tree found in tropical Africa, which furnishes part of the Senegal gum. A. seyal. A species growing in Libya

and Nubia, and affording a variety of gum arabic.

A. specio'sa, Willd. (Ilud. Seriss, Serecka; Beng. Sireesha; Tam. Kalu-vaghy-marum; Tel. Dirisana.) Sirissa tree. Hab. Coromandel, Bombay, Chittakong, Bengal, Silhet, &c. The flowers are fragrant and beautiful; a deeoction of the leaves is taken internally and dropped into the eyes in ophthalmia and in nebulous cornea; the bark dried and pounded is applied to foul ulcers; the oil extracted by heat from the seeds, and applied to the white spots of leprosy, is said to effect a cure; the leaves are also used in beri-beri.

A. stenocar'pa. Hab. Southern Nubia.

Yields Suakin gum arabic.

A. suma. Yields a kind of catechu.

A. sun'dra. (Tam. Karungali. Tel. Sundra.) A species resembling the A. catechu, and yielding a similar astringent extract.

A. tortuo'sa, Willd. Hab. W. Indies. The wood, when fresh, smells like assafætida, but when old like resewood; in the coats of the pod is a syrupy, bitter, and astringent fluid.

A. tor'tills. Hab. Arabia, Nubia. A gum-

producing species.

A. ve'ra, Willd. Hab. Upper Egypt and Senegal. A tree twenty feet high, with a reddishbrown bark; leaves alternate, smooth, bipinnate; piuuæ in two pairs; leaflets 8-10 pairs, small, oblong linear; spines in pairs at the insertion of each leaf; pods moniliform. Bark and pods astringent. Yields gum arabic and part of gum senegal.

A. veravel. A synonym of A. vera.

A. verek. Hab. Senegal. From the bark exndes the hard variety of Senegal gum. (W.)

A. zeylon'ica. The Hamatoxylon Campechrianum.

Aca'ciæ gummi. (F. gomme arabique; G. arabisches Gummi; I. gomma arabica; S. gomm arabiga.) The concrete juice of Acacia vera, A. arabica, and of other species of Acacia. The most common varieties are the Turkey, Barbary, Senegal, India, Cape, and Australian gum. It is found in rounded or amorphons yellowish or reddish pieces, more or less transparent, hard, brittle, and pulverisable. It is inodorous and has a slightly sweetish taste. Its sp. gr. is 1.31—1.48. It contains about 17 per cent. of water. It is soluble in its own weight of water, both hot and cold, but insoluble in alcohol, ether, and oils. It is precipitated from its watery solution by alcohol, borax, mercuric nitrate, ferric perchloride, and plumbic subacetate. Strong sulphurie acid carbonises it; strong nitrie acid converts it into mucic acid, with formation of oxalic and malic acids. Between 148.8° C. (300° F.) and 204.4° C. (400° F.) it softens, and may be drawn into threads. At a red heat it is decomposed. It is chiefly composed of arabate or gummate of lime. When burnt it leaves 3 per cent. of ashes, consisting of calcium and potassium carbonate, caleium phosphate, potassium chloride, iron, alumina, magnesia, and silica. It is used in medicine as a demulcent, but is consumed as an article of diet in the countries producing it. It has been recommended internally in coughs, in strangury and calculous affections, in diarrhæa and dysentery, and in chrouic bowel affections in children; and externally in homorrhages, as in epistaxis, in burns and sealds, and in sore nipples. Used to make emulsions and pills.

A. ve'ræ suc'cus. An extract obtained from the immature pods of A. Arabica and A. vera. Little used. It is a solid reddishbrown substance, of a sweetish-acidulous, styptic taste, and soluble in water. It is a mild astrin-

gent.

Aca'cine. Pure gum arabic.
Acac'us. ('A, neg.; κακός, evil.) Harm-less; applied to diseases which do not endanger (Pechlinus, Obs. Phys. Med. i, 71, p. 188.)

Ace'na sanguisor'ba. A genus of the Nat. Ord. Sanguisorbea. Hab. Tasmania.

Leaves used as a substitute for tea.

Acahi. (Ar.) An aqueous solution of alum. Acaid. (Ar.) Term for Acetum, or vinegar. Acajou. Two plants belonging to different natural orders vield medicinal substances thus named.

1. The Swietenia mahogoni, or mahogany. Nat. Ord. Meliacew. (F. acajou à bois; G. wohl-riechendes Cedrela Gummi.)

2. The Cashew nut. The Anacardium occidentale. Nat. Ord. Anacardiacew or Terebinths. (F.

acajou des pommes; G. Kaschunussbaum.)
Acaju ba. The cashew-nut.
A. officinalis. The Anacardium occiden-

Acalai. (Ar.) Salt. (R. and J.) Acalcum. Stannum, tin. (Müllerus.)

Acale'phæ. ('Ακαλήφη, a nettle.) A group of animals under which Cuvier included many of the forois now embraced in the Hydrozoa, Acti-nozoa and Ctenophora. They are all characterised by the possession of thread cells, trichocysts, or nematocysts, by the stinging action of which they are capable of paralysing small animals and powerfully irritating the skin of man.

Acalic'ulate. (A, neg.; caliculus, dim. of ealyx). Having no caliculus or accessory calyx.

Acal'ycal (A, neg. ; καλυξ, a cup.) Applied to stamens which are inserted into the receptacle without adhesion to the calyx.

Acal'ycine. (Same etymon). Having no calvx.

Acal'ypha. (Ακελυφος, without shell.) A genus of plants of the Nat. Ord. Euphorbiaceæ. A. amenta'cea. A synonym of A. fruti-

A. carpinifo'lia. Hab. St. Domingo. The leaves are employed as an antispasmodic.

A. cilia ta. Hab. Arabia, Asia, Trop. Africa. In Ashantee known as Crowera, and when ground up with the lesser cardamom seeds is applied locally to the cheat to relieve pain: (Waring.)

A. cupameni. A synonym of Acalypha indica.

A. frutico'sa. (Tam. Sinnie; Duk. Chinnie; Tel. Tsinnie.) Birch-leaved acalypha. An Indian shrub, the leaves of which are prescribed by the native doctors in dyspeptic affections and cholera. They are also regarded as attenuant and alterative.

A. in'dica. (Sansk. Arithamum-jayrie; Mal. Koopa-mani; Tam. Cupa-mani; Beng. Muktojuri.) An Indian annual. The root hruised and infused is used as a cathartic, the infusion of the leaves as a laxative, and their expressed juice as an emetic and expectorant, and when mixed with anlt as a cure for scabies; a decoction of the whole plant mixed with oil is antiarthritic, and mixed with lime is useful applied externally in various eutaneous diseases. The leaves are also applied to syphilitic nicers, and to relieve the pain of venomous bites.

A. virgin'ica. Three-seeded mercury. An indigenous American plant, flowering in Angust, said to have expectorant and dinretic properties. It has been successfully employed in humid asthma, ascites, and anasarea.

A. betuli'na. A synonym of A. fruticosa. A. his pida. llab, E. Indies. The decoction is tonic, and is used in diarrheea and dysentery.

Acalyph'cæ. (A, neg.; καλος, beauti'nl; aφη, touch; unpleasant to the touch.) A Sub-order of the Nat. Ord. Euphorbiaceæ or Spurgeworts. Ovule solitary, flowers apetalous, in clustered spikes or racemes.

Acalyp'tera. ('A neg.; καλ.ύπτρα, a veil.) A Family of the Group Muscarida, Sub-Ord.

Brachycera, Ord. Diptera, Class Insecta. first posterior marginal vein runs straight to the margin, the wing-scales for the most part atrophied; the halteres free. The larvæ seldom parasitie, for the most living on excrements or on vegetables.

Acam'atos. ('A, priv.; κάμνω, to be weary. Lat. Acamatus.) Without sense of toil; untiring. A state of perfect rest of muscle, when there is no action either of the extensors or flexors (Galen, de Mot. musc.; Hippocrates, de Fract. c. i. t. 16).

Acama'sia. (A, priv.; κάμνω, to be weary; Fr. acamasie; G. Unerwüdlichkeit.) A state of rest, or freedom from exertion.

Acamech. (Ar.) An alchemical term for the dross of silver.

Acamelt. A synonym of the Agave Ameri-

**Acamp'sia.** ('A, neg. ; κάμπτω, to bend.) Intlexability of a joint.

Acanor. (Ar.) A kind of furnace.
Acanos. A thorny plant, used by the ancients as a styptic. It was probably a species of Onopordon.

Acan'tha. ('Aκανθα, a spine.) A plant used by the ancients as an astringent in hæmorrhages, especially in hæmoptysis, also in gastric disease. The seeds were given in convulsions (Paulus Ægineta, lib. vii). Dioscorides mentions four kinds of aeantha, which have been thus identified by Sibthorpe—I. "Ακανθα (lib. iii, cap. 19) with Acanthus spinosus. 2. "Aκανθα αγρια (lib. iii, cap. 20) with Cnicus Syriaeus. 3. "Ακανθα αραβικη (lib. iii, eap. 15) with Onopordon Arabicum; and 4. "Ακανθα λευκη (lib. iii. cap. 14) with Cnicus acarnus, Lion., or with Echinops lanuginosus. (Waring.)

Acan'tha. (Gr.) The spine generally, and also the spine of an individual vertebra.

In Botany, à thorn, spine, or priekle.

Acanthab'olus. ("Ακανθα, a thorn; βάλλω, to put over.) Forceps for extracting any foreign body as a thorn or prickle from a wound, or fish-bone from the esophagus (Paulus Ægineta, vi. 32); supposed to have been similar to the Volsella, mentioned by Celsus, vii. 30, and delineated in Scultetus, Armam. Chir. tab. iv. f. 1.

Acantha ceæ. ('Ακανθα, a thorn.) An order of dicotyledonous, monopetalous, and hypogynous plants, chiefly inhabiting the tropics. Herbs or shruhs. Leaves opposite, simple, exstipulate; flowers irregular, bracteated; calyx 4-5 parted, or consisting of 4 or 5 sepals, persistent, much imbricated, sometimes obsolete; corolla more or less bilabiate; stamens 2 or 4, in the latter case didynamous; placentæ parietal, though extended to the axis; style 1; fruit eapsular, 2-celled, with 1-2 or many seeds in each cell; seeds hanging by hard cup-shaped or hooked projections of the placenta, without wings; alhumen none; cotyledons large and fleshy; radicle inferior.

Acantha'ceous. (Same etymon. acanthace.) Having spines or prickles.

Acan'thads. (Of Lindley.) A synonym of Acanthacea.

Acanthalru'ca. The Echinops sphærocephalus, or globe-thistle (Hooper); Quincy spells it Acanthalzuca.

Acanthav'ola. Same as Acanthabolus. Acan'theæ. ('Ακανθα, a thorn.) A tribe of the Nat. Ord. Avanthacea, characterised by the calyx having four divisions, of which the anterior and posterior are the largest. Corolla unilabiate, eartilaginous at the base; andrœcium almost didynamous; capsule containing 2-4 seeds.

Acan'thia. (Same etymon.) A synonym of Cimex.

A. cilia'ta. A synonym of Cimex ciliata. A. lectula'ria. A synonym of Cimex lectularia.

A. rotunda'ta. A synonym of Cimex rotundata.

Acanthichthyo'sis. **Acanthichthyo**'sis. ("Ακανθα, a thorn; ιχθυς, a fish. F. acanthichthyose; G. Dornfischschuppenkrankheit.) Spinous ichthy-

**Acan'thidæ.** Lindley. ('Ακανθα, a thorn.) A Tribe of the Sub-order *Ecchinacanthea*, Nat.

Ord. Acanthacea. See Acanthea.

Acanthiodon tum. (Same, and ôcôo's, a tooth. F. acanthiodonte.) Name under which oryctographers describe the fossil teeth supposed to belong to Squalus acanthius.

Acan thium. ('Ακανθα.) The specific name of the cotton-thistle (Onopordum acanthium).

Acanthiu rous. ( 'Ακανθα; οὐρὰ, a tail. F. acanthiure ; G. dornschwanzig.) Having

a tail supplied with spines.

**Acanthobdel leæ.** ('Ακανθα, a thorn; βδέλλα, a leech.) A Family of the *Discophora* or Hirudinea, Class Annetida. Hab. Sicily. Body fusiform, flat; anterior extremity acuminate, with a fasciculus of hooked setæ on each side, at the posterior extremity is a sucker, on the floor of which the anus opens; the genital organs are neutral, and situated one behind the other. Some are found amongst the ova of the lobster.

Acanthob'olus. See Acanthabolus. **Acanthocar pous.** (Άκανθα; καρπός, nit. Fr. acanthocarpe; G. dornfruchtig.) fruit.

Having fruit clothed with spines.

**Acanthoceph ala.** (Λανθα; κεφαλή, the head.) An Order of the Class *Scolecida*, Subkingdom *Annuloida* or *Vermes*. They are parasitic, cylindrical, and more or less elongated, having a firm, elastic integument, a retractile prohoscis, armed with hooklets, which is continued backwards into a ligament to which the reproductive organs are attached; they have no digestive canal, but live by absorption; under the integument is a series of reticulated canals, probably a ventro-vascular system; at the base of the proboscis is a nerve-ganglion with radiating filaments; the sexes are distinct, and they are developed within a hooked embryo. This order includes only one genus, the Echinorhyncus.

Acanthoceph'alous. (Same etymon.) Having a spiny or thorny head.

Acanthochias mida. - (('Aκανθ·ι, a thorn; χιάω, to make the Greek letter χ.) A Subfamily of the Fam. Acanthometrida, Ord. Radiolaria (Cytophora, Haeckel), Class Rhizopoda. The radical spines traverse the capsule, but do not unite in the centre.

Acantho cladus. (Same; κλάδος, a hranch; Fr. Anthoclade; G dornüstig.) Having

brauches charged with spines.

Acanthocys'tidæ. ("Ακαυθα, κόστις, a chest.) A family of Sub-order Heliozoaria, Order Radiolaria, living in fresh water and having small siliceous spiculæ.

**Acantho'des.** (Same; terminal ώδης; Fr. acantheux.) Acan'thous. Spiny.

Acanthodes'mida, ('Aκανθα, a thorn: δέσμη, a bundle.) A Family of the Order Radio-laria of Müller (or Cytophora of Haeckel), of the Class Rhizopoda. The solid framework of the body consists of irregularly arranged rods. Central capsule spheroidal, not traversed by the spicules.

**Acanthod'idæ.** ('Λκανθα; είδος, a form.) A Sub-order of the Order Ganoidei, Sub-class Palæichthyes, Class Pisces. Body covered with shagreen; lateral line between, not on, the bony plates; cephalic plates not ossified; no operculum; gills naked, heterocercal.

Acanthoid'es. (F. acanthoide; G. dornuhnlich.) Resembling a spine or thorn.

Acanthome'tra. ' ('Ακανθα; μήτηρ, α mother.) A Family of the Order Cytophora, of the Class Rhizopoda, according to Haeckel. In Müller's classification it is a group of Radiolaria. The skeleton consists of several radial spicules, which perforate the central capsule and unite in its interior, without forming a perforated test; frequently the ramifications of the rays form an external trellised framework.

Acanthomet'ridæ. (Same etymon.) A Family of the Sub-order Acanthometra, Class Radiolaria, having no trellised external framework and no extra-capsular yellow cellules.

Acanthoph'agous. ('Ακανθα; φάγω, to eat.) Term applied to larvæ or other animals

which feed on the spines of plants.

**Acantho'phis Browni'i.** ('Ακανθα, a spine; οφις, a suake.) A Genus of the Family Elapidæ, Sub-order Proteroglyphu, Order Ophidiu. Posterior part of the head covered with scaly plates. Tail terminating in a recurved point. Subcaudal scales in a single row. The "black snake" of N. S. Wales, extremely venomous.

A. palpebro'sus. Another snake of N. S.

Wales, poisonous.

**Acanthoph'orous.** ('Λκανθα; φέρω, to bear. F. acanthophore; G. dorntragend.) Beset with spines or thick coarse hairs.

Acanthop'oda. (Δκανθα; ποῦς, a foot.) A section of the Family Mustelida, Order Carnivora, Class Mammalia. It includes the marten and otter, skunk, and ermine. The digits are short, more or less united by membrane, the last phalanx bent upwards; claws short, compressed, sharp, retractile.

**Acanthop'odous.** ('Ακανθα; ποῦς, a foot. F. acanthopode; G. dornfüssig.) Having

the legs very spinous.

Acanthopo matous. ( Ακανθα; πῶμα, a lid. F. acanthopome.) Having the opercula furnished with serratures or spines.

Acanthopo'mous. The same as pre-

ceding.

Acan'thopous. Same as Acanthopodous. Acan'thops. ('Ακανθα; ἄνψ, the eye; F. acanthops; G. dornaugig.) Having the circumference of the eye set with prickles.

Acanthop teri. ( Άκανθα; πτέρυξ, a wing.) A Sub-order of the Order Telcostei, Class Pisces, comprising 4000 species, defined by v. Carus as having an integument covered with ctenoid scales, and as a rule possessing paired hypopharyngeal bones. The dorsal, ventral, and abdominal fins have unsegmented spine-like anterior rays. The abdominal fins are usually in front of the pectoral fins. Swim-bladder, if present, without air-duct or trachea. The Order is represented by the perch.

Acanthopteryg'ii. (Idem; πτερύγιον, the extremity of any object which hangs loosely; or, πτέρυξ, a wing.) An Order, according to Cuvier, of the class *Pisces*, having spinous rays in the paired fins, including blennies, gobies, mackerel, perch.

Acanthosperm'um hirsu'tum. "Ακανθα, a spine; σπέρμα, a seed.) Nat. Ord. Compositæ. Hab. Brazil. Said to be only a variety of the A. Brazilium of Schraub. Bitter, aromatic, tonic, diurctic, and diaphoretic, and given in infusion in duarrhora.

A. xanthioid'es. Also a variety of A. Brazilium.

Acanthostau'rida. ('Λκανθα; σταν-οός, a cross.) A Sub-family of the Family Acan-thometrida, of the Order Eudiolaria (Müller) or Cytophora (Hacket), of the Class Rhizopoda. The members have twenty spines peculiarly arranged, and centrally applied to each other with wedge-shaped extremities.

Acanthothe'ca. **Acanthothe'ca.** (Λκανθα; θήκη, a case.) Animals that are new under the name Linguatulina or Pentastomida, ranged as a Family of the Order Acaridea, Class Arachnoda. Davaine defines them as solitary animals having a complete digestive tube; the mouth on the inferior surface of the fore part of the body, and armed with two pairs of retractile hooklets; the anus terminal; nervous system well defined, consisting of a large subcesophageal ganglion, from which two filaments run backwards. Sexes separate, the female oviparous. The body, which may reach the length of three inches with the diameter of a goose quill, is clongated, cylindrical or compressed, and transversely striated; the head is obtuse, the tail pointed. The muscles are striated. There is a tolerably well-defined dorsal vessel. The Acanthotheca present many analogies to the Crustucca, and the embryos resemble those of the Lermidæ. Members of the group have been found in the frontal sinuses, larynx, trachea, lungs, and in cysts on the surface of various organs, both in man and animals. See Pentastoma.

Acan thous. ("Anada, a spine. acuntheux; G. dornig.) Spinous or thorny.

Acan'thulus. (L., diru. of Acanthus.)
Au instrument with which thorns, or spiculae of wood, bone, or other substance, may be extracted from wounds.

**Acan'thus.** ("Λκανθα, a spine.) A plant in use amongst the ancients as a diurctic and astringent, and locally applied to sprains, bruises, gout, &c. The Romaus recognised two kinds, one thorny (A. spinosus), and the other smooth (A. mollis). The latter was called Paderos and Melamphyllos (Pliny).

**Acan'thus.** ('Λκανθα, a spine.) A Genus of Nat. Ord. Acanthacew. Cal. 4-partite; cor. split posteriorly; stamen didynamous, with unilocular, introrse anthers; ovary bilocular and bio-vulated; style with 2 lobes; ovules ascending, anatropal. The fruit is a localicidal capsule, each cell containing two seeds. The beautifully lobed and sinuated leaves of the plants belonging to this genus are believed to have suggested the noble ornamentation of the Corinthian column.

A. mollis. (F. branc-ursine; I. acante; G. gemeine Bürenklaue, Burenklauenkrant.)
Bear's breech. A species having a viscous juice. It is emollient, and is employed in the form of injection, cataplasm, and fomentation.

A. spino'sus. A species of Acanthus having properties similar to the A. mollis

Acantic'onitc. ('Λκανθίν, a goldfinch; Kopes, dust. So called because the powder is like n goldfinch in colour.) A synonym of Pistacite.

Acanus. ("Akaros. A kind of thistle; also the prickly head of some fruits, as the pineapple; also, the same as Acantha.

Acapat'li. The Piper longum, long pepper.

**Acap'nos.** (Λ, neg.; καπνός, smoke; supposed because it gives out little smoke when burned.) Without smoke. Gr. anal. ἄκαπνον, formerly applied to the plant marjoram,

Also, ακαπνον was used for honey obtained without smoking the bees, according to Pliny.

Again, ἄκαπνα was applied by the Greeks to all kinds of dry wood.

Acap'nus. The same as Acapnos. Acap'sular. ('A, priv.; capsula, a little ehest. F. acapsulaire; G. ohne Kapsel.) Having no capsule.

Acar'dia. ('A, neg.; κάρδια, heart. F. Acardie; G. Herz-mangel.) In Teratology, absence of a heart; as opposed to the extreme acardiae form of monstrosity, where not only the heart but the whole thorax is wanting. It is a remarkable form of arrest of feetal evolution, the heart only being absent. Most of these cases are twins; and of these one is perfect.

Acar'diac. (Same etymon.) Applied to animals destitute of a heart.

Acar'dinate. ('A, priv.; cardo, a hinge. uearde.) Applied to a shell, or valve of a shell, without trace of a hinge.

Acardiohæ'mia. ('Λ, neg.; κάρδια, heart; άιμα, blood.) Want of blood in the heart. Acardioner'via. (Same; νευρον, a nerve. F. ucardionervie.) Want of nervous energy in the heart. Defective nerve supply to the heart.

**Acardiotroph'ia.** ('A, neg.; κάρδια, heart, τροφη, nourishment.) Atrophy of the heart. Defective nonrishment of the heart.

Acari'asis. (Acarus. F. acariase; G. Millun-Hautschabe.) Term by Fuchs for a species of skin-disease, the Phthiriasis interna of Plenk, Acar'icide. (Acarus, a mite, and cado, to

kill.) Remedies that destroy Acari. Acarico'ba. The Brazilian name of Hydrocotyle umbellatum, used by the Indians as an arematic, alexipharmic, and emetic.

Acar'ida. (F. ucarides; G. Milben.) A Family of the Order Acarina, of the Class Arachnoidea. A synonym of Acaridea.

**Acaride'a.** ("Ακαρι, a mite.) An Order of the Class Arachnida, Sub-kingdom Arthropoda. Low forms of spider-like animals, commonly called mites, and found on or under the ground, in water, in cheese, feathers, dried fruit, and the like. Some are parasites. The acari have soft bodies of oval or clongated form, and are of small size. The cephalothorax and abdomen are consolidated into one piece. The legs are eight in number in the adult animal. The parts of the mouth consist of two movable pieces (falces), in front of which is another piece (labium); on each side of the labium is a strong piece (maxilla), and from the outer side of each maxilla springs a palpus of four or five joints. In some instances the falres, maxillie, and labium, form by their union a sort of tube or proboses, fitted for piercing, adhering to, and sucking the juices of their prey; when not so united, the falces are terminated variously by a diductyle claw or by a movable fang, or they consist of two long styles, which by moving backwards and forwards alternately perforate the substance of their prey. The palpi of acaridians are also variously formed, and, like the legs, have been described by Dugés, who recognises seven kinds. The eyes are frequently absent, but are generally two, four, or six in number. In some cases there is but one, composed of a varying number of small facettes. The alimentary canal is short, with lateral execa in the gastric region, and an anus opening near the posterior extremity of the body. Respiration is generally effected by means of tracheæ opening by stigmata, but in the parasitic forms no special organs for breathing exist, and the aeration of the fluids is accomplished through the skin. The nervous system in the families Trombidides and Acarides, and probably in the rest also, consists of one large globular ganglion, from which nervous filaments are given off before and behind. No evidence of the existence of a heart or circulatory system has been obtained. The reproductive organs open on the ventral surface of the body, generally between the hinder pair of legs. The ova in Trombidides are de-yeloped in a tubular double-branched ovarium, but in other instances in the substance of the general tissue of the body. Acarids are both oviparous and ovo-viviparous. Some, like the Pentastomides, are hermaphrodite; in others the sexes are believed to be separate. Parthenogenesis certainly exists in some species. Some spin webs. (Cambridge in Encyclop. Brit.) The families of the order are—Pentastomides; Tauurides; Tardigradides; Acarides; Oribatides; Gamasides; Ixodides; Hydrachnides; Trombidides; and Bdellides.

Acarides. (Same etymon.) A Family of the Order Acaridea. The acarides have a long-A Family of oval, soft, thiu-skinned body, with the thoracie jnnction often visible, flat below, convex above; the falces are seissor-like; maxilla obsolete; the legs of the first two pairs often widely distant from those of the hinder ones; in some low forms, or perhaps only in the immature state, four legs are found, each having four joints, and ending in a

long-stalked sucker.

Acarid'iæ. A synonym of Acaridea. Acari'na. A synonym of Acaridea. Acarn'a. Old name for the Carline thistle. A. gummif'era. See Atractylis. Acaro'dium. Term for acaroid resin. Ac'aroid. (Acarus; F. acaroïde.) scurbling the acarns.

A. resin. (G. Acaroidharz.) A gum resin flowing from the Xanthorrhea hastilis, yellowish red, very friable, with balsamic odour and astringent taste; it melts at a low temperature; burns with a smoky flame; when distilled yields benzine, cinnamine, phenol, benzoic and cinnamic acids. It is insoluble in water, soluble in alcohol and alkalies.

Acaro'is resinif'era. A synonym of

Xanthorrhæa hastilis.

Ac'aron. (Aκαρής, short, small.) The wild myrtle, Myrica gale.

Acarop'sis. A synonym of Tyroglyphus.

A. Mericourt'ii. See Tyroglyphus Meri-

**Acarotox'ic.** ('Ακαρι, τοξικόν, a poison.) Term applied to remedies that destroy Acari.

**Acar'pæ.** ('A, neg.; καρπός, fruit.) Cutaneous affections in which no "fruit," in the form of tubercles, vesicles, or pustules, appears on the Lentigo, Chloasma, Argyria, and Pityriasis, belong to it. (D.)

A. mac'ulæ. Fruitless spots; term for spots

on the skin without elevation.

Acarpel'lous. ('A, neg., and carpel.) Having no carpels.

**Acar pous.** ('A, priv.; καρπός, fruit. F. acarpe, G. unfruchtbar.) Having no fruit; sterile. Acar'tum. Alchemical name for minium, triplumbic tetroxide, or red lead. (Ruland.)

**Ac'arum.** See Acaron. **Ac'arus.** ('A. neg., κείρω, to ent; because, from its small size, it cannot be divided. F. acure, ciron; It. acaro; G. Milbe.) A genus of Acarides. The mite; several species of which are parasitic ou man and animals. This genus possesses four pairs of legs, and the mouth is provided with distinct mandibles.

A. autumnalis. The harvest bug, a species of spheroidal form, with the abdomeu bristly behind. Its bite produces swelling, inflam-

mation, and much itching.

A. ca'sei. See Acarus domesticus.

A. cella'ris. A species once found by Louth in the pitnitary body of a lunatic.

A. ci'ro. A synonym of Acarus domesticus. **A.** come'donum. A synonym of Demodexfolliculorum.

**A. domes'ticus.** (G. Kasemilbe.) The cheese mite. The eggs of this arachnid are hatched in about eight days.

A. dysenter icus. An acarus said to bave been found in the dejections of dysenteric patients

A. fari'næ. The flour mite; it is said by some to be more frequently met with in the flour of the Leguminosæ than in that of the Graminea

A. folliculo'rum. A synonym of Demodex folliculorum.

A. margina'tus. Λ species found by Brasdor in the corpus callosum of a soldier who had died from fracture of the skull.

A. ric'inus. The dog tick; a parasite infesting the dog and sheep. A synonym of Ixodes. A. sac'chari. The sugar mite; found in

most specimens of brown sugar.

A. scabie'i. A synonym of Sarcoptes scabiei.

A. si'ro. A synonym of Acarus domesticus. A. si'ron. A synonym of Acarus domesticus. A. Stockholm'ii. A supposed variety of Sarcoptes scabiei.

A. syron. A synonym of Acarus domesticus. Acatalep'sy. ('A, neg.; καταλαμβάνω, to apprehend.) A term for uncertainty in the diagnosis of prognosis of disease.

Acata'lis. ('A, neg.;  $\chi a \tau \ell w$ , to want.) A name of the Juniper tree from the abundance of its seeds.

**Acatapo'sis.** ('A, neg.; καταπίνω, to swallow,) Difficulty in swallowing; dysphagia.

**Acatas tatæ.** ('A, neg.; καθίστημι, to establish.) Inconstant; applied by Hippocrates to fevers which maintain no uniformity either in their paroxyms or in the state of the urine, but are always changing.

Acatastatic. ('A, neg.; καθίστημι, to regulate.) Term applied to diseases that are

irregular in their course.

Acate'ra. The Juniperus communis.

Acatergas tus, ('A, neg.; κατεργά-ζομα, to digest.) Rough; undigested. Acatharsia. ('A, neg.; καθαίρω, to cleause.) Used by llippocrates for impurity of the blood and humours; also for the omission of purgation.

Acatsjaval'li. A plant growing at Malabar, used as an astringent and aromatic.

Acau'date. (A, neg.; cauda, a tail.)
Tailless; absence of the coccyx.

Acau'les. ('A, neg.; caulis, a stem.) A term in Botany applied to plants in which the stem is inconspicuous.

Acaules'cence. (A, neg.; caulis, a stem.)

Stemlessness. A term applied to many herbaceous plants, and to some arborescent monocotyledons in which the internodes of the stem never become much lengthened, and the leaves in consequence appear closely packed and more or less overlap-ping. The stem is absent in all Thallogens.

Acquies cent. (Same ctymon.) Term

Acaules'cent. (Same etymon.) Term applied to plants in which the stem is very short

or inconspicuous. See Acaulescence.

Acau'line. (A, neg.; caulis, a stem. F. acaule; G. achsenlos.) Term applied to plants having little or no stem.

Acaulo'sia. Synonymous with Acaulescenter.

Acawe'ria. The Cingalese name of the Ophioxylum serpentinum.

Acazdir. (Ar.) Stannum, or tin. (R.)
Acaztem. A compound metal nearly resembling brass. (R. and J.)
Accatum. A synonym of Accatem.
Accelerated. (F. acceleré; G befordert; baschleunigt.) Hastened.

Accelerating nerves. (Accelero, to quicken.) The nerves by which the cardiac and respiratory movements are quickened. which accelerate the heart proceed from the medulla oblongata, or some higher segment of the cerebro-spinal nervous system, descend for some distance in the spinal cord, enter the rami communicantes that join the sympathetic nerve, and coursing through the first thoracic ganglion pass to the heart in the sympathetic fibres that proceed from that ganglion. The nerves by which the respiratory movements are accelerated run in the vagus to a circumscribed spot in the medulla oblongata at the point of origin of the vagus and spinal accessory nerves.

Acceleration. (Accelero; ad and celero, to hasten.) Qniekened, increased motion. Used to indicate a greater rapidity of the functions of organs, especially those of the circulation and

respiration.

Accelera tor urinæ. (F. accelerateur de l'urine; G. Mus. bulbo-cavernosus.) A perineal muscle covering the bulb of the nrethra, composed of two symmetrical halves, united in the median raphe, from which, commencing at the central tendinous point of the perinæum, the tibres pass obliquely outwards and forwards for three or more inches, the most posterior to he inserted into the triangular ligament, the middle to surround the bulb and adjacent part of the eorpus spongiosum, and to join with those of the opposite side on the upper surface of the corpus spongiosum, and the auterior fibres to enclose the corpus cavernosum and to meet over the dorsal veins of the penis. In the female these muscles are represented by the sphincter vaginæ. Supplied by the superficial perineal branch of internal pudic artery and muscular branches of perineal nerve. It assists in expelling the last drops of urine and in effecting erection.

Accentor ides. A Family of the Group Dentirostres, Order Passeres, Class Aves. Beak strong, conical, subulate; toes short, with strong claws. Example, A. modularis, hedge-sparrow.

Accentuation. (Ad to, and cantus, a song.) A term applied to a sound when marked with special loudness or clearness.

Accentuation of the second sound of the heart

indicates simple pulmonary congestion.

Access. Same as Accession.

Acces'sion. (Accessio ; ad, and cedo, to draw near. F. accis; G. Anfall.) The beginning

or onset of diseases, or of fits, paroxysms or exacerbations in fevers

Accesso rii orbicula ris o ris. A few muscular fibres, arising from the alveolar border of the superior maxilla opposite the incisor teeth on each side, and continuous at the angles of the mouth with the other muscles of this part.

Accessorius. (Ad, to; cede, to upproach.) The eighth pair of cerebral nerves.

A. ad sa'cro-lumba'lem. One of the fourth layer of the muscles of the back, arising by separate flattened tendons from the angles of the six lower ribs, internal to the tendons of insertion of the sacro-lumbalis; the fibres are inserted by separate tendons into the angles of the six upper ribs and into the posterior transverse process of the seventh cervical vertebral nerves. Supplied by external posterior branches of dorsal acteries, and by external posterior branches of intercostal nerves.

A. ad il'io-costa'lem. A synonym of

Accessorius ad sacro-lumbalem.

A.pe'dis. See Accessory flexor muscle of foot. Acces sory. (Same etymon.) Joined to, additional, accompanying.

A. buds. Buds that appear in the axil of

a leaf in addition to the primary bud.

A. fis'sure (ear). (G. Hilfs-spalte.) A term applied by Rüdinger to the fissure connected with the semi-eylindrical space beneath the cartilaginous hook of the Eustachian tube.

A. flex'or mus'cle of the foot. A muscle of the sole of the foot, which arises by two heads from the inferior and inner surface of the os calcis; the outer head is tendinous, the inner fleshy; between the two is seen the long plantar ligament. The muscle is covered by the flexor brevis digitorum and the external plantar nerve and artery; anteriorly it is inserted into the tendon of the flexor longus digitorum near the centre of the foot, and it contributes slips to the portions of that tendon going to the second, third, and fourth digits. It is supplied by the external plantar artery and nerve, and its action is to aid in flexing the toes into which the flexor longus digitorum is inserted.

A. glands of the pan'creas. Brunner's

glands.

A. gland of the parot'id. Socia parotidis; or that portion of the parotid gland which surrounds the duct of Stenson. A. nerve of Willis. A synonym of the

Spinal accessory nerve.

A. obtura'tor nerve. An inconstant nerve derived from the trunk of the ohturator near the lumbar plexus, or from the third and fourth lumbar nerves; passing over the brim of the pelvis, it lies beneath the pectineus, which it supplies, at the same time giving off a branch to the hip-joint, and generally a branch which communicates with the anterior branch of the obturator nerve, and is continued as a cutaneous branch to the leg.

A. palatine canals. One or two small openings in the outer and posterior part of the horizontal plate of the palate bone, transmitting small posterior palatine nerves or arteries.

A. pro'cess of lumbar ver'tebree. small downward pointing process of a lumbar vertebra behind the base of the transverse proccss. The anapophysis of Owen.

A. pu'dic ar'tery. An artery that occasionally arises from the internal iliac artery, rons forward along the side of the bladder and prostate gland and, perforating the triangular ligament,

supplies the penis and urethra.

Accib. (Ar.) Plumbum, or lead. (R. and J.) Accident. (Accide, to happen; ad, to, and cado, to fall.) Used by the French as synonymous with symptom; such having been the case with the Greeks, who sometimes employed σύμπτωμα in the same sense, and also with certain of the older Euglish writers; things out of the usual course, happening to the healthy, were termed (Galeu, Meth. med. i, 9.)

Accident'al. (Same etymon.) Applied by French writers to textures resulting from morbid action, as the adhesions that are seen in pleurisy and pericarditis, and similarly adopted by

some English authors.

A. hæm'orrhage. A form of hæmorrhage in the last months of pregnancy, depending upon accidental separation of the placenta, although the latter occupies its usual site, as contradistinguished from placenta prævia. See Uterine hæmorrhage.
A. symp'toms. Symptoms which super-

vene in the course of a disease without having

any necessary connection with it.

Accident'alism. A system of medicine in which disease is regarded as an external and accidental modification of health without any primary or original root in the body, which can be guarded against by foreseeing and destroying external causes and their occasions.

Accident'alist. Term applied to those who study and treat disease in accordance with

the doctrine of accidentalism.

Accident ia. A chauce or occurrence happening unexpectedly; an accident.

Accipenser. See Acipenser. Accipiter. (L. Accipiter, a hawk. F. épervier.) A bandage applied over the nose resembling a elaw of a hawk.

Accip'itres. (Accipiter, a hawk.) A group of the Order Raptores, Class Aves. Carmate birds. The head and neck always clothed with feathers, eyes more or less sunk in head and provided with a supraciliary ridge; claws much recurved.

Accipitri'na. The Hawkweed.

Accipitrines. A Sub-family of the Family Accipitres. Bill short, strong, with a blunt tooth ; claws pointed ; wings rarely reaching the middle of the tail.

Accli'mate. See Acclimatise.

Acclimation. See Acclimatisation.
Acclimatisation. (Ad and clima; κλίμα, a slope, a region of the earth. F. acclimatisation; G. Akklimatisirung.) The process by which plants and animals become adapted to, and so retain health in, countries having different conditions of the air, soil, and water, to those of which they are indigenous. The term may be applied to an individual and to a race, or, in other words, it may be effected in part by changes occurring in the individual and in part by inherited modifica-tions of constitution. Altitude, temperature, moisture, and the nature of the soil and of its productions, are the chief conditions which vary, and to which the constitution must be accommodated. The disturbances caused by difference of altitude seem to he rapidly surmounted, but the effects of great variations of temperature in producing disorder of the system are more permanent and serious. The English race does not thrive in Calcutta, and the Ethiop dies out in the North. In some localities the prevalence of endemic diseases, intermittent and remittent fevers, will probabl. prevent them from ever being inhabited by the

white man. Amongst animals a good example of acclimatisation is afforded by the history of the Egyptian goose, which, according to M. Quatre-fages, was introduced into France in 1801 by Geoffrey St. Hilaire, and at first laid its eggs, as in its native country, in December, and therefore at a most unfavorable season for hatching them. With care, however, several generations were reared. In 1844 the period of incubation was postponed to February; in 1845 to March; and in 1846 to April, which is the same time as the domestic goose. M. Quatrefages gives an equally marked instance of acclimatisation in plants in the case of the Chrysanthemum sinense, which, originally a native of China, was introduced into France in 1790, but proved incapable of ripening its seeds in 1852; however, some specimens flowered earlier than others; the seeds matured, and now the plant can be propagated to any extent by seed.

Accli'matise. (Same etymon.) To effect the changes by which a plant or animal is adapted to conditious of life different from those to which it has been accustomed.

Accli'vis. (Ad, to; clivus, the side of a hill.) Ascending. A synonym of the obliques

internus, from the direction of its fibres.

Acco'cay. A bark much employed by the natives of Senegal as a febrifuge. It does not contain either quinine or cinchonine. (W.)

Accommodation of the Eye. (L. accommodo, to adjust.) The act by which the eye is adjusted to see objects distinctly at different distances. The normal or emmetropic eye of an adult when at rest is adapted to see infinitely distant objects, or in other words to bring parallel rays of light to a focus on the retina. By an effort of the will, generally exerted automatically, the divergent rays proceeding from an object in close proximity to the eye can also be focussed on the retina. To effect this, either the distance between the lens and the retina must be increased, or there must be increased refraction of the rays of light. In the human eye, the latter plan is adopted. That a distinct effort is required may easily be shown by a simple experiment; if a remote object be looked at through a piece of coarse muslin the observer can either see the distant object with tolerable clearness, when the meshes of the fabric become indistinct, or he can fix his attention upon the meshes of the muslin when the distant object becomes indistinct. In either case he alters the adaptation, adjustment, or accommodation of the eye. In looking at the distant object he relaxes his accommodation, in looking at the near one he exerts his accommoda-tion. The extent or range of accommodation is the distance between the furthest point of distinct vision and the nearest. It varies with the strength and efficiency of the ciliary muscle, the clasticity of the lens, and the age of the patient. It undergoes steady decrease from childhood to old age. It is ascertained practically by determining the distance between the nearest and the most remote point at which an object can be distinctly seen. In childhood the near point is between two and three inches distant from the eye; at 20 it is between three and four inches, at 30 about five inches, at 40 about eight inches, at 50 twelve to sixteen inches, at 60 two feet. The phenomena observed when a healthy or emmetropic eye, at rest, exerts its accommodation in looking at a near object, are that the pupil slightly contracts, the pupillary margin of the iris being moved

forwards, and the periphery backwards; and that the lens becomes thicker, both of its surfaces becoming more convex, but the anterior to a much greater degree than the posterior. The exact mechanism or cause of this increased convexity of the lens is not certainly known. Young thought that it was due to the contraction of the fibres of the lens itself; others have attributed it to a direct compression of the lens by the ciliary muscle; whilst others, with greater probability, regard it as an indirect result of the contraction of the ciliary muscle, which, drawing forward the anterior part of the choroid, relaxes the suspensory ligament of the lens and thus allows its own elasticity to come into play, in consequence of which it increases in thickness. If the lens be absent, as in aphakia, the power of accommodation is entirely lost. The best instruments for testing the range of accommodation are Snellen's test types and Gräfe's wire optometer. See Ametropia, Aphakia, Emmetropia, Hypermetropia, Myopia, and Refraction.

A. ab'solute. The range of accommodation possessed by each eye separately. The near point is rather more distant when the two eyes are used together than when one alone is

employed.

A. anom'alies of. Under this term are included those conditions of the accommodation caused by impaired, abolished or spasmodic action of the ciliary muscle (paresis, paralysis, or spasm

of this muscle).

A. range of. (F. espace de l'accommodation; G. Accommodationsbreite.) This term signifies the length of a line the successive points of which from the most distant to the nearest can be accurately focussed on the retina; in other words, the distance between the nearest (punctum proximum) and the most distant point (punctum remotissimum) that can be distinctly seen.

A. rel'ative. The relation existing between the accommodation of the eyes and the degree of their convergence. From constant habit and exercise a connection becomes established between the degree of contraction of the recti interni muscles, which control the convergence of the eyes, and that of the ciliary muscle. It is not, however, so intimate but that some change in the accommodation can still be effected with a definite amount of convergence. A certain range of accommodation remains, and this is made up of two parts, one of which is associated with relaxation of the apparatus of accommodation, and may be called negative, whilst the other is due to a still further contraction of the ciliary muscle, and may be termed positive accommodation; the sum of the two is called the relative range of accommodation. The extent of this range may be determined by ascertaining the strongest concave and convex glasses with which, the convergence of the eyes remaining the same, a given object may be distinctly seen.

Accord. The simultaneous emission of more than two sounds. See Consonance and Dis-

sonance.

Accouchement. (Fr., from ad and couche, bed.) The act of being delivered in child-

bed. See Labour.

A. for'ce'. A term applied to the delivery of the child in severe hamorrhage occurring during pregnancy, when the hand was forced through the cervix, the child seized and extracted, and the membranes and placenta removed as quickly as possible.

Accoucheur. (F.) A man-midwife; an obstetrician.

Accoucheuse. (F.) A midwife. Accrementitial. Growing by infernal increase or accrementation.

Accrementition. Term applied to a form of growth in which increase of anatomical elements similar to those already existing, takes place, both by interstitial development from a blastema, and by fission of the original cells.

Accres'cent. (Ad, to; cresco, to increase.)
A term in botany applied to parts of the flower exclusive of the ovary, which grow after fecuadation, as the persistent calyx of Physalis.

Accrete. (Ad; cresco, to grow.) In

Botany, grown together.

Accretion. (Ad, to; cresco, to incresse.) The process by which fresh particles are added to a growing crystal. The term has also been applied to similar modes of increase in organic forms.

Applied to the adhering together of parts that

are naturally separate, as the fingers.

Accuba'tion. (L. ad; cubo, to lie down.) A lying down; the being in childbed.

Accubitus. (Accubo, to lie near.) The lying together of an old and a young person or

of a healthy with a sick one. (Dunglison.) Accum'bent. (F. accombant.) Lying ainst another body. A term in botany applied against another body. to cotyledons, with the margins of which the radicle is in contact, as in Pleurorhizal Cruciferæ.

Aceconitic acid. C<sub>6</sub>H<sub>8</sub>O<sub>6</sub>. Obtained by the distillation in vacuo, at about 200 (392° F.), of the brown viscid mass resulting from the action of sodium on bromacetic ether. It crystallises in mamelons, is soluble in ether, and is, perhaps, identical with earballylic acid, or aconitic acid.

Ace'dia. ('Ακήδεια; α, neg., κήδος, care. F. acedie; G. Sorglosigkeit.) Carelessness, listlessness, or want of interest; want of care; neglect; fatigue. This condition is well known in monasteries. It is produced by the enmi of solitude, and by too assiduous reading and fasting; it chiefly affects the younger monks. It is characterised by sadaess, mental confusion and disturbance, bitterness of spirit, loss of all liveliness, and utter despair.

Acella. See Axilla.

Accogno'sia. ('Ακέομαι, fo cure; γνῶσις, knowledge.) A knowledge of therapeatics.

Accel'ogy. ('Ακέομαι; λόγος, a discourse.) A treatise on materia medica.

Aceph'ala. ('A, neg.; κιφαλή, the head.) One of the three great divisions of Mollusca, represented by the oyster, defined by v. Carus as having no head; mouth without masticatory apparatus, surrounded by two lobulated processes of the mantle; foot compressed, occasionally flat or rudimentary; the mantle covers the back of the animal and forms two lateral lobes, either quite free or more or less completely united on the ventral surface, invested by two lateral, calcareous valves or shells. Now called Lamellibranchiata.

Acephale'nia. Former name of the Acephala or Lamellibranchiata.

Acephal'ia. ('Λ, neg.; κεφαλή, the head.) In Teratology, the absence of the head; headless. Acephalobra'chia. (Same; βραχίων, arm.) In Teratology, a monstrosity without head or arms.

Acephalocar'dia. (Same; καρεία, the heart.) In Teratology, a monstresity without head or heart.

Accohalochei'ria. (Same; χείρ, the

hand.) In Teratology, the absence of head and hands in a fœtus.

**Aceph'alocyst.** ('A, neg.; κεφαλή, a head; κύστις, a box.) A sterile hydatid. Au hydatid in which the eyst naturally formed at one stage of development of a tænioid worm becomes reduced to a cell-wall, which contains no echinococci but is capable of producing from its internal or external surface or in its substance a series of vesicles encapsuled within one another.

Acephalocys'tis endog'ena. Formerly used to denote an acephalocyst with laminated walls; and also a hydatid cyst with enclosed

cysts and its contained echinococci.

A. eremi'ta. A single acephalocyst.

A. exog'ena. A name given to the echinococcus cyst of ruminant animals when smaller cysts bud from the outer surface.

A. granulo'sa. A form of hydatid supposed, but erroneously, to be a species of Acepha-

locyst.

A. multif'ida. A name given to compound echinococcus cysts found in the brain.

A. ovoide'a. A form of acephalocyst supposed, but erroneously, to be a species.

A. prolifera. A term by which compound cchinocoeeus cysts were formerly known.

A. racemo'sa. The vesicles of the chorion, which, when enlarged and diseased, were erroneously regarded by Cloquet as a form of hydatid.

A. ramo'sa. Term applied to the hydati-

form mole of the uterns.

A. socia'lis. A synonym of A. prolifera. A. sterilis. A single simple acephalocyst. A. surculig'era. A form of hydatid supposed, but erroneously, to be a species of the

ordinary hydatid. Acephalogas'tria. (Same: γαστήρ, the belly.) In Teratology, a monstrosity without

head or belly.

**Acephaloph'orous.** (Same; φέρω, to ear. F. acephalophore.) Applied to Mollusca, hear. which have not the head distinct from the rest of the body.

Acephalopo'dia. (Same; πούs, a foot.) In Teratology, a monstrosity without head or feet. **Acephalora chia.** (Same; ράχις, the

spine.) In Feratology, a monstrosity without head or vertebral column.

Acephalosto'mia. (Same; στόμα, a mouth.) In Teratology, a monstrosity without head, but with a superior aperture or mouth.

Acephalothorac'ica. (Same: θώραξ, the chest.) In Teratology, a monstrosity without

head or chest.

Aceph'alous. ('A,neg.; κεφαλή, the head.) Il cadless; applied to monsters without heads, and to the conchiferous or lamellibrauchiate mollusks.

A'cer. (F. erable; G. Ahorn.) A genus of the Nat. Ord. Aceraceæ.

A. campes'tre. (F. erable; G. Mass-

holder.) The native maple. A. dasycar pum. A species yielding sugar. A. eriocar'pum. (F. erable blanc). A sugar producing species.

A. negun'do. A sugar-yielding species. A. ni grum. (F. erable noire.) A variety of A. saccharinum.

A. palmifo'lium. A synonym of the A. saccharinum.

A. pennsylvan'icum. The striped maple. A decoction of its bark has been used internally and externally in cutaneous affections and of the leaves and twigs to relieve vomiting. (D.)

A. platanoi'des. (F. crable plane; G. Milchahorn) A synonym of A. pseudop/atanus.

A. pseudo-platanus. (F. erable syco-more; G. falsche Platane.) The sycamore.

A. ru'brum. (F. erable rouge, or erable de Virginie.) Red maple. A sugar producing species. The inner bark is a mild astringent, species. used by the American Indians in diseases of the

A. sacchari'num. (F. erable à sucre; G. Zuckerahorn.) The sugar maple. The sugaris obtained in America by perforating the tree and boiling down the sap. The bark has been used in the manufacture of a blue dye and in making ink.

A'cera. A synonym of the Arachnida. A'cera. (G. Ahorne.) An Order of Thalamifforal Exogens, according to some, which inclides Sapindaeea, Erythroxylea, Acerinea, Hippocastanea, and Tropwolea.

Acera. A Family of the Section Pleurobranchia, Order Opisthobranchia, Class Mollusca. Tentacles and labial appendices united into one large cutaneous fold; some possess an internal shell, others an external spiral shell; foot divided into two lateral lobes.

(G. Ahorngewächse.) The Acera'ceas. (G. Ahorngewachsc.) The maples: a Natural Order, or a Suborder of Sapins daceæ. Trees or shrubs with opposite exstipulate leaves; regular or unsymmetrical, polygamous, or diœcious, sometimes apetalous flowers. Stamens usually 8, on a fleshy disk; ovary 2 lohed, 2-celled, with 2 ovules in each cell, style 1, stigmas 2; fruit a double samara, with 1 seed in each cell. Seeds without perisperm; cotyledons folded, radicle inferior.

('Ακεραs, a spur.) The man A'ceras. orchis.

A. anthropoph'ora. (F. homme pendue.) Nat. Ord. Orchidacee. The root supplies one of the varieties of salep. The leaves are reputed sudorifie, and yield a perfume.

Acerate. A salt of aceric or malic acid.

Also in Botany, needle-shaped.

Acera'tes decum'bens. Nat. Ord. Asclepiadacea. This plant, which grows in New Mexico, is stated by Dr. William Wilson to be used by the Mexicans as a specific in snake bite.

A. longifo'lia. Long-leaved green milkweed: indigenous in the U.S. Diaphoretic.

Acera tia. ('A. neg.; κέρας, a horn.) The condition of a ruminant destitute of horns.

Ace'ratos. ('Ακήρατος, from à, priv.; κεράω, to mix.) Pure; unmixed; uncorrupted.

The humours of the body. (Hippocrates.) **Acerato'sia.** (A, neg.;  $\kappa \epsilon \rho as$ , a horn.) The condition of a ruminant destitute of horns. Acerato'sis. (Same etymon.; F. acera-

tose.) A defect of horn-formation.

Aceratothe rion. ('Λ, neg.; κέρας, hern; θηρίου, a wild beast.) In Teratology, an animal which is monstrous in consequence of the absence of horns.

Acerbity. (L. acerbitas; F. acerbité; I. acerbeza; G. Herbigkeit.) Astringency, combined with acidity, as in the flavour of unripe fruit, or of a mixture of tannic and gallic acids.

Acerboous. (F. acerbe; G. herbe; I. aud S. acerbo.) Having the quality of acerbity. Acerdese. Hydrated sesquioxide of mannese. A very common mineral, used in the

preparation of chlorine. ('Asn, a point. F. Acerel'latous. ('Aκή, a poi acérellé.) Terminating in a sharp point.

Acer ic acid. An acid obtained from the

maple (Acer saccharinus.) It is identical with malie acid.

Ace'rides. ('A, neg.; κηρός, wax.) Plasters which have no wax in their composition. (Galen.)

Acerin'eæ. A synonym of Aceracea. Aceritous. ('A. priv.; κηρός, wax. F. Acerote; G. ohne Wachs.) Having no wax.

Acerodes. A synonym of Acerides. Acerosæ. (G. Nadelholzer.) A Class of **Acerosæ.** (G. Nadelholzer.) A Class of plants including the Conifera and the Gnetacea, according to Thomé.

Ac'erose. (Δκή, a point.) In Botany, needle-shaped and rigid, like the leaves of the pine. Also applied to a leaf having brawny scales at its base.

Acero'sus. ('Αχυρον, chaff.) Brown bread. A'cerous. ('A, priv.; κίρας, a horn. F. acère; G. ohne Horn.) Applied to apterous insects without antennæ; and to Gasteropoda, and Chetopoda, without tentacula.

Acer'va. Italy; near Capua. Cold sulphur waters, containing calcium chloride and sulphate, with carhonic acid and sulphuretted hydrogen

Little used.

Acer'vulus cer'ebri. (Dim. Acervus, a heap. F. acervale; G. Gehirnsand.) The sandy matter contained in a cavity of the pineal gland, composed of calcium phosphate and earhonate, magnesium and ammonium phesphate, amyloid bodies and some other organic matters.

Aces'cence. (f. acescence; I. acescenza; Sauerliehkeit.) The quality of becoming sour G. Sauerlichkeit.)

or heing ascescent.

Aces cent. Becoming sour, or being slightly acid. ('Akeois, cure.) The treatment

Ace'sia. and cure of discase.

**Ac'esis.** ( 'Ακεσις, from ἀκεσμαι, to cure or heal.) A cure. The act of healing. Aces'mus. ("Ακεσμα, cure.) A remedy

conducive to the cure of disease.

Aces'odyne. ("Ακεσις, cure; ὁδύνη, pain.) Anodyne.

Acesod'ynous. ("Ακεσις, cure; όδύνη, pain. F. acesodyne; G. Schmerzheilend.) Allaying pain.

Acesphor'ia. (Same; φέρω, to bring. F. acesphorie; G. Heilung, Heilbringen.) A healing or bringing of health.

Aces'phorous. (Same; F. acesphore; G. heilbringend.) Bringing health.

Aces tis. The same as Acesis.

Aces toris. (Feminine of ἀκέστωρ, a physician.) A medicatrix, or female physician, and, the latter especially, a midwife.

Aces'tos. (Gr.) Curable. Aces'tra. (Gr.) A needle; also a Genus of the Siluridæ, Order Physostomi, Class Pisces. Aces'tria. Same as Acestoris. Aces'tris. Same as Acestoris.

Aces'tris. Same as Acestoris. Ace'ta. Pharmacopeial preparations in which vinegar or acetic acid is used as the menstruum.

Acetab'ula. (L. Acetabulum, a little cup.) The suckers with which the cephalic processes of many Cephalopoda are provided.

A. uterina. The depressions in the mucous membrane of the uterus in Herbivera receiving the cotyledons.

Acetab'ular coxal'gia. hip-joint disease in which the acetabulum is primarily or principally affected.

Acetabula ria. (Acctabulum, a vinegar saucer.) One of the Chlorosporew or marine algae; green, umbrella shaped. In the cell-walls finely divided lime is deposited.

Acetabulif'era (Acetabulum, a vinegar saucer; fero, to bear.) A synonym of the Dibranchiate Cephalepods.

Acetab'uliform. (Acetabulum; forma, likeness. F. acetabuliforme; G. becherformig; schalenformig.) Hellowed in form of a cup, goblet, or jug.

Acetabulose. (Same ctymon. F. aceta-buleux.) Having, or full of, cups; formed like a cup, as the fructification of many lichens, or the pileus of certain mushrooms; or like a vase, as the ealyx of the Marrubium acetabulosum.

Acetab'ulum. (L, a kind of cup to hold vinegar, from acctum, vinegar, and κοτύλη, a measure containing 0.27 of a litre. F. acctabule; G. Gelenkpfanne; I. acetabolo.) A cup-shaped, hemispherical cavity, for the reception of the head of the femur, situated on the outer surface of the os innominatum; in man the os puhis forms one fifth, the ischium a little more than two fifths, the ilium a little less than two fifths of the whole. The union of the three pieces takes place by means of a Y-shaped piece of cartilage, which essifies and clamps them together about the fourteenth year. Its diameter is about 21 inches. It is directed downwards, forwards, and outwards, and is lined with cartilage, except at its lower third, which presents a large rough depressiou, to which the ligamentum teres is attached. The horder is interrupted below by a notch (the cotyloid notch), which, however, is in life converted into a foramen by a fibro-cartilaginous structure, beneath which, the vessels and nerves of the joint of the ligamentum teres and of the fatty gland of Havers enter. Vascular supply, from obturator and sciatic arteries; nervous, from branch of sacral plexus to gemellus inferior and quadratus femoris, or from upper part of great sciatic nerve. In monotremes and birds the acetabulum is perforated, and in crocodiles the os pubis forms no part of it.

A.al'terum. The Sedum telephium. A. cotyle. A synonym of the acetabu-

A synonym of the glenoid A. hu'meri. cavity of the scapula.

A. mari'num. The Umbilicus marinus. Ac'etal. (G. athylidendiathylat or athylidenduathylather.  $C_6H_{14}O_1 = CH_3 - CH(OC_2H_5)_2$ . Ethidene diethylate, isomeric with ethene diethylate, is formed by oxidation of ethyl alcohol, and is found among the first portions of the distillate obtained in the preparation of ordinary spirit. It is a colourless liquid smelling like alcohol. Sp. gr. 0.821 at 22 C. (71.6° F.); boils at 104° C. (219.2° F.). With chlorine it yields mono-, di-, and trichloracetal.

Acetal'dehyde. A synonym of Aldchydc. Aceta'ria. (Acetum, vinegar.) Salads made of roots or herbs mixed with oil, salt, and vinegar.

Aceta'rious. Term applied to salad herbs. Aceta'rium scorbu'ticum. A pickle for scorbutic patients, made of Cochlearia Anglica, a salt obtained from it, and sugar.

Ac'etas. An acetate.

A. ammo'niæ solu'tus. A synenym of the Ammonium acctum solutum, Aust. Ph.

A. lixi'væ. A synonym of the Kalium accticum solutum, Aust. Ph.

A.na'tricus c. a'qua. A synonym of the Natrium accticum of the Aust. Ph.

A. plum'bi acid'ulus. A synonym of the Plumbum aceticum of the Aust. Ph.

A. potas'sæ. A synonym of the Kalium accticum solutum of the Aust. Ph.

A. so'dæ. A synonym of the Natrium accticum of the Aust. Ph.

A. zin'ci. A synonym of the Zinci aceticum of the Aust. Ph.

A. zin'cicus. A synonym of the Zincum accticum of the Aust. Ph.

Ac'etate. (Acetum, wine vinegar.) A combination of acetic acid with a base.

A. of alu'mina. (Actas aluminicus. F. Acetite d'argile; G. neutrales essigsaures aluminium.) Al<sub>2</sub>(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>6</sub>. Is obtained by combining directly alumina hydrate with acetic acid, or by the double decomposition of plumbic acetate and aluminium sulphate. Colourless, crystallising with difficulty, and always acid. It has been employed in cases of chronic gonorrhœa and of hamoptysis.

A. ammonia, acid. C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>, NH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>, Obtained as a white crystalline sublimate when dry powdered chloride of ammonium is heated with an equal weight of acetate of potassium or calcium, ammonia being simultaneously given off. A warm saturated solution of this salt kept in a closed bottle deposits long needle-shaped crystals. The crystals redden litmus and rapidly deliquesce, They melt at 76° C. (168.8° F.), and sublime undecomposed at 121° C. (250° F.).

A. of ammo'nia, neutral. NH<sub>4</sub>C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>
A white odourless salt, obtained by saturating glacial acetic acid with dry ammonia. Crystallises with difficulty, the aqueous solution losing ammonia on evaporation, and being converted into the acid salt. It is readily soluble in water and alcohol. See Lig. ammon. acetalis.

A. of ammo'nia and cop'per. (F. Acci-

A. of ammo'nia and cop'per. (F. Acctate exprico-ammonique.) Obtained by dissolving 250 parts of neutral acetate of copper in 1500 parts of water and 50 parts of acetic acid, filtering, and then adding ammonia till the precipitate at first thrown down is just redissolved. The fluid is evaporated till a pellicle forms, when it is set aside to crystallise. It enters into the composition of some collyria.

A. of a'myl. See Amyl acetate.

A. of amyl'ic ether. A synonym of Amyl acetate.

A. of bis'muth. Obtained by decomposing a hot concentrated solution of acetate of potash by a solution of nitrate of bismuth. An insoluble salt not now in use in medicine.

A. of copper, neutral. (F. acctate neutre de cuivre, cristaux de Venus, verdet erystallisé; G. Essigsauves kupferoxyd; Dut. azynzuur, koperoxyde; I. verde eterno.) Ph. G. Cu (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub>+Aq. Prepared by dissolving verdigris in dilute acetic acid and crystallising; also by dissolving copper sulphate in solution of ammonia to saturation and boiling with an excess of vinegar, when crystals of acetate of copper rapidly appear. It consists of deep-green rhomboidal crystals, efflorescent, soluble in water and alcohol, styptic to the taste, and very poisonous. It was formerly used in fevers, but chiefly as an escharotic in fungoid granulations, and in solution as a collyrium. Dose, 0·01 to 0·06 grm. in pill.

A. of copper, basic. (Verdigris, euprum subaccticum, vivide æris, subacctas cupricus; F. acetate basique de cuivre verdetgris; vert-de-gris; G. Grünspan; I. verde rame; Sp. cardenillo; Dut. kopergroen.) Obtained by exposing plates of copper to the air in contact with acetic acid. There are two varieties of this salt, the blue,  $2\mathrm{Cu}(\mathrm{C}_2\mathrm{H}_3\mathrm{O}_2)$ .  $\mathrm{Cu}0+6\mathrm{Aq}$ ., and the green,  $\mathrm{Cu}(\mathrm{C}_2\mathrm{H}_3\mathrm{O}_2)$ 2,  $2\mathrm{Cu}0+3\mathrm{Aq}$ .

A. of copper, tribasic.  $\mathrm{Cu}\mathrm{C}_2\mathrm{H}_3\mathrm{O}_2\mathrm{Cu}_2\mathrm{O}+$ 

A. of copper, tribasic.  $CuC_2U_3O_2Cu_2O_+$   $H_2O$ . The most stable of all the acctates of copper. It is obtained by holling the aqueous solution of the neutral salt, or by heating it with alcohol; it forms green or bluish needles or scales.

A. of i'ron and ammo'nia. Obtained by mixing 7 parts of ammonium acetate and 1 part of ferric acetate. Dose, 30 to 120 grains.

A.ofi'ron perox'ide. (Fextrait de Mars; vinaigre martial ou chalybe.) Fe<sub>3</sub>(C<sub>2</sub>II<sub>3</sub>O<sub>2</sub>), Ferrie acetate. Obtained by saturating, with the aid of a gentle heat, acetic acid (10) with well-washed hydrated ferric oxide. Forric acetate is a deep-brown liquid with styptic taste; when evaporated beyond a certain point it decomposes, acetic acid being given off, and iron oxide left hebind. It is but little employed in medicine, though it is used instead of the peroxide as an antidote in poisoning by arsenic. See Tinet. ferri acetatis.

**A.** of iron protoxide. (G. Ferro diacetat.) Fe( $C_2H_3O_2$ )<sub>2</sub>. Ferrous acetate. Obtained by dissolving iron sulphide in concentrated acetic acid, or better, by the double decomposition of plumbic acetate and ferrous sulphate. It is filtered and evaporated without access of air; when sufficiently concentrated it becomes converted into a green mass of silky crystals. It is very soluble in water, and attracts oxygen from the air with great avidity. It is not commonly found prepared in shops.

F. acetate de plomb cristallisé, sel de Saturne; Germ. Bleizucher; Dutch, Zootsniker; I. Zucchero di saturno. Pb(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>3</sub>, 3H<sub>2</sub>O. Appears in the form of acicular crystals, with acetous odour and sweet taste. One part dissolves in 2.5 parts of water. Sedative and astringent. Used in chronic diarrhea and dysentery, in phthisis; applied as a wash or lotion in ulcers, in ophthalmia, and gonorrbea. Dose, 1—8 grains, usually prescribed with excess of acid. A non-officinal collyrium in use at ophthalmic hospitals, contains two grains of acetate of lead to one ounce of water, but should not be used in cases of ulcer of the cornea.

A. of lime. (F. terre folice calcaire. acetate calcique; G. Calcium acetat; essigsaures Calcium.)  $Ca(C_2H_3O_2)$ . Prepared by acting on lime or chalk with acetic acid. It is a salt crystallising in silky needles, very soluble in water and alcohol, insoluble in ether. A mixture of 3 parts of calcic acetate, 19 parts of water, and 78 of alcohol, forms a thick and solid coagulum. It is prescribed in 1 to 4 grs. in scrofula.

A. of magne'sia. Mg(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>). Obtained by saturating pyroligneous acid with magnesia or its carbonate; it is filtered and evaporated to dryness, or to the consistence of a thick syrup, as its deliquescent properties prevent its being kept in the crystalline form. It has been recommended as a purgative, being tasteless and very soluble in water and alcobol.

A. of morphia. C <sub>7</sub>H<sub>19</sub>NO<sub>3</sub>C(<sub>2</sub>H<sub>3</sub>O<sub>2</sub>.) Crystallises in needles. Soluble in 6 parts of water and in 100 of spirit. Dose ½ to ½ of a grain. See Morphia.

A. of quini'ne. Acetas quinicus. Obtained by heating quinine with double its weight of water,

adding acctic acid in slight excess, filtering, and setting uside to crystallise. Its action is analogous

to citrate of quinine.

A. of potash. (Areanum Tartari, Kali Acctutum; F. Terre folice de tarture ou végétale; (Arcanum Tartari, Kali acctate de potassium; G. essigsaures Kalium; Dutch, azynuur potasch.) KC<sub>2</sub>H<sub>3</sub>O<sub>2</sub>. Prepaied by adding acetic acid to carbonate of potash (B.P.), or to bembonate of potash (U.S.P.), and evaporating to solidification. A white, foliated, neutral, deliquescent salt, unctuous to the touch, and warm and pungent in taste. Dissolves in half its weight of water, and twice its weight of alcohol. Diarctic and purgative; it causes the urine to be alkaline. Used in dropsics, in uric acid deposits, in rheumatism, and some skin diseases. Dose, as a diuretic, 15 to 60 grains; as a purgative, 60 to 180 grains.

A. of sil'ver. Ag (C2H3O2). Obtained by acting on carbonate of silver with diluted acetic acid, and evaporating the fluid till small colourless crystals form; one part dissolves in 100 of water.

Not in use in medicine.

A. of so'da. (Terra foliata tartari. F. ace tate de sonde; G. Essigsaures Natron; I. acetato di soda.) NaC<sub>2</sub>H<sub>3</sub>O<sub>2</sub>+3 aq. Prepared in the process for obtaining vinegar, hy first adding lime to the crude pyroligneous acid, then sodium sulphate to the solution of acctate of lime thus formed, and crystallising the acetate of soda from the liquid after the calcium sulphate has been deposited. It forms transparent, colourless, striated prisms, of a cooling, sharp, bitterish taste; soluble in 3 parts of water, and 24 of alcohol. It is a diuretic and purgative, like acetate of potash, and is used

m similar cases. Dose, as a diurctic, 20 to 120 grains; as a purgative, 120 to 240 grains.

A. of zinc. ZnC<sub>2</sub>H<sub>3</sub>O<sub>2</sub>. Two ounces of carbonate of zinc is added to three fluid ounces of carbonate of zinc is added to three fluid ounces. of acetic acid dilnted with six ounces of distilled water, boiled, filtered while hot, and set aside to crystallise (B.P.). Eight ounces and a half of acctic acid are mixed with five ounces of water and two ounces of commercial oxide of zinc is digested in it for half an hour and treated as above (U.S.P.) Thin, translucent, colourless, efflorescent, hexagonal plates or white micaecous crystals, of astringent, metallic taste; soluble in water. Used as an astringent collyrium, and as an injection in gonorrhea; also in chorea and convulsive diseases. Dose, I to 5 grains; locally,

1 to 2 grains in an ounce of water. Aceta'ted. Combined or impregnated with

acetic acid or vinegar.

**Ac'etates.** (F. acetates; I. acetati; S. acetato; G. essignaures.) The salts of acetic acid are represented by the formula  $M(C_2\Pi_3O_2)$ ,  $M''(C_2\Pi_3O_2)$ , and  $M'''(C_2\Pi_3O_2)$ , according to the equivalent value of the contained metal. Normal acetates of the alkali-metals can form on the one hand, diacetates by taking up a molecule of acetic acid; and on the other, basic acetates by taking up a molecule of metallic oxide of hydrate. They are nearly all soluble in water; and are decomposed at a high temperature and by strong acids. In consequence of their solubility they are often satisfactory therapeutic agents. When treated with strong sulphuric acid they give up acetic acid, which may be recognised by its smell; beated with lime they yield acctone; distilled with potassic hydrate they give of methane; cold solutions give with mercurous nitrate, a precipitate of mercurous oxide, and with persalts of iron they form a reddisb-brown liquid.

Accte'ne. A synonym of ethylene and of olefiant gas.

Ace'tica. Medicated vinegars.

Ace'tic Acid. (F. acide acétique, esprit de Venus, vinuigre radical, vinaigre de bois; G. Essigsüure, Holzessig; Dutch, Azynzuur, hontu-zynzuur; 1. acido acetico, acido acetico del zynzuur; 1. acido acetico, acido acetico del ligno; Turkish, Sirké rouhou; Arabic, Roh le Kal.) C<sub>2</sub>II<sub>4</sub>O<sub>2</sub>. Purified pyroligneous acid. It is formed during the fermentation of many organic substances, and in the dry distillation of wood, sugar, starch, tartaric acid, and other matters. It is produced by the slow oxidation of alcohol, whether resulting from oxidising agents or from fermentation. It is manufactured in Ger-many by mixing diluted alcohol with yeast or other decomposable nitrogenous matter, and allowing it to flow over wood shavings steeped in vinegar and placed in a vessel through which a current of air is passing. It is generally procured from the destructive distillation of wood, the produet, after purification, containing 28 per cent. of anhydrous acid or 33.3 per cent. of glacial acid. Formerly obtained by heating the acetate of copper and receiving the product in a retort, but the distillate contains acctone. Also obtained by distilling acctate of soda with sulphuric acid; the product crystallizes in lamina. The crystalline acid melts at 120° C. (248° F). Diluted alcohol dropped upon platinum black is changed by the action of the oxygen in the pores of the platinum into acetic acid. A colourless acid liquid, of a penetrating but pleasant odour. Its vapour is inflammable and burns with a blue flame. It dissolves resins, albumen, and fibrin. It is found in small quantities in vegetable and animal fluids. The British Pharmacopæia orders three strengths. See Acidum aceticum, Pyroligneous acid and Vinegar.

Strong acetic acid is an escharotic and a vesicant when applied locally. It is used as an application to warts, in herpes circinatus, tinea tonsurans, to destroy the surface and the epiphyte when present; in epithelioma it has been injected into the diseased structure, or applied to its surface. It is also sometimes applied to sloughing ulcers of the throat, or diluted as a gargle. When mixed with water it forms a cooling lotion in heat of head and local inflammations, and has been used as an enema in ascarides. Internally it is a refrigerant, and has been recommended in

scarlet fever, but it is not much used.

A. acid, poi'soning by. Usually the symptoms are whitening of mucous membrane of mouth, with great pain, sometimes cedema or inflammation of larynx, salivation, comiting, and convulsions. The mucous membrane of the stomach has been found blackened, but not corroded. The remedies recommended are alkalies and milk.

A. acid, tests for. Acetic acid is to be recognised by its smell; by the fragrant smell of acetic ether when beated with sulphuric acid and alcohol; by the white precipitate on the addition of nitrate of silver, which is soluble in hot water, dilute nitric acid, and ammonia; and by the production of a deep red colour on the addition of perchloride of iron to a neutralised solution.

A. al'dehyde. A synonym of Aldchyde. A. anhy'dride. Anhydrous acetic acid.

A. e'ther. See Ether.

A. ox'ide. A synonym of anhydrous acctic

Ace'tifica'tion. (Acetum, vinegar; facio, to make.) See Acetous fermentation.

Acetins. Propenyl or glyceryl acetates. Ethers derived from propenyl alcohol (glycerine) by substitution of 1, 2, or 3 equiv. of acetyl for hydrogen. They are oily liquids, produced by heating glycerin and acetic acid together in various proportions in sealed tubes.

Aceti'te. A term formerly applied to the

salts of a supposed acetous acid.

Ace'tobutyr'ic acid. A synonym of propionie acid.

Acetola'ta. (G. Essigaufgüsse.) Term ap-

plied to acctous infusions of roots, berbs.

Acc'tolated. (F. acctole; G. Essigauf-losung.) Term applied to remedies composed of distilled vinegar, in which various substances are dissolved.

Ace'tolates. (F. ace'tolats.) In French pharmacy, medicated vinegars obtained by dis-

tillation.

Ace'tolature. (G. Essigauszug.) A liquid in which various remedial agents are dissolved by the aid of vinegar. By evaporation particular kinds of extracts are obtained.

Aceto'lea. (G. Essigauflösungen.) Solutions of vinegar and oil.

Acetol'ica. (G. Essigverbindungen.) Compounds of vinegar.

Acetoliti'va. (G. Essiglösungen.) Pre-parations of vinegar by solution, maceration, or distillation.

Acetomel'lia. (Acetum; mel, honey. G. Essighonige.) Preparations of drags in vinegar and honey, otherwise called Oxymellita.

Acetom'eter. (Acetum, viaegar ; μέτρον, a measure.) A hydrometer, graduated for deter-mining the strength of commercial acetic acid

according to its density.

Acetom'etry. (Same etymon.) A mode of determining the amount of acetic acid in vinegar. This may be done by observing the saturating power of the acid for potassium or sodium or calcium bicarbonate; by noting, by means of the acetometer, the sp. gr. of the liquid when saturated with hydrate of lime; or by means of tables which have been drawn up, showing the average percentage of acetic acid according

to the specific gravity.

Acetonæ'mia. (Acctone, ăiµa, blood.) A diseased condition in which acctone is found in the organism. It may result from improper diet and the abuse of alcohol; from obstinate constipation, leading to peculiar forms of decomposition in the retained fæcal matters; from chauges occurring in certain febrile diseases as variola, scarlet fever, and typhoid fever; from diabetes and organic diseases of the stomach, such as cancer; from inanition. Post-mortem examinations have revealed no constant changes of importance, but the blood, muscles, and viscera exhale a strong odour of acetone, and the presence of this peculiar fluid has been demonstrated in the blood after death. Its source and mode of formation during life are unknown, some attributing it to the abnormal gastric digestion of starch, the acetone formed being absorbed, while others think that it is generated in the blood. The disease appears typically in the course of chronic diabetes, the characteristic symptoms being respiratory, circulatory, and nervous disturbances. Dyspnæa of a remarkably sudden and intense character supervenes, with increased frequency of respiration, severe pain at the hypochondrium and cough, without corresponding auscultatory signs. The pulse is retarded, the temperature below the normal standard. The cutaneous sensibility becomes so for diminished the grown sensibility becomes so far diminished that even vesicants act but feebly and slowly. There is aphonia, almost complete suspension of all the secretions, and a strong and penetrating odour is emitted by the skin and lungs. In the later stages, owing to paralysis of the vasomotor system, the pulse and tempera-ture rise. Ultimately the patient falls into a state of coma. The disease may last either several days or only a few hours. The treatment consists in preventing organic fermentation by making the secretions more active and by removing the causes of the disease. Acetone can be denonstrated in the blood, and recovered from the urine by distillation.

Aceton'amines. Three bases resulting from the action of ammonia and heat on acctone. They are—Diacetonamine=C<sub>6</sub>H<sub>13</sub>NO. Triacetonamine = C9H17NO. Dehydrotriacetonamine =

C<sub>9</sub>II<sub>15</sub>N.

Aceto'ne. (Acco, to become sour. F. esprit or ether pyroacetique or pyroligneux; G. Essiggeist.) C<sub>3</sub>H<sub>6</sub>O = CH<sub>3</sub>CO.CH<sub>3</sub>. Dimetyhl ketone, methyl acetyl. Acetone is best prepared by the dry distillation of acetates; it is also obtained by passing the vapour of acetic acid through a redhot tube. It is a colourless, limpid liquid of peculiar odour; density, 0.792; and boils at 55.50° C. (131.7° F.) the density of its vapour, referred to air, is 2.022. It is very inflammable, and burns with a bright flame; it is miscible in all proportions with water, alcohol, and ether. dissolves camphor, caoutchouc, and fats. It is developed in the body by the fermentation of organic matters, and especially of grape sugar. It is given off in the breath of drunkards, and is said to be formed in the stomach in certain cases of gastric catarrh when there is an abundant secretion of mucus. It has been given in gout and rheumatism, and has been used as an authelmintic. Dose, 15-30 drops, three or four times a day. See Acetonamia.

Aceto'nes. A synonym of Ketones. Acetonuria. (Actione; ούρου, unine.)
The presence of acetone in the urine.

Accto'sa. (Aceo, to be sour.) Specific name for the Rumex acetosa, common sorrel.

A. alpi'na. The Rumex alpinus. A. nos'tras. The Rumex acetosa.

A. praten'sis. The Rumex acetosa.

A. roma'na. The Rumex scutatus, or Roman sorrel.

A. rotundifo'lia. Same as A. Romana.

A. scuta'ta. The Rumex scutatus.
A. vulga'ris. The Rumex acetosa.

Acetosel'la. Wood-sorrel. See Oxalis acetosella.

Ace'tous. Of or belonging to vinegar. The acetous and acetic acids, formerly supposed distinct, are now known to be the same in all respects.

A. ferment. See Saccharomyces myco-

derma. A. fermenta'tion. The conversion of the alcohol in beer or wine into acetic acid. The change that takes place consists in the oxidation, or in the substitution of oxygen for the hydrogen of the hydroxyl group, of the alcohol contained in dilute alcoholic liquids, and this is associated with the development of a microscopic fungus, the Sac-charomyces mycoderma or Mycoderma aceti, ordinarily known as mother of vinegar, or vinegar mould, which forms a coating on the surface of the liquid undergoing acctous fermentation. very small quantity of this fungus placed on the surface of a dilute alcoholic liquid will in a short time convert the alcohol into acetic acid, especially it albuminous substances and alkaline phosphates he present. The conversion of the alcohol into acetic acid always takes place at the surface of the liquid, and continues only as long as the fungoid growth floats upon the liquid; when it sinks below the surface, out of contact with the air, the action ceases. It is doubted by some whether the action is physical or physiological, but the balance of opinion is in favour of the latter theory. The amount of alcohol present must not exceed 11 per cent., and the action goes on slowly when there is less than 2 or 3 per cent. The temperature must be kept above 20° C. (68° F.), but it should not exceed 40° C. (104° F.).

Ace'tum. (Acco, to become sour. F. vinaigre; I. accto; S. vinagre; G. Essig.) Vinegar. An acid liquid of a brown colour, pleasant acid taste, and peculiar odour, prepared from malt and unmalted grain by acctous fermentation; containing 4.6 per cent. of anhydrous acetic acid. Sp. gr. 1-017 to 1-019. Ten minims of solution of chloride of barium (1 in 8) will precipitate all the sulphuric acid allowed by law to be added to one ounce of vinegar. It is used as a discutient in spraius and bruises; when diluted, to sponge the surface in the sweating of hectic, and with astringent infusions as a gargle. It is a refrigerant and diuretic, in fevers; it has been used as an enema, and as an injection into the bladder to break up blood clots. It is a popular but useless disinfectant. It is a ready and safe antidote in cases of poisoning by the alkalies. It is used in making emplastrum cerati saponis.

The term acctum was applied by the Romans to all honey which flows of itself like must or oil. (W.)

A. antisep'ticum. The Acetum aromaticum.

A. aromat'icum. (F. vinaigre antiseptique.) This vmegar, formerly known as the vinegar of four thieves, contains :- Artemisia vulgaris 40, Artemisia pontica 40, rosemary 40, sage 40, mint 40, rue 40, lavender 40, sweet flag 5, canella 5, wallflower 5, nutmegs 5, garlie 5, campbor 10, ery stallised acetic acid 40, white or French vinegar 2500 parts. Macerate the substances for ten days in the vinegar, strain with pressure; add the camphor dissolved in the acetic acid; filter. Used as a disinfectant in infectious diseases, and as an external stimulant. (Fr. Codex.)

A. aromaticum. Ph. A. (A. antisepti-

cum; G. Aromatischer Essig). Leaves of peppermint, resemary, sage, of each 25 parts; roots of angelica and zedoar, of each 5 parts; oil of cloves, 5 parts; and vinegar, 1000 parts. Macerate for

three days.

A. aromat'icum. Ph. G. (G. Gewirzessig, aromatischer Essig.) Oils of rosemary, juniper, and lemon, 1 part; oil of thyme, 2; oil of cloves, 5; digested with aromatic tineture, 50 parts; tineture of cinnamon, 100; diluted acetic acid, 200; water, 1000 parts; and filter. Used as a perfume in sick chambers and as an embrocation.

A. Britan'nicum. A term applied by the French to the English aromatic vinegar. contains:-Crystallised acetic acid 600, camphor 60, volatile oil of lavender 0.5, volatile oil of wallflower 2, volatile oil of canella 1 part.

A. canthar'ides. B.P. Cantharides, pow-

dered, 2 oz.; glacial acetic acid 2 fl. oz.; neetic acid 18 fl. oz. Digest the cantharides in the acid mixed with 13 fl. oz. of the acetic acid, for two hours at 200° F.; when cold, percolate, press, and add acetic acid to make 20 fl. oz. A strong rubefacient when mixed with soap liniment; a vesicant when painted on the skin.

A. cardi'acum. The Acetum aromaticum.
A. cerevis'iæ. Vinegar.

A. col'chici. Ph. G. (G. Zeitlosenessig.) Colchicum seeds 1, alcohol 1, vinegar 9 parts. Digest for eight days. Dose, 1-4 grm.

A. commu'ne. Vinegar.

A. concentra'tum. Ph. G. A synonym of the Acidum aceticum delutum.

A. cru'dum. Ph. G. A synonym of Acetum. A. destilla tum. The Acetum purum of the P.G. Distilled vinegar. A limpid, colourless liquid, wholly volatilised by heat.

A. digita'lis. Ph. G. (G. Fingerhutessig.) Digitalis 1, nleohol 1, vinegar 9 parts; macerated for eight days. Dose, 10-30 drops on sugar once

or twice daily.

A.gal'licum. Vinegar made from wine. It is about one sixth stronger than pure malt vinegar, and is of two kinds, white wine and red wine

A.glacia'le. See Acidum aceticum glaciale. A. ligno'rum. A synonym of Acetic acid when obtained from the destructive distillation of wood.

A. lobe liæ. U.S.P. Lobelia, 4 troy oz., is moistened in dilute acetic acid 2 fl. oz., packed in a percolator, and sufficient dilute acetic acid passed through to make up two pints. Dose, as an expectorant, 30 to 60 mininis; in asthma, 60 to 120 minims; as an emetic, half a fluid ounce.

A. mul'sum dui ce. A synonym of Oxy-

A. o'pii. An imitation of Black drop. Opium 5 oz., nutmeg 1 oz., saffron 150 grains, macerated in dilute acctic acid 1 pint for 24 hours, percolated, and dilute acetic acid added until the ultered product measures 26 fl. oz.; sugar, 8 oz., is dissolved in it and sufficient dilute acid added to make 2 pints. Six and a half minims is equal to a grain of opium. Dose, 7-10 minims.

A. philosoph'icum. An alchemical preparation, used as a solvent of metals; its com-

position is unknown.

A. plum hicum. A synonym of the Liquor plumbi subacctatis.

A. prophylac'ticum. The Vinaigre dea quatre volcurs, or vinegar of the four thieves, who, during the plague, plundered the sick, but escaped the disease themselves. This was attri-buted to a medicated vinegar, for which the Acetum aromaticum is a substitute; also called Marseilles vinegar and Thieves' vinegar.

A. pu'rum. The officinal name in the Ph.G.

of distilled vinegar.

A. pyroligno'sum cru'dum. Ph. G. (G. roher Holzessig.) Impure acetic acid obtained from destructive distillation of wood. It is of brownish colour and empyreumatic odour. See Pyroligneous acrd.

A. pyroligno'sum rectifica'tum. Ph.G. (G. rectificirter Holzessig.) Crude pyroligneous acid distilled in a glass retort till eight tenths have passed over. A clear, colourless or yellowish liquid, of empyreumatic smell and taste. Used only externally.

A. quatuor fu'rum. The Acetum aroma-

A. quat'uor latro'num. The Acetum aromaticum

A. radica'le. (G concentrirte Essigsäure.) A synonym of the Acidum aceticum concentratum of the Austrian Pharm.; 100 parts contain 96 parts of hydrated acetic acid.

A. rosa'tum. (F. vinaigre rosat.) This vinegar is made of red roses 100, white vinegar 1200 parts; macerate for ten days; express and filter. An astringent, applied as an injection and as a cosmetic.

A. ru'bi idæ'i. P.G. (G. Himbeeressig.) Raspberry vinegar. Syrupus rubi idæi 1, vinegar

2 parts. A colouring and flavouring agent.

A. sanguina riæ. U.S.P. Blood-root, 4 oz., moistened with dilute acetic acid, packed in a percolator, and sufficient acid passed through to make two pints. Dose, as an alterative and expectorant, 15-30 minims; as an emetic, 3-4

A. saturni'num. A synonym of the Liquor plumbi subacetatis. B.P. Also a synonym of the Liquor plumbi subacetici. P.G.

A. scil'læ. B.P. Squills, 2½ ounces; diluted acetic acid, 1 pint; macerate for seven days, and add proof spirit, 12 ounce. Dose, 15-40

A. scillæ. A. P. (G. Meerzwiebelessig.) Squills, 5 parts to 50 by weight of Acetum crudum.

A. scillæ. P.G. Squills, I part; spirit, I part; vinegar, 9 parts. Dose, 1—6 grm.
A. scillit'icum. P.G. A synonym of the Acetum scillæ.

A. theriaca'le. A synonym of the A. aromaticum.

A. vi'ni. Vinegar made from wine. Acetum gallieum.

**Ace tylene.**  $C_2H_2$ . One of the constituents of coal-gas. It may be obtained by synthesis from its elements; by passing the vapour of chloroform over ignited copper; by the incomplete combostion of bodies containing carbon and hydrogen; and in other ways. It is a colourless gas, sp. gr. 0.92, with peculiar and uopleasant odour. It burns with a bright and smoky flame. Mixed with chlorine it detonates almost instantly with separation of earbon.

Ace'tylene-hæmoglo'bin. A combination of hamoglobin with acetylene, of bluish-

red colour, but little known

Acey'te de Sal. A remedy for bronchocele, used in South America; it contains iodine. Achaca'na. Nat. Ord. Cuetacea. A

Peruvian plant, possessing a fleshy edible root. (Dunglison.)

Achæ'menis. ('Axaquevis.) A leafless plant to which the ancients ascribed magical properties. It was called llippophobus, being supposed to be a terror to mares (Pliny). Fee regards it as a variety of Euphorbia antiquorum, or else as a Solanaceous plant. (Waring.)

Achæ'na. Same as Achænium.

Achæ'nium. ('A, neg.; xaiwo, to split or crack. F. achaine, akène; G. Schliessfrucht; Schalenfrucht.) A dry one-celled, one-seeded indehiscent fruit, the pericarp of which is closely applied to the seed, but separable from it. It may be solitary, forming a single fruit as in the dock and in the cashew, where it is supported on a fleshy peduncle; or aggregate, as in Ranunculus, where several achania are placed on a common elevated receptacle. In the strawberry the achania are aggregated on a convex succulent receptacle. The Cynar-

rhodum (Rose), Cypsela (Compositæ), Utricle (Amarantaceæ), Samara (Ash), Caryopsis (Graminacear), Carcerule (Mallow), and Cremocarp (Umbelliferæ), are fruits composed of one or more achsenia

Achahi. Arabic for alum-water. (J.)

Achainum. See Achanium.

Achalybhæ'mia. ('Λ, neg.; χάλυψ, steel; aiµa, blood.) A synonym of Anamia.

Achamel'la. See Acmella.

Achana'ca. An African plant used in the

kingdom of Mely, as antisyphilitic and sudorific. Acha'ovan. An Egyptian plant producing flowers like the chamomile, used in decoction as deobstruent.

A. ab'lat. An Fgyptian plant, highly esteemed as emollient and resolvent; supposed to be the Cineraria maritima.

Achar. Same as Atchor.
Acharis'tum. ('A, priv.; χάρις, tbanks.)
A confection against catarrh and difficult respiration, because given gratuitously.

**Achas'cophyte.** ('Λ, neg.; χάσκω, to gape; φυτόν, a plant; **F**. achascophyte.) Λ plant having its fruit indehiscent. (Necker.)

Acha'tes. ('Αχάτης.) The agate stone, found by the Achates, a river of Sicily; it contains 98 per cent, of silica, and presents a great variety of colours and images, chiefly due to oxide of iron; formerly supposed to possess many virtues, as of resisting the poison of serpents, allaying thirst, improving the sight, making eloquent.

Ache. ("Axos, affliction L. dolor; F. mal; G. Uebel.) Any continued throbbing pain.

Also the old name of parsley. **Achei'lary** ('A neg., χείλος, a lip.)

Applied to the flower of an *Orchis* when the labellum is absent.

Acheilia. (Same etymon.) A malformation in which one or both lips are absent.

Achei'lous. (Same etym.) Having no lip.
Achei'ria. (A, nez.; xeip. the band. F.
acherie; G. Handlosigkeit.) An organic deviation, characterised by the want of hands.

Achei'rous. (Same stymon ) Handless. Ache'lia. A synonym of Acheilia. Ache'na. Same as Achenium.

Ache'nium. Properly Achenium. Acheno'dium. (F. achénode ; G. Schalenfruchtkrunz.) A fruit composed of many achænia disposed on the same level.

(From 'Axégony, the river Achero'is. Acheron ; so-called because from its pale colour it was supposed to have been brought from the shades by Hercules.) The white poplar.

Achet'idæ. ('Hxéτηs, the clear-sounding. F. achétides.) A family of Orthoptera having the

Acheta or cricket for their type.

Achiar. Same as Atchar.

Achic'olum. The sudatorium, or sweating-bath of the ancients. (Cel. Aurelianus.)

Achido-peirastica. Same as Acidopeirastica.

Achie-patchie-elley, or Pachie-elley, atchouly. The Tamul name of certain dry fragrant sub-astringent leaves; esteemed as stomachic and sedative. Origin unknown. **Achille'a.** ('Αχίλλεια'; from Achilles, said

to have discovered this plant, or used it for curing Telephus. F. achillee; G. Achillenkraut.) Milfoil. A Gen. of the Sub-ord. Tubuliflore, Nat. Ord. Composite. Pappes 0; florets of the ray short, \$\varphi\$: of the disk \$\varphi\$, with a flattened winged tube; bracts forming an ovate or oblong imbricated discovery is of great importance in those who have to attend to coloured signals. Probably from 2 to 5 per cent. of the total population are colour blind to a marked extent. See Dyschromatopsia.

Achromatop'sy. Same as Achroma-

topsia

Achro'matous. Same as Achromatistous. **Achro'mia.** (A, neg.; χρώμα, colour. F. achromie, achromatic.) Absence of colour. A synonym which has been used sometimes for Lepra alphoides, and sometimes for leucoderma.

Achro'mous. Same as Achromatistous. **Achronizo'ic.** (Λ, neg.; χρονίζω, to last.) Term applied to medicines which undergo no change when kept.

**Achro'nychous.** ("Λκρος, highest; ονυξ, the nail. F. acronyque.) Having nails, elaws, hoofs.

Achroodex'trine. ('Αχροος, eolourless ; and dextrine.) Colourless dextrine.

Achroomy'ces. ('Αχροος, colourless; δέης, a mushroom.) Α Genus of Hyphomyμὖκης, a mushroom.) A Genus of cetous Fungi. Fam. Tubercular ineæ.

Achro'os. ("Axooos, colourless.) A term entering into the formation of various words derived from the Greek, and signifying colourless or uncoloured.

Achro'ous. Same as Achromatistous. Achy. (Arab.) An Arabiau species of Cassia; also called Daphnitis.

Achyla. A different spelling of Achlya. Achylia. (A, priv.; xuxos, juice. I achylie; G. Saftmangel.) Defect of chyle.

Achylo'sis. (Same etymon. F. Achylose.) Deficient chylification.

Achylous. (Same etymon. F. Achyle; G. saftlos; ohne Chylus.) Without chyle.

Achymo'sis. (A priv.; χυμός, juice. F. achymose.) Deficient chymification.

Achy'mous. (Same etymon. F. achyme; G. ohne Chymus.) Without chyme or juice.

Achyranth'eæ. In Riebards' System a Tribe of Amarantaceæ, having a uniovular evary and bilocular anthers.

Achyran'thes. ( Άχυρου, chaff; ἄνθος, a flower.) A genus of the Nat. Ord Αμαγαμίας ως. Α. as'pera. (Hind. Chirchira; Duk. Αὐαμία; Tam. Na-yurioi; Tel. Uttu-rin'; Mal. Katalati; Beng. Spang.) An Indian shrub. The seeds are given in hydrophobia, enake-bites, ophthalmia, and various eutaneous diseases. The leaves reduced to a pulp are applied to relieve the pain of the bite of the scorpion. It is regarded as astringent and diuretic.

A. frutico'sa. Hab. India Used in dropsy. A.globulifera. Hab. Madagasear. Used

in syphilis.

A.re'pens. Indigenous in America; a decoetion of the plant is used as a diuretic in dropsy and ischuria. (Dunglison.)

A. vir'idis. The bruised leaves are used as an emollient.

**Achyro'des.** ("Αχυρον, bran; έιδος, likeness.) Applied to a sealy cruption.

**Achyr'ophyte.** ('Αχυρον, chaff, φυτόν, a plant. F. achyrophyte.) Name by Neeker for a plant the flower of which is composed of glumes or chaffy seeds.

**Ach'yrum.** ('Λχυρου.) Palex, or chaff. **Achselmann'stein.** Bayaria; altitude 1407'. Saline, aperient, and slightly chalybeate waters. Climate mild and agrecable. Season, May to September. Baths and vapour baths, recommended for incipient tuberculosis, cutaneous diseases, and derangements of the uterine system. See Edelquette.

A'c1a. (.1cus, a needle.) A word variously supposed to denote the thread of, or the needle with which, a suture is made to join the lips of a wound; also applied to indicate the kind of suture.

Acic'olus. (Acus, a needle; colo, to inhabit. F. acicola.) Applied to a fungus (Desmazierella acicola) that grows on the decayed leaves of the wild pine.

Acic'ular. (Same etymon. F. aciculaire; G. Nadelaholich; Nadelformig.) Needle-like; shaped like a needle or spike; spicular.

Acic ulate. (Same etymon.) shaped.

Acicu'le. (L. acioula; dim. acus. F. acicule.)
A little needle; a little spike; a spikelet.

Aciculidæ. (Same etymon.) A Family of the Division Operculata, Section Pulmonifera, Class Gasteropodu. Shell elongated, cytindrical; operculum thin, subspiral. (Woodward.)

Acicu'liform. (Acicula; forma, likeness. F. aciculiforme; G. Nadelformiy.) Formed

like a needle.

Acicys. (Λ, priv.; κίκυς, strength.) Gr. anal. ἄκικυς, applied by Hippocrates to those who were infirm, or had not strength to move.

Ac'id. (Acco, to he sour.) Sour; sharp to the taste; applied to substances characterised, generally, by a quality of sourcess. Many hodies, however, without this, agree in the other dis-tinctive properties of acids, as turning the vegetable dyes to red, combining with alkalies, metallie oxides.

A .- albu'min. A white, floeculent deposit, obtained on the addition of dilute hydrochloric or acetic acid to serum- or egg-albumin, heating to 70° C. (158° F.), and neutralising when cool. It is insoluble in water and in solution of sodium chloride, soluble in acids, alkalics, andalkaline carbonates. Its solution has a strong left-sided polarisation. This artificial production cannot be distinguished from the natural acid-albumin of muscle called Syntonin.

A. ox'ides. One of the three varieties of oxides, or combinations of oxygen with other They possess the property of uniting hodies. with basic oxides; and are represented by oxides of sulphur and phosphorus; when united with

water they form acids.

A .- radicles. A term applied to oxy-

genated hydrocarbon radicles.

Acidifiable. (Acidus; fio, to become. L. acidifiabilis; F. acidifiable; G. Säuerungsfühig.) Capable of becoming or of being converted into an acid.

Acidifiant. (Acidus, acid; facio, to That which is capable of preducing The term was originally applied to make.) acidity. oxygen because all acids known at that time contained oxygen, and because it was observed that all combustible bodies in undergoing oxydation terminated in becoming acid. The term was terminated in becoming acid. The term was subsequently applied to hydrogen and to tellurium, but it has fallen into disuse in consequence of its being perecived that when two bodies unite to form an acid both play an equal part in the process.

Acidifica'tion. (Acidus; facio, to make. F. acidification.) The act or process of forming or impregnating with an acid.

Acid'ifying. (Acidus; fio, to become. F. acidifiant; G. Sauermachend.) Making acid; changing or converting into acid.

A. prin'ciple. A term for that which, combining with an acidifiable substance, forms an acid.

**Acidim'etry.** (.1cidus; μετρέω, to measure. L. acidimetria. F. acidimetria.) The process for determining the amount of free acid in any liquid. This may be accomplished by exactly neutralizing the acid by an alkali, noting the amount of the latter used and calculating the quantity of acid according to its saturating power; or an alkaline carbonate in solution may be used and the quantity of acid calculated on the basis of the amount of carbonic acid which it has displaced; or a rough estimate may be made by noting the specific gravity of the liquid and comparing it with tables which have been compiled to show the amount of acid at different weights.

Acid'ity. (L. aciditas. F. aci'dité. G. Saure.) The impression given to the organs of taste by sour substances; sourness.

Acidita'tio. Excess of acid in the diges-

Acido-basig'enous See Amphigenous. Acidol'ogy. ('Anis, a point; hoyos, a description.) An account of surgical instruments.

**Acidom'eter.** (Acidus; μέτρον, a measure.) A bydrometer for determining the density of acids. Also a tubular measure, holding usually 1000 grains of water at 60° F., and graduated into 100 divisions; employed to measure the alkaline standard solution used in Acidimetry.

Acido-peirastica. ('Asis, a point;  $\pi \epsilon \iota o \alpha \zeta w$ , to explore.) A method of diagnosing and treating disease by the introduction of needles

or fine trocars.

Acidos'teophyte. ('Akls, a point; οστέου, a bone; φυτόυ, a plant. F. acidostéo-phyton; G. Akidosteophyt.) Pointed fungous Pointed fungous exostosis of Sir Astley Cooper. **Acido tous.** ('Λκίδωτὸς, pointed; F. aci-

dote.) Terminating in a point.

Acids. (Acidus, sour. F. acide; I. and S. acido; G. Saure; D. Zure; Russ. Kilosta; Turk. Eksi.) Bodies in which hydrogen is united to a simple or compound organic or inorganic electronegative radical, either containing or not containing oxygen. Those acids which do not contain oxygen are very few in number, and are called hydrogen acids, the others are oxygen acids. hydrogen is the essential element of an acid, but the chemical energy depends less on it than on the elective attraction of the radical of the acid for a base. This substitution of the hydrogen for a base produces a salt. Acids have a sour taste, and the power of reddening certain blue vegetable colours. They are soluble in water, and contain the elements of an acid oxide and water. Therapeutically, acids are used in the diluted state as refrigerants, anhydrotics, and astringents; and concentrated, form escharotics and corrosives.

In Pathology this term has been used to indicate certain supposed irritants which were generated in the fluids of the body and produced disease.

A. acrylic. A series of monatomic acids represented by the formula Culfin-202.

A. adip'ic. A synonym of fatty acids. A. aldehyd'ic. Acids containing the group CHO, as well as CO. OII, in place of hydrogen, and exhibiting an aldehydic as well as an acid character. Synonymous with ketonic acids.

A. aromatic. Acids which bear the same relations to the hydrocarbons homologous with benzine that the fatty acids bear to the paraffins. They are produced by oxidation of the corresponding alcohols and aldehydes; by the action of water on the corresponding acid chlorides; by the action of acids or alkalies at boiling point on the aromatic nitrils; by the action of sodium and carbon dioxide on the monobrominated derivatives of benzine and its homologues; by oxidation of the hydrocarbons homologous with benzine by dilute nitric acid; and by fusing the sulpho-acids of the aromatic hydrocarbons with potssainm formate. They occur free or combined in many resins and balsams, and in the animal body.

A. arsenic. Unsymmetrical ethers formed from arsenious acid.

A. basic'ity of. The capacity of an acid for a base, depending on the number of its atoms of hydrogen replaceable by one of a metal, and thus constituting monobasic, bibasic, tribasic, and other forms.

A. carbon. A synonym of organic acids. A. diatomic. Acids formed from alcohols containing two hydroxyl groups; they are monobasic or bibasic, according as one or both of the

hydroxyls belong to a carboxyl group COOH.

A. fat'ty. Formula CnH2aO2. So called because some are solid tats and the rest of an oily consistence. They are found free or combined in the structures of plants or animals. They are formed by oxidation of the primary alcohols of the methyl series; by the oxidation of aldehydes; by the action of earbon dioxide on the sodium compound of an alcohol radicle of the methyl series; by heating the ethylate of an alkalimetal in alcoholic solution with carbon monoxide under pressure; by the action of alkalies or acids on the cyanides of the alcohol radicles; by the action of water on the corresponding acid chlorides; by the action of phosgene on the zinc compounds of the alcohol radicles; by dissolving sodium in ethylic acetate, adding the iodide of an alcohol radicle, heating the mixture to 100° C. (212° F.), and distilling. Acetic, butyric, and stearic acids are examples of the group.

A. hexatom'ic. Acids formed from alcohols having six hydroxyl atoms, of which each H2 may be replaced by an atom of oxygen.

A. hy'drogen. Acids which contain no oxygen, only hydrogen and a radical.

A. inorgan'ic. A synonym of mineral

acids. A. keton'ic. Acids which contain the groups CO<sub>2</sub>H and also the group CO, and which consequently possess the characters of ketones as well as acids. Synonymous with aldehydic acids.

A.min'eral. Acids derived from inorganic or mineral substances; as sulphuric and nitric

A. monatom'ic. Acids formed from alcohols having one bydroxyl atom, in which the H2

is replaced by an atom of oxygen.

A. organic. Acids derived from the class of substances called organic, as acetic and citric acids. Also called carbon acids. They are derived from hydrocarbons, saturated or unsaturated, by the substitution of one or more of the univalent groups CO<sub>2</sub>H, carboxyl, for an equal number of hydrogen atoms.

A. ox'ygen. Acids which contain oxygen

as well as hydrogen and a radical.

A. pentatom'ic. Acids formed from alcohols, having five hydroxyl atoms, of which each II2 is replaced by O.

A. polythionic. (Πολύς, many; θεῖον, sulphur.) A series of acids, in which the same quantities of oxygen and hydrogen are united

with sulphur in the proportions of 2, 3, 4, and 5.

A. saturated. Acids in which the whole of the hydroxyl atoms of the corresponding alcohols have had their 112 replaced by an atom of oxygen.

A.tetratom'ic. Acids formed from alcohols having four hydroxyl atoms, of which each Il2 may be replaced by an atom of oxygen.

A. triatom'ic. Acids formed from alcohols having three hydroxyl atoms, of which each II<sub>2</sub> may be replaced by an atom of oxygen.

A. unsat'urated. Acids in which only some of the hydroxyl atoms of the corresponding alcohols have had their H2 replaced by an atom of oxygen.

Acid'ulated. (I. acidulus, dim. acidus. F. acidulé; G. sauerig.) Tinctured, or blended

with some acid substance.

Acid'ulous. (Same etymon. F. acidule, G. sauerlich.) Applied to salts in which the acid is slightly in excess; subacid.

Ac'idum. (Acco, to be sour. F. acide G. Saure.) An acid; a noun used for neuter of Acidus, which it ought alone to be considered.

A. ace'ticum aromat'icum. P.G. (Gewürzessigsaure.) Oil of cloves, 9 parts; oils of layender and lemon, of each 6 parts; oils of bergamot and thyme, of each 3 parts; oil of cinnamon, I part, dissolved in 25 parts of acetic acid.

A. ace ticum camphora tum. Ph. Ed. and D. Camphor one oz., rectified spirit one fluid drachm, strong acctic acid ten fluid ounces. Dissolve. An aromatic, pungent perfume, used in fainting and nervous debility.

A. ace'ticum concentratis'simum. A synonym of Acidum aceticum glaciale in the

Aust. and Russ. Ph.

A. ace ticum concentratum. F. Ph. (Acide acétique concentré; esprit or alcool de vinaigre; vinaigre glacial; acetate normal.) Density between 1.075 and 1.083 (10-13° Bé).

Aust. Ph. (G. concentrirte Essigsaure.) Contains 96 per cent. of hydrated acctic acid. One gramme neutralises 16 grammes of the Volumetric

A. ace'ticum dilu'tum. Br. Ph. Sp. gr. 1.006. Contains 3.63 per cent. of anhydrous acid. Three fluid ounces (1320 grain measures) neutralise 939 grain measures of Volumetric solu-

ion of soda. Dose, 3j-3j with water.

Aust. Ph. Sp. gr. 1028. Contains 20.4 per cent. of hydrate of acetic acid. Ten grammes neutralises 34 grammes of the Volumetric solution.

Belg. Ph. Contains 5.5 per cent. of anhydrous acid.

Ger. Ph. Contains 30 per cent, of anhydrous acid.

Russ. Ph. Contains 4 per cent. of anhydrous acid.

U. S. Ph. Diluted acetic acid. Sp. gr. 1:006. An imperial fluid ounce (440 grains by weight) requires for neutralisation 313 grain measures of the Volumetric solution of soda, corresponding to 3.63 per cent. of anhydrous scetic acid.

A. ace ticum e lig'no venale. A synonym of Pyroligneous acid.

A. ace'ticum empyreumat'icum. A synonym of Pyroligneous acid.

A. ace'ticum for'te. Strong acetic acid. A. ace ticum for tius. The strongest acetic acid.

A. ace'ticum glacia'le. B.P. Glacial

acetic scid. C<sub>2</sub>H<sub>4</sub>O<sub>2</sub> Contains 84 per cent. of anhydrous acid. Sp. gr. 1.065. It is monohydrated. One fluid drachm (60 grains by weight) in one ounce of water is neutralized by 990 grain measures of the Volumetric solution of soda. It is a colourless, pungent liquid, which is converted into a mass of crystals when cooled at 1° C. (33.8° F.), and remains crystallised at 9° C. (48.2° F.) An escharotic, employed for removing corns and warts. It speedily vesicates.

A. ace'ticum scillit'icum. A synonym

Acetum scillæ. A. acetosel'læ. A synonym of Oxalic

acid. A. aceto'sum. A synonym of Vinegar. A. aceto'sum camphora'tum. Asynonym of A. aceticum camphoratum.

A. aceto'sum debil'ius. Dilute acetic

acid, c. distilled vinegar.

A. aceto'sum destilla'tum. Distilled vinegar.

A. aceto'sum for'te. Strong acetic acid. A. aceto'sum ten'ue. Distilled vinegar, or dilute acetic acid.

A. aconit'icum. See Aconitic acid. A. æthe'reum. A synonym of Sulphuric

A. alumino'sum. A synonym of Sulphuric acid. antimon'icum. Antimonic

acid.

See Antimonious A. antimonio sum. acid.

A. arsenico'sum. A synonym of Arsenious acid.

A. arsen'icum. See Arsenic acid. A. arsenio'sum. See Arsenious acid.

A. azo'ticum. A synonym of Nitric acid. A. benzo'icum. See Benzoic acid.

A. borac'icum. A synonym of Boric acid.

A. bo'ricum. See Boric acid. A. Borus'sicum. Prussie or Hydrocyanic acid.

A. carbolicum. See Carbolic acid. A. carbol'icum impu'rum. U.S. A liquid obtained from coal-tar, by heating it first with an alkali, then with an acid, and then distilling. It has a brownish colour, the smell and taste of the pure acid with a somewhat empyreumatic odour of tar. It consists of carbolic scid with some coal-tar impurities. It is used only for purposes of disinfection.

A. carbon'icum. See Carbonic acid gas.
A. cathol'icon. A synonym of Sulphuric acid.

A. chlor-hy'dricum. A synonym of Hydrochloric acid.

A. chlo'ro-nitro'sum. Ph. G. and R. (G. Königswasser.) Contains 1 part of nitric acid, and 3 parts of concentrated hydrochloric acid. Used as a footbath when diluted with about two hundred times its volume of water.

A. chro'micam. G.P. (G. Chromsäure.) See Chromic acid.

A. ci'tri. A synonym in Austrian Ph. of Citric acid.

A. cit'ricum. See Citric acid.

A. cyanhy dricum. A synonym of Hydrocyanic acid.

A. dephlogistica'tum liq'uidum. Chlo-

A. fluorhy'dricum. A synonym of Hydroftworic acid.

A. fluor'icum. See Finoric acid.

A. formi'eze. A synonym of Formic acid.

A. formic'icum. Λ synonym of Formic

A. for'micum. See Formic acid.

A. gallo-tan'nicum. A synonym of Tannic acid.

A. gal'lleum. See Gallic acid.

A. hydriod icum dilu'tum. Formerly in U. S. Ph. Dilute hydriodic acid. A colourless fluid of acid taste. Sp. gr. 1 112. It contains 10 grains of iodine in each fluid drachm. Dose, 30

A. hydrocarbonicum. A synonym of Oxalic acid.

A. hydrochlora'tum. A syuonym of Acidum hydrochloricum.

A. hydrochlora'tum cru'dum. A synonym of A. hydrochloricum crudum.

A. hydrochloricum. See Hydrochloric

- A. hydrochloricum cru'dum. G. Ph. (G. rohe Salzsaure.) A clear, yellowish, fuming fluid. Sp. gr. 1·160—1·170, containing from 30 -33 per cent. of anhydrous hydrochloric acid. It contains traces of sulphuric and sulphurous acids, alumina and irou, and sometimes of arsenic.
- A. hydrochlor'icum dilu'tum. B. Ph. Dilute hydrochloric acid. Acid 8 parts; distilled water sufficient to make the mixture, when cooled to 60°, measure 264 parts. Contains 10°5 per cent. of acid gas. Sp. gr. 1°052. Dose 10—30 minims. Pharm. Germ. Equal parts of acid and water.

Sp. gr. 1.060.

A. hydrocyana'tum. A synonym of

Hydrocyanic acid. A. hydrocyan'icum. See Hydrocyanic

A. hydrocyan'icum dilu'tum. B. Ph. Take of yellow prussiate of potash 2½ oz., sulphuric acid 1 fl. oz., distilled water 30 fl. oz., or a sufficiency. Dissolve the prussiate of potash in 10 oz. of the water, then add the acid, previously diluted with 4 oz. of water and cooled. Put the solution into a flask to which are attached a condenser and a receiver, and having put 8 oz. of distilled water into the receiver, apply heat to the flask till the liquid in the receiver, kept cool, is increased to 17 fl. oz. Add to this 3 oz. of distilled water or sufficient to bring the acid to the required strength, so that 100 grains (or 110 minims) of it, precipitated with a solution of nitrate of silver, shall yield 10 grs. of dry cyanide of silver. Colourless. Sp. gr. 0.997. Dose, 2-8 minims.

A. hydrocyan'icum dilu'tum. U.S. Ph. The directions given for this preparation are-Take of ferrocyanide of potassium, two troy ounces; sulphuric acid, a troy ounce and a half distilled water, a sufficient quantity. The acid and four ounces of water are mixed, and, wher cool, added to the salt dissolved in ten fluid ounces of distilled water, the whole being placed in a retort. Distillation is now effected into a receiver containing some water, and water is added to the distillate till 12.7 grains of nitrate of silver dissolved in distilled water is accurately saturated by 100 grains of the acid. Or, a more expeditious way-Take of cyanide of silver 50 grains and one balf, muriatic acid 41 grains, distilled water a fluid ounce. Mix the acid with the water and add the cyanide. Agitate, place at rest, and decant. Keep in the dark in a well stoppered vessel. Dose 2-6 drops.

A. hydrosulphu'ricum solu'tum. A synonym of the A. sulphohydricum liquidum. Belg. Ph.

A. hydrothion'icum. A synonym of Hydrogen monosulphide.

A. hydrothion'icum liq'uidum. synonym of Hydrogen monosulphide dissolved in

**A. hyposulpharsenio'sum.**  $\Lambda$  syuonym of Arsenic disulphide.

A. iodhy'dricum. A synonym of Hydriodic acid gas.

A. lod'icum. See Iodic acid.

A. lac'ticum. See Lactic acid.
A. lig'neum. A synonym of Pyroligneous acid.

A. lig'ni pyro-oleo'sum. A synonym of Pyroligneous acid.

A. ligno'rum empyreumat'icum. A synonym of Pyroligueous acid.

A. limona rum. A synonym of Citric acid.

A. limo'nis. A synonym of Citric acid.

A. limo'num. A synonym of Citric acid. A. ma'licum. See Malic acid.

A. mari'num concentra'tum. A synonym of Hydrochloric acid.

A. mecon'icum. See Meconic acid.
A. morbo'sum. Acidity of the stomach.
A. muriat'icum. U. S. Ph. An aqueous solution of hydrochloric acid gas, of the sp. gr. 1.16. See Hydrochloric acid.

A. muriat'icum cru'dum. G. Ph. A synonym of A. hydrochloricum crudum.

A. muriaticum dilu'tum. U.S. Ph. Take of muriatic acid four troy ounces, distilled water a sufficient quantity to make together one pint. The sp. gr. is 1.038. Dose, 20 to 60 drops or minims.

A.muriat'icum nitro'so-oxygena'tum. A synonym of Nitro-hydrochloric acid.

A. muriat'icum oxygena'tum. A synonym of Aqua chlori.

A. muriat'ieum pu'rum. A synonym in Ed., Dub., and U.S. Ph., of Hydrochloric acid.
A. ni'tri. A synonym of Nitric acid.

A. ni'trico hydrochlora tum. A synonym of A. nitro-hydrochloricum.
A. ni'tricum. See Nitric acid.

A. ni'tricum cru'dum. G. Ph. (Scheidewasser.) Colourless or yellowish, leaving no residue on evaporation. Sp. gr. 1 323-1 331, which corresponds to 50-52 per cent. of pure acid (NHOa).

A. ni'tricum dilu'tum. Br. Ph. contains 15 per cent. of anhydrous acid. Sp. gr. 1·101. Dose, 10-30 minims.

Aust. Ph. contains 21 per cent. of anhydrous acid.

Belg. Ph. contains 17.5 per cent. of anhydrous acid.

Germ. Ph. (verdünnte Salpetersäure). Equal parts of nitric acid and water. Clear, colourless. Sp. gr. from 1.086 to 1.089.

Russ. Pharm. has a sp. gr. 1-001. U. S. Ph. Nitric acid (sp. gr. 1-42) three troy ounces, distilled water one pint. Sp. gr. 1.068. Dose, 20 to 40 drops or minims.

A. ni'tri dulcifica'tum. A synonym of Spiritus etheris nitrici.

A. ni tricum fu'mans. G. Ph. (Rauchende Salpetersäure.) A clear brown-red fluid, giving off brownish-red fumes. Sp. 1.520-1.525. See Nitric acid.

A. ni'tricum vena'le. Belg. Ph. The nitric acid of commerce.

A. nitrochlorhy'dricum. The officinal name in the Belg. Ph. of the A. nitrohydrochloricunt.

A. nitro-hydrochlor'icum dilu'tum. B. Ph. Dilute nutro-hydrochloric acid. Nitric acid, 3; hydrochloric acid, 4; water, 25 parts. B. Ph. Mix the acids twenty four hours before adding the water, to develop the chlorine. Colourless. Sp. gr. 1.074. Sixteen minims contain 14 minim of hitrie acid and 2 minims of hydrochloric acid. Dose, 10 to 20 minims.

A. ni'tro-muriat'icum. U. S. Ph. Nitromuriatic acid. A golden-yellow fluid, resulting from the mixture of five parts of muriatic acid and 3 parts of nitrie acid. Sp. gr. 1 068. It has the odour of chlorine, and dissolves gold and platinum. This acid, introduced by Dr. Scott, of Bourbay, as an external remedy in hepatitis, produces, when thus employed, a tingling sensation of the skin, thirst, a peculiar taste in the mouth, occasional soreness of the gums, and ptyalism; and at the same time stimulates the liver. When used as a footbath, or for sponging, three gallons of water may be acidulated with six fluid ounces of the acid. It is also used internally, in doses of 3 or 4 drops, largely diluted, in chronic hepatic and syphilitie affections, and in oxaluria.

A. ni tro-muriat'icum dilu tum. Diluted nitro-muriatic acid. U. S. Ph. An acid of the same streugth as the A. nitro-hydrochloricum. B. P. Dose, 10-20 minims.

A. nitro'so-ni tricum. A synonym of Acidam nitricum famans. G. Ph.

A. nitro'sum. A synonym of Nitric acid. A. opianicum. See Opianic acid.

A. os sium. A synonym of Phosphoric acid.

A. oxal'icum. See Oxalic acid.

A. oxali'num. A synonym of Oxalic acid. A. phanol'icum. A synonym of Carbolic acid.

A. phe'nicum. A synonym of Carbolic acid.

A. phenylicum. G. Ph. A synonym of  $oldsymbol{A}$ cidum carbolicum crystallisatum.

A. phosphor'icum. See Phosphoric acid. A. phosphor'icum dilu'tum. B. Ph. Diluted phosphoric acid. Colourless. Con 10 per cent. of auhydrous acid  $(P_2O_5)$ . Contains gr. 1 080. Dose 10-30 minims. See Phosphoric acid.

Aust. Ph. contains 16 per cent. of strong

acid. Sp. gr. 1.117.

Belg. Ph. coutains 40 per cent of strong acid.
Sp. gr. 1.350.

Freuch Ph. contains 52 per cent. of strong acid. Sp. gr. 1:454.

Germ. Ph. contains 20 per cent. of strong acid.

Russ. Ph. has a sp. gr. of 1 062. U. S. Ph. contains 8 per cent. of strong acid. Sp. gr. 1.056.

A. phosphoricum glacia'le. See Phosphoric acid.

A. phosphor'icum sic'cum. phoric oxide. A white powder, very deliquescent, obtained hy hurning phosphorus in oxygen. Dose, 1 grain.

A. pi'ericum. See Pierie acid.

A. pin'gue. An acid which was supposed to exist in, and to explain the causticity of, lime.

A. prima'rum via'rum. Acidity in the stomach.

A. primige'nium. A synonym of Sulphuric acid.

A. prus'sicum Scheele'ei. A solution of hydrocyanic acid containing about 6 per cent. of the auhvdrous acid.

A. pyroace'ticum. A synonym of Pyroligneous acid.

A. pyrogal'licum. See Pyrogallic acid.
A. pyrolig neum. A syuonym of Pyroligneous acid.

A. pyroligno'sum. See Pyroligncous acid.

A. pyroxyl'icum. A synonym of Pyroligneous acrd.

A. quercitan'nicum. A synonym of Tannie acid.

A. quino vicum. A synonym of Kinovic acid.

A. sac'chari. A synonym of Oxalic acid. A. sacchari'num. A synonym of Oxalic acid.

A. salicyl'icum. See Salicylic acid. A. sa'lis. A synonym of Hydrochloric acid.

A. sa'lis culina'ris. A synonym of Hydrochloric acid.

A. sa'lis mari'ni. A synonym of Hydrochloric acid.

A. santon'icum. A synonym of Santonine. A. scytodeph'icum. A synonym of Tannic acid.

A. sep'ticum. A synonym of Nitric acid. A. stibio'sum. A synonym of Antimonious acid.

A. succin'icum. See Succinic acid. A. succin'icum inpu'rum. See Suc cinic acid.

A. sulfu'ricum. The A. sulphuricum. A. sulfuro'sum. The A. sulphurosum. A. sulpho-arsenio'sum. A syuonym of

Arsenie trisulphide.

A. sulphohy'dricum liq'uidum. Belg. Ph. Antimony trisulphide 1, nitrohydroehloric acid 5 parts. The sulphuretted hydrogen gas is distilled off and water saturated with it.

A. sulphostiblicum. A synonym of Antimony pentasulphide.

A. sulphostibio'sum. A synonym of the Antimony trisu'phide.

A. sulphu'reum. A synonym of Sulphuric acid.

A. sulphu'ricum. See Sulphuric acid. A. sulphu'ricum alcoolisa'tum. G. Ph. A synonym of the Mistura sulfurica acida.

Belg. Ph. Concentrated distrilled sulphuric acid, 250, alcohol, 750 parts.

A. sulphu'ricum aromat'icum. B.Ph. Elixir of vitriol. Contains sulphurie acid, 3; rectified spirit, 40; cinnamon, in powder, 2; ginger, in powder, 1 parts. Sp. gr. 0.927. Six fluid drachms, 304.2 grains by weight, require for neutralisation 8:30 grain measures of the volumetric solution of soda, containing, therefore, 33.2 grains of anhydrous acid. Dose, 5-30 minims.

A. sulphu'ricum aromat'icum. U. S. Ph. Elixir of vitriol. Prepared by mixing six troy ounces of sulphuric acid with a pint of alcohol, and allowing the mixture to cool. Then one troy ounce of ginger and a troy ounce and a half of emnamon are placed in a percolutor, and sufficient alcohol added to make a pint of tineture. Lastly, the diluted acid and the tineture are mixed. Brown in colour, aromatic in odour, acid in taste. Dose, 10 to 30 drops in a little water thrice

daily.

A. sulphu'ricum eru'dum. G. Ph. (rohe Schwefelsaure, Englische Schwefelsaure.) A elear, colourless fluid, of oily consistence. Sp. gr. 1.830—1.833, indicating a percentage proportion of pure sulphuric acid (SH<sub>2</sub>O<sub>4</sub>) of 91.8 to 93.1.

A. sulphu'ricum destilla'tum. Belg. Ph. Commercial sulphuric acid distilled in a glass vessel. Sp. gr. 1.847.

A. sulphu'ricum dilu'tum.

sulphuric acid.

Brit. Ph. contains 11:14 per cent. of an-hydrous acid. Sp. gr. 1:094. Twelve minins contain 1 minim of strong sulphuric acid. Dose, 5-20 minims.

Aust. Ph. contains 16.6 per cent. of strong

acid. Sp. gr. 1117.
Belg. Ph. contains 13.5 per cent. of strong acid. French Ph. contains 10 per cent. of strong acid. Germ. Ph. contains 20 per cent. of strong acid. Sp. gr. 1113-1117.

Russian Ph. contains 20 per cent. of strong acid. U. S. Ph. contains 2 parts of strong acid in one

pint. Sp. gr. 1.082.

A. sulphu'ricum fu'mans. G.P. (rau-chende Schwefelsaure, Nordhauser Vitriolol). A brownish fluid of oily consistence, giving off whitish vapours. Sp. gr. 1.860-1.900.

A. sulphu'ricum pu'rum. A synonym

of A. sulphuricum destillatum. Belg. Ph.

A. sulphu'ricum rectifica'tum. synonym of the A. sulphuric. destillatum. Belg. Ph.

A. sulphu'ris volat'ile. A synonym of

Sulphurous acid.

A. sulphuro'sicum. A synonym of Sulphurous acid.

A. sulphuro'sum. See Sulphurous acid. A. sulphy'dricum. A synonym of Hydrogen sulphide.

A. tan'nicum. See Tannic acid.

A. tartar'icum. See Tartaric acid. A. tar'tarl essentia'le. A synonym of

Tartaric acid.

A. tartaro'sum. A synonym of Tartaric acid.

A. tar'tricum. A synonym of Tartaric acid.

A. thionhy'drieum. A synonym Acidum sulphohydricum liquidum of the Belg. Ph. A. thion'icum. A synonym of Sulphuric acid.

A. urolith'ieum. A synonym of Uric acid. A. valerian'icum. See Valerianic acid. A. valer'icum. A synonym of Valerianic

acid.

A. vitrio'li vino'sum. A synonym of Ether.

A. vitriol'icum. A synonym of Sulphuric acid.

A. vitriol'icum alcoho'li aromat'icum. A synonym of the A. sulphuricum aromaticum as formerly made with alcohol.

A. vitriol'icum aromat'icum. Asynonym of A. sulphuricum aromaticum.

A. vitriol'icum vino'sum. G. Ph. A synonym of the Mistura sulfurica acida.

A. zoot'icum. A synonym of Hydrocyanic acid.

A. zootin'icum. A synonym of Hydrocyanic acid.

Acidur'gia. ('Anis, a point; also a sur-

gical bandage; εργον, work. F. acidurgie; G. Akidurgic.) Operative surgery, especially such as involves the escape of blood.

A'cies. (F. epine; G. Grat.) An intu-

mescence of the tænia semicircularis at the side of the foramen of Monro, and at the distance of

about one line from it.

A'cies. ('Δκίς, a sharp point. F. ucirr.)
The point of a spear; also a battle array. Applied as a name for iron or steel; and also to the rows of the phalanges of the fingers.

In Botany (F. arète, angle saillant) a ridge or

projecting angle.

A. diur'na. (Acies, keen eyesight) Hemeralopia. (Dunglison.)

Acie'sis. Sterility in women. A'ciform. Same as Aciculiform.

Acinacifo'lious. ('Aκίνακης, a scimitar; folium, a leaf. F. acinacifolié; G. Schwert-bluttriy.) Having acinaciform leaves.

Acinac'iform. ('Ακίνακης; forma, resemblance. F. acinaciforme; G. Subelformiy.) Like a scimitar or sabre in shape.

Acina'lis. (Acinus, a berry. F. acinal.)

Pertaining to a grape.

Acina'rius. (Acinus.) Having small, spherical, pediculated vesicles on the stem and branches, like the grains of the grape, as the Fucus acinarius.

Acine'ses. ('A, neg.; κινέω, to move.) Neuroses which are characterised by loss of the

power of moving.

Acine'sic. ('A, neg.; κινέω, to move.) That which is opposed to movement. Acinesic remedies are those which are opposed to motion.

Acine'sia. (A, priv.; κίνησις, motion. F. acine'sie; G. Unbeweglichkeit.) Loss of motion in the whole or in any part of the body.

The interval between two beats of the heart; the period of diastole.

Acinesiatro'phia. Same as Acinetatrophia.

Acine'sis. Same as Acinesia.

Acinetatro'phia. ('Aκίνητος, motionless; atrophia. F. acinetatrophie.) Atrophy from want of motion.

Acine'tæ. A synonym of Acinetidæ.

Acine'tic. ('A, neg.; κινέω, to move.)
That which relates to the arrest of movement; applied to medicines which inhibit motion.

Acine tide. ('A, neg.; κωίω, to move.)
The only Family of the Order Suctoria, Class
Infusoria, Sub-kingdom Protozoa. These organisms are found parasitic upon hydroid polypes. Bodies spherical and non-ciliated, from which stand out a number of radiating, retractile, rarely ramified filamentons tubes, of which one is shorter than the rest and serves to fix the animal whilst the rest are free, and end in a trumpet-shaped sucker.

Acineti'na. A synonym of Acinetida.

Ac'ini. Plural of Acinus.

A. glandulo'si. Conglomerate glands. A. lie'nis. The Malpighian corpuscles of

the spleen. A. Malpighia'ni. The Malpighian cor-

puscles of the spleen.

A. rena'les. The Malpighian corpuscles of the kidney

Acin'iform. (Acinus, a grape; forma, resemblance. F. aciniforme; G. Beerenformig.) Having the form or colonr of a grape; grape-

Acinifor'mis tu'nica. The uvea of the iris.

**Acinoden'drus.** (Acinus; εξινέρου, a tree. F. acinodendre.) Applied to a plant the fruit of which is arranged like that of the

Ac'inos. (Akwos.) A medicinal plant of the ancients, used for restraining alvine and uterine discharges and as a diuretic. It was also applied externally in erysipelas and ulcers. Probably Ocimum pilosum, or, perhaps, Melissa (Thymus) acinos. (Waring.)

Also a different mode of spelling Acinus.

Acino'sa tu'nica. The uvea of the iris.

Acinous. (Acinus; F. acineux.) Round,

like the fruit of the grape.

A. adeno'ma. A form of adenoma having the structural characteristics of a racemose gland.

A. glands. (L. glandulæ acinosæ; F. glandes acincuses or en grappes; I. ghiandole acinosi; ghiandole a grappolo; G. tranbin- or blasen-fermigen Drüse.) Glands in which the termination of the ducts present the form of a ini, as in the case of the salivary glands, the panereas, and Brunner's glands.

Acinus. ("Akwos, a grape. G. Lüppehen, Drusenblaschen.) In Biology the word has been applied to several structures in no very definite manner. It has been used to denote the smallest lobules of conglomerate glands, as the panereas; the saccules of compound racemose glands, as the glands of Brunner; and the lobules of the liver. In some cases being used to describe the secreting structure, in others

the execal termination of an excretory tube or duct of a gland.

In Botany (F. baie, pepin; G. Beerchen) applied to the small berries which form the fruit of the bramble, rasp.

Also a species of thyme, sometimes spelt Acinos;

also a term for the seed of the grape.

Acipen'ser. (As if Acipesner, from acies, the point of anything, and pesna, anciently used for penna, i.e. a beak; from its acute and wide-opening mouth. F. esturgeon; G. Stör). The sturgeon; a Genus of the Group Chondrostci, Order Ganoidei, Class Pisces. Osscous plates reaching to the tail, which is heterocercal; skin naked between the plates and shagreened by small Mouth inferior. Most of the species are marine, but some are confined to the Caspian and Black Seas, and the great American lakes with the rivers flowing into them. The Danuhe, Columbia, and Mississippi rivers have peculiar species. Their roe forms Caviare, and the external membrane of the swim-bladder when dried is Isinglass.

A. hu'so. (F. hauser, grand esturgeon.)

The Beluga of the Russians.

A. ruthe'nus. (F. sterlet.) The Sterlet. A. stella'tus. (F. scherg.) The Starred

A. stu'rio. (F. esturgeon commun.) The Common Sturgeon.

**Aciphyllous.** ('Δκίς, a point; φύλλον, a leaf. F. aciphylle; G. nadelblattrig.) Applied to a plant having linear and acuminated leaves.

Ackawai Nut'meg. Produced 1

Produced by Accodichdium camara. Nat. Ord. Lauracea. Considered in Guiana to be one of the most efficacious remedies in colic, diarrhoxa, and dysentery.

Ackonk. An Indian plant. Species undetermined, the juice of which is given by the natives with pepper for the cure of anasarea. It acts in doses of an onnce as a hydragogue cathartie. (Waring.)

Acla'dium. The conidiferons stage of

fungi of the Family Pleospora.

Aclas'tic. ('A, neg.; κλάω, to break.)
Applied to substances which permit the passage of rays of light without refracting them.

Aclei'dii. (A, neg.; κλείς, the clavicle. F. acleidicn.) Applied by Desmarest to a section of the Rasores, having no clavicles, or only rudimentary ones.

Acleitocar'dia. ('Ακλείτος, not closed; καρδία, heart.) Persistence of the foramen ovale, leading to imperfect æration of the blood.

**Aclin'ic line.** (A. neg.;  $\kappa\lambda i\nu\omega$ , to slope.) The magnetic equator. That line which joins all those parts of the earth where there is no dip of the magnetic needle.

Aclow'a. Nat. Ord. Leguminosce. A plant employed by the natives of Guinea as a cure for the itch, which is effected by rubbing the fresh plant over the part. (Waring.)

Aclyth'rophyte. (Λ, priv.; κλεῖθρου, an enclosure; φυτόυ, a plant. F. aclythrophyte.) Applied by Neeker to plants supposed to have naked seeds.

**Acmas'ticus.** ('Δκμάζω, to be strong. F. acmustie.) Gr. ακμαστικός, applied by Galen to a fever of equal intensity throughout its course; same as Homotonos (Castellus). Continued fever. When the symptoms gradually increased, it was called ἐπακμαστικός σύνοχος, when they gradually diminished. παρακμαστικός.

Acmæ'amor'pha. ('Ακμαΐος, in full bloom; α, priv.; μομφή, torm.) An indeterminate skin affection in adults.

Acmæ ochloro'sis. ('Annaios; chloro-F. acmaochlorose.) Chlorosis of adults.

Acmæ'opimelorrhæ'a. ('Ακμαΐος; pimelorhæa, a morbid discharge of fat. F. acmaopimelorrhec.) The pimelorrhea of adults.

Acmæ'opolysar'cia. ('Λκμαΐος, polysarcia. F. acmæopolysarcie.) The polysarcia or obesity of adults.

**Ac'me.** ('Λκμή, a point, the bloom of anything. F. acme.) The highest degree or height of a disease; the erisis. The ancients divided the duration of diseases into four periods, or stages. Aρχή, the commencement, or accession; 'Aνάβaσιs, the growth, or advancement; 'Ακμή, the height; and Παρακμή, the declension.

Also by some supposed to be the correct spelling of Acne.

Acmel'la. See Spilanthes acmella.
A. lumæ'i. Hab. India and S. America. Acrid, provoking secretion of saliva, and in repute for scurvy. A synonym of Spilanthus aemella.

A. mauritia'na. A synonym of Spilanthes acmella.

Acmo. A term for the red coral, Corallium rubrum.

Ac'mon. A synonym of the Incus. Acmosporia sew. An Order of Hy-phomycetous fungi embracing 12 genera. The fungi composing it present cellular filaments, usually with septa not branched, producing spores at their extremities, by the difference in the form of which the genera are diagnosed.

**Acna.** Otherwise *Acne*. **Acne.** ('*Λκυή* or ἀκμή, the bloom of anything. Tovbos; L. varus, psydraeia, aene Aetii, vari Sennerti; F. boutous, couperose, dartre pustuleuse, miliaire and disseminée (Alibert); G. Boule, Hautfinne, Kupferfinne im Gesicht, Fin-

nenaussschlag; I. Pinna aene; Arab. Abedsamen, Badschenan.) Retention of the secretion of the sebaceous glands of the skin, with secondary inflammation and deposit in them and in the hairfollicles. It appears in the form of red conical or hemispherical elevations or nodules, varying in size from hemp seeds to heans; some solid, others filled with pus; mostly distinct, but occasionally arranged in groups or in lines; found everywhere except upon the palms and soles, but chiefly affecting the skin of the face, chest, and back, and in the majority of cases occurring in young persons. The disease appears to be due to the occlusion of the orifice of the hair-follicles or of the ducts of the sebaceous glands opening into The retained secretion then becomes a source of irritation and inflammation, and snp puration in and around the hair sac and its appendages follows. The treatment consists in the use of baths and friction with various kinds of soap, the application of weak aqueous or alcoholic solutions of corrosive sublimate, alkaline lotions, or weak snlphnr ointment, and appropriate general and hygienic treatment.

A. artificia'lis. Aene produced by artificial irritants, such as iodides and bromides, when taken internally, and by tar applied externally.

A. atrophica. A form in which the pustules are succeeded by atrophy of the structures

A. cachectico'rum. A form occurring in eachectic and scrofulous persons. It occurs on the limbs, as well as in other parts, each papule being surrounded by a livid border.

A. cilia'ris. Acne occurring at the edges of the eyelids.

A. dissemina'ta. A term for the ordinary form of acne.

A. fronta'lis. A synonym of Acne varioliformis, from its occurrence on the forehead.

A. horde'olans. A form of ordinary acne in which the papules, being ranged so close to each other, lose their rounded form and assume

the shape of a grain of barley.

A. hypertroph'ica. A form in which the pustules are succeeded by an hypertrophied condition of the parts affected. It is a sequel of Acne rosacea. The skin becomes reddish or purple, uneven, and oily; the hypertrophy of connective tissue and corium sometimes produces small sessile or pedunculated growths.

A. indura'ta. A form of ordinary acne in which the papules obtain a large size, and are

hard and non-pustular in appearance.

A. menta'gra. A synenym of Sycosis. A. molluscoi'da. A synonym of Molluscum.

A. of the throat. A synonym of Folli-

cular pharyngitis.

A. puncta'ta. That form of simple acne in which small red papules surmount a comedo, and rise slightly above the level of the skin.

A. pustulo'sa. A condition of

ordinary form of aene in which there is more or

less pus.

A. rosa'cea. (Gutta rosca, bacchia; F. couperose; G. das kupfrige Gesicht, Kupferhandel, Kupferrose.) Attacks the face and scalp alone, and is characterised by an intense reddening of the skin, due to an injection of the bloodvessels without much swelling or tension. serpentine vascular lines, the blood in which may be momentarily driven out by pressure, are most abundant and evident on the sides and

bridge of the nose. This condition forms a ground on which develop protuberances of variable size and firm consistence, but without any purulent contents. An obstinate affection occurring chiefly in youth and in advanced age, and owing to the great hypertrophy of the skin of the nose occasioning great disfigurement. Aene rosacea never leads to ulceration, nor does the discase extend deeper than the skin. The treatment in the slighter eases consists in the application of sulphur in soap, ointment, or solution; iodo-chloride of mercury; solution of corrosive sublimate; in severer cases, incisions, and subsequent brushing over with perchloride of iron, touching the apices with acid nitrate of mercury: and, in the worst form, removal has even been advised.

A. seba'cea. A synonym of Schorrhæa.
A. sim'plex. A term for the ordinary form of sene.

A. strephulo'sa. Also called Strophulus is. It consists of small white pimples on the face and neck, which are distended sebaceous glands.

A. syphilitica. Occurs on the face and trunk in spots of the size of a lentil, having a hard base and dark scabs, and leaving foveolated cicatrices

A. tuberculo'sa. A synonym of Acne hupertrophica,

A. umbilica'tus. A synonym of Acne varioliformis.

A. variolifor mis. One of Bazin's varieties, so called from its likeness to a smallpox pustule. It usually occurs on the forehead and leaves deep scars.

A. vuigaris. A name of the ordinary form of acne.

**Acne'mia.** ('A, neg.; κνήμη, the leg.) In teratology, defective development of the legs.

Acne stis. (Λ, priv.; κνάω, to scratch; because quadrupeds, to which it was originally applied, cannot reach this part.) Used by Pollux for the spine of the back, or rather that portion of it between the loins. (Castellus.)

Acocan'thera. A genus of the Nat. Ord. Solunacea.

A. venena'ta. Hab. Cape of Good Hope. A large bush with fragrant flowers. A decoction of the bark is very poisonous, and is used by the Hottentots to envenom their weapons.

Ac'oe. ('Ακοή, hearing.) The faculty of

hearing.

Acce'lia. Same as Acadious.

Acœlious. (Λ, priv.; κοιλία, the belly.) Having no belly; applied to persons who become wasted to such a degree that they seem to have no belly.

Acoelo mic. ('A, neg.; κοῖλος, a hollow.) A form of animal in which, as in the Protozoa, a second cavity or colom containing hamolymph, is absent; or if present, as in the Colenterata, it is not entirely shut off from the enteron.

Acoe meter. ('Ακοή, hearing; μέτρον, measure). An acoumeter.

Acce'na argente'a. A species of the Sub-ord. Sanguisorbeæ, Nat. Ord. Rosaceæ. A ereeping plant inhabiting the bogs and cornfields of Chili and Peru, where it is known under the name of Proquin. It is an excellent vulnerary when applied as a cataplasm. (Waring.)

Acoeno'si. ( Λκοή, hearing; νόσος, a discase.) Diseases of the ear, or of hearing. (D.) Acogno'sia. ("Akos, a cure; yvwois, knowledge. F. acognosic.) Knowledge of remedies.

Aco'itus. An old term for honey.

Acola'bis. A small-pointed forceps for taking up blood-vessels.

Acola'sia. (A. priv.; κόλασις, a pruning. F. acolasie; G. Ausschweifung; Wollust.) Intemperance or lust.

(F. acolastique.) Belonging Acolas'tic. to acolasia; applied to atrophy, the effect of libidinous indulgence.

Acolas'tus. Similar to Acolastic. Acol'ogy. (Aκος, a remedy; λόγος, a discourse. F. acologie; G. Heilmittellehre.) The doctrine of remedies; by some restricted to operative surgery.

Acolyc'tin. An organic base obtained from the Aconitum Lycoctonum. A white powder soluble in water, alcohol, and chloroform. Insoluble in ether; it tastes bitter and has an alkaline re-Probably a decomposition product of action. aconitine, and identical with aconine.

Acomas. Trees of S. America. One is the Racomba Guianensis. Another is a species of Achras, and the root, which is astringent, is employed in the cure of genorrhæa. (Waring.)

Acomat. The same as Acomas. Acomia. (Άκομος, bald. F. acomie; G. aarlosigkeit.) Want or deficiency of hair; Haarlosigkeit.)

baldness. See Calvities.

Aco'mis. (F. bois-camboge.) The common name in the Antilles of the Myrtus Greggii, a species of the Genus Eugenia, the fruits of which are aromatic, stimulant, and stomachic.

**Acon'dylous.** (A, priv.; κόνδυλος, a joint. F. acondyle.) Without joints; jointless. Aco'ne. ('Akovn. a whetstone.') A hard stone on which to levigate.

Aconella. Same as Aconellin.

Aconellin. An organic base obtained from the root of Aconitum napellus. Closely analogous to, or identical with, narcotin. It is bitter. Five grains administered to a cat produced no effect.

Aconine.  $(C_{26}H_{39}NO_{11}.)$ A substance obtained, together with benzoic acid, as a product of the action of water on aconitine, when heated for 10 or 12 hours in a scaled tube. It is readily soluble in alcohol and chloroform, but almost insoluble in ether. Is bitter, but produces no tingling of the lips. It seems to be identical with the Acolyctin or Napellin of Hübschmann.

Aco'nion. ('Ακόνιον, a little grinding stone.) A former medicine for the eyes, consisting

of very finely levigated powder.

Aconite. The officinal parts of the Aconite, Aconitum napellus, are the leaves, tops, and root (see Aconiti folia and A. radix). active principle is aconitine, but there is also present pseudaconitine in Aconitum ferox, aconella, and aconitic acid, as well as resin, wax, gum, albumen, mannite in the root, extractive, lignin, calcium malate and citrate, with other saline substances.

In very small medicinal doses tingling of the lips and tongue, with slight warmth at the epigastrium, is produced; the pulse is diminished in frequency and strength, the temperature is decreased, and the skin becomes moist. larger doses the tingling is more violent and extensive, the pulse and respiration are lowered, any pain that may be present disappears, and the urine is increased in quantity. In still larger and poisonous doses, alarming de-

pression is experienced without narcotic symptoms or loss of mental power, the numbness and tingling, first experienced in the ness and tinging, list experience in the mouth, extend to the throat and skin generally, vomiting, purging, deafness, and impairment of vigour occur, and there is great muscular debility. The pulse is slow, feeble, and irregular, respiration infrequent and laborious, urine suppressed, pupil variable, death sudden, preceded by clammy sweats.

Its action on the circulation is the most manifest:

the blood pressure is diminished, the heart's action being slow and irregular; it is uncertain whether this action depends on paralysis of the vagi, or on excitation of the inhibitory nerve centres in the medulla oblongata, or on depression of the cardiac ganglia, or even on direct action on the muscular heart-structure itself. Its action on the vaso-motor system appears slight. The breathing is disturbed by its influence on the vagus, or on the respiratory centres. Its action on the nervous system is very imperfectly known; it diminishes sensibility and depresses muscular action, but whether it acts on motor nerves or motor centres, or on sensory nerves or sensory centres, is as yet uncertain. Externally, aconite is used to relieve neuralgia. Internally, it is administered for the purpose of controlling inflammation and reducing fever. It is very useful in inflammations of the throat, especially in children; indeed, at the commencement of all acute febrile attacks, whether specific or symptomatic, especially when the skin is hot and dry. It has been given in asthma, acute rheumatism, palpitation and nervous restlessness. In acute diseases it is given in small doses every half hour or hour until some effect is produced.

A. leaves. See Aconiti radix.

A. poi'soning. The symptoms are described under Aconite. Death has taken place almost immediately by cardiac syncope; it occurs at periods varying from twenty minutes to as many hours; when death is at all delayed signs of asphyxia are added to those of syncope. One ounce of the tincture, one drachm of the root, and four grains of the extract, have each proved fatal. After death the veins are found engorged, as also the brain, lungs, and liver; the right heart is full of dark fluid blood, and there is some gastro-intestinal irritation.

The treatment consists in giving an emetic or using the stomach-pump, after administering some finely powdered animal charcoal, the administration of stimulants, as ammonia, brandy, coffee, and tea, friction to body, galvanic shocks to heart, artificial respiration long maintained. Digitalis

has been recommended as an antidote.

A. root. See A. radix.
A. tests for. The chief test is the physiological one of the production of tingling and numbness by placing some of the concentrated alcoholic extract of the suspected substance on the lips and tongue. The salts of aconitia give a white precipitate with caustic alkalies; a yellow amorphous precipitate with salts of gold; a similar one, insoluble in ammonia, with carbazotic acid; and an iodosulphate recognisable under the microscope on the addition of tineture of iodine, with a little sulphuric acid.

A. win'ter. The Eranthis hyemalis. Aconi'ti extrac'tum. Br. Ph. The fresh leaves and tops of Aconitum napellus are bruised, and the juice expressed and strained; the liquor is heated to 200° F., and evaporated to the consistence of a thin syrup; the green colouring

matter which has been strained off is then added, and evaporation continued at 140° F, until the extract is of a proper consistence. Dose, 1-2

U.S. Ph. The dried leaves of Aconitum napellus are percolated with alcohol, and the produce evaporated to a proper consistence. Dose, half a

grain, gradually increased.

Helvet. Ph. Obtained by digesting one part of recently dried and bruised aconite leaves with four parts of spirit for two days at 30° C. (86° F.) to 40° C. (140° F.), expressing, digesting the residue for two days more with two parts of spirit, and expressing. The liquid is filtered and eva-

porated to a proper consistence. Dose, 0.2 gramme. Germ. Ph. (Eisenhutextrakt.) An alcoholic extract of aconite tops evaporated to a proper consistence. Dose, 0.005-0.025 gramme daily, in pills or solution.

Aust. (Sturmhutextract.) A similar alcoholic

extract.

Fr. Codex. (Extrait d'aconit.) Also an alcoholic extract of the leaves.

A. extrac'tum alcohol'icum. U.S. Ph.

See Extractum aconiti.

A. extrac'tum sic'cum. Helvet. Ph. One part of extract of aconite is mixed with two parts of sugar of milk and dried thoroughly at 40° C. (104° F.) to 50° C. (122° F.); then powdered and mixed with a sufficient further quantity of sugar of milk to bring it to a total weight of

three parts. Max. dose, 0.6 gramme.

A. folia. Folia aconiti; herba aconiti. (F. feuilles d'aconit; G. Eisenhutkraut, Sturmhutkraut.) The fresh leaves and flowering tops of Aconitum napellus, gathered when about one third of the flowers are expanded, from plants cultivated in Great Britain. The aconite leaves of commerce are obtained from A. napellus. The stiff, upright, herbaceous, simple stem of this plant, which is from 3-4 feet high, is clothed in its upper half with spreading dark-green leaves, which are paler on their under side. The leaves are from 3-5 in. in length, nearly half consisting of the channelled priole. The blade, which has a roundish outline, is divided down to the petiole into three principal segments, of which the lateral are subdivided into two, or even three, the lowest being smaller and less regular than the others. The segments, which are trifid, are finally cut into 2 -5 strap-shaped pointed lobes. The leaves are usually glabrous and are deeply impressed on their upper side by veins which seldom branch. The uppermost leaves are more simple than the lower. When bruised they have a herby smell. Their taste is at first mawkish, but afterwards persistently burning. The flowers are numerous, irregular, deep blue, and in dense racemes

Root of A. linimen'tum. Br. Ph. Aconitum napellus 20 oz., camphor 1 oz., rectified spirit a sufficiency; the aconite is macerated for three days and percolated into a receiver containing the camphor until a pint is produced. Applied with a camel's hair pencil, or diluted as

an embrocation.

U.S. Ph. Aconite root 8 oz., glycerine 1 oz., alcohol a sufficient quantity; macerate the acomite in 4 oz. of the alcohol for 24 hours; percolate to two pints; distil off a pint and a half of alcohol, evaporate the remainder to 7 fl. oz., and add the glycerine. Used as above.

A. ra'dix. B.P. Radir aconiti, tuber aconiti. (F. Racine d'aconite; G. Eisenhutknollen, Sturmhutknollen.) The dried root of Aconitum napellus; imported from Germany, or cultivated in Great Britain, and collected in the winter or early spring before the leaves have appeared.

It is an elongated tuberous root, 2-4 in hes in length, and sometimes an inch in thickness. It tapers off into a long tail, whilst numerous branching rootlets spring from the sides. If dug up in summer, a second and younger root, and occasirnally a third, is attached to it near its summit. This second root has a bud at the top, which is destined to produce the stem of the next season. The dried root is dark brown outside, breaks with a short fracture, exhibiting a white and farinaceous, or brownish, or grey, inner substance, sometimes hollow in the centre. A transverse section of a sound root shows a pure white central portion (pith), which is many-sided, and has at each of its projecting angles a thin fibro-vascular bundle.

Indian aconite root, or Nepal aconite, known in India under the names of Bish, Bis, or Bikh, is chiefly derived from A. ferox, but is also obtained from A. uncinatum, A. luridum, A. napellus, and A. pulmatum. The ancient Sanskrit names of this potent poison were Visha and Ativisha. The roots sold under this name are simple tuberous roots of an elongated conical form, 3-4 inches long, and  $\frac{1}{2}$  –  $1\frac{3}{4}$  inches in diameter; aerial stem cut away; blackish-brown in colour, with interior horny and translucent. In the Indian bazaars, Bish is found in another form, the roots having been steeped in cow's urine, to preserve them from insects. These roots are plump and cylindrical when fresh, with offensive odour. Externally dark and black, and horny within.

Poisoning has occasionally occurred in consequence of the root of aconite having been mis-taken for that of horseradish. The tapering root of aconite, its darker colour, its cut surface becoming red, and its tingling taste, distinguish it from the cylindrical, bright-coloured, bitter and hot tasting root of horseradish, the section of which remains

white on exposure to air.

A. tinctu'ra. Br. Ph. The root of Aconitum napellus in coarse powder 21 oz., rectified spirit 1 pint; macerate for 48 hours in 15 oz. of the spirit, percolate and pass the remainder of the spirit through, press, filter, and make up with spirit to a pint. Dose, 5—15 minims. spirit to a pint. Dose, 5—15 minims.

Aust. Ph. (Sturmhuttinetur.) Aconite tops 1,

rectified spirit 5 parts.

Fr. Codex. Aconite leaves 1, rectified spirit 5

Germ. Ph. (Eisenhuttinctur.) Acouste tops 1 part, rectified spirit 10 parts; digest. Dose, 5-10 drops. Max. dose, I gramme; per diem, 4 grammes.

Helvet. Ph. Aconite leaves 1, rectified spirit 5 parts. Max. dose, 1 gramme.

U.S. Ph. Aconite root 12 oz., alcohol a sufficient quantity; percolate 2 pints. Dose, 3-5 drops.

A. tu'ber. A synonym of Aconiti radix. A. unguen'tum. Br. Ph. Aconitia 8 grains; rectified spirit 30 minims; dissolve and mix with lard 1 oz. Used in neuralgia.

Aconit'ia. An organic base found in all

parts of the Aconitum napellus, and in various plants of the Acontum nopetats, and in various plants of the Genus Acontum.  $C_{30}H_{47}NO_2$  (v. Planta) or  $C_{54}H_{40}NO_2$  (Duquesnel), or  $C_{32}H_{43}NO_{11}$  (Wright). A light, white powder, without smell, with a bitter taste, and soon causing a peculiar heat and tingling sensation in the mouth; extremely poisonous. It dissolves in 150 parts of cold and 50 parts of hot water, in 4.2 parts

of alcohol, 2.6 of chloroform, and 2 of other. The solution polarises to the left. It melts at 248° Fahr. Its solution in sulphuric acid is first yellow, then red; heated in a water bath with phosphoric acid to 212° it assumes a violet colour. It has an alkaline reaction; is precipitated from acid solutions by caustic alkalies, but not by carbonates. The only salt that crystallises readily is the nitrate. It is used to subdue pain, especially that of facial neuralgia, of acute articular rheumatism, and of rbeumatic ophthalmia. MM. Gréhant and Duquesnel conclude from their experiments on frogs that Acoustine resembles Curara in impairing the conducting power of motor nerves. It also slows the circulation by enfectling the action of the heart. Topically it produces the effects of an aerid substauce, the symptoms when swallowed in poisonous doses being those of acute stomato-gastritis. Taken internally it produees a sensation of tingling in the skin, vertigo, cerebral excitation, insomnia, generally dilatation of the pupil, with or without amblyopia; disturbance of the eardiac and respiratory movements, anxiety, nausea, diuresis, diminution of temperature, and pallor of the surface.

**Aconit'ic acid.** Equisetic acid, Citridic acid, Citridinic acid. A basic triatomic acid. Form,  $C_6\Pi_0O_6$  or  $C_6\Pi_3O_6\Pi_3$ , found in Aconitum napellus, Delphinium consolida, Equisetum fluviale, hyemale and laniosum. It also results from heating Citronic acid. It is polymeric with Maleinic

and Fumaric acids.

Aconitifo'lia. (L. aconitum; folium, a lesf.) A term for the Podophyllum pultatum.

Aconiti'na. Same as Aconitia. Acon'itine. Same as Aconitina.

Aconit'ium. Same as Aconitia. Aconi'ton. ('A, neg.; κονία, plaster.) Unplastered; applied to unlined vessels.

Aconi'tum. (Either from ἀκόνη, a whetstone, because it grows on sharp, steep rocks; or .å, neg.; κόνις, dust, because it requires but little earth; or akov, a javelin, as darts were dipped in its poisonous juice; or 'Akovat, a place where it grew. F. aconit, tucloup; G. Eisenhut, Sturmhut; 1, S., and Portug. aconito.) Monkshood, wolfsbane. Nat. Ord. Ranunculacca. Erect peremial herbs; leaves alternate, palmatelylobed or cut; flowers in panicles or racemes. Sepals 5, the upper falcate. Petals 2—5, small; 2 upper, with long claws hooded at the tip, covered with the sepaline hood, 3 lower, small or absent, hammer-beaded; follicles 3-5; seeds many; testa spongy, rugose.

A. altigalea'tum. A synonym of A. cammarum.

A.antho'ra. (F. aconit anthore; G. Giftheil, Heilyift, Herzwurz.) Yellow helmet flower. Formerly believed to be an antidote to a ranunculaceous plant named Thora.

A. anthoroid'eum. The A. anthora.

A. Bernhardia'num. A synonym of A. cammarum.

A. cam'marum. (F. aconit à grandes fleurs.) Flowers white and blue, in straggling panicles; young carpels incurved. Hab. Switzerland and Germany.

A. Candol'iei. The A. anthora.

A. casios'tomum. A variety believed to be not poisonous. A. eulo'phum. The A. anthora.

A. te'rox. Flowers purple, in rather loose panicles; helmet, semi-circular; young carpels very downy; lobes of the leaves much acuminated and divarioating. Hab. Nepal, Himalays.

A. heterophyl'lum. (Hind. Atis; Duk. Atvika; Tam. Ativadyam; Tel. Ativasa.) An Indian shrub. Flowers large, of a dull yellow veined with purple, or altogether blue, and re-niform or cordate, obscurely 5-lobed radical leaves. Hab. Temperate regions of West Himalava. The root of this plant, known as atecs, is a tonic and valuable febrifuge. It is sold in the form of a white powder, which is intensely bitter and slightly astringent. Dose, 5 to 20 grains.

A. interme'dium. A synonym of A.

ncomontanum

A. Jacqui'ni. The A. anthora.

A. japon icum. A species used as a local anæsthetic in China, and also for poisoning arrows.

A. Fusnezo'vii. The A. cammarum. A. lu'ridum. A poisonous species found in the temperate and subalpine regions of the Himalaya mountains.

A. lycoc'tonum. (F. aconit tuc-loup.)
Wolfsbare. Flowers yellow; petals with a thiform circinate spur. Hab. Switzerland.
A. macran'thum. The A. cammarum.

A. multif'idum. Dr. Hooker states that

the roots of this species are edible.

A. napel'lus. Roots clustered, fusiform, black. Stem 1-2 feet, erect, slightly pubescent. Leaves palmately 5-7, partite; periole dilated at the base; upper often sessile. Flowers bracteate and bracteolate, 1—12 in. diam., dark blue, horizontal pedicels, erect, pubescent. Upper sepal at first concealing the others, then thrown back. Spurs of upper petals conical, deflexed. Filaments delated below. Anthers greenish-black. Follocks 3—5, subcylindric, beaked. Hab. Europe, Siberia, North America, Hinualaya. The officinal preparations of aconite are made from the roots and leaves of the Aconitum napellus.

A. nemoro'sum. The A. anthora.

A. neomonta'num. A species possessing only moderate activity.

A. Neubergen'se. A synonym of A. napellus.

A. nit'idum. A species believed to be not poisonous.

A. ochroleu'cum. A species believed to be not poisonous.

A. palma'tum. A poisonous species found in the temperate and subalpine regions of the Himalaya mountains.

A. panicula'tum. A variety of A. cammarum, with blue flowers. Less active than A. napellus.

A. pyrena'icum. A species believed to be not poisonous.

A. racemo'sum. The Actae spicata.
A. reclina'tum. A species indigenous to North America.

A. rotundifo'lium. Dr. Hooker states that the roots of this species are edible.

A. salutif'erum. A synonym of A. anthora.

A. septentrionale. A variety of A. lycoctonum. The leaves are eaten as a potherb, but the root is poisonous.

A. sinen'se. A species found by Dr. Christison to possess intense aerimony.

A. Stoerckca'num. A variety of A. cammarum.

A. tau'ricum. A species found by Dr. Christison to possess intense acrimony.

A. uncina tum. A poisonous species found in the temperate and subalpine regions of the Himalaya mountains, and also indigenous to North America.

A. variega tum. A blue-flowered species less active than A. napellus. Probably the same as A. cammarum.

A. vulparia. A species that is believed to be not poisonous.

Aconu'si. Diseases of the car. (D.)

Acoono'si. ('Ακούω, to hear; νόσος, a dis-

ease. Diseases of the ear. (D.)

Acoonusi. (Akoń, hearing; vovos, for vosos, disease. G. Gchörkrankheiten.) Diseases of the ears and of hearing.

**Ac'opa.** ('A, neg.; κόπος, toil and trouble.) A term for medicines which relieve the pain and stiffness of weariness.

Also applied to medicines which from their

softness are easily prepared.
Acopis. (A, priv.; κόπος, weariness.) A stone anciently supposed to be good against weariness.

Acopomy'ron. Same as Myracopon.
Ac'opos. (Gr.) A plant formerly supposed to drive off or prevent weariness, believed to be the Menyanthes tripoliuta.

Aco'pria. Same as Acoprosis.

Acoprosis. (A, priv.; κόπρος, excrement. F. acoprose.) Defective secretion of f.eces.

Acopus. Gr. anal. ἄκοπον, applied to any

medicine against weariness. (Galen.)

A'cor. (Acor, a sour taste. F. acidité;
G. Saure.) Sonrness, acidity, or acrimony, as in the stomach from indigestion. Also applied to various acids.

A. ace'ticus. A synonym of Glacial acetic

A. borac'icus. Boracic acid.

A. succin'eus. A synonym of Succinic acid.

A. sulphu'ris. Sulphuric acid. A. tartar'icus. Tartaric acid.

Acor'dina. Indian tutty; an impure

**acore**'a. ('A, neg.; κόρη, the pupil.) Absence of the pupil.

Acores. A synonym of Achor.
Acori ra'dix. A root having this name is said to be that of a variety of the Maranta

**Acoria.** (A, priv.; κορέω, to satiate. F. acorie; G. Unersattlichkeit.) A synonym of Bulimia. Castellus contends that the term was used by Hippocrates to signify that eating, short of satiety, and diligence, and alacrity in labour, are, or show the sound exercise of health.

Ac'orin. A nitrogenous glucoside obtained from the root of the Acorus calamus. It is a white resinous substance, which has the bitter aromatic flavour of the root. It dissolves readily in ether and alcohol, but not in water.

Acori'næ. (F. acorines.) Name by Link

for the Aroida.

Acori'tes. (Acorus.) A wine impregnated with the qualities of the sweet flag and liquorice. Acormous. (A, priv.; κόρμος, the trunk of a tree. F. acorme; G. ohne Stamm.) Having no stem.

Also in Teratology, a monstrosity devoid of a

A'corn Cof'fee. Acorns roasted like coffee; used in the form of infusion with lemon and orange peel, in the diarrhœa of children.

A. Ju'piter's. The fruit of Fagus Castanea.

The Beech mast. (D.)

A. oily. Fruit of the Guilandina Moringa.

A. Sardin'ian. The chestnut.

Acorus. (Λ, neg.; κόρη, the pupil; because used in ophthalmic disease) A genus of the Sub-ord. Orontiaceæ, Nat. Ord. Aronaceæ. Spathe replaced by a two-edged leaf-blade; scales 6, permanent, herbaceous; stamens with filiform filaments.

A. adulterinus. The Iris pseudacorus.
A. asiaticus. The Acorus calamus.
A. braziliensis. The A. calamus.

A. cal'amus. (F. Arore eran; G. Kalmus.) The sweet flag. The leaves are alternate, distichous, ensiform, equitant, with undulating margins. The flowers are herma-phrodite. The perianth six-partite, stamens 6, with filiform filaments; the ovary trilocular, polyspermous, the spathe is ensiform. The plant grows in marshy districts throughout Europe, and has a spongy, somewhat flattened rhizorue, which presents irregular rings corresponding to the attachment of the leaves and punctatious below which are the marks of the rootlets. It coutains Acorin, and is an aromatic stimulant used in asthma, fevers, ague, chronic catarrh, dyspepsia, and in perfumery.

A. gramin'eus. The rhizome is used in India and China instead of that of A. Calamus.

A. odora'tus. A synonym of A. calamus. A. palus tris. The Iris pseudacorus, or I. palustris.

A. ve'rus. The Acorus calamus.
A. vulga'ris. The Iris pseudacorus. A'cos. ("Ακος, from ἀκέσμαι, to cure.) Term for a medicine, cure, or healing. See Accesis.

**Acos mía.** (A, priv.; κοσμέω, to order.) A disturbed state of things. Applied by Galen to irregularity in the critical days of fever, as κόσμος signified their regularity; also applied to baldness, because it destroys the ornameut of the hair, κόσμος signifying adornment, as well as order or regularity. (Castellus.)

Acotyledo'neæ. A synonym of Crypto-

**Acotyle'donous.** (Acotyledonus, from 'A, neg.; κοτῦληδών, a cup-shaped hollow. F. acotyledone; G. samenlappenlos.) Term applied to plants having no true embryo, and therefore destitute of cotyledons.

**Acotyle'dons.** ('A, neg.; κοτῦληδών, a cup-shaped hollow. F. idem; G. saumenlappenlos.) Flowerless or eryptogamous plants having no true embryo, and therefore no cotyledons. They produce spores instead of seeds, which in most instances consist of one cell, composed of two or more membranes enclosing a granular matter. Germination takes place from any part of the surface of the spore, the resulting filaments either reproducing the plant directly or giving rise to an intermediate body of varying form called the prothallium, prothallus, or pro-embryo, from which the fructiferous frond or stem ulti-mately springs. The stems are acrogenous. The leaves are either purely cellular or present fibrovascular bundles arranged in a piunate or palmate manner at first, and afterwards dividing dichotomously. There are no true flowers. The roots are heterorhizal, and aerial roots are of common occurrence. They are usually divided into Acrogens and Thallogens.

Acoucro'ba. A plant growing in Guinea.

which boiled in wine is held in esteem by the natives as a remedy in measles. (Waring.)

Acou'meter. ('Λκούω, to hear; μέτρου, a measure. F. acoumetre.) An instrument devised by Itard for measuring the amount of hearing in man.

Acou'metry. (Same etymon.) The method of estimating the power or extent of the

sense of hearing.

Acouom'eter. Same as Acoumeter. **Acouopho'nia.** ('Ακούω, to hear, and φωνή, voice.) Α mode of auscultation, in which the sounds produced by percussion are analysed by the application of the ear to the chest of the patient.

\* Acouox'ylon. ('Ακούω, to hear; ξύλον, wood. G. Horholz.) A form of stethoscope recommended by Niemeyer, formed of a solid and

massive piece of wood.

Acous ma. ("Λκουσμα, the thing heard; from ἀκούω, to hear.) A species of deprayed hearing, in which sounds are imagined as if they were really heard.

Acous mate. ("Ακουσμα.) An imaginary

**Acousmet'ric.** (Ακουσμα; μέτρον, measure.) Term applied to the power of the perception of the relative distance of sounds; second of the sixteen senses admitted by Recamier.

A synonym of Acousmomet'ric.

Acousmetric.

**Acoustic.** (Ακούω, to hear. F. acoustique; G. Akustisch.) Belonging to the ear, as the organ of hearing, or to sound, or the sense of hearing. Anciently applied to remedies for deafness.

A. duct. The meatus auditorius.

A. fo'cus. The point at which sonorous vibrations reflected from a concave surface meet. A. nerve. The auditory nerve, or portio

mollis of the seventh pair. Acoustica. (Same ctymon.) Medicines

used in deafness.

Acous'tico-mal'leus. The external muscle of the malleus.

Acous'tics. ('Λκούω. F. acoustique; G. Akustik.) The doctrine of the theory and principles of sonorous undulations.

Ac'qua aceto'sa. Italy; not far from Rome. Alkaline chalybeate waters containing sodium chloride and sulphate, calcium sulphate and carbonate, iron oxide, and a large amount of carbonic acid. Used as an aperient tonic in enfeebled conditions of stomach, and in mucous

A. aceto'sa. Italy. A second spring of this name is found near Baccano, not far from the Lago Bracciano. It contains free carbonic acid, and is an alkaline chalybeate containing some alum. Used in antemia.

A.aceto'sa. Italy. A third spring of this name is found near Capronica. Also a carbonated

alkaline saline water, and used as the others.

A. acid'ola. Italy; near the baths of
Montolecto. An alkaline chalybeate water of
22° C. (71.6° F.), containing calcium, magnesium, and iron carbonate, carbonic acid gas, and traces of sulphuretted hydrogen.

A. acid'ula. Italy. A chalybeate and carbonated spring, of temp. 14° C. (57° F.), near Viterbo. Recommended in chlorosis, anamia, and

dyspepsia.

A. al'le gam'be. (It.) The grease in the horse.

A. allumino'sa di Fallop'pio. (It.)
Alum and corrosive sublimate, of each 7 parts; rose water and plantain water, of each 360 parts. A lotiou formerly in use for foul and for venereal pleers.

A. anodi'na di Pra'ga. (It.) A mixture of 180 grammes of ammoniated alcohol, 30 grammes of essence of saffron, and 2 grammes of oil of layender. It is used as a liniment in rheumatic

affections.

A. antiepilet'tica de Langio. Aqua ant. d. Langio.

See A. antioftal'mica di Loche. Aqua a. d. Loche.

A. antipedic'ulare di Ca'det. remedy employed to kill liee. It contains rose water 70 grammes, aqua mercuriale 10 grammes.

A. antipestilenzia'le del'la sca'la. (lt.) A remedy in repute for languor of the stoma h and flatulence, and as a preservative against infective diseases. It contains rosemary, spikenard, rne, mint, absinth, horseradish, of each three handfuls; angelica root, 60 grammes; zedoary, 120 grammes; alcohol, 3200 grammes; distil, and add to the distillate red sandal wood, 160 grammes; eamphor, 40; and hard Peruvian balsam, 32 grammes. A limpid, reddish fluid, with pleasant smell and an acrid and bitter taste.

A. antipsor'ica di Ranque. remedy consists of a decoction of staphisagria, in which is dissolved some extract of opium. It is

used as a cold lotion.

A. antister'ica di Po'terie. Contains Valerian root, 107 grammes; absinth, artemisia, mint, marjoram, of each three handfuls; white wine, 6500 grammes; galanga, ginger, long pepper, opium, camphor, of each 27 grammes; alcohol, 2000 grammes. A milky, aromatic, and bitter fluid; employed in hysteria hypochondriasis.

A. antister'ica di S. Mari'a Novel'la. See Acqua di melissa.

A. argen'ta. A literal translation of Υδράργυρος. A name given to mercury from its metallic lustre and liquid form.

A. argenti'na. A solution of silver in nitric acid, and of potassium cyanide in water, are mixed with powdered chalk. A remedy employed to obtain the rapid action of silver.

A. aromat'ica spirito'sa. Contains flowers of lavender, leaves of salvia balm (melissa), and of mint, 100 parts; nutmegs, cloves, mace, canella, ginger, fennel, 50 parts; bruise and infuse in a mixture of 100 of spirit of wine with 800 of water; macerate for 12 hours. An excellent calmative.

A. arzente. Spanish name for spirit of wine.

A. benedet'ta del'la car'ita. A solution of 30 centigrammes of tartar emetic in 276 grammes of water. It is taken in two doses for the relief of lead colic.

A. Benedet'ta di Ru'land. See Aqua Bened. d. Rul.

A. bian'ca. See Aqua regeto-minerale.
A. Bol'le. Italy; on the Lanzo in Tuscany. A carbonated alkaline chalybeate water springing

from the limestone rock. Temp. 15° C. (59° F.) Used in urinary concretions.

A. celes'te. (It.) A name applied to many remedies now wholly disused. In Italian

pharmacy the name is still preserved for a solution of 20 centigrammes of sulphate of copper in 128 grammes of water, with the addition of 32 drops of ammonia. It is used as an astringent collyrium.

A. Chine'se. Same as Aqua ethiopica. A. d'An'halt. (lt.) A preparation obtained by distilling an alcoholic infusion of turpentine, incense, aloes, mastic, cloves, cubebs, canella, saffron, fencel, and laurel berries. Employed externally as a liniment in cases of paralysis, and internally against vomiting and diarrhœa.

A. d'Armagn'ac. The Teinture aromatique.

A. d'Egit'to. Same as Aqua africana.

A. dei Carmelita'ni. A synonym of the

Acqua di melissa.

A. del Cardina'le di Luynes. (It.) Contains rose water 250 grammes, corrosive sublimate 6, white lead 15, alum-sulphate 12 grammes, and the white of one egg. A remedy in great repute as a local application in herpetic affections.

A. di archibugia te. See Aqua vul-

neraria.

A. di Binel'li. An hæmostatic liquid, probably a solution of creosote.

A. di Bon'ferme. The Teinture aroma-

A. di Catra'me. (It.) Tar water, made by agitating one part of tar with 10 of water.

A. di Clau'der. See Acqua di fuliggine composta.

A. di Dar'del. An imitation of the Acqua di melissa.

A. di Falconie'ri. (It.) A solution of potassium carbonate, helieved to be anticalculous.

A. di Fra' Ilario'ne. (It.) See Aqua vulneraria.

A. di fulig'glne compos'ta. (lt.) A remedy containing of soot, 15 grammes; potash carbonate, 45 grammes; sal ammoniae, 5 grammes; distilled elder water, 270 grammes. In repute in cases of gout.

A. di Giambattis'ta la Por'ta. (It.) A remedy containing many substances, of reddish colour, pleasant aromatic odour, and bitter taste. It was reputed useful as a tonic.

A. di Giovinez'za. (It.) A remedy

supposed to restore youth to old age.

A. di magnanim'ita. (It.) An alcoholic infusion of the red ant. Used formerly as an

aphrodisiac.

- A. di melis'sa. (It.) A remedy in high repute in Italy as a stomachic, tonic, and vulnerary, especially that made in the pharmacy of S. Maria Novella. It contains 750 parts of fresh mellissa (balm), in flower, and 120 grammes of the rind of fresh lemons. These are bruised with 60 grammes of canella, of cloves and of nutmegs, 30 grammes of dry coriander, and 30 of angelica. These ingredients are macerated for four days in 4 kilogrammes of alcohol at 85°, and distillation effected in a sand bath.
- A. dl Napoli. (It.) Liquor arsenicalis.

A. di Paglia'ri. (It.) An hamostatic fluid, obtained by boiling 8 parts of benzoin and 16 of alum in 160 of water for six hours.

A. dl Peru'gia. A synonym of the Acqua Toffana.

A. di Pra'ga. An alcoholate, prepared with galbanum, myrrh, assafætida, valerian, zedoary, angelica, mint, camomile, coriander, and castoreum. It is in repute in Germany as a remedy for hysteria.

A. di San Glovan'ni. (lt.) A watery solution of sulphate of copper and of zinc, to which are added camphorated alcohol and alcoholic tineture of sattron.

A. di San Nic'ola alla Doga'na. A remedy containing mint water 500 grammes, and a sufficient quantity of pure nitric acid to give it a pleasant flavour. Employed as an anthelmintie.

A. epatica. (It.) A solution of hydrogen sulphide in water.

A. fageden'ica. (It.) This remedy is prepared with a solution of 40 centigrammes of mercury chloride (corrosive sublimate) in 120 grammes of lime water. Three forms are described, as A. f. bianca, gialla, e nera, or white, yellow, and black, in accordance with their colour.

A. fonden'te di Trevez. (It.) A solution containing crystallised sodium sulphate, 30 grammes; potassium acetate, 1-20 grammes; potassium nitrate, 90 centigrammes; water, 1 kilogramme

A. nanna. (It.) A synonym of the Acqua Toffunu.

A. Nan'fa. (It.) A corruption of Λequa di fiori d' Araucio, orange flower water.

A. oftal'mica di Y'vel. Zine sulphate 8

parts, copper sulphate 3 parts, saffron and camphor of each 9 parts, water 1000 parts. Used as a collyrium.

A. pana'ta. (It.) Toast and water.
A. per la boc'ca. (It.) This contains 4 grammes of canella, vanilla, coriander, and of cloves, 90 centigrammes of mace, cochineal, saffron, and of hydrochlorate of ammonia, all of which are infused for 15 days in a litre of tincture of pyrethrum. To the fluid are then added 16 grammes of orange flower water, 90 centigrammes of essential oils of anise and of cedar, and 40 centigrammes of essential oils of lavender, thyme, and of tincture of ambergris. The fluid is filtered.

A. pri'ma. A name applied by Albertus Magnus to nitric acid.

A. putril'lica. (It.) A mixture of basic acetate of lead with water, in the proportion of 1 to 50 parts.

A. Puzzolen'te. Italy; near Livorno. A saline sulphurous water springing from the foot of an alluvial hill. Temperature varies from 12° C. (53.6° F.) to 15° C. (59° F.) Used in scabies, herpes, psoriasis, and rheumatism.

A. Raineria na. Italy; in Venetia, near

the lake of Arqua. A sulphur water springing from the calcareous tufa. Temp. 20° C. (68° F.) Used in skin diseases, scrofula, and indolence of digestion and intestinal action.

A. roma'na. See Aqua vulneraria.

A. san'ta. Italy. A mineral spring containing sodium sulphide, near Ascoli. Used internally and in the form of baths in scrofulous enlargement of the glands and articulations.

A. san'ta. Sardinian States, Piedmont; Prov. of Genoa; about two miles from Voltri. Here are mineral waters, containing sulphur and lime. Temp. 20°-25° C. (68°-77° F.) The baths have been long frequented, and are in the midst of pretty scenery. They are reputed useful in herpetic eruptions, and in scrofulous affections.

A. san'ta di Buyhu'to. Sicily; in the

neighbourhood of Palermo. A cold carbonated bitter water springing from the limestone. Used as a purgative.

A. saturni'na. (It.) A mixture of basic acetate of leag with water, in the proportion of

1 to 50 parts.

A. stagnot'ica di Monteros'si. water distilled from various aromatic and astringent plants with pitch and the white agaric. It is an hæmostatic, and is both used externally and

taken internally.

A. Toffa'na. (It.) A transparent, extremely poisonous liquid, invented towards the close of the 17th century by a woman named Toffana, who resided first at Palermo, and then at Naples. It proved fatal to many persons, to whom it was given in doses of 4 to 6 drops. It is believed to have been composed of arsenic dissolved

in the salva of the pig.

A. Tur'ca. (lt.) Contains sulphuric ether 10 grammes, distilled water 100 grammes. An

autispasmodie.

A. virgina'ie. (It.) This fluid, employed as a vaginal injection, contains acetate of lead and sulphate of zine, of each 5 grammes, distilled water 125 grammes, ean de Cologne 60 grammes.

A. zefferi'na. (It.) Lime water 300

grammes, sal ammoniae 1 gramme, verdigris 30 centigrammes. Used as a resolvent and desiceative collyrium.

Acquet'ta. A synonym of Acqua Toffuna. A. di Nap'oli. A term applied to the celebrated Acqua Toffana, which was a solution of

Ac'qui. Italy; in Piedmont, a small town on the river Bormida. The climate is pleasant, but somewhat moist. The waters were known to the Romans as Aquæ statiellæ. Mild solphur waters, of 48° C. (118·4° F.) to 97° C. (207·6° F.), springing by several sources, some from the limestone, and some from the clay slate. There is also a cold sulphur spring near the Ravanesio. There is The waters deposit a considerable quantity of mud, which is the curative agent chiefly employed; either as a general bath, the head of the patient only being uncovered with the mud, or as a local application to one or more joints. Rheumatic arthritis, and rheumatic or gouty contractions and thickenings, are much benefited; the baths are also used in skin diseases, scrofula, chronic metallic poisoning, atonic nlcers, and syphilis.

Acquired. (L. acquire, from ad and quaero, to seek. L. acquisitus; F. acquis; I. acquisto.) A term used to indicate defects or diseases resulting from habits or conditions of life proper to the individual, as opposed to those which are con-

genital or inherited.

A. hab'its. Acts which result from constant repetition and practice. The movements required for locomotion, for musical performances, speech, and many other acts, become so thoroughly engrained or co-ordinated in the nervous system that they can be performed without thought, or whilst the mind is fully engaged on other subjects; guiding perceptions are, however, probably still required. No one would continue to walk if suddenly deprived of light. Parrots and many other animals afford remarkable examples of acquired habits. They are most easily implanted in early life, and are either transmissible from parent to child, or a strong tendency to them is inherited; of this, handwriting is a good example.

A. intuition, of common sense. The immediate or instinctive response that is given by the automatic action of the mind, or, speaking physiologically, by the reflex action of the brain, to any question which can be answered by such a

direct appeal.

A. percep'tions. The faculty acquired by the several senses, whereby the inference which has been originally drawn from the sensation produced by some impression becomes, by force of habit, so blended with the sensation itself that the judgment is exercised unconsciously; as when something is seen or heard afar off, and the impression of the thing seen or heard is in-separably blended with the inference of the distance at which it is.

Acqui'sitiveness. (Acquiro, to obtain.) A faculty common to man and the lower animals, producing the tendency to acquire property, and the desire to possess in general, without reference to the uses to which the objects may be applied; its organ is placed by phrenologists at the anterior

inferior angle of the parietal bone.

Acracon'itine. A synonym of Pseudaconitine.

Acrae'idæ. A Family of the Sub-order Rhopalocera, Ord. Lepidoptera, Class Insecta. It contains 1 Genus, and 90 species; especially abundant in the Ethiopian region.

Acræ'palum. (Same as Acræpalus.)

Acræ palus. ('Ακραίπαλος, from à priv., κραιπάλη, drunken or gluttonous excess.) llaving power to correct the effects of excess in eating or drinking. (Dioscorides.)

Acrai. (Arab.) A certain degree of irrita-

tion of the genital system of either sex; held to he a species of Satyriasis. (Avicenna and Cas-

tellus.)

Acra'lea. Same as Acrea. Acramphibry'a. ('Ar **Acramphibry'a.** ('Ακρος, summit; ἀμφί, around; βρύω, to bud forth.) A section in Endlicher's System of Botany of his Legion of Cormophytes. In the plants belonging to it the stem grows at both the apex and circumference. It includes the Dicotyledonous or Exogenous plants of other botanists.

Acra'nia. ('A, neg.; κρανίου, the skull.)
A term employed by Hackel to designate the Leptocardii, represented by the Amphioxus, or

lowest type of fish.

Also that species of defective development consisting in the partial or total absence of the cranium.

**Acra'sia.** (A, priv.; κρᾶσις, a mixture. F. acrasic.) Used by Hippocrates for incontinence, or intemperance in food, drink, or any other thing.

Also used synonymously with Aeratia.

Acras peda. (A, ueg.; κράσπεδου, a hem or margin.) A term employed by Gegenbaur to indicate the naked-cyed Medusæ, corresponding to the Steganophthalmata of Forbes, the Medusæ phancrocarpæ of Eschscholtz, and the Lucernariada of Haxley.

Acratei'a. Same as Acratia. Acrati'a. (Λ, priv.; κράτος, strength. F. acratie; G. Kraftlosigkeit; Ohnmacht.) Used by Hippoerates for debility, impotence, or inefficiency. (Castellus.)

Acratis'ma. Same as Acratismus.

**Acratis'mus.** ('Ακρατίζω, to breakfast, from ἄκρατος, pure; because the breakfast of the ancient Greeks consisted of bread soaked in pure or unmixed wine.) Term for the breakfast as taken by the ancient Greeks.

Acratom'eli. ("Akpatov, pure wine; μέλι, honey.) Wine mixed with honey.

Acratope'gæ. (A, neg.; κράτος, strength; πηγή, a spring.) Mineral waters having no marked chemical qualities.

Acratopo'sia. (Acratos; πίνω, to drink. F. acratoposic.) Pure drink, as of unmixed wines, **Acratous.** (Ακρατος, from ά, neg.; κεράω, to mix.) Without mixture; unmixed; κεράω, to mix.) Without mixture; unmix formerly applied to secretions and excretions.

etions and ('Λκρατεία, want Inability to Acrature'sis. strength; ουρησις, micturition.) Inability discharge the urine from atony of the bladder.

**A'cre.** (" $\Delta \kappa \rho \eta$ , the top; for  $\ddot{a} \kappa \rho a$ , the summit of anything.) The end or extremity of the (Quincy.)

A'crea. (Same etymon.) Formerly used for the extreme parts and points of the bedy, as the arms, legs, ears, nose.

Acribom eter. ('Ακριβής, exact; μέτρον, a measure.) An instrument adapted for measuring extremely minute objects.

Ac'rid. (Acer, sharp. F. acre; G. beissend; scharf.) Applied to any substance which tastes het, sharp, er tart.

A. let'tuce. The Lactuca virosa.

A. prin'ciple of plants. A peculiar preximate principle formerly believed to exist in some plants, to which their irritating properties were

Acridi'idæ. ('Λκρις, a locust. Fr. Grillons sauterelles; I. Grilli locuste; G. Feldheuschrecken.) A Family of the Group Saltatoria; Suborder Orthoptera; Class Insecta. The crickets. Body long, laterally compressed; head vertical; antennæ short, inserted in front; labrum very targe, with a median division; maxillary palpi in five joints; tongue fleshy; posterior wings when in repose folded fan-wise and covered by the elytra; the chitinous cuticle of the metathorax presents on each side above the articulation of the last pair of legs a thin tympaniform membrane, having a raised rim, which is probably the organ of hearing. Stridulation is produced by rubbing the inner dentate border of the tibia of the hind leg against serratures on the elytra.

Acridoph'agous. ('Ακρίς, a locust; φάγω, to eat. F. aeridophage; G. heuschreekfressend.) Locust-eating; an epithet applied by

the Greeks as of the Ethiopian.

Ac'rids. (L. acer, sharp.) A term applied to various substances which stimulate, irritate, or inflame the living parts with which they are placed in contact. To distinguish them from chemical irritants, they are sometimes called dynamical irritants. The most important vegetable acrids are mustard, horse-radish, elaterium, pellitory of Spain, poison oak, capsicum, mezereon, arum, bryony, anemone, stavesacre, euphorbium resin, croton oil, pepper, turpentine, manchineel tree, savine, gamboge, ginger, onions, and garlie. Cantharides is a representative of an animal acrid, and potassio-tartrate of antimony of an inorganic acrid. Acrids are used as condiments and stimnlants; as rubefacients and vesicants; and to maintain suppuration. They are also employed to stimulate chronic and torpid ulcers. In cases of poisoning by the vegetable aerids, vomiting should be encouraged by mucilaginous draughts, irritation allayed by opiates, external derivatives, and emollient and anodyne enemata. The active principle of eantharides is soluble in oil, which should not therefore be given in cases of poisoning with that substance. See Irritants.

Acrifo'lium. (Acris, acid; folium, a leaf.) A plant, so called from the actimony of its leaves; supposed to be the Lotus.

Also applied to any plant with a prickly leaf. Acrimony. (Same etymon. F. acrete; G. Scharfe.) A sharp, aerid, corrosive quality,

biting to the tengue.

Formerly used to denote certain nnnatural conditions of the humours of the body which produced disease as they were thrown out from the system, and chiefly by the skin. Such was supposed to be the cause of most skin diseases, of cancer, tubercle, gout, and similar affections.

Acrinia. ('Λ, neg.; κρίνω, to separate.)

Absence or diminution of secretion.

Acrinyl sulphocy anate. A synenym of Acrinul throcyanate,

A. thiocy'anate. C8H7NSO. One of the products of the decomposition of the sinalbin of white mustard by its myrosin when mixed with water. It is an acrid volatile oil, insoluble in water, soluble in alcohol and ether; it is decomposed by caustic potash, with the production of potassium thiocyanate.

A'cris. ('Ακρις.) A sharp bony prominence;

also the point of a fractured bone.

Also a species of locust or grasshopper, probably the Oedipoda migratoria, the wingless variety mentioned by some authors being the insect in its transition state. It was employed in fumigations to relieve dysuria, and when macerated in wine as an antidote to the bite of the scorpion.

Acris'ia. (A, priv.; κρίσις, a judgment. F. acrisic.) Applied to a state of disease in which either there is no crisis, and no judgment or opinion can be formed, or in which there is a had

erisis. (Galen and Castellus.)

Acri'sis. A synonym of Acrisia. Acrita. ('Ακριτος, confused.) A synonym of the Protozoa.

Acrit'ical. ('Akpiros.) Applied to a disease having no regular crisis, or to a symptom which does not indicate a crisis. (Castellus.)

Acritochro'masy. ('Arpiros, confused; χρωμα, colonr.) Same as Achromatopsia.

Acri'tus. Same as Acrisia.

Acrivi'ola. (Acer, sharp; viola, a violet.) The Tropwolum majus.

Acroamatic. ('Aκροάσμαι, to hear.) Term applied to certain doctrines transmitted erally and not written, because thought to be unattainable or inadvisable to be known by the many. It corresponds in a sense to esoterie, and is opposed in meaning to the term exoteric.

Acroa'sis. (Same etymon. F. audition; G. Gehor.) Gr. ἀκροάσις, applied to the act of hearing by Hippocrates; also, a discourse or re-

Acrobap'tus. ('Aκρος, the summit; βαπτός, dyed.) The Asilus acrobaptus has a brown spot at the end of its wings.

Acroboth'rium. A sexually mature cestoid entozoon found in the pyloric appendix of the Lota vulgaris.

**Acrobrya.** (Άκρος, summit; βρύω, to bud forth.) A section in Endlicher's System of Botany, of his Legion of *Cormophyta*. The stem grows at the point only, the lower part being unchanged, and only used for conveying fluids. The section is divided into three cohorts, viz:

A. anophy'ta. Having no spiral vessels: both sexes perfect; spores free in spore cases. Examples, Hepatica and Musci.

A. hysterophy'ta. Having perfect sexual

organs. Seeds without an embryo, polysporous,

parasitic. Example, Rhizanthe &.

A. protophy'ta. Having vascular bundles, more or less perfect; male sex absent; spores free in one or many-celled spore cases. Examples, Filices and Equisctucea.

**Acrobys tia.** (Άκρος; βύω, to stop up; because it covers the glans penis; or perhaps a corruption of ἀκροποσθία.) The prepuee.

corruption of ἀκροποσθία.) The prepuce. **Acrobys tiolith.** ('Ακροβυστία, the prepuce; λίθος, a stone.) Λ preputial calculus. **Acrobystitis.** (Ακροβυστία.) Inflam-

mation of the prepuce. **Acrocar'pi.** (Άκρος; καρπος, fruit. F. acrocarpe; G. gipfelfruchtige; hochfruchtig.) A Class of Musci having the fructification ter-

Acrocarpid'ium. A genus of the Nat.

Ord. Piperacea

A. hispid ulum. Hab. West Indies. Used

as a bitter stomachic.

Acrocar pous ("Ακρος, summit; καρπός, fruit.) A term applied to those mosses in which the sexual organs mixed with paraphyses, the socalled "flower," terminates the growth of a primary axis.

Acrocar pus crina lis. An alga which forms one of the species producing Corsican Moss. Acrocephal'ic. Of or belonging to a

pointed head. That which relates to Aerocephaly. Acroceph'aly. ('Ακρος, pointed; κεφαλή, the head. F. Acrocephalic, crane clevic, oxycephalic, hypsocephalic, pyrgocephalic.) A condition of the skull in which the vault is lofty. Considered by Topinard to result from the sagittal and coronal sutures being early essified, whilst the lambdoid and inferior lateral sutures remain free.

**Acrocer'idæ.** ('Λκρος; κέρας, a horn.) A synonym of *Henopiidæ*.

**Acrocheir.** ("Λκρος; χείρ, the hand.) Used by Hippocrates and Galen; it appears to mean specially Manus, the hand, or extreme hand or that part of the arm from the forearm, or Radius and Ulna, to the points of the fingers, and so, is distinct from xeip which has a double acceptation-1. All that proceeds from the Scapula, divided into Brachium or Humerus, Cubitus, or Ulna and Radius, and extreme hand. 2. The extreme hand itself.

Acrocheire'sis. Same as Achrocheirismuses.

Acrocheir ismus. (Same etymon.) A kind of exercise mentioned by Hippocrates, engaged in by the ancients, in which the hands alone, without help from the rest of the body, were employed. A wrestling by means of the hands.

**Acrochor**'didæ. ('Ακρόχορδών, a wart with a thin neck.) A Family of the Suborder Colubriformes, Order Ophidia. Head and hody covered with small warty protuberances instead of scales; nostrils approximated; no grooved teeth.

**Acrochor'don.** ('Aκρος; χορδή, a string of gut. F. achrochordon; G. Hangewarze.) small wart, having a narrow base or pedicle.

Acrochoris'mus. ('Λκρος; χορεύω, to dance.) A kind of festive dance celebrated by the Greeks, and referred to among the proper exercises of the body, the legs, hands, and arms.

Acrocolia. ('Ακρος; κώλον, a member, or limb.) A term for the end of a limb, the extremities of members of animals, and the food

prepared from certain of them, as the snout, ears, or feet; also applied to the internal parts of animals, familiarly called giblets.

Acrocolium. The acromion.
Acrocomia. A Genus of the Tribe Cocoinew, Nat. Ord. Palmacew. Hab. Warm regions of North and South America.

The pericarp and A. sclerocar'pa. almond are used in Brazil to make an emulsion; employed in catarrhal affections.

Acrocor'don. See Acrochordon.

**Acrodac tylous.** ("Λκρος, topmost; δάκτυλος, a finger. F. acrodactyle; G. Zehenrücken.) Applied by Illiger to the upper surface of the toes.

Acrodiclid'ium Cam'ara. Ord. Lauraceæ. Indigenous in the forests of Guiana, yielding the nuts termed Camara, Camacou, Ackawai, Waccawai, or American nutmeg. These brown aromatic nuts are used in diarrhœa and dysentery. (Waring.)

**Ac'rodont.** ('Aκροs, the summit; δδούs, tooth. F. acrodont.) Applied by Owen to scaly or loricated Saurians, having teeth anchylosed

to the summit of the alveolar ridge.

A. teeth. Teeth which are anchylosed to

the summit of the jaw, and have no alveolus on either side.

Acrodry'a. ('Ακρύδρυα, from ἄκρος, a point; δρύς, a tree.) Fruits such as nuts and

apples. Also fruit trees themselves.

Acrodyn'ia. ('Aspos, the extremities, οδύνη, pain.) An epidemle disease, rarely sporadic, characterised by disorder of the digestive organs and of the nervous system, with impaired nutrition of the skin and mucous membranes. disorder of the digestive system, though occasionally absent, manifests itself generally by want of appetite without redness of the tongue, nausea, vomiting, colic, and diarrhea, sometimes becoming dysenteric. The disorder of the nervous system expresses itself in pain and hyperæsthesia of the palms and soles, and sometimes of the calves of the leg, inner side of the knee, and thigh. In some cases analgesia or anæsthesia has been observed, the patient losing his shoes or wearing them in bed without knowing Cramps and spasms of the muscles occur, followed often by contractions and by great debility. Associated with the pathological condition of the nervous system are various disorders of the skin and mucous membranes. The skin of the hands and feet is attacked by a kind of erythema, the redness and swelling resembling chilblains or patches of urticaria, and resulting in thickening of the epidermis, which either grows out in the form of horny excrescences, or is thrown off to be replaced by a delicate and excessively tender epidermic tissue. The secretion of pigment is increased. The subcutaneous tissue is brawny and anasarcous, and even the face is puffy and hard. The conjunctive are red and painful, and catarrh with urethral discharge have been commonly observed. It is essentially a disease of adults. Its cause is unknown. It presents certain points of analogy with pellagra, ergotism, and the disease called in Spain the Phlema salada or Mal del nigado, and has been attributed to unwholesome food, and especially to diseased grain. Its subjects and its observers have been almost exclusively French-

Also used to denote pain in the extremities of

the limbs.

Ac'roe. A plant of Gninea, the vinous de-

coction of which is given as a tonic. (Waring.)

Acrog'enæ. ('Ακρος, a point; γεινάω, to generate. F. acrogène.) Acrogens constitute one of the two divisions of Cryptogamia, the other being Thallogens; they are characterised by presenting a distinct stem and leaves; and grow only

at the extremity of the axis.

All the species have stomata or breathing pores. There is no trace of flowers. The fructification differs in different families; in the Filiers and Equisctacee, consisting of sporangia or capsules, containing spores, with no differentiation of sex; in Lycopodiaceæ the sporangia being differentiated into oosporangia and pollen sporangia; whilst in the Musci and Hepaticuceæ, antheridia and archegonia appear, in which sexual differences are well marked. True spiral vessels are principally confined to the Ferns, Clubmosses and Horsetails. In general they are plants of small stature, but ferns may acquire the size of trees, always growing with a simple or simply forked stem.

The group includes Filices, Equisctacea, Marsileacea, Lycopodiucea, Musci, Hepatiere, and

Characeæ.

Acrog'enous. ("Ακρος; γεννάω, to generate. L. Acrogenus; F. acrogène.) Growing from the top or highest point; applied to plants the growth of which progresses from their apical points, and whose increase is mainly in length.

A. fun'gi. Those fungi which are attached

to the ends of threads.

A. stem. In the simplest form, as Mosses, the acrogenous stem is composed of ordinary parenchyma, with sometimes a central axis of liber cells, but no true vessels. In Lycopodiaceæ the simultaneous vascular bundles make their appearance. In Ferns this form of stem attains its highest development; externally there are wood cells covered by parenchyma; internally is a thinwalled parenehyma; between the two is the woody structure formed of the simultaneous vascular bundles. The stem is terminated by, and grows by the division of, an apical cell.

Acrogens. See Acrogenæ.
Acrogyra'tæ. ('Λκρος'; γῦρος, a circle.)
Bernhardt's term for the Osmundæ.

Acrolein. (Acer, sharp; oleum, oil.) crylic aldehyde. Form C<sub>3</sub>H<sub>4</sub>O. A thin, co-Acrylic aldehyde. lourless, volatile fluid, lighter than water, and boiling at 52°.2 C. (126° F.). In the allyl series it corresponds to the aldehydes. It gives off a pungent vapour, which canses profuse lachrymation when in contact with the conjunctiva or Schneiderian membrane. It results from the destructive distillation of the neutral fats containing glycerine, and gives the offensive odonr to the smoke arising from the glowing wick of an extingnished candle. Inhalation of acrolein has been known to produce serious results; and it is its presence in over-roasted fat which probably causes so much disturbance in digestion when eaten.

**Acrolen'ion.** (Λκρος, the snmmit; ωλένη, the elbow.) The oleeranon.

Acroma'nia. ('Λκρος; μανία, madness. F. aeromanie.) Confirmed, or incurable madness.
Acromas'thium. Same as Aeromastium.

Acromas'tium. ('Ακρος, summit; μασθός or μαστός, the breast.) The mammilla, or nipple.

Acro'mia. The acromion.
Acro'mial. (F. acromial.) Belonging to the acromion.

A. ar'tery, supe'rior. A branch of the suprascapular artery; it anastomoses on the aero. mion with the inferior acromial, a branch of the aeromio-thoracie artery

A. ar'tery, infe'rior. A branch of the acromio-thoracie artery; it is distributed partly to the deltoid muscle and partly to the aeromion, and anastomoses with the infrascapular and pos-

terior circumflex arteries.

A. nerves. One or two branches that, arising from the anterior branch of the fourth cervical nerve, are distributed to the skin of the acromial region.

A. veins. These accompany their respective arteries, and open into the axillary vein.

Acro'mio-clavic'ular articula'-tion. Is formed between the oval concave articular surface on the internal margin of the acromion process, which is directed inwards, forwards, and upwards, and the convex, or sometimes concave, surface at the extremity of the clavicle. The surfaces are separated more or less completely by an interarticular fibro-cartilage; if perfectly, there are two synovial membranes; if imperfectly, and, as usual, only at the upper part, there is one. The joint is surrounded by a cap-sular membrane, the fibres of which are thicker above and below, forming the superior and inferior aeromio-clavicular ligaments.

Acro'mio-cor'acoid lig'ament. A ligament extending transversely from the acromion to the coracoid process. It arches over the head of the humerus, and materially aids in preventing

dislocation of that bone upwards.

Acro'mio-coracoide'us. The coracoaeromial or aeromio-coracoid ligament.

Acro'mio-thorac'ic ar'tery.(Artère troisième des thoraciques, Chaus.) A short trunk which arises from the front of the first part of the axillary artery just above the upper border of the pectoralis minor muscle, and divides into three sets of branches. The inner or thoracie supply the pectorales and anastomose with the intercostals and other thoracie arteries. The outer terminate in the deltoid and anastomose with the superior aeromial, one branch descends with the cephalic vein. The ascending supply the subclavian and deltoid. The veins correspond to the arteries.

**Acro'mion.** ('Ακρος; ωμος, the shoulder. L. Aeromium; summus humerus; F. aeromion; G. Akromion, Schulterhöhe.) A projecting process constituting the extremity of the spine of the scapula. It is large and somewhat triangular, flattened from before backwards, directed at first a little outwards, and then enrying forwards and upwards, so as to overhang the glenoid cavity. The upper surface, directed npwards, backwards, and outwards, is convex, rough, and gives attachment to some fibres of the deltoid. The under surface is smooth and concave. The outer border, which is thick and irregular, gives attachment to the deltoid muscle. The inner margin, shorter than the outer, is concave, gives attachment to a portion of the trapezius muscle, and presents about its centre a small oval surface for articulation with the acromial end of the clavicle. The apex, which corresponds to the point of meeting of these two borders in front, is thin, and has attached to it the coraco-acromial ligament.

The acromion is wanting in some mammalia, as the giraffe; in others, as the hare and elephant, it is large and gives off a process, the metacromion; in the sloth and in birds it joins the coracoid process, and forms a bony arch; in the delphin it exists, although there is no clavicle; in the armadillo it has an articulating surface for the humerus.

In man a small nucleus of ossification is present in the cartilaginous aeromion at birth; about the 15th year two distinct nuclei exist; at about the 25th year ossification is complete and the process is

united to the spine of the scapula.

A. frac'ture of. The most frequent cause is a fall, but it may proceed from a direct blow. The direction of the fracture is generally vertical, more rarely oblique; its site, about one inch from the extremity. The pain is severe, whether the arm or neck be moved, which is explained by the attachments of the trapezius and deltoid There may be only slight displaceninscles. ment, but the separated part is generally drawn down and the shoulder is flattened. Crepitation is perceived on grasping the shoulder, raising the arm, and rotating it. The prognosis is favorable, though fibrous union is not infrequent from the difficulty of maintaining comptation of the fragments. In the treatment the arm should be well raised, and a figure-of-eight bandage may be applied. Union takes place in about six weeks.

Acromiorrheu'ma. ( Ακρωμία ; ἡεῦμα. F. aeromio-rhume; G. Schulter-Rheumatismus.) Rheumatism of the aeromion.

Acro'mis. The acromion. Acrompha'lium. Same as Acrom-

Acrom'phalum. Same as Acromphalus. Acrom'phalus. ("Ακρος; όμφαλός, the umbilicus, or navel. F. acromphale.) The centre of the umbilicus, to which the cord is attached in the fetus.

Also incipient umbilical hernia.

**Acrom'yle.** ("Ακρος, apex; μύλη, the knee-pan.) The patella.

**A'cron.** (' $\Lambda \kappa \rho \omega \nu$ , an extremity of a hody or member.) The extreme part of a limb.

Also an old betanical term for the top or flower

of thistles.

**Acro-narcot'ic.** (Accr, sharp, irritating; νάρκωσις, a henumbing.) A term applied to certain poisons possessing both an irritating and a narcotic Amongst the most important of these are the empyreumatic oils, fool's parsley (Æthusa cynapium); various fungi (amongst which the Amanita muscaria stands pre-eminent); hemlock; drepwort (Enanthe crocata); diseased grain; lahurnum; some leguminous seeds, as these of Lathyrus cicera and darnel grass (Lolium temulentum); and the yew (Tuxus baccata). Most or all of these, taken internally, produce gastrointestinal irritation, headache, delirium, convulsions, and death.

Acro'nia. ('Αρωνία, mutilation.) Amputation of the extreme part of a body or limb, as

an ear, the nose, a finger, or tee.

Acronu'ridæ. A Family of the Suborder Acanthopterygii, Order Teleostei, Class Pisces. Marine herbivorous fishes found in all tropical seas, but most abundant in the Malay region. Body long, compressed, with minute scales; buccal aperature narrow; dorsal fin long; teeth pointed, in a single row.

Acronych'ious. (Same; ôvv &, the nail;

F. acronyque.) Bent like the nails.

Acronyc'tidæ. A Family of the Group Noctua, Order Lepidoptera. Eyes naked, generally non-ciliated; thorax rounded in front, shaggy; feet hairy; tibiæ without bristles.

**A'cronyx.** ('Ακρος, the summit; ὅννξ, a nail.) Growing in of the nail. (D.)

**Acroparal'ysis.** ("Ακρος, apex; παρά-λυσις, paralysis.) Paralysis of the extremities.

**Acrop'athous.** ('Ακρος; πάθος, disease. F. acropathe.) Applied to disease which affects some high or extreme part of the body, or of an organ. Gr.  $d\kappa \phi \delta \pi a \theta \sigma s$ , applied by Hippocrates to disease of the orifice of the uterus.

**Acropet'alous.** ('Ακρος'; πέταλου, a leaf.) A term applied to the inflorescence of a plant, when an axial structure produces similar and equivalent lateral members in such order that the younger a member is, the nearer it is to the apex, that is to say, counting from below upwards, the members occur in the order of their age

Acrophal'li. ("Ακρον, extremity; φαλλός, the peris.) A group of Nematode worms, including the Trichina and Strengylus, in which the male genital opening is at the posterior extremity of the body.

Acrophy'tum. ('Ακρος; φυτόν, a plant.)
Another name for Tussilago far fara.

Ac'ropis. ('Aκροπις, disabled.) A doubtful reading in Hippoerates, signifying imperfection of the voice from a disordered coudition of the end of the tongue.

Acropo dium. (Άκρος; πους, a foot. F. acrocope; G. Fussrucken.) Name by Illiger for the upper side of the entire foot.

**Acropos thia.** (Λκρος; πόσθη, the prepuce.) Gr. ἀκροποσθία, or ἀκροποσθίη, the extremity of the prepuce, or that portion removed in the operation of circumcision. (Hippocrates and Castellus.)

Acroposthi'tis. (Same; πόσθη, the prepuce.) Inflammation of the prepuce.

Acropsi'lon. Same as Acropsilus.

**Acropsi'lus.** ('Ακρος; ψιλός, naked.) Gr. ἀκρόψιλον, given to the extremity of the glans penis by Hippocrates, when uncovered by the prepuce. (Castellus.)

Acrori'a. ('Ακρώρεια, a monntain-ridge.) A term for the vertex.

**Acrorrheu'ma.** ('Ακρος; ὀεῦμα mour.) Rheumatism of the extremities. (''Ακρος; ρεύμα, a hu-

A Sub-family of the Acrosale'niæ. Family Cidarida of the Order Regulares, Class Echinoidea. Fossils of the colitie system having perforated tubercles.

**Acros'apes.** (Appos;  $\sigma \eta \pi \omega$ , to make putrid.) Applied to food, meaning that it is easily digestible; Gr. ἀκροσαπήs, used by Hippecrates for that which had become putrescent on the surface, and was therefore supposed to be more easily assimilable. (Castellus.)

**Acrosar'cum.** ('Ακρος; σάρξ, flesh. F. acrosarque.) Name by Desvanx for a spherical fruit, fleshy, and united with the calyx, as that of the Ribes rubrum.

('Akpos, the topmost; Acroscop'ic. **Acroscop'ic.** ('Ακρος, the topmost; σκοπέω, to look at.) • A term applied to the end cell of a growing plant-stem or reet; signifying the extreme growing cell of the extreme point.

Acros'pelos. ('Akpos;  $\pi \epsilon \lambda \dot{o}$ s, for  $\pi \epsilon \lambda$ - $\lambda \dot{o}$ s, dark-coloured; from the dark colour of its ears, or tops.) A Greek name for Bronus Diosco-ridis, or wild cat-grass. (Gorræus.)

**Acrospi're.** (Λκρος; σπείρα, anything wound round.) The *plumula*, or first sprout, of

Ac'rospo're. ('Λκρος.) Λ spore borne on the top of a filament or thread.

Acrospo'rous. A synonym of Basidiosporous.

Acrostich'ea. A Sub-family of Polypodicæ having naked sori.

Acros'tichum. (Λκρος, summit; στίλος, a row.) A Genus of the Nat. Ord. Filices.

A. au'reum. Lonchitis palustris. mon in the marshes of Jamaica. A decoction of the root is given with advantage in dysentery and splenic affection. A salt prepared from the leaves is recommended as a local application to nleers.

A. dichot'omum. Hab. Arabia, where it is named Medjabese. The fresh leaves bruised are employed as a local application in burns.

A. fla'vum. Hab. New Granada, where it

is employed as a laxative.

A. furca'tum. Tree ferns of N. Holland and N. Zealand. The large tuberous roots are used as food.

A. huacsa'ro. Hab. Hills of Peru. is the middling Calaguala or Cordoncillo of the Spanish settlers. The rhizome yields a red astringent deposition and the continuous settlers. gent decoction, said to have solvent, deobstruent, sudorific and antirheumatic, as well as antivenereal and febrifuge properties. See Calaguala.

A. punctula'tum. An officinal drug in the Chinese Pharmacopæia, but its uses are un-

known.

A. sorbifo'lium. Hab. Jamaica. jnice, mixed with oil, ginger, and pepper, is said to cure sick headache when locally applied. (Waring.)

Acrotar'sium. ('Ακρος, summit; τάρσος, a broad flat surface, the tarsus. F. acrotarse.) Name by Illiger for the anterior surface of the tarso-metatarsus of birds.

Acrote ria. ('Ακρωτήριον, the highest point.) Applied to the extremities of the body, as the head, hands, and feet. (Hippocrates.)

Acroterias mus. ('Ακρωτηριάζω, to mutilate by cutting off the hands and feet.)

Amputation of extreme parts of the body, or of an extremity, as the hand, or foot. (Aquapendente and Hildanns.)

**Acrote riosis.** ( Λκρωτήριου, an extremity.) A term applied to senile gangrene of the limbs, and to their amputation; and in Tera-

tology to their absence.

Acrothy'mium. ('Λκρος, summit; θύμος, thyme. F. acrothymion.) A kind of wart, resembling a bunch of the flower of thyme, which easily splits and bleeds.

Acrotic. (Assos.) Belonging to, or affecting the external surface; applied to an Ord. of the Class Eccritica, in Good's classification.

**A'crotism.** (A, priv.;  $\kappa\rho\delta\tau\sigma s$ , a striking. Fr. acrotique, adj.) A defect of the pulse.

Acrus. (Akpos, summit.) A word properly signifying at the head or top, but used also by Hippocrates for the state of the body when at the height of its well being.

**Acryd'ium.** ('Δκρίς, a loenst.) locust. See Œdipoda migratoria.

Acrylic acid. Form. C3H4O2. lowest member of the acrylic series of monatomic acids, obtained by the oxidation of its aldehyde, aerolein, with moist silver oxide; a colourless, pungent, slightly aromatic fluid. It melts at 7° C. (45° F.) and boils at 139° C. (282°2° F.)—140° C. (284° F.).

Actæ'a. ('Ακτέα, the elder tree.) Nat. Ord. Caprifoliacea. A name given by the Greeks to the elder tree; also called 'Λκτη. See Sambucus nigra.

Actæ'a. ('Ακτέα, the elder tree, the leaves of which some of the species resemble.) A Genus of the Tribe Actaea; according to some, of the Tribe Pagnica; to others, of the Tribe Helleborea, Nat. Ord. Ranunculaceae. Sepals 4, deciduous; petals 4; carpel single, baccate, one or more seeded.

A. alba. White Cohosh. Hab. Michigan. The rhizome is said to be violently purgative. It is thought by some to be a distinct species, by others only a variety of A. americana.

A. america'na. A species presenting two varieties, sometimes regarded as distinct species, A. alba and A. rubra. White and red cohosh. Ilab. The rich deep mould of rocky woods, from Canada to Virginia. Properties probably similar to those of A. spicata.

A. brachypet'ala. Hab. North America. The root is used in coughs, rheumatism, chorea, and anasarea.

A. christophoria'na. A synenym of A. spicata.

A. monog'yna. A synonym of A. racemosa.

A. race'mis longis'simis. Linnœus's name for A. racemosa.

A.racemo'sa. (F. actée à grappes, Herbe aux punaises; G. traubenformiges Schwarz-kraut.) Cimicifuga racemosa, Serpentaria phylla. Black snake root or Richweed. A perennial herb 3-8 feet high. Hab. North America and Canada. The rhizome is short, knotty, and branching, half an inch or more thick, having in one direction the remains of several stout, aerial stems, and in the other, numerous brittle, wiry roots,  $\frac{1}{25}$   $\frac{1}{10}$  of an inch in diameter, giving off still smaller rootlets. The rhizome is of somewhat flattened, cylindrical form, distinetly marked at intervals with sears of fallen leaves. A transverse section exhibits a horny, whitish pith, with coarse, irregular, woody rays, and a hard, thick bark. The larger roots, when broken, display a thick cortical layer, and a central woody column, traversed by a star or cross of wide medullary rays, and often enclosing a pith. The drug is of a dark-brown colour. It has a bitter, rather acrid, and astringent taste, and a heavy narcotic smell. Gum, sugar, starch, resin, tannic acid, cimicifugin, and an acrid neutral crystalline substance have been obtained from it.

In full doses it produces nansea and vomiting, vertige, tremers, and headache. It has been used in catarrh, bronchitis, hysteria, chorea, and rheu-matism. Formerly thought to cure snake bites and to drive away fleas, whence two of its names. The black berries are poisonous.

A. ru'bra. A variety of A. americana, or perhaps a distinct species.

A.spica'ta. (F. herbe de Saint Christophe, actée en epi, faux ellebore noir; G. ahriges Christophskraut; I. Barba di cupra.) Baneberry. An herbaceous perennial plant; height, 2 feet or more; leaves ternate, twice pinnate; racemes ovate. Hab. Mountains of Europe. Root poisonons, antispasmodic, astringent, cathartic. The powder and decoction kill lice, and are said to cure scabies.

Actæ eæ. A tribe of the Nat. Ord. Ranunculacea. Calyx coloured, imbricated; fruit succulent, indebiseent, one- or many-seeded.

Ac'te. ('Ακτή.) A name of the elder tree, Sambueus nigra.

Actine. ('Aκτίs, a ray; from its radiated ramifications.) Name for Bunium bulbocastanum.

Actinenchy'ma. ('Ακτίς, aray; ἔγχυμα, au infusion. F. actinenchyme; G. strahlzellige Gewebe.) Name applied to the stellate cells of plants, well seen in the pith of the rush.

Actin'ia. ('Astis, aray.) The sea anemone. A genus of the Sub-family Actiniae. Tentacles retractile, acuminate; body naked; the calveiue border furnished with pigment tubercles.

Actin'iæ. A Sub-family of the Family Actiniidæ. Tentacles simple; base discoidal.

Actinia'ria. A Sub-order of the Order Zoantharia, Class Actinozoa. Body soft, with no kind of skeleton.

Actin'ic. ('Ακτίς.) Belonging or related to Actinism.

The invisible and more re-A. rays. frangible rays of light at and beyond the violet end of the spectrum, on which the chemical action of light chiefly depends.

Actin'iform. ('Λκτίε, a ray; forma, likenes.) Star-shaped; radiate,

Actini'idæ. A Family of the Sub-order Actiniaria. Tentaeles in alternating rows, and each corresponding to a perigastric cell.

Actin iochrome. ( Ακτίς, a ray; χρώμα, colour.) The red colouring matter of certain Actinias, which gives a single absorption band.

Actinis'ceae. A Sub-family of the Family Bacullariaceæ or Diatomaceæ, having cells beset with stellate bristles. Marine forms and also fossil in the chalk.

**Ac'tinism.** ('Aκτls, a ray.) That property of the solar rays by which they produce chemical effects, as in photography. The actinic force is greatest in the blue and violet rays of the spectrum, and beyond them.

Also that branch of physics which treats of the

radiation of heat or light.

**Actinob'olism.** (' $A\kappa\tau$ 's;  $\beta$ \alpha\lambda\omega, to throw out.) Anciently applied to the instantaneous flow of animal spirits by which volition is communicated to the different organs, according to Willis.

Also applied to certain phenomena in birds and

animals analogous to Hypnotism.

**Actinocar pous.** (Άκτίς; καρπός, fruit. F. actinocarpe; G. strahlenfruchtig.) Applied by Allmann to plants with tropbosperms or wings of trophosperms, disposed like the rays of fruit.

**Actino'des.** ('Aκτίς. Fr. actineux; G. strahlend.) Having or full of rays; radiant:

actinous.

Actin'ograph. (' $\Lambda \kappa au is$ ; γυάφω, to grave, to write.) An instrument by which the actinism of solar light is measured.

Actinog'raphy. (Same etymon. Term for a description of the actinographic.) rays of light.

Ac'tinoid. ('Aktis; είδος, form. actinoide; G. strahlenahnlich.) Resembling a ray; radiiform.

Actinol ogy. ('Ακτίς; λόγος, a discourse. actinologie; G. Strahlenlehre.) The doctrine of rays of light.

**Actinome're.** ('Aκτίς'; μίρος, a part.) The lobes of the median part of the hody of the Ctenophora, divided off by the etenophores.

**Actinomor'phous.** ('Λκτίες'; μορφή, shape. F. actinomorphe; G. strahlenformig.)

Having a circular and radiated form, nearly like

the flowers of vegetables.

Actinophry'idæ. ('Ακτίς, a ray; όφρύς, the hrow. G. Nonnenthierchen.) A Family of the Sub-order Heliozoaria, Order Radiolaria (Monocyttaria, Haeckel), Class Rhizopoda. Or otherwise, a Family of the Class Anwboidea, Sub-kingdom Protozoa. Vesicle pulsatile: central Vesicle pulsatile; central capsule or mass enclosing a number of nuclei; no siliceous skeleton.

Actinophry'ina. A synonym of Actinophryide.

Actino phrys sol. ('Ακτίε, a ray; ὁφρύε eyebrow; sol, snn.) Fam. Actinophryida; a species with a single central capsule, the outer layer condensed to form a cortex, the inner or contained sarcode throwing out pointed contractile processes. If Mr. Carter's observations be correct, it is the product of the development of the gonidia of the Characeæ; these are formed in the interior of gonidial cells, each of which results from the aggregation and modification of the chlorophyll granules lining the interior of the interuodes of the plant, separate masses of which become invested by a cell wall. The colour of the granules changes from green to brown, and a bluish semitransparent mucus appears in different parts of the mass. This mucus separates into gonidia, and the cell bursting allows them to issue in the form of ovate or fusiform bodies of a light blue colour, having one or two cilia, by means of which they execute lively movements, but after a short period the eilia disappear and the gonidia perform amobiform movements, and finally assume the form of the Actinophrys sol of Ehrenberg.

Actinophthal'mic. ('Aktis, a ray; φθαλμός, eye. L. oculus radians, oculus lucens.) Term applied to animals possessing a tapetum

reflecting rays of light strongly.

Actinoso'ma. ('Ακτίς; σῶμα, a body.) A term for the entire organism of the Actinozoa.

Actinos'teophyte. ('Artis; osteo-phytum, an osseons tumour. F. actinostiophyte; G. Aktinostcophyt.) Term for a radiated osteophyte.

Actinosto matous. ('Ακτίς; στόμα, the mouth. F. actinostome; G. strahlenmundig.) Having a radiated mouth.

Actinosto'mous. Same as Actinostomatous.

Actino te. ('Λκτινωτός, radiated.)

Actin'otroch. ('Ακτίε, a ray; τροχόε, a wheel.) That form of Gepbyrean larva in which the post-oral band of cilia is produced into namerous tentaeuliform lobes, and fringes the free edge of a broad concave lobe of the dorsal side of

the body, which arehes over the mouth. **Actinozo'a.** ('Ακτίς, a ray; ξω̃ον, a hiving heing. G. Blumenthuere.) One of the two great divisions of the Coelenterata, the other being the Hydrozoa. The sea anemones, stone corals, and beroe, are representatives of the group. The Actinozoa agree with the Hydrozoa in the primitive and fundamental constitution of their body, which is composed of two membranesan ectoderm and an endoderm-between which a middle layer or mesoderm may subsequently arise; in the absence of a completely differentiated alimentary canal, and in possessing thread cells or nematocysts, but they present a somewhat greater complexity of structure. They are cylindrical radiate animals of tetramerous and hexamerons

type. The alimentary canal, commencing at the mouth, which is surrounded by tentacles, forms first a kind of stomach, and then opens into the general cavity of the body, and there is neither intestine nor anus. The reproductive clements are constantly situated in the lateral walls of the chambers into which the hody cavity is divided, and hence the ova are detached into the interior of the body instead of being thrown off externally, as in Hydrozoa. The group is subdivided into Coralligena or sea anemones, stone corals, and sea peus; and Ctenophora. The members of both groups appear to possess a rudimentary nervous system, and in the Ctenophora canals are given off from the visceral cavity which traverse the body. There is no alternation of generations, but dimorphism has heen observed by Kölliker to occur amongst the Pennatulide.

Actinozoa are by some called Anthozoa, a Class

of the Sub-kingdom Cælenterata.

Actinozoa rius. ('Ακτίε; ξωου, an animal. F. actinozoaire; G. Strahlenthicria). Applied by Blainville to a type the regular body of which constantly presents a radiated arrangement either in itself or in the organs of a different nature with which it may be provided.

Actin'ula. The larval condition of an

**Actin'ula.** The larval condition of an *Hydrophora*, following the gastrula stage, when tentacles begin to bud out round the mouth.

Ac'tion. (Ago, to do.) The exercise of an active power; a faculty, or function of the

body.

A. cur'rents. A term employed by Hermann to denote those electric currents which are set up in a muscle as the result of direct excitation; a negative condition of the part excited is produced, and this tract of negativity travels along the muscular fibre. By some this condition is held to be a diminution of a pre-existing current, by Hermann as a manifestation of electro-motive force. Action-currents are phasic and tectanic.

Action and reaction, Law of. Action and reaction are equal and opposite; in other words, the mutual actions of two bodies on each other are equal in quantity and are exerted

in opposite directions.

Ac'tions. The functions of the body, which were formerly divided into several classes.

A. an'imal. The actions of parts specially distinguishing an animal body, as those of the eye, ear, and brain.

eye, ear, and brain.

A. natural. Those that serve for refreshment and repair of loss, as the taking and the digestion of food.

A. pri'vate. Those which concern the

well-heing of individual organs merely.

A. pub'lic. Those which concern the whole

body.

A. re'flex. (F. Acte reflexe; G. Reflex-bewegungen.) A movement, act of secretion, or trophic change, taking place as the result of an impression on a sensory nerve. The impression is believed to travel along an afferent nerve till it reaches a sensory nerve cell or group of cells, when it excites a change that itself becomes or constitutes an impulse, which is either transmitted directly to an efferent motor nerve proceeding from this cell, or, as is more probable, is conducted by a communicating branch to a motor nerve cell or group of cells, from which the efferent branch or branches arise. Reflex actions are best seen in the spinal cord, especially when this is separated from the brain, which seems to exert an inhibitory influence over such acts, and

in the ganglia of the sympathetic nervous

system.

Some reflex acts are performed without any consciousness on the part of the individual, whilst others are attended with consciousness. Amongst the former may be included the movements of the intestinal canal and of the bloodvessels, which are dominated by the sympathetic ganglia, whilst amongst the latter are such movements as the start that occurs when a sudden and loud sound is heard, and the winking of the eye on the approach of a foreign body or on the unexpected appearance of a bright light. Reflex acts are more manifest at an early period of life than at a later. They are exalted by strychnia, and during sleep lowered by cold, and abolished by woorara and by anæsthetics. In general several muscles are called into play in reflex acts, and their action is then co-ordinated or purposive.

Pflüger has established certain laws of reflex action, which are: firstly, that if the stimulus is only capable of exciting a reflex action on one side, it is always on the same side as that to which the stimulus is applied; secondly, that if the stimulus be sufficiently strong to excite movements on both sides of the body, only those muscles will be caused to contract on the second side which have already contracted on the first; thirdly, that if the movements are of different strength on the two sides, the strongest will be on the side to which the stimulus is applied; fourthly, if any sensory nerve be irritated, those muscles first contract which are supplied by motor nerves arising at about the same height as the stimulated sensory nerves arise, and if the stimulus he sufficiently strong to cause other muscles to contract, they will always be found to be supplied by nerves arising nearer the medulla oblongata, and never by those arising from a lower plane of the spinal cord.

Reflex actions are inhibited by the brain, hy irritation of the lower cut surface of a divided cord, by simultaneous strong irritation of a sensory nerve, during apnœa, and by the action of morphia, chloroform, digitalis, and chloral hydrate. The time occupied in the transference of a sensory impression to a motor fibre is estimated by Helmholtz at 1-30th to 1-10th sec. Less time is occupied in a unilateral than in a bilateral reflex act, but with increasing strength of stimulus both periods are greatly reduced and become almost inappreciable, whilst they are prolonged after exhaustion. See Reflex centres.

longed after exhaustion. See Reflex centres.

A. respective. Those peculiar to the organ concerned, as contradistinguished from those of other organs.

A. sex'ual. The operations of the organs of generation.

A. vi'tal. The actions of parts necessary to life, as those of the heart and lungs.

Active. (Ago, to do. F. actif; G. wirksam, thatig, hatsig, krafig.) Acting with energy; applied to treatment of the sick, coming under this character. Applied similarly to medicines and surgical remedies.

A. electric ity. Electricity, either positive or negative, made manifest by friction or other method.

Ac'ton. Eugland; four miles west of London. Saline waters containing magnesium and some calcium sulphate. Formerly in great repute as a purgative.

Ac'tual Cau'tery. (F. cautère actuel; G. das gluhendes Eisen; Brenneisen.) A red-

hot iron, or other substance, or fire, used as a cautery, because having an immediate power inherent in it, in distinction from caustic substances which are termed potential cauteries; also called Ignis actualis.

The instrument should be at a white heat and drawn quickly and lightly over the skin, so as to form a superficial eschar. A method of treatment of great value in chronic joint affections, neural-

giae, and myalgiae. See Moxa.

Actua rius. A title of dignity originally given to the Byzantine physicians, corresponding to the present title of physician-in-ordinary.

(Dunglison.)

Actualtion. (Ago, to do, or perform.) A psychological term intended to designate the department of mental function that intervenes between the impulse of will to do a particular act and the actual muscular performance of it-in other words, to denote the play of the conception of the purpose of the definite movement, or the motor intuition of it, through which the will is enabled to put in action the proper muscles to execute it.

Formerly this term was used to denote the change supposed to be produced by the vital heat in a medicine when taken into the body, without which no effect would be obtained.

Ac'tus. Parturition. (D.)

Actyn'olite. ('Λκτίς, a ray; λίθος, a stone.) A dark-green mineral allied to hornblende, consisting of radiating crystals. It contains silica, magnesia, lime, protoxide of iron, with traces of magnesia and fluoric acid.

Acuduc'tor. (Acus, a point; duco, to

lead.) A grooved director.

Acuition. (L. aeuo, to sharpen.) old term intended to describe the action of medicines which are added to others of like but weaker nature, in order to increase their power.

Acuity. (Acuo, to sharpen. F. acuité; G. Scharfe.) Term for acrimony.

Aculca'ta. A term employed to designate the Hystricida or Family of porcupines.

Also a Group of Hymenoptera including ants, bees, and wasps.

Acu'leate. (Aculeus, a prickle. F. ziguillé; epineux; G. dornig.) Having prickles, or sharp

points; prickly,

Acule'iform. (Aculeus; forma, likeness. F. acideiforme; G. stachelformig.) Formed like a prickle or thorn. Applied to scales of fishes formed like curved points, as of Diodon atinga; to tubercles on shells; and to shells themselves which are small and pointed at the spire.

Acules'cent. (L. aculcus, a spine.) Applied to an acute and rigid hair on other organs,

and ending in a sharp point.

Aculeus. (Acus, a needle. F. aiguillon; epine; G. Dorn, Stuchel.) A prickle or sharp body arising from the bark or epidermis of any part of a plant, and which may be peeled off with the bark.

Also the ovipositor of the Hymenoptera.

Acu'meter. See Aconometer.

Acuminate. (Acumen, a point. F. acuminé; G. zu- or langgespitzt.) Pointed; ending in a point; (apered; tapering; applied to leaves, and leaf stalks.

Acuminif'erous. (Acumen, a point; fero, to bear. F. acuminifere; G. spitztragend.) Bearing points; applied to an animal whose hody has small pointed tubercles, as Caprilla acuminiAcuminifolious. (Acumen; folium, a leaf. F. acuminifolie; G. spitzblättrig.) Having acuminated leaves.

Acumin'ulate. Diminutive of Acuminate. Having a shortly tapered point.

Acuoph'ony. (Ακούω, to hear; φώνη, voice.) An irregular spelling of Acouaphony.

See Aconophonia.

Acupres'sure. (Acus, a needle; premo, to press.) A method of arresting hæmorrhage, suggested by Professor Simpson, by means of the pressuro of a needle. The needle, which should be long, sharp-pointed and headed, as well as rendered unoxidisable, is passed through the tissues on one side of the vessel, in aneurism is made to cross over the vessel and at right angles to it, and then plunged into the tissues on the opposite side of it. The compression thus exerted stops the flow of blood, and as soon as coagulation has taken place, or at the close of the second day, the needle can be withdrawn, and the wound being freed from the presence of any foreign body, is placed under favourable conditions for healing. The advantages claimed for this method are that it is easy, simple, and expeditious, that the needles set up very little irritation, and hence lessen the chances of suppuration, gangrene, phlebitis, and

pyæmia.

Acupunc'ture. (Acus, a needle; pungo, to prick. F. acupunction; G. Nadelstich; 1. ago-puntura; S. acupuntura.) A method of treating disease in which, the skin being made tense by stretching, one or more long steel needles are slowly passed through it with a rotatory motion to a variable depth in the neighbourhood of the affected parts. It has been long practised by the Chinese and Japanese, and was introduced into European practice in 1683 by Dr. Rhyne, but fell into disuse, till Berlioz published his Memoirs in 1816, and has been recently employed in rheumatic and neuralgic affections, paralyses, rehellious hiecough, odontalgia, gastralgia, sciatica, lumbago, and other forms of myalgia, epilepsy proceeding from a fixed point, trismus, neuralgia of the testis, meteorism of the stomach and intestines; in ununited fractures, aneurism, varicose veins, hydrocele, odema, and anasarea; in visceral enlargements, as in those of spleen, and in amaurosis. Any of the tissues, muscles, nerves, vessels, heart, or intestines, may be simply perforated in this way by a fine needle without injury. It has, however, been used for the purpose of infanticido by penetrating the brain through the fontanelles. The mobility or immobility of the free portion of a long and slender needle introduced through the parietes of the chest into the substance of the heart affords a very certain means of establishing the persistence of life or the occurrence of death in ease of trance, catalepsy, and the like. It has been used with some success, in combination with electricity, as a means of coagulating the blood in ancurisms, varicose enlargement of veins, and erectile tumours.

Acureb. (Arab.) Vitrum, or glass. Acur'gia. Samo as Acidurgia.

A'cus. (Acus, a needle; from its sharp points; F. paille; paillette; G. Spreublüttehen.) The refuse after winnowing corn; chaff.

A'cus. ('Axis, a point. F. aiguille; G. Nadel; Nahnadel.) A needle, bodkin, or pin.

A. cannula'ta. A trochar; a cannulated needle.

A. interpuncto'ria. A couching needle. A. moscha'ta. The Geranium moschatum.

A. ophthal'mica. A couching needle; an ophthalmic needle.

A. pasto'ris. A synonym of the Scandix pecten.

A. trique'tra. A name for a trochar; a

three-cornered needle. Acu'sia. The faculty of hearing. Acusim'eter. The Aconometer.

Acus'ma. The same as Acousma.

Acus'ticus. ('Δκούω, to hear.) A uame of the auditory nerve.

Acus'to. Old term for Nitrum.

Acutang'ular. (Acutus, sharp; angulus, a corner. F. acutangulé; G. spitzwinkelia; scharfeckig; scharfkantig.) Having sharp angles, corners, or edges; sharp-cornered.

Acutang'ulate. Same as Acutangular. Acu'te. (Acuo, to point. L. acutus; F. aigu; G. heftig; hitzig; scharf; spitzig.) In Botany, ending in a point.

In Pathology, sharp and pungent; applied to diseases which have violent symptoms, are attended with danger, and terminate quickly.

Acutenaculum. (Acus, a needle; tenaculum, a holder. F. porte-aiguille.) A needle with a handle to make it pass through more quickly when stitching a wound.

Acu'te-poin ted. Applied to a leaf when its apex is sharp, so that the two margins make

an acute angle with each other.

Acutospinous. (Acutus, sharp; spinosus, spinous. F. acuto-épineux; G. scharfdornig.) Applied to caterpillars having many rows of sharp and ramous spines.

Acyan'icum. ('A, neg.; κύανος, blue.) Term applied by Pouchet to animals in which the

blue colour is deficient.

**Acy** anoblep'sia. ('A, neg.; κύανος blue; βλέπω, to look upon.) Term for a defect of the vision, by which the colour of blue cannot be distinguished; in such patients it is often con-

founded with green. **Acy'clia.** ('A, priv.; κύκλος, a circle.)

Acylic flowers include those Dicotyledons having a spiral arrangement of their parts, but in which the transition from one foliar structure to another, as from cally to corolla, or from corolla to stamens, does not coincide with a definite number of turns of the spiral.

Acye'sis. ('A, priv.; κύησις, pregnancy.)

Sterility in women.

Acyi'sis. The same as Acyesis.
Acy'rus. The Arnica montana.
Acystia. ('A, neg.; κύστιs, a bag. F. acystie) In Teratology, absence of the urinary

Acystoner via. (A, neg.; κύστις, a bag;

νεύρου, a nerve.) Paralysis of the bladder. (D.) **Acysturoner via.** ('A; κύστις; οὐρου, urine; νεύρου, a nerve.) Paralysis of the bladder. (D.)

Acysturotrophia. ('Α; κύστις; οὖρον; τροφή, nourishment.) Atrophy of the bladder.

Acyterium. (A, priv.: κυητήριος, aiding delivery.) Term by Hesyehius for a drug to produce abortion.

Acytta'ria. ('A, neg.; κύτταρος, a cell.)

A synonym of Foraminifera.

Ad. A prefix introduced into various compound terms, and used as a distinct word in expressions of frequent occurrence; it has numerous significations, but the most generally used are to, and at.

A. deliq'uium. To fainting; an expression used in directions for venesection when the blood is to be allowed to flow till syncope is induced.

A. lib'itum. At will, at pleasure, according to discretion; a phrase used in prescriptions.

A.pon'dus om'nium. To the weight of the whole; as much as the whole; a term used in prescriptions to indicate the proportion of some particular ingredient.

Ada, Ginger.

Adabadani. A tree of British Guiana, botanical name unknown, the fresh bark of which quickly vesicates. (Hooker and Waring.)

Adaca. The Spharanthus indicus.
Adac'rya. ('A, neg.; δακρύω, to weep.)

Defective secretion of tears.

Adactylous. (A. priv.; δάκτυλος, a finger. L. adactylus; F. adactyle; G. ohne Fingers.) Without fingers. Applied to a crustaceous animal the arms of which are without claws.

Adæmo'nia. Same as Ademonia.

Adag gregated. (L. ad, to; aggrego, to attach to. F. adagrégés. A term used to describe one of the divisions into which aggregated organisms have been divided, where the individuals are united to each other by some part of their body, as the Salpa.

Adai. Abyssinian name of the Salvadora persica, the wood of which is used to clean and

polish the teeth.

Ada Kodien. An Apocynaceous plant used as an astringent, and for the cure of oph-

Adal. A Paracelsian term for that part of plants on which their medicinal virtues depend; mentioned in Fragment. de re herbar. l. i. § Incarnati

Ad'ali. Name for a Malabar plant, used as an antidote to the bite of the Cobra di capello.

Ad'aly. Indian name of the Verbena nodiflora. The expressed juice is employed in the treatment of entarrhal affections of the respiratory organs and in indigestion.

Adamant. ('Αδάμας, from ά, neg.;

Adamant. δαμάω, for δαμάζω, to overpower.) An old term which included several minerals, especially the diamond, which were characterised by very great hardness.

Adaman'tine. ('Aĉãuas, the unconquerable, the diamond. F. adamantin; le Very hard. Applied to bodies of exdiamant. treme hardness, polish, brilliancy, or transparency.

A. lay'er. Term applied to the enamel of

the teeth.

A. sub'stance. The enamel of the teeth.

Ad'amas. ('Αδάμας. F. diamant; G.

Diamant.) The diamond, so-called from its hardness and durability; also an old name for steel.

Also the Apuleian name of Hyoscyamus, because it triumphs over man and compels him to sleep. (Waring.)

Adam'enon. ('Adamvos, insuperable.) Apuleian name of *Hyoscyamus*, because its narcotic action cannot be resisted. (Waring.)

Adam'ic. (Adam, the first man.) A term applied to a supposed primitive race of men in Abyssinia.

Adam'ica ter'ra. A name applied to several kinds of bole, or clay of a red colour; from an Eastern tradition that Adam was formed of red earth.

Adami'ta. ('Αδάμας, the diamond.) Term

employed by Paracelsus for a very hard white calculus; properly, a vesical calculus.

Adami'tum. ('Adanas.) A term used by Paracelsus for the calculous diathesis.

Ad'am's ap'ple. (F. pomme d'Adam; G. Adams Apfel.) A term applied to the upper and median portion of the thyroid cartilage. See Pomum Adami.

A. nee'dle. Common name for the plant

Yucca gloriosa.

Adanson, Michel. French botanist, b. 1727 at Aix, d. 1806 at Paris. His chief work was his 'Familles naturelles des Plantes.'

Adanso'nia. A Genus of the Tribe Bombacca of the Nat. Ord. Sterculiacea.

A. digita'ta. (F. Baobab; G. Affenbrodbaum.) The Baobab tree; the Monkeybread tree. One of the largest trees in the world; the trunk being sometimes 30 feet in diameter, but the height is not in propertion. It is emellient and mucilaginous in all its parts. The leaves dried and reduced to powder constitute Dalo, a favourite condinent with the Africans, who mix it with their food to diminish perspiration. The fruit is sub-acid, and forms a cooling drink in fevers; the rind and the central farinaceous pulp are used in diarrhea and dysentery. bruised leaves are used as an application to ulcers and rheumatic pains. The hark has been used

instead of quinine. It contains Adamsonine.

A. Grego'rii. Sour gourd. Hab. N. Australia. Its properties are similar to those of A.

digitata.

Adanso'nine. A white, bitter alkaloid, forming needle-like crystals with acids, soluble in alcohol; obtained from the Adunsonia digitata; a febrifuge.

Adapta'tion. (Ad, to; apto, to fit.) The adjustment of the body to elimate and soil;

aeclimatisation.

The accurate fitting together of the edges of wounds, and of the extremities of fractured bones; couptation. The adjustment of the eye to the perception of

objects at different distances; accommodation. Adap'ter. (Ad, to; apto, to fit.) A tube

employed to lengthen or enlarge the neck of a retort, so that it may fit the receiver.

**Adar'ca.** ('Αδάρκη, from à, neg.; δέρκω, to see; hecause it hides the substance of the plant on which it grows.) A lax and porous saline formation, like bastard sponge, found incrusting the reeds and grass in marshy grounds of Galatia, formerly esteemed for cleansing the skin in leprosy and tetter. (Quincy.)

Adar'ce. Same as Adarea. Adar'ces. Same as Adarca.

Adar'cion. Same as Adarea.
Adar'cos. Same as Adarea.
Adarigo. (Arabic.) Orpiment.
Adarinech. (Arabic.) Orpiment.
Adarticulation. (Ad, to; articulus, a joint.) The form of articulation called Arthrolia.

Adatina-palay. Tamul name of the Aristolochia bracteata. The root is regarded by the Indians as a powerful alexipharmic; it is also extensively used in infusion as a vermifuge, and when mixed with easter oil as an external applieation in scabies.

Adeliv'ity. (L. adelivitas, for acclivitas, a rise. F. adelivité.) A projection.

A. of tib'ia. The spine of the tibia which

separates the two condylar articulating surfaces.

Abbreviation for adde, add; or Add. addatur, let there be added.

Addad. A plant of Numidia, so poisonous that forty drops of its distilled water is said to be fatal.

Addepha'gia. ("Λδδην, enough, one's fill; φαγεΐν, to eat. F. addephagie ; G. gefrassigkeit.) Term for a voracions appetite, or the disease Bulimia.

Ad'der. (Anglo-Saxon Næddre, a serpent, not improbably the Exis of Aristotle, and the Vipera of Virgil. F. vipere; G. Natter; I. Marasso; Swed. Hugg-orm.) The Adder or Viper, Vipera communis, of the Family Viperida, Ord. Ophidia, Class Reptilia, Sub-kingdom Vertebrata. Hab. Europe generally, Ireland excepted. It is found in copses and dry heaths. Head depressed, oval; no teeth in the upper maxillary bones, excepting the poison fangs; a row of small teeth in the palatine bone on each side. Body covered with scales; colour variable, but usually brown or olive, with markings of much darker tint. The common snake is harmless, but the adder's bite is poisonous. The adder is known by its smaller size, the numerous and small cranial plates, and the zigzag, continuous dark-coloured line running the whole length; the common snake is known by its larger size, the large and few cranial plates, the non-continuous dark spots, and its more decressed and prolonged head. The and its more depressed and prolonged head. tlesh was formerly thought to be invigorating and useful in ulcers and elephantiasis. The bite is very painful, but rarely, if ever, terminates fatally. Viper catchers rub oil into the part bitten over a chafing-dish of charcoal. See Snake-bites.

A.'s tongue. (F. ophioglosse vulgaire; G. Natterzunge.) The Ophioglossum vulgatum.
A. wort. The Polygonum bistorta.
Addison, Thomas. English Physician, b. 1793 at Long Benton, near Newcastle, d. 1860. Addison's disea'se. (F. Muladie bronzée, muladie d'Addison; I. mulatia dell' Maladie Addison; G. Addison'sche Krankheit.) Melasma supra-renale. Tubercular infiltration of the supra-renal bodies, usually characterised by discoloration or bronzing of the skin and progressive asthenia, which is ultimately fatal, first described by Dr. Addison. The symptoms are great debility, without much loss of flesh, shallow, easily burried respiration, irritability of stomach leading to nausea and vomiting, pain in the epigastrium and loins, feebleness of the heart's action, palpitation, and vertigo. As the disease progresses, abnormal deposits of colouring matter take place in the skin, and in some of the mucous membranes, producing a dusky brown, snoky, or olive tint of the parts affected. The discoloration begins as a rule on the face, neck, hands, and forearms, and the shade is usually deeper here than on the general surface of the body. The axillæ, groins, nipples, penis, and scrotum, are commonly very dark. The lips, scrotum, are commonly very dark. The lips, gums, and tongue are sometimes affected, but the conjunctive escape, remaining pearly white. The skin is cool, the tongue clean and moist, bowels regular, urine scanty and deficient in nrea. Towards the close of life the patient lies in a dreamy, semi-comatose state, there is seldom delirium, the body gives off a cadaveric odonr, the skin is often scaly, and death ultimately takes place from exhaustion. The bronzing has occasionally been observed without disease of the supra-renal bodies; and, rice-rersa, disease of the supra-renal bodies has been noticed without the bronzing. After death the adrenals are usually

found enlarged and nodulated; they are changed into a dense, grevish, transluceut, fibroid material, enclosing opaque, yellow cheesy masses; sometimes there is calcareous degeneration, sometimes tubercular abscesses. The degeneration is manifestly tubercular; miliary tubercles are in many cases found in the lungs and other structures; in a few cases caries of the vertebræ is a concomitant. The nerves distributed to the capsules have been noticed to be enlarged. The connection between the disease of the adrenals and the discoloration of the skin and the fatal asthenia is as yet unknown. The cause of the cutaneous discoloration is an excessive deposit of pigment in the rete mucosum, and pigment has been observed in the blood. The disease is most common in males, the proportion in 128 cases being 92 males and 36 females; and it is rare in youth or old age. The disease is always fatal in the end, sometimes rapidly so; it may prove fatal in a few weeks or it may last several years. The treatment is directed to the diminution of the distressing symptoms.

A. ke'loid. A synonym of Scleroderma. Additamen'tum. (Addo, through the obsolete verb addito, to add to.) An addition. A small suture sometimes found added to the lambdoid and squamous sutures.

Also a synouym of Epiphysis.

A. ad sa'cro-lumba'lem. The Acces-

sorius ad sacro-lumbalem.

A co'li. The Appendix caei vermiformis.

A.neca'tum. The olecranon.

A. sutu'ræ lambdoida'lis. See Additamentum.

A. ul'næ. The radius.

A. unca'tum ul'næ. The olecranon. Adducens. (Adduce, to bring to, or lead to. F. adducteur; G. anzichend.) Leading, or bringing together; adducent.

A. oc'uli. A synonym of the Rectus in-

ternus muscle of the eye.

Adduction. (Adduce, to lead, or bring F. adduction; I. adduction; S. adduccion; G. Anziehen, Anzichung.) The movement by which one part of the body, as a limb, or finger, is led or brought to another, or to the median line.

Adductor. (Adduce, to lead, or bring to. F. adductor; I. adduttore; S. aductor; G. Anzieher.) A term applied to certain muscles that draw a part towards the middle line either of a limb or of the body.

A. ad min'imum dig'itum. A synonym of the A. pollicis manus.

A. ar cuum. A very small muscle arising from the fascia on the ventral surface of the sterno-hyoid in Amphibia. The fibres are directed npwards and outwards to be inserted into the last branchial arch.

A. bre'vis. (F. Adducteur court, a. second de la cuisse, sous-pubio-femoral, Ch.; G. kurzer Anzieher des Schenkels.) A muscle of the thigh arising from the front of the descending ramus of the pubes on the outer side of the gracilis and the inner side of the obturator externus. It is inserted into the line leading from the small trochanter to the linea aspera, behind the pectinens and adductor longus. The profunda artery and anterior branch of the obturator nerve are in front of it; the adductor magnus, posterior branch of the obturator nerve, and a branch of the circumflex artery behind it. The internal circumflex artery passes between its upper border and the obturator externus. It is an adductor of

the thigh and a flexor of the hip-joint, and is supplied by the internal circumflex and first perforating of the profunda, arteries, and by a branch of the posterior and occasionally by one from the anterior division of the obturator nerve.

A. dig'iti quar'ti. A muscle found in the chamæleon, corresponding to an interesseous muscle, and attached to the fourth digit.

A. dig'iti ter'til. A muscle found in the chamæleon, corresponding to an interesseous muscle.

A. dig'iti ter'til pe'dis. The second plantar interesseous muscle.

A. fem'oris pri'mus. A synonym of the A. longus femoris.

A. fem'oris quar'tus. A term applied to a part of the A. magnus.

A. fem'oris secun'dus. A synonym of the A. brevis of the thigh.

A. fem'oris ter'tius. A term applied to a part of the A. magnus.

A. grac'ilis. A synonym of the Gracilis muscle.

A. lon'gus. (F. adducteur moyen de la cuisse, a. premier, pubio-femoral, Ch.; G. langer Anzieher des Schenkels.) A muscle of the thigh arising by a round tendon from the fore part of the angle of the pubis, and inserted into the middle third of the middle lip of the linea aspera, between the vastus internus in front and the addnetor magnus behind. It is in relation in front with the sartorius, from which it is separated by the femoral vessels; behind are the adductors magnus and brevis, with the superficial branch of the obturator nerve and the profunda vessels. It is a flexor and adductor of the hip joint; and is supplied by the internal circumflex and muscular branches of the femoral artery and by the anterior division of the obturator nerve.

A. mag'nus. (F. adducteur long de la cuisse, a. traisième, a. grand, ischio-femoral. Ch.; G. grosser Anzieher des Schenkels.) A muscle of the thigh arising from the pubic arch of the innominate bone, the attachment extending from the symphysis to the lower part of the ischial tuberosity. It is inserted into the lower part of the linea quadrata, the line leading down to the linea aspera from the great trochanter, the linea aspera, and the continuation of that line to the inner condyle. The fibres arising from the ischial tuherosity have a special tendon of insertion into the inner condyle of the femur. The two divisions of the muscle diverge below, leaving an aperture, which is fleshy behind and aponenrotic in front, and through which pass, from before backwards, the femoral artery and vein to become the popliteal. On the anterior surface are the other two adductors and the pectineus, with the obturator nerve and the profunda artery. The posterior surface touches the hamstring muscles and the great sciatic nerve. In contact with the upper border are the obturator externus and the quadratus femoris, with the internal circumflex vessels; and along the inner or lower border lie the gracilis and sartorius. It is an adductor of the thigh, and assists in rotating it outwards; it is supplied by the internal circumtlex and the perforating branches of the femoral artery, and by the posterior division of the obturator nerve, and a branch of the great sciatic nerve.

A. me'dil dig'iti pe'dis. A synonym of the first plantar interesseous muscle.

A. metacar'pi min'imi dig'iti.

synonym of the A. minimi digiti.

A. minimi digiti. (F. adducteur du petit doigt, opposant du petit doigt, curpo-susphalanguen du petit doigt, C., G. Anzieher des kleinen Fingers.) A muscle of the inner side of the hand. It arises from the annular ligament and the process of the uneiform hone, and is inserted into the whole length of the anterior surface of the fifth metacarpal bone. It is covered by the flexor brevis and abductor minimi digiti. It lies on the last interoseous space and metacarpal bone, and on the deep branches of the ulnur artery and nerve, which pass beneath its upper part. Along the radial border lie the long tendons of the little finger, and its ulnar border has a branch of the dorsal cutaneous nerve and of the metacarpal artery running along it. It is supplied by the ulnar nerve and deep branch of the ulnar artery.

A. min'imus. A term applied to the upper transverse fibres of the Adductor magnus separated from the rest by the superior prefunda

artery.

A. mus'cles of foot. The three plantar

interessei and the adductor pollicis.

A. mus'cles of hand. The three palmar interessei, the adductor pollicis, and the adductor minimi digiti.

A. mus'cles of thigh. The gracilis, pectinens, adductor longus, adductor brevis, and adductor magnus.

A. oc'uli. (F. adducteur de l'æil.) A synonym of the Rectus internus of the eye.
A. pollicis. The A. pollicis manus.

A. pol'licis ma'nus. (F. addacteur du ponce; metacarpo-phalanqien du ponce, Ch.; G. Anzieher des Daumens.) It arises from the whole length of the palmar surface of the metacarpal bone of the middle finger; it is inserted with the inner tendon of the flexor brevis pollicis into the uluar side of the base of the first phalanx of the thumb, and into the internal sesamoid bone. The eutaneous surface is in contact with the tendons of the flexor profundus and lumbricales muscles; the deep surface lies on the first dorsal interosscous muscle, and the second and third metacarpal bone with the intervening muscle. It is supplied by the ulnar nerve and by the superficialis vola artery.

A.pollicis pe'dis. (F. adducteur du gros orteil, metatarso-sous-phalangien du gros orteil, Ch.; G. Anzieher der grossen Zehe.) Itarises from the tarsal extremities of the second, third, and fourth metatarsal bones, and from the sheath of the tendon of the peronens longus, and is inserted with the outer portion of the flexor brevis pollicis into the outer side of the base of the first phalanx of the great toe. To the inner side is the flexor brevis, and beneath the outer border the external plantar vessels and nerve are directed inwards. It is supplied by the external plantar nerve and by the

branches of the plantar arch.

A. tri'ceps fem'oris. A term applied to the three adductors of the thigh, magnus, longus, and brevis.

Adducto'res. (Same etymon.) A term applied by Hedwig to the early stage of the

sporangia of mosses.

A. branchia rum. Muscles found in the tadpoles of Batrachia; the first runs from the dorsal end of the second branchial arch to the first gill-tuft; the second similarly from the third branchial arch to the second gill-tuft; the third,

long and delicate, extends from the angle between the precoracoid and scapular eartilages forward to the root of the third gill-tuft and dorsal part of the last branchial arch.

Adec. Arabic for Lac acctosum, or sour milk.

Adech. (Arab.) A Paracelsian term for the vital spirit of man, and internal author of the intrinsic operations and functions.

Adecid'uous. Term applied to placental

mammals having no Decidua.

**Adec tos.** ('λδηκτος, from a, neg.; δάκνω, bite.) An old name for a remedy which can remove the uneasy sensation caused by the action of more energetic medicines.

Adel-Adagam. Common name of the

Adhatoda vasica.

Ad'elaide. Australia; the eapital of South Australia, situated on rising ground on the River Torrens, seven miles from the sea. It has an average temperature in the winter of 13.5° C. (56.3° F.), and in the summer of 27.7° C. (81.9° F.) See Australia, South.

Adelarthroso mata. ('Λοηλος, not seen; ἀρθρου, a joint; σώρια, the body.) An Order, according to some, of the Division Trachearia, Class Arachnida. Abdomen present, nore or less distinctly segmented, undistinguishable from the eephalothorax; mouth with masticatory appendages. It comprises harvest-spiders and chelifers.

Adelheidsquelle. In Heilbruan, a healthy town in the lower Alps of Bavaria, altitude, 2400 feet. Mineral waters saline, containing iodine and bromine. Temperature, 10° C. (50° F.) Season, May to September. Alterative and tonie; the iodine is very small in quantity, and its influence in treatment is doubtful. Used in serofulous complaints, strumous affections of the skin, rheumatism, and gout, and for complaints peculiar to females.

Adelholz'en. Bavaria, near Traunstein. A biearbonated calcareous water; recommended in gout.

Adeli'de. ('Aôηλos, concealed.) A French term used by some authors for insensible; as transpiration adélide, insensible perspiration.

transpiration additide, insensible perspiration.

Adelipa ria. ('λόην, enough, abundant; λιπαρός, tat.) Name by Alibert for Polysarcia.

Adelobranchia ta. ('λόηλος, not

**Ade'lobranchia'ta.** (Λοηλος, not visible; βράγχαι, the gills. F. adelobranchiate, adelobranche.) An Order of the Gasteropoda, according to some authors, in which the brauchiæ are not externally visible.

Ade'locodo'nic. (Λόηλος; κώδων, a bell.) A term applied to the sessile closed sacs, sperosacs, in the llydrozoa, consisting of a process of the ectodern and endoderm, with a pouch of the somatic eavity contained. (Macalister.)

Adelodagam. A bitter plant, Adhatoda vasica, used in Malabar against asthma, eatarrh, and gout.

Adeloder ma. (Λόηλος, hidden; δίρμα, the skin. F. adeloderme.) A Sub-order of the Gasteropoda, in which the branchiæ are not seen externally. (Ferussac.)

Adelomor phous. (Aôn\lambdas, concealed;  $\mu o \rho \phi \dot{m}$ , shape, form.) A term applied by Rollett to inconspicuous cells of rounded form which line the glands of the stomach to a greater or less extent. In some instances, as in the so-called aurous glands, the cylindrical epithelium of the general surface of the nucous membrane occupies the mouth of the gland, and is replaced in its

neck and fundus by the adelomorphous or chief cells (Hauptzellen of Heidenhain). In the peptic glands of the pylorus the adelomorphous cells succeed the cylindrical cells of the orifice and line the neck of the gland, but are themselves separated from the wall of the gland, and ultimately altogether replaced near the fundus by the delomorphous cells of Rollett (Belegzellen of Heidenhain). In the process of digestion these cells at first swell up strongly, and then return to their former size.

Adelopneu mona. ('Λδηλος, hidden; πυεύμων, the lungs. F. adelopneumone.) Applied by Gray to an Order of the Gasteropoda that respire by branchiæ hidden in the interior of

the body.

Ade'lop'odous. ('Aδηλος, hidden; πούς, foot. G. Verborgenfüssler.) A term applied to

animals whose limbs are concealed.

**Adel'pheous.** ('Αδελφός, a brother, or relation.) Related; cognate; formerly applied to diseases which have an affinity to each other. **Adel'phia**. ('Αδελφός, a brother; F.

adelphe.) In Teratology, a form of monstrosity which is double.

Also a term used to express similarity between diseases.

**Adelphix** 'ia. ('Αδέλφιξις, brotherhood.) Term applied to parts having relationship to

each other in disease.

Adelphix'is. (Same etymon.) Sympathy. Adel phous. ('Αδελφός, a brother. F. adelphe; G. bündelige.) Term applied to the union of stamens by their filaments, the number joined being indicated by the prefix, as, monadelphous, di-, tri-, and polyadelphous.

Ademo'nia. (Λοημονία, trouble, distress. F. ademonie; G. Angst.) Restless thought;

mental distress or anxiety.

Ademos yne. (λδημοσύνη, rare form for Αδημονία.) Depression of spirits, nostalgia.

Ade'n. ('λδήν, a gland.) A gland; a bubo.

Adenal'gia. (Αδήν, a gland; ἄλγος, pain. F. adenalgie; G. Drusenschmerz.) Pain in a gland.

**Adenan'dra.** ('Αδήν; ανήφ, a man.) A Genus of the Suborder *Diosmew*, Nat. Ord. Rutaceæ, chiefly found in Southern Africa. The flowers have a cupuliform receptacle. Petals naked and subsessile. Stamens 10, 5 epipetalous and sterile, and 5 fertile and surmounted with a stipitate gland. Gynæcium composed of 2-5 carpels with stipitate gland; styles fused into a 2-5 lobed column, with discoid extremity. Fruit formed of 2-5 cocci. Leaves alternate. They are aromatic, and are employed as stimulants, expectorants, and diuretics.

A. uniflo'ra. The leaves of this species, mingled with those of some Diosmea, Barosma,

Agathosma, &c., constitute Buchu.

Adenan'thera. ('Aδήν, a gland; anther.) A Genus of plants of the Suborder

Mimoseæ, Nat. Ord. Leguminosæ.

A.pavoni'na. (Tam. Anal-kundamume; Hind. Kuchun-doona.) Ilab. India. A large tree, with bipinnate leaves and small, fragrant, yellow flowers. The seeds are of a shining scarlet colour, with a circular streak in the centre, and are used as weights by the jewellers, each being equal to four grains. They are said to be poisonous.

Adenceto'pia. ('Λδήν, a gland; ἔι, τοπος, away from a place. F. adencetopie; G. Adenckopic.) A condition in which a gland does not occupy its natural situation.

Adenemphrax'is. ('Λδήν; ἐμφράσσω, to obstruct. F. adenemphraxie; Drüsenverstop-

fung.) Term for glandular obstruction.

Ade'nia. (F. adenie.) A term applied to a form of disease frequent in scrofula, and occasionally seen in syphilis, in which many of the lymphatic glands of a particular region are affected with chronic adenitis. See Anemia lymphatica. Also used to describe certain of the conditions

of Leucocythæmia.

Ade'nia venena'ta. A doubtful name of a strongly poisonous plant of Arabia.

Also the name of a Passion flower growing in

Central Africa, and used as a vesicant.

Ade'niform. ('Αδήν, a gland; forma, resemblance.) Formed like a gland; glandiform; of the shape of a gland.

Adenisation. ('Aôn, a gland. F. ad nisation.) The state of a part in which adenoid degeneration has taken place; or the pathological process in which it consists.

Adenitis. ('Aôn'v, a gland. F. adenite; G. Drusenentzundung.) Inflammation of a gland.

A. acu'te. This may be either preceded by an inflammation of the ducts, angioleucitis, or the inflammation may commence in the interior of a gland by the absorption of some deleterious agent from a simple, a syphilitic, or a malignant sore. General phenomena of inflammation are observed. The afferent and efferent vessels become occluded by the exudation of inflammatory products, and pus is formed. Such cases of phlegmonous adenitis are common in the groin, where care must be taken to avoid confounding them with strangulated hernia, and in the axilla. Adenitis may terminate in resolution, in induration, or in suppuration. The treatment should be directed to the constitutional disturbance causing the formation of the tumour. In the early stages leeches may be needed, with fomentations or poultices, or spirit lotions may be sedulously applied. If an abscess form, several punctures may be made into it through the skin with a needle, or it may be opened, or aspirated, or poulticed and allowed to burst, or a seton may be passed through it.

A. chron'ic. This condition constitutes the greater number of the so-called cold abscesses and scrofulous swellings. They are very common in the neck. Iodide of potassium in spirit lotion, or iodine ointment is generally recommended; tonies and cod-liver oil, and good diet will be needed. The sore, after the opening of the abscess, may need stimulating applications.

A. meibo'mian. A term used to describe inflammation of the Meibomian glands.

Also a synonym of Chaluzion.

A. subacu'te. A condition which often follows injuries or strains, especially in weakly or scrofulous persons. Spirit lotions containing iodide of potassium, good diet, tonics, and rest are advised.

Adeni'tis lymphat'ica. Inflammation of the lymphatic glands.

A. mesenter'ica. Inflammation of the mescuteric glands.

A. palpebra'rum contagio'sa. A syn-

onym of purulent ophthalmia.

Ade'no-. ('Αδήν, a gland.) This word occurring as a prefix in many compound terms denotes relation to, or connection with, the glands or adenoma.

Ade'nocele. Same as Adenoma.

**Adc'nochirapsolo'gia.** ('Λεήν'; χειραψία, a touching with the hands; λόγος, a discourse. F. and G. adenochirapsologie.) The doctrine of the reputed faculty possessed by the kings of England of curing scrofulous disease by touching the patient.

Ade'nochœradolo'gia. The same as

Adenochwiradelogia.

Ade'nochoiradelo'gia. ('Λδήν; χοιeders, scrofulous swellings; λόγος, a discourse.) The doctrine of glandular and strumous swellings; a book under this title was published by Dr. John Browne, of Norwich, in 1684.

**Adenochon'drious.** ('Λδήν, a gland; χόνδρος, cartilage.) Applied to tumours affecting

gland and cartilage.

Adeno'des. Same as Adenose. Adenodias'tasis. ('Αδήν'; διάστασις. a separation. F. adenodiastase.) Division of a gland; the abnormal separation of the lobes of conglomerate glands from each other.

**Adenodyn'ia.** ('Αδήν, a gland; ἀδύνη, pain.) Pain in a gland.

Adenogen'esis. ('Acin; yévers, generation. F. adenogénésie; G. Drusenbildung.) The

formation of glands.

**Adenog raphy.** ('Αδήν, a gland; γράφω, to write. L. udenographia; F. adenographie; G. die Beschriebung der Drüsen.) Term for a treatise or dissertation on the glandular system.

Adenoid. (Acop. a gland. L. adenoides; F. adenoide; G. drüsenformig.) Resembling a gland; adeniform; gland-like; glandular.

A. bod'y. A synonym of the I'rostate gland.

A. can'cer. See Cancer, adenoid. A. mus'cle. A small fasciculus of muscular fibres occasionally found on each side of the thyroid gland; it forms part of the inferior con-

strictor of the pharynx. (Winslow.)

A. tis'sue. A variety of connective tissue occurring in the lymphatic glands, Peyer's patches, mucous membrane of the alimentary canal, and other structures. It consists of delicately reticulated, sometimes nucleated, fibres, in the meshes of which are numerous lymphoid corpuscles.

A. tu'mour. A tumour presenting the structures of a gland. See Adenoma.

A. vegeta'tions. Term applied to small polypoid growths of mucous membranes.

Adenoi'da cor pora. ('Αδήν, a gland; corpus, a body.) A term proposed instead of inclanosis for those tumours in which the glandular structure is more important than the pigment deposit.

**A. plas'mata.** (Πλάσμα, a thing formed.) A synonym of A. corpora,

Adenoi'des. An old epithet of the prostate gland.

Adenologadi'tis. ('Αĉήν; λογάδες, the white of the eyes.) Inflammation of the Meibomian glands and of the conjunctival membrane of the eye.

**Adenol'ogy.** ('Aδήν, a gland; λόγος, a discourse. L. adenologia; F. adenologie; G. Drnsculchre.) The doctrine which treats of the glandular system.

Adenolymphat'occle. The same as

Adenolymphocele.

Adenolymph'ocele. ('Aôn'v, a gland; lympha, water; κήλη, a tumour.) Dilatation of the afferent or efferent vessels of lymphatic glands. A synonym of

Adenolympho'ma. Lymphadenoma.

Adeno'ma. ('Λδήν, a gland; and the ter-

mination oma adopted to indicate a tumour. F. adenome, tumeur glandulaire hypertrophique; I. tumore glandulare; G. Lymphome, Drüsengeschwulst.) Adenomata are tumours originating from pre-existing gland-structure and presenting the general characters of racemose or of tubular glands. Robin considers that they differ, according to whether all the constituent parts of a gland are equally or nearly equally hypertrophied; or whether only the vesicles or closed sacs, with their contained epithelium, have augmented in numher and in volume, without the intermediate elements of the gland being altered in quantity or disposition; or whether the walls alone of the vesicles have become thickened and enlarged with or without fibroid degeneration; or lastly, whether, as is most usual, the epithelium alone of the gland vesicles has increased in quantity and altered in character. In this last case, by the distension of the vesieles and the compression of the intermediate tissue, the tumour may assume the characters of an epithelium, or the organ may aetnally, as a whole, diminish in size, as is sometimes seen in the case of the manima and liver. Adenoid tumours are lobulated, hard, nonadherent to the skin or surrounding tissues; not painful, and develop slowly. The mammary, parotid, thyroid, prostate, and sudoriparous glands, are those that are most frequently affected. They may remain in direct connection with the gland from which they sprang, or they may become separated and encapsulated.

Adenomata are usually divided into two forms,

the racemose and tubular.

A. ac'inous. A synonym of Racemose adenoma.

A. cylin'drical. A synonym of Tubular adenoma.

A. rac'emose. This form occurs in the breast gland and the entaneous glands, less frequently in the salivary and mucous glands. It seldom exceeds the size of an egg; is firm, elastic, smooth, and lobulated. It consists of small acini. limited by a fine hyaline membrane, and enclosing two or more layers of small epithelial eells. The acini communicate with each other, and are surrounded by a greater or less quantity of connective tissue, which carries the blood-vessels, and sometimes contains spindle cells. Racemose adenomata approach the characters of cancer when the cell element predominates; those of fibroma when the connective tissue is in excess. Fatty degeneration and eystic and mucoid changes are not uncommon.

A. tu'bular. This form occurs in the glands of mucous membranes, and constitutes one form of mucous polypus. It is soft, greyish, slightly vascular, somewhat gelatinous, and semitranslucent, and occasionally peduneulated. A longitudinal section discloses long, sacculated gland tubes, often with lateral outgrowths, enclosing cylindrical epithelial cells of larger size than natural; in transverse section the same tubes appear as circles lined with epithelium, and containing a refractile colloid material. Thoular adenoma is very liable to cystic degeneration, in which is a colloid or nincoid substance; it is very subject to cancerous infiltration.

Adenomala'cia. ('Λδήν; μαλακία, softness. F. adinomalaeue; G. Drüsenerweichung.) Softness or softening of the glands.

**Adenomeninge'us.** ('Λέην; μήνιγξ, a membrane. F. adenomeninge.) Λ name given

by Tinel to the mucous or pituitous fever (Febris adenomeningea), because the membranes and follicular glands of the intestines were held to be the chief seat of the complaint. Probably typhoid

Adenomesenteritis. ('Acho; mesenteritis. F. adenomesenterite.) Indammation of

the mesenteric glands.

Ade'nomyxo'ma. ('Λεὴν, and μύξα, mucus.) A composite growth, presenting the characters both of adenoma and of myxoma.

Adenonco'sis. ('Αδήν; δγκόω, to increase in hulk. F. adenoncose; G. Drusengesch-wulst.) The swelling of a gland.

Adenonervo'sus. See Adenoneurosus. Adenoneuro'sus. ('Λδήν'; νεύρον, a nerve. F. adenonerveuse.) A term applied by Pinel to the plague (Febris adenoncurosa), because the disease attacks the nerves and lymphatic glands of the axilla and groin.

**Adenop**'athy. ('Αδήν; πάθοs, disease.) Affections or diseases of glands, and especially of

the lymphatie glands.

Adenopet'aly. (F. adenopetalie.) A term employed by Morren to indicate the metamorphosis of the nectary into petals.

Ade no-pharynge al. ('Αδήν, a gland; φάρυγξ, the throat.) That which belongs to, or

relates to, the pharynx and the thyroid gland.

A. mus'cle. A part of the inferior constrictor muscle of the pharynx, consisting of a small muscular fasciculus found on each side of the thyroid gland. Also called Adenoid muscle.

**Ade'nopharyngi'tis.** ('Αδήν; φάρυγξ, the throat. F. adenopharyngite.) Inflammation

of the tonsils and pharynx.

Adenoph'orous. ('Αδήν; φέρω, to bear. F. adenophore; G. drusentragend.) Applied to a plant or an organ having glands on some one of its parts.

Adenophthal'mia. ('Αξήν; ὀφθαλμός, the eye. F. adinophthalmie; G. Augendrusenentzündung.) Inflammation of the Meihomian glands.

Adenophthalmi'tis. Same as Adenophthalmia.

Adenophyllous. ('Αδήν; φύλλον, a leaf. F. adenophy/le; G. drüsenblüttrig.) Ap-('Αδήν; φύλλον, α

plied to a plant with leaves possessing glauds. **Adenophy'ma.** ('Aôήν', φῦμα, a tumour. F. adénophyme; G. Drusengeschwulst.) A glandular tumour.

Adenop'odus. ('Aĉńv; πούs, a foot. F. adinopode; G. drüsenfüssig.) Having glands on the petioles, as the Passiflora adenopoda. Ade'nos. The ancient name of cotton.

**Ade'nosarco'ma.** ('Αδήν; σάρξ, flesh.) A tumour, presenting the characters of a sarcoma mixed with adenoid growth.

**Ade'noscir'rhus.** ('Αδήν; σκίζος, or σκίζος, an induration. F. adenoscirrhe, adenosquirrhe; G. Drüsenskirrhus.) Glandular seir-

**Ade'nosclero'sis.** ('Αδήν; σκληρόω, to harden. F. adenosclerose; G. Verhartung der A term applied to a hard indolent Drüsen.)

swelling of a gland, not of a scirrhous character.

Ad'enose. ('Aciju, a gland. F. plein des glandes.) Having many glands; full of glands; glandulous.

Adeno'ses. ('Aĉήν.) Chronic diseases of the glandular system. (Alibert.)

Adeno'sis. Same as Adenogenesis. A. scrofulo'sa. Scrofula,

Adenoste mon. ('Αδήν; στήμων, thread. F. adenostemone; G. drisenstanhfadig.) Having glands on the filaments of the stamens, as Macairca adenostemon.

Adenosty'leæ. ('Λδήν; στῦλος, a pillar, F. adenostyle.) Applied by Cassim to a tribe of the Compositive having the Adenostyles for their

Ade'nosynchitoni'tis. ('Aôn'; synchiton, the conjunctiva, from συν, together, χιτών, a tunic.) Same as Adenologaditis.

Adenot'omy. ('Αδήν: τέμνω, to cut. adenotomic.) Term for dissection of the adenotomie.) glands.

A'den ul'cer. An ulceration of the leg which follows on a condition of body very similar to Beriberi.

**Ade'phaga.** ('Λδηφάγος, voracious.) Λ Sub-group of the Group Pentamera, Order Coleoptera. Two palpi to each maxilla; antennæ filiform.

Adepha'gia. ('Λόην, one's fill; φαγείν, Voracity, or the disease Bulimia.

Ad'eps. (L'. adeps, the soft fat of animals; perhaps from άλειφα, anointing oil. F. lard, graisse; I. grusso, adipe; S. grassa, manteca; G. Fett, Schmalz; Dutch, ret, talk.) The officinal name, U.S. Ph., of the fat of the hog. Lard contains 62 per cent. of olein and 38 per cent. of palmitin and stearin. It has been adulterated with potato flour, water, and also with salt, alum, potassium and sodium carbonates, and lime. The starch grains may be detected by the microscope, the salme matters by incincration.

A. anseri'nus. (F. graisse d'oie; G.

Gans fett.) The fat of the goose.

A. an'seris. (L. unser, a goose.) The fat of the goose.

A. benzoa'tus. Br. Ph. Benzoated lard. Prepared lard, 16 oz.; benzoin in powder, 160 gr.; heat together in a water bath for two hours, stirring occasionally, and strain: lastly, stir till cold. Out of the 160 grs, of Siam henzoin in tears 50 grs. remain undissolved. Proportion 1-64. The benzoin is intended to prevent the occurrence of rancidity. It is used as a basis for ointment and suppositories.

A. cantharid'ibus medica'tus. The Pommade épispastique verte. Fr. Codex.

A. cor'tice daph'nes gni'dii medica'tus. The Pommade épispastique au garou. Fr. Codex.

A. ex hydrar'gyro mit'ius die'tum cine'reum. The Unguentum oxidi hydrargyri cinerei.

A. huma'nus. Human fat.

A. hydrar'gyri muria'te oxygena'to medica'tus. The Fommade de Cirillo. Fr. Codex.

A. hydrar'gyri nitra'te medica'tus. The Unquentum hydrarqyri nitratis.
A. hydrar'gyri oxi'do ru'bro et

plum'bi aceta'te medica'tus. The Pommade ophthalmique de Rigent. Fr. Codex.

A. hydrar'gyro medica'tus. The Unguentum hydrargyri

A. lau'ro medica'tus. The Pommade de laurier. Fr. Codex.

A. medul'læ bo'vis. (G. Rindsmarkfett.) The fat contained in the spinal canal of the ox.

A. myris'ticæ. (F. beurre de museade ; G. Oleum myristice; Aust. and Belg. ol. nucis moschate.) Concrete oil of nutmegs, or oil of mace; Oleum myristice expressum of the B. Ph. A concrete oil of firm consistence and orange colour, obtained from nutnegs by expression and heat. It is contained in the Emplastrum calefaciens and in the Emplastrum picis.

A. odorif'erus. Aromatic lard. Made by mixing lard and magnolia pomade in equal

weights.

A. ovil'lus. (L. sebam; F. snif; I. sevo; S. sabo; G. Hammelstalg; Dan. Faarctalg; Int. osseret.) The fat of the sheep, mutton suet; tallow.

A. oxi'do zin'ci medica tus. The Un-

guentum oxidi zinci impuri.

A. oxygenatus. Oxygenated lard. A non-officinal preparation made by heating 8 parts of lard with 1 of nitie a id, sp. gr. 155, added by degrees, and stirring till nitrons acid is given off, when it is removed from the fire and stirred till cool. Used, when mixed with half its weight of almoud oil, to dilute citrine ointment.

G. Ph. Nitrie acid 1, lard 16 parts.

A. papav'ere, hyoscy'amo et belladon'na medica'tus. The l'ommade populium. Fr. Codex.

A. pe'dum tau'ri. (G. Rindsklauenfett.)

Neat's foot oil, or fat.

A.præpara tus. Br. Ph. Prepared lard, axunge. The fresh internal fat of the abdomen of the hog. Sus scrofa, washed in cold water, then liquefied at a heat not exceeding 100°C. (212°F.), strained through flannel, put into a pan, heated by steam to a slightly higher temperature until it becomes clear and free from water, and again strained A soft white substance, melting at about 38°C. (100°4°F.), and soluble in ether. Used as a basis for ointments.

A. suil lus. (F. axonge, graisse, saindoux; I. sugna di majule, grasso di porco lurdo; S. manteca de pueres; G. Schweineschmalz, Schweinefett; Dut. Reuzel; Dan. Seinefatt; Swed. Swinister; Arab. Sciahumkansir.) The fat of swine; lard; hog's lard; saim. See Adeps pra-

paratus.

A. suil'lus cura'tus. A synonym of A. præparatus.

A. suil lus præpara tus. A synonym

of A. præparatus.

A. sulfu're et ammo'niæ muria'te medica'tus. The Pommade antipsorique. Fr. Codex.

A. sulfu're et carbona'to potas'sæ medica'tus. The Pommade antipsorique d'Helmerich. Fr. Codex.

A. tar'taro stib'ii medica'tus. The Unquentum antimonii tartarati, Br. Ph., and similar ointments.

Adep'ta philosoph'ia. See Adeptus.

A. medicina. See Adeptus.

Adep'tus. (Adipiscor, to obtain or come by a thing.) Having gotten, or obtained; applied by Paracelsus, and van Helmont, to that kind of philosophy which aimed at the transmutation of metals, and the discovery of a universal remedy styled Adepta philosophia, its professors being called adepts.

Formerly applied to a branch of medicine which professed to treat diseases caused by the influence of the stars and planets, and was called

Adopta medicina.

Adermia. (Λ, priv.; εέρμα, the skin. F. adermie; G. Hautmangel.) Absence or defect of the skin

Adermoner via. (A, neg.; εέρμα, skin; νεύρου, a nerve.) Paralysis or loss of sensibility of the skin. (D,)

**Adermotroph'ia.** ('Λ; δέρμα; τροφή, nourishment.) Atrophy or imperfect nutrition of the skin.

Ades'mia. ('A, neg.; ἀεσμός, a bond.) Defective union. M. Morren, who suggested the use of this term in Botany, distinguishes homologons from heterologous adesmia, the former signifying defective coherence, the latter defective adherence.

Ades'my. Same as Adesmia.

A deux temps. (F.) An operation performed à deux temps signifies that a preliminary proceeding is undertaken with a view of facilitating the performance of the chief operation, as when an iridectomy is performed previously to the extraction of a cataract. It is also applied to the operation of lithotomy when the calculus, being encysted in a puch of the bladder or retained by its contraction, cannot be immediately extracted, and is therefore let alone for some days in the hope that during the suppurating stage it will have become disengaged, and may then be extracted.

Adfla'tus. See Afflatus.

**Adhæ**'rens. (Adhæreo, to stick to. G. anhang nd.) Applied to some part of an animal or vegetable united more or less intimately with surrounding parts. See Adherent.

Adhæsivus. (Same etymon.) See Ad-

hesive.

Adhato'da. A Genus of the Nat. Ord. Acanthaceæ. Herbaceous plants with opposite entire leaves. Flowers axillary, with large bracts, calyx gamosepalous, 5-partite; corolla gamopetalous, irregular, bilabiate; anthers bilocular and spurred; ovary superior, with 2 cavities, each with 2 ovules. Fruit a depressed capsule with 4 lenticular seeds.

A Cingalese term for the expelling of a dead

fætus, according to Turton.

A. tranquebarien'sis. (Tam. Tavashumocrungie, Poonakoo-poondoo; Tel. Findi-konda.) Ilab. India. The juice of the leaves is considered cooling and aperient, and is given to children in smallpox. The bruised leaves are applied to contusions.

A. vasica. (F. Noyer des Indes; Hind. and Duk. Adalsa, Arusa, Adarsa; Tam. Adatodai; Tel. Adasaran; Mal. Atalotakam.) Malubar nut. A shrub inhabiting India. The juice of the leaves, in doses of one or two drachms, with one drachm of fresh ginger jnice, is nsed as an expectorant in coughs, asthma, and phthisis. The leaves, flowers, and root are considered antispasmodic, and are given in cases of asthma, internittent fever, and rheumatism. The fresh flowers are hound over the eyes in cases of ophthalmia. The decoction of the leaves is employed as an anthelmintic.

Adherence. (L. adharentia, from adharo, to stick to. F. adherence; 1. aderénza; S. adherencia; G. Verwachsung.) The fusion, more or less extensive, of adjoining tissues or organs.

In Botany, in gamopetalous flowers, the filaments of the stamens habitually adhere to the petals, and the petioles of leaves frequently con-

tract adhesions to the stem.

In Medicine, adherence often occurs between inflamed contiguous internal surfaces, as the pleura, and also between opposed or neighbouring parts after hurns, as in the case of the fingers, and of the chin and chest.

In Teratology the fingers and toes, and the margins of the cyclids are sometimes adherent.

Adhe'rent. (Same etymon.) Attached to; connected with; fused together or coalesced.
A. attrac'tion. Capillary attraction.

A. ca'lyx. In Botany, applied to the calyx when it is more or less united to the ovary, as in the iris, myrtle, and gooseberry.

A. o'vary. In Botany, applied to the ovary when the cally x is more or less united to it.

A. placen'ta. See Placental adhesion. A. stip ules. In Botany, applied to stipules which are more or less united to each side of the base of the petiole.

**Adhe'sion.** (Adhæreo, to stick to. F. adhésion; G. Anhängung; Anhlebung.) The act of two hodies sticking to each other.

In Physics, the term is used to denote the form of molecular attraction which is exerted between bodies in closest contact, by which they are enabled to stick to each other. Adhesion may take place between solids, between solids and liquids, and between solids and gases. The force is independent of atmospheric pressure, in its manifested in vacuo.

In Surgery, the term expresses the union of two cut, or raw, or inflamed surfaces, and is of

two kinds, primary and secondary.

In Pathology, the term is applied to unnatural union of two surfaces after inflammation, as when the costal and pulmonary pleure become adherent after pleurisy; the two pericardial surfaces after pericarditis; or two synovial surfaces after inflammation of a joint.

A.figures. A term applied to the changing form presented by a drop of crude carbolic acid, or of esseutial oil, when brought into contact with

water or other fluid.

A. pri'mary. One of the modes of healing of wounds; in which healthy lymph is poured out when two cut surfaces are brought into close proximity, and vascularisation and cicatrisation take place without suppuration. See *Healing of wounds*, *Lymph*.

A. secondary. That mode of healing of wounds in which primary adhesion not having taken place, granulations spring up, and, being brought together, unite. See *Healing of wounds*.

Adhe'sive. (Adharco, to stick to. F. adhésif; G. adhäsive; verwachsend.) Having the property of adhesion; capable of sticking to.

A. inflammation. (F. inflammation adhesive; G. rerwachsende Entzingdung.) Term for the process by which incised wounds sometimes heal; their sides being brought into exact contact, are united without any suppuration, constituting what is termed, union by the first intention.

 $\Lambda$  synonym of Primary adhesion.

Also a term used to express that form of inflammation in which lymph or plasma is poured out, which, becoming organised, produces adhesions between naturally free parts, or deposits in, and indurations of, the substance of organs.

A. iri'tis. See Iritis.
A. of soft pal'ate. A condition occasionally resulting from the healing of syphilitic ulcerations, whereby the soft palate becomes united to the pharyux, and the aperture between the posterior nares and the mouth is much obstructed.

A. phlebi'tis. See Phlobitis.
A. plas'ter. (F. emplaire adhésif; G. harzigtes Bleipflaster.) The Emplastrum resine, or Emplastrum lithargyricum resina; made from resin in powder 2 parts, litharge plaster 16, hard eap 1 part; melt the plaster with a gentle heat, add the resin and soap, first liquefied, and mix.

Used, spread on muslin, for bringing the edges of wounds together, and for giving support to ulcers.

Adhe'siveness. (Adhaero, to stick to. F. adhesivite.) The power or quality of sticking or adhering to. A faculty common to man and the lower animals, producing the instinctive tendency to attach one's self to surrounding objects, animate and inanimate, and also, the love of seeiety. Its organ, according to the phrenologists, is on each side of Concentrativeness, higher up than Philoprogenitiveness, and just above the lambdoid suture.

Adhoto'da. Same as Adhatodu.

**Adiabat'ic.** ('Αδιάβατος, from å, neg.: διαβάλλω, to pass over.) In physics, absence of interchange of heat with surrounding bodies. Applied to the compression or expansion of gases.

Adianta'ceæ. A synonym of Adianteæ. A Subtribe of the Tribe Polypodteæ, Order Filiess. Sori linear, marginal, placed at the apiess of the veins; indusium spurious, formed by the revolute margin.

Adian tum. (Adiantos, the maidenhair fern, from a, neg; handon's, capable of being wetted. F. eapillaire; G. Francahaar.) A Genus of the Suborder Polypoliee. Nat. Ord. Filices; or of the Order Filices, Class Filicina; Subkingdom Pitridophyta. Petioles slender, bi- or tripinnate, pinuules triangular, cunciform; sori oblong, situated on the apices of all the lobes; industum marginal, formed by the reflexed portion of the apex of the lobe, veiny, dehiseing on its innerside; sporothece divided into compartments by septa, which contain the sporangia.

A. Æthiop'icum. A species of maidenhair, found at the Cape of Good Hope, and used as an astringent and aromatic, and to relieve cough.

A. al'bum. A synonym of Asplenium ruta muraria.

A. au'reum. The Polytrichum commune. A. canaden'se. The A. prelatum.

A. eapil'lus ven'eris. (F. Capillaire de Montpellier; G. Frauenhaarkrautfurn, Venushaar; S. culentrillo de poo; I. Cupelvenere; Arab. bersallsan, cozbar-el-bir; Turk. baldiri kara.) The maidenhair fern. Ilab. Europe. Leaves doubly compound; leaflets alternate, wedge-shaped, ou capillary stalks; indusia obloug; nervures divergent, dichotomous. Grows on moist walls and rocks. It is mucilaginous and aromatic. Used as a pectoral in infusion or syrup. See Capillaire.

A. coriandrifo'lium. A synonym of A. capillus veneris.

A. melanocau'lon. (Μέλας, black; κανλός, the stalk of a plant.) An Indian species, the leaves of which are believed to be tonic.

A. ni'grum. A synonym of A. capillas vencris.

A. pa'tens. A synonym of A. pedatum. A. peda'tum. (F. Capillaire du Canada; G. fussformiges Frauenhaar.) Leaves pedate, divisions pinnate; leaflets oblong, lunate, incised at the upper edge, representing half a leaf. Hab. North America. Used as the A. capillus veneris.

A.ru'brum. A synonym of the Asplenium trichomanes.

A. ten'erum. (F. Capilluire du Mexique.)
Petiole smooth, black, much branched; leaflets
trapeziforu, alternate, incised at the upper border,
dark greeu. Hab. South America. Used as the
A. capillus veneris.

 $\mathbf{A}$ . trapezifor'me. A synonym of A.

tenerum.

A.ve'rum. The Adioutum capillus l'eneris. A. vulga're. Same as A. verum.

Adiaphore sis. ('A, priv.; διαφορέω, to throw off by perspiration. F. adiaphorese.) A term for deficient cutaneous perspiration.

Adiaphoro'sis. Same as Adiaphoresis. Adiaph'orous. ('Αδιαφορέω, to be indifferent.) Indifferent; inert. A term applied synonymously with neutral, to medicines which do neither good nor harm; also to neutral salts.

Adiapneus'tia. ('A, neg.; διαπνέω, to perspire. F. adiapneustie; G. unterbrochens Hautausdünstung.) Suppression of perspira-tion; held by the ancients to be the cause of

**Adiapto'tos.** ('Λδιάπτωτος, not liable to err.) An electuary composed of stone parsley, henbone, &c., according to Galen, de C. M. sec. loc. ix. 4, and which was supposed efficacious

against all inflammations. (Gorræus.) **Adiarrhoe'a.** ('Λ, priv.; διαβόρω, to flow through.) Gr. άδιάββοια, used by Erotianus for a suppression or retention of any of the natural secretions.

Adiathe'sic. (A, neg.; διάθεσις, diathesis. F. adiathésique ; I. adiatesico.) Applied to discases which are not due to congenital diathesis.

A'dib. Arabic for wolf, the liver of which was recommended in all cases of weakness of that

organ by Avicenna, iii. fen. 14, tr. i. c. 18, fin. A'dibat. (Arab. Adib.) A former name for mercury.

Ad'ice. Same as Adike.

Ad'ike. ('Λοικέω, to mjure.) Greek name for the nettle.

Ad'ipate. A salt of Adipic acid.

Adipa'tus. (Adeps, fat.) Adipose, fatty. Adip'ic ac'id. (Adeps, fat. F. acide adipique; G. Adipinsaure.) Formula C6H10O4. A dibasic, diatomic acid, obtained as one of the oxidation products of the fatty acids by means of nitric acid; it is also produced by the action of nascent hydrogen on hydromuconic acid. It crystallises in white bemispherical masses or in flat needles, which dissolve in thirteen parts of cold water, sublimes when heated, and melts at 148° C. (298.4° F.).

Adipoce'ra. Adipocere. A. ceto'sa. (L. cetus, a sea-monster, a kind of whale.) A synonym of Spermaceti.

Ad'ipocere. (L. adeps, fat; cera, wax. F. adipocere, gras des cadavres; I. adipocera, grasso dei cadaveri; S. adipocera; G. Fetiwachs, Lichenwachs.) This term, as originally employed by Foureroy, included cholesterine and spermaceti, as well as the substance now known by the name, which is a whitish soapy material, produced by the exposure of animal structures to moisture when air is excluded. It consists chiefly of ammonium, with some potassium and calcium, in combination with stearie, palmitie and oleic acids; and so is a soap. Its melting point varies from 94 C. (201.2° F.) to somewhat higher. The time required to convert the human body into adipocere varies according to several circumstances, among others according to the fatness, for muscles and viscera require a longer time for the change than fat. In water the conversion has taken place in some degree in five or six weeks; in the earth a much longer period is necessary.

This power of conversion of flesh into fat has been supposed to account for the fattiness of geological strata in which animal remains are

abundant.

Adipocer'iform. Having the appearance of Adipocere.

A. tu'mour. A synonym of Cholesteatoma. Adipo'cerite. A fatty susbtance found in peat bogs, along with the ironstone of the coal-measure and with sandstone strata.

Adipo'ma. A synonym of Lipoma.
Adipose. (L. adeps, fat; Gr. λιπαρός; F. adipeax; I. and S. adiposo; G. fettartig. fettig.) Of, or belonging to, or of the nature of,

A. ar'terics. A name given to branches of the phrenic, capsular, and renal arteries, which

supply the fat around the kidneys.

A. cush'ion of ear. A cushion of fat found in horses and ruminants, and never absent even in the most emaciated animals. It envelopes the base of the concha in front, inwardly and posteriorly. It facilitates the movements of that organ.

A. lig'ament. (F. ligament adipeux; G. fetthaltige synovialfalt der Knie-gelenk.) Term applied to a fold of the synovial membrane lining the knee-joint; it extends from the patella to the space between the condyles of the femur.

A. mem'brane. The Adipose tissue. A. sarco'ma. A term given to a firm fatty tumour, and also to a sarcoma which contains much fatty tissue.

A. tis'sue. (L. adeps, fat; F. tissu adipeux; 1. tessuto adiposo; S. tejido adiposo; G. Fittgewebe.) Fat cells united by connective tissue into lobules which are freely sup-plied with blood-vessels. Adipose tissue is especially found in man beneath the skin, where it is termed the panniculus adiposus, and is accumulated in large masses on the buttocks. palm of the hand and sole of the foot, and female breast, as well as generally over the belly: in the abdomen forming large masses around the kidney; in the mesentery, and omentum; in the thorax, around the heart; in the orbit; in the central medullary eavity of bones; and, in fat persons, abundantly deposited around the vessels and joints, and between the muscles. In many animals adipose tissue is collected in the form of humps and separate masses. It is absent beneath the skin of the eyelids, penis, scrotum and nymphæ, the eavity of the eranium, and in such organs as the liver, lung, and kidney. It is pale in colour in the infant, yellower in the adult. Fat or adipose cells are round, or polygonal from pressure, and vary in diameter from 1-500 to 1-50 of an inch. They have a well-defined cell-wall, beneath which is a layer of granular protoplasm, presenting at one point a thickening which surrounds the nucleus and one or more large drops of oil. The oil is liquid during life, but after death presents in some instances a crystalline stella resulting from the solidification of its less fusible constituents. These constituents vary in different animals, but in man fat is a mixture of a fluid oleaginous substance, triolein C<sub>57</sub>II<sub>104</sub>O<sub>6</sub>, and two solid substances, tripalmitine  $C_{51}H_{190}O_{67}$  and tristearine  $C_{57}H_{110}O_{67}$ . The sp. gr. of fat is about 0.924. The blood-vessels form a fine network surrounding and supporting the vesicles and forming lobules. lymphatics follow the course of the bloodvessels. The nerves found in adipose tissue are those which are traversing it only, and do not furnish any supply to it. The development of adipose tissue results from changes taking place in the ordinary cells of connective tissue; these

become enlarged, their protoplasm studded with minute oil globules, which, fusing together, form a single large one, occupying the centre of the cell and pressing the protoplasm and nucleus towards the periphery. The uses of adipose tissue are to distribute pressure, as on the buttoeks and mamma; to fill up inequalities, as around joints; to facilitate motion, as in the cases of the eye and heart; to retain heat, as in the panniculus adiposus, a striking example of which occurs in the whale; to confer lightness and elasticity; and. lastly, to constitute a store of nutriment, which by its oxidation may maintain the temperature of the body. It is always present where active metamorphosis of tissue is taking place. In prolonged fasting and in wasting diseases it is almost entirely absorbed, the fat cells losing their oil and become partially filled with a serous fluid. Its accumulation is favoured by abundant food, whether nitrogenous or nonnitrogenous, by rest of mind and body, by sleep, and perhaps by some medicaments, as arsenic. Adipose tissue may become a morbid growth. either as a diffused mass interfering with the action of an organ, or as a distinct tumour, Lipoma.

A.tu'mour. See Cholesteatoma and Lipoma. Adipo'sis. (Adeps, fat.) Fatness; obesity. A. hepatica. (Hepar, liver. F. degéneresence graisseuse du foie.) Fatty liver. An undue accumulation of fat in the liver.

Adiposu'ria. (Adeps, fat; οὖρον, nrine.)

Fatty urine.

Adipous. (L. adeps.) Fatty. Adiposia. (A. neg.; δίψα, thirst. adipsie; Durstlosigkeit, Durstmangel.) V Want or absence of thirst.

Adip son. (Same etymon.) A Greek term, for a drink or julep which allayed thirst, described

for a drink or juliep which also, 1902.

Adip'sos. ("Λειψος, from ά, neg.; είψα, thirst.) Glycyrrhiza glabra, liquorice.

"The drink or juliep which also have been discovered by the state polymer."

Also the fruit of the Egyptian palm-tree Adip'sous. (Same etymon.) Allaying or quenching thirst. Applied to medicines and fruits which act in this way.

Adip'sus. Same as Adipsos.

Adir. Arabic name of a plant growing in the sandy plains near Suez. A decoction of the fresh leaves is used as a purgative. (Waring.)

Adis'cal. (A, neg.; δίσκος, a round plate.) Term applied by Lestiboudois to stamens inserted directly into the floral axis without the intervention of a disc.

Ad'itus. (Ad, to; eo, to go.) An approach or entrance to a canal or duct.

A. ad aquæduc'tum Fallo'pii. opening of the Aquaduct of Fallopius.

A. ad infundib'ulum. The vulva. A. laryn'gis. The superior aperture of

the larvnx. **Adiulis'tos.** ('Αδιύλιστος, from å, neg.; εινλίζω, to strain.) Unstrained wine for pharma-

ceutical purposes Adjour Djebel. A species of Cucumis, indigenous in the mountains of Persia, possessing

purgative properties. (W.) Adjus'ter. (L. ad, to: justus, just, exact.) See Jarvis's adjuster.

Adjuto'rium. (Adjuvo, to assist.) An old term for the humerus or brachium, the whole arm being raised and moved by its means, according to Joh. Angliens, Ros. Angl. p. 1060, c. de dislocatione adjutorii.

Also applied to a medicament used externally. in aid of internal remedies, to the part affected.

Adjutor min ister. (L. adjuvo, to assist.) An aid, or assistant.

A. partus. (L. partus, birth.) An accoucheur.

Adjuvant. (Adjuvo. F. adjuvant; I. adjuvant; S. adjuvant; G. Hülfsmittel.) A medicine added to a prescription for the purpose of assisting other and more energetic remedies.

Adligans. (L. od, to; ligo, to bind.) Term applied by Aug. de Saint-Hilaire to roots that fix vegetable parasites to the bodies on which they grow.

Adliga'tus. (Same etymon.) Term applied to a plant fixed by means of tendrils or arrial

roots.

Admaston. Shropshire. A salt spring very little used

Admin'icle. (Adminiculor, to support; from ad, to; minor, to jut forth. F. adminicule.) Applied by Scopoli to all the vegetable organs ranked by Linnans under Fulerum.

Kirby's term for a half-circle of small teeth on the abdomen of the subterranean pupæ of the Lepidoptera, by which they cause themselves to issue from the earth.

A term applied to whatever aids the good effect

of a remedy.

Admiration. (Admiror, to wonder, F admiration; I. ammirazione; G. Bewunderung.) Admiration apparently consists of surprise, associated with some pleasure and a sense of approval. When vividly felt, the eyes are opened, and the eyebrows raised; the eyes become bright, instead of remaining blank, as under simple astonishment; and the month, instead of gaping open, expands into a smile. (Darwin)

Admisurab. Arabic for Terra, or earth. Admix'ture. (Admisseo, to blend together.) The mixing, or blending together of one substance with another.

Ad-mor'tal. (Ad, to; mortuus, dead.) See Ab-mortal.

Admo'tive germina'tion. (Admoveo, to move to. F. germination admotive.) That in which the episperm containing the end of the cotyledon more or less tumefied remains fixed laterally near the base of the cotyledon.

Adnas'cence. (Ad, to; nascor, grow.) Adhesion of parts to each other, as of the

Ids to each other, or to the globe of the eye.

Adnas'cent. (Ad, to: nascor, to grow.)

Name applied by Fournefort to bulbuli which appear in the axillæ of the peripheric scales of the bulb.

Adna'ta tu'nica. The conjunctiva of

Adna'te. (L. adnatus, for agnatus; from agnascor, to grow to or upon a thing. F. adné, adossé; G. angewachsen, angelehnt.) Closely connected; grown together.

In Botany, applied to a part grown to another by its whole surface.

A. an'ther. An anther, the back of which is attached by its whole length to the filament or the connective, as in the water lilv.

A. ca'lyx. A ealyx is adnate to the ovary when the ovary is inferior.

A. lamel'læ. The lamellæ of Agaries are said to be adnate when they extend to the stipe, and are attached to it.

A. sta'mens. Stamens are said to be adnate when, as in many gamopetalous flowers, the filaments are attached, to a greater or less extentto the corolla.

A. stip'ules. Stipules which adhere to each side of the base of the petiole, as in the

Adna'tion. (Same etymon.) In Botany, this term is used to express those deviations from a theoretically symmetrical flower which depend upon adhesion of the different whorls to each other; as, for instance, when the ealyx is united to the androccium, or the stamens to the corolla.

Adna'tum. (Same etymon.) Term apphed by Richard to designate a bulb which appears in the axil of the peripheric scales of the parent bulb.

Ad-ner'val. (Ad, to; nervus, a nerve.) See Ab-mortal.

Adnex'ed. (L. ad, to; necto, to bind.) In Botany, applied to the gills of Agaries when they just reach the stem.

Adnex'us. (L.) In Botany, attached; fixed.

Adoc. (Arab.) An old term for milk.
Adoles'cence. (L. Adolescentia, from
adolesco, to grow. F. adolescence; I. adolescenza;
S. adolescencia; G. Jünglingsalter.) Term for
the period between puberty and full development. It is reckoned from the age of 14 to 25
in males, and from 12 to 21 in females, and is

in males, and from 12 to 21 in females, and is distinguished by the completion of the development of the osseous system.

Adolfs berg. Sweden; Prefecture of Oërebro, and about one mile from this town. An alkaline saline mineral water, of a temperature of 9° C. (48°2° F.), containing some iron, and also carbonic acid and nitrogen gases. Used in gout, rheumatism, amemia, and chronic diarrheea.

Adolia. A Malabar plant, the leaves of which, boiled in oil of sesamum, assist in forming a liniment used by the natives with the purpose

of facilitating parturition.

Ado'nis. ('Aôwers, the son of Cinyras, king of Cyprus, beloved by Venns, and changed by her, at his death, into a flower named after him Adonium. G. Tenfelsange.) The pheasant's eye. A Genus of the Tribe Anemoniæ, Nat. Ord. Rammendweræ.

A. æstiva'lis. Λ species growing in France having vesicating properties.

A. anom'ala. A species having vesicating

properties.

A. apenni'na. The roots of this species were held to passess emmenagence navers

were held to possess emmenagogue powers.

A. autumna'lis. (F. Gouttes de Sang.)
An irritant and vesicant species.

A. capen'sis. Hab. South Africa. The leaves are used as a vesicating agent.

A. grac'ilis. Hab. South Africa, The leaves are used for blistering purposes.

A. ver'na. A synenym of A. vernalis.
A. verna'lis. (G. Frinhlingsadonis.) The
root was formerly regarded as emmenagogue, and
has been used to adulterate black hellebore. The
dried leaves, if gathered at the time of flowering,
contain 10 per cent. of aconitic acid, and are employed on the Continent as a drastic purgative.

Adop'ter. (G. Vorstoss.) Name for a vessel placed between a retort and a receiver.

A'dor. (From edo, to eat.) A kind of wheat anciently used in sacrifice; also, a coarse kind of corn or spelt, and maize or Indian wheat.

Adorf. Saxony. Three springs rise here—the Augustbrunn, the Augenquelle, and the

Neubrunn—the principal salts of which are sedium chloride and sulphate, but which also contain traces of bromine, lithium, strontium, and calcium fluoride.

Adorion. The carrot, Daucus carota.
A'dos. ('Aôos, satiety.) Water in which
red-hot iron has been cooled, quenched, or satiated.

Adoscula'tion. (Ad, towards or near; osculor, to kiss.) A term for the external contact only of the genital organs of the opposite sexes, which occurs in the act of impregnation in many birds and fishes, instead of the insertion of that of the male.

Adox'a. A Genus of plants variously referred to Araliaecæ, D.C., Saxifragaecæ, Juss., and Sambucaecæ, Baillon.

A. moschatelli'na. (F. muscatelline.) The only known species of the genus, n lowly plant growing in spring in woods. Stem with two or three radical, deeply cut leaves, and higher up two opposed and tripartite leaves, terminating in a spike of five flowers, of which the apical one is tetramerous, the others pentamerous; ovary inferior, with five styles, five bondi, and five ovules; fruit, a drupe; embryo surrounded by albumen. Formerly used as an antispasmodie.

Adplicitus. (l.) A term indicating that two organs are in contact with each other.

Adpres'scd. (Ad, to; premo, to press.) Same as Appressed.

Adrach'ne. Same as Andrachne.
Adragan'thin. A gummy substance found in tragacanth, and deriving this name from the French Adragante, tragacanth. A synonym of Bassorin.

Adram. (Arab.) An old term for Sal gemme, or rock salt.

Adrarhi'za. ('Λορός, thick ; ρίζα, a root.)

The root of the plant Aris/olochia. Adre'nals. (Ad, to; ren the kidney. F. glandes or capsules surrénal; G. Nebennieren.) Also called the supra-renal capsules. Two in number, placed symmetrically on the upper and fore part of each kidney; flattened and triangular in form, the base concave and inferior; about 1½ in. in vertical height and 1½ in transverse diameter. Weight from I-2 drachms. Each rests on the diaphragm, with the liver above it on the right and the spleen on the left side. On the inner side of the right capsule is the vena eava and part of the solar plexns, and of the left capsule the aorta and solar plexus. The arteries come from the aorta and from the renal and diaphragmatic arteries. The right supra-renal vein opens into the vena cava, The nerves are the left into the left renal vein. numerous and large, originate in the solar plexus and the renal plexus, and accompany the arteries. The lymphatics are divided into the superficial and deep. The organ is divisible into a connective tissue framework and a cellular parenchyma. On section, a firm radially strenked vellowish cortical substance and a soft central medullary brownish parenchymatous portion are seen, the two being separated in man by a brown stria, the zona reticularis. The whole organ is invested by fibrous tissue, from which trabeenlas pass into the interior. In the outer layer of the gland, the zona glomerulosa of Arnold, the parenchyma cells are arranged in rounded groups of various sizes, separated by septa. The cells themselves are either destitute of an investing membrane, large, polyhedrie, and containing numerous fine granules and fat, or smaller and

eubical; some columnar and fusiform cells may also be seen. The cells of the zona reticularis contain brown pigment. The cell clements of the medulla are also large, less granular, wauting in oil-globules, and often have a double nucleus; the cells are sometimes branched. Notwithstanding the similarity of the cells to gland-cells, they are believed to be a modification of connective tissue, since the fusiform cells are continuous with connective-tissue fibres. Some observers have regarded these cells as nerve-cells, and have asserted that they are connected with nerve-fibres.

The function of the adrenals is unknown. Most physiologists believe that they belong to the class of blood-vascular glands; some contend that they are a part of the sympathetic nervous system; and others look upon the cortical part as a glandular, and the medullary part as a

nervous apparatus.

Adrobo'lon. See Adrobolum.

**Adrobolum.** ('Aèpós, large;  $\beta m\lambda$ ós, a mass.) A name for the Indian gum-resin Báctlum, which is brought in larger pieces than the Arabian species.

Arabian species.

Ad'ros. ('Aĉoós, plump and full.) Applied to the habit of body, and also to the pulse. (D.)

Adros'tral. (L. ad, to; rostrum, a beak or snout.) Attached to the fore part of the face.

A. car'tilages. The upper labial carti-

A. cartilages. The upper labial cartilages of the larvæ of anourous batrachia, answering to the anterior dorsal cartilage of the launprey.

Adsamar. (Arab.) A term for the urine. (R. and J.)

Adsaria palla. A synonym of the Dolichos pruriens; cowage. (D)
Adsella're. (Adsello, to go to stool.) An

Adsella're. (Adsello, to go to stool.) An ancient name for a disburthening of the belly, or a daily exerction from the bowels.

Adsper'sus. (F. tacheté; G. gefleckt.) Spotted.

Adspira'tion. A different spelling of Aspiration.

Adstantes. See Astantes.

Adistites glandulo'si. (L. adsto, to stand near.) A synonym of Cowper's glands.

A. conglomera'ti. A synonym of Cowper's ylunds.

Adstric'tion. See Astriction.

Adstringens Fothergillii.

Adstringen'tia. A different spelling of Astringentia.

Ad'ula. Same as Adularis.

Adularis. (F. adulaire.) Epithet, originally by Phny, applied to a variety of felspar found among others on Mont St. Bernard, otherwise called Adula.

Adulasso. The Justicia bivalvis, an Indian shrub; used as a local application in gout. (D.)

Adul oil. A product of the Sarcostigma Kleinii. Used in India, especially by the natives of the western coast, in rheumatism.

Adult. (L. adultus, from adolesco, to grow; or as if ad allum, to a lusty or high condition. F. adulte; G. erwachsen.) Applied to hving things which have arrived at maturity.

Adultera'tion. (Adultero, to counterfeit. F. adulteration; G. Verfülschung.) Term for the mixing or corrupting of pure ingredients with others resembling them, but of inferior value.

Dr. Hassall defines adulteration as the intentional addition to an article of any substance or substances, the presence of which is not acknowledged in the name under which the article is sold, for purposes of gain, deception, or concealment. The adulteration of food or of drugs, which is of most interest to the profession, may have one of several objects in view. It may be intended to lower the price of the article adulterated by the admixture of substances of a cheaper kind; to improve the appearance of the adulterated article, and thus to deceive the public in regard to its quality; or to simulate some property injured or destroyed in the process of adulteration. The adulterants themselves may be of two kinds, being either of a harmless kind or injurious to health in a greater or less degree. The penalty for adulterating any article of food is £50 for the first offence, and imprisonment for not more than six mouths with hard labour for the second. The penalty for knowingly selling adulterated food is a fine of not more than £20 and costs for each conviction. The name and address to be published in some way appointed by the justices.

The following is a list of the principal adultera-

tions which have been practised :-

Acouitia . . . . With other alkaloids, as delphinia, aconella.

Ale, porter, and ? Common salt, cocculus indistout . . . § eus, grains of paradise, quassia and other bitters, sulphate of iron, alum, sugar, treacle, water, pieric acid, colchicum, tobacco, capsicum, ginger, wormwood, calamus, caraway, coriander, liquorice, honey, sulphuric acid, cream of tartar, carbonate of potash. oyster shells, hartshoru shavings, nux vomica, beans.

Allspice . . . Mustard husks.

Anchovies . . . Other fish and colouringmatters, Armenian bole, Venetian red.

Annatto . . . All sorts of starch, soap, red ferruginous earths, red lead, sulphate of copper, carbonate and sulphate of lime, salt, turmeric.

Arrowroot . . . Various other starches, such as sago, tapioca, potato, and others.

Balsam of copaiba Turpentine and fixed oils. Beef (potted) . Armenian bole.

Bismuth . . . . Carbonate of lead, sometimes arsenic.

Bloaters (potted) . Armenian bole. Brandy . . . . Water, burnt sugar.

Bread . . . Potatoes, alum, interior flour, rice, beans, Indian corn, curd, sulphate of copper.

Butter . . . Water, salt, colouring-matter, lard, tallow, and other fats.

Cajuput oil . . . Copper, camphor dissolved in oil of rosemary, and coloured with copper.

Calamine . . . Coloured sulphate of baryta.
Calomel . . . Sulphate of baryta, chalk,
white precipitate, white-

lead, pipe-clây.

Calumba . . . Tinged bryony root, root of
Frasera Walteri, and others.

Camboge . . Starch.

Camphor . . . A substitution of Borneo camphor has been made.

## ADULTERATION

| Cantharides Golden beetle, artificially-<br>coloured glass.  | Confection, aro-<br>matic Expensive ingredients omit-<br>ted, turmeric substituted   |
|--|--|
| Carbonate of lead . Sulphate of baryta, sulphate of lead, chalk.   | for sattron. Copal Gum dammar, resin.  |
| Carmine (cochi-) Sulphate of baryta, boneneal) black.  | Curry powder Red-lead, ground rice, salt, potato starch.   |
| Cassia (senna) Leaves of Solenostemma argel, and other foreign   | Cusparia bark The bark of Strychnos nux vomica has been substi-  |
| leaves.  Castor oil Other oils, often small quantities of croton oil.  | Custard and egg   Turmeric, chrome yellow, and powder   different flours.  |
| Cayenne Ground rice, vermillion, Venetian red, turmeric, mus-  | Elaterium Starch, flour, chalk.<br>Epsom salts Chloride of magnesium,  |
| tard husk, salt.  Champagne Gooseberry and other wines as a substitute, different  | ebalk. Ether Alcohol. Flour Other and inferior flours, as  |
| colouring-matters. Cheese Annatto, Armenian bole,  | the flour from rice, heans,<br>Indian corn, potato, sul-   |
| Venetian red, mangold<br>flowers, saffron, carrots,<br>sage, parsley, beans, po-   | phate of lime, alum.  Fruits and vege- Acetate, sulphate, and other tables (bottled) salts of copper, logwood, bottled tables. |
| tato-flour. Chicory Colouring-matters, such as ferruginous earths and  | beetroot, aniline. Gelatine Salt and sugar. Gin Water, sugar, flavouring-  |
| burnt sugar, Venetian red,<br>different flours, such as<br>wheat, rye, beans, and  | matters of different kinds,<br>cayenne, cassia, cinnamon,<br>turpentine, alum, tartar,   |
| sometimes saw-dust.  Cider Lead (as an impurity, not intentional).   | grains of paradisc, sul-<br>phuric acid, coriander,<br>angelica, almond, calanuus,   |
| Cigars Substitutions of hay and other rubbish, inferior tobaccos.  | orris, cardamom, orange<br>peel.   |
| Cinnamon Cassia, clove stalks, and different flours.   | Ginger Turmeric and husks of mus-<br>tard, flour from wheat,   |
| Claret Brandy, and substitution of inferior wines.   | sago, potato, ground rice,<br>eavenne.   |
| Cloves Clove stalks.   | Guaiacum resin . Other resins.   |
| Cocoa and choco- Cheaper kinds of arrowroot, late Such as Tous-les-mois, Ma-   | Honey Flour, cane-sugar.<br>Hops Cocculus indicus, grains of   |
| ranta, and East Indian,<br>animal matter, corn, sago,<br>tapioca, sugar, chicory,  | paradise. Iodide of potassium Water, carbonate of potash, chlorides of soda and potash,  |
| potato husks, Venetian red, red ochre.   | iodate of potash, iodine. Iodine Water, plumbugo, charcoal,  |
| Coffee Chicory, roasted wheat, rye and potato flours, roasted  | black oxide of manga-<br>nese.   |
| beans, mangel wurzel,<br>acorns, and colouring-<br>matters, such as burnt  | Ipecacuanha . Other roots, extraneous<br>woody fibre; also in pow-<br>der, chalk, flour, have been                             |
| sugar. Cod-liver oil Other oils mixed with it.   | added.<br>Isinglass Gelatine.  |
| Colocynth (ex-) The extract is not unfre-<br>tract comp.)   quently made with the  | Jalap Raspings of guaiacum, false jalap root.  |
| Confectionery, in the pulp and seeds. Confectionery, in the pulp and seeds. Injurious colouring-matters, such as arsenite of copper, | Lard Carbonate of soda, salt, alum, potato, mutton suct, potash, flour, lime.  |
| chromate of lead, cocbineal,<br>lake, indigo, Prussian   | Lemon juice A mixture of sugar and water, acidulated with sulphuric  |
| blue, Antwerp blue, arti-<br>ficial ultramarine, carbon-   | acid, has been substituted. Liquorice Rice, chalk, gelatine, and   |
| ate of copper, carbonate of<br>lead, red-lead, vermillion,<br>gamboge, sap green, Bruns-   | Magnesium sul- Lime, carbonato of magnesia.  |
| wick green, Indian red,<br>umber, sienna, Vandyck  | Magnesium car-<br>bonate Lime sulphate.  |
| brown, cobalt, smalt, lit-<br>mus, Naples yellow, ace-   | Marmalade Apple or turnip pulp.  Meats and fish Flour, Armenian bole, Vene-  |
| tate of ethyl, but wrate of amyl, acetate of amyl,   | (potted) } tian red. Mercury Lead, tin, zine, bismuth.   |
| valerianate of amyl, white potter's clay, pipe-clay,   | " green io. Red iodide of mercury.   |
| chalk, saud, flour, starches,<br>hydrated calcium sul-   | " oxide of . Brick-dust, red-lead.   |
| phate.   | ", white pre-} Chalk, carbonate of lead, cipitate of } plaster of l'aris.  |

## ADULTERINUS-ADUSTION.

| ADULTERINUS—ADUSTION.  |   |
|--|---|
| Milk Water, annatto, flour, starch, white carrots, treacle, gum, dextrin.                              | Tea Saud, exhausted tea leaves, foreign leaves, as syen-more, elm, horse-chestuut,                          |
| Mustard Turmerie, wheat flour, Cayenne pepper, ginger, charlock, potato flour, rice, plaster of Paris. | plum, beech, plane, bastard<br>plane, poplar, willow,<br>fancy oak, hawthorn,<br>sloe; lie-tea, paddy lusk, |

| Opium Stones, sand, clay, vegetable extracts, sugar, treacle, water.                                   | China clay, soapstone,<br>mica, sulphate of lime,<br>rosepink, Dutch pink,                                  |
| Pareira root Different roots substituted.  | chrome yellow, arsenite of  |
| Pepper Linseed meal, different flours,<br>mustard husks, pepper  | copper, chromate of potash,<br>carbonates of lime and   |
| dust, sand, woody fibre.  Pickles Salts of copper, acetate of  | magnesia. Tobacco Sometimes inferior tobacco  |
| copper. Pimento Mustard husk.  | mixed with good, water;<br>other adulterations rare.  |
| Potash   | Turmeric Yellow ochre, carbonate of soda or potash.   |
| iron, and alumina.   | Uva ursi Leaves of red whortleberry and others.   |
| potash.  | Vegetables (tinned) } Sulphate of copper.   |
| pôtash.  | Vinegar Sulphuric acid, and metallic impurities, water, burnt   |
| " bicarbou-<br>ate of . Carbonate of potash.   | sugar, pyroligneous acid,   |
| ,, citrate of . Sulphate of potash.  | sulphate of potash, cane<br>sugar, cider, juice of rhu-   |
| ,, chlorate of . Chloride of potassium.  |   |
| ,, tartrate of . Tartrate of lime.   | barb, gooseberries, apples,<br>pears.   |
| " nitrate of . Sulphate or chloride of pot-<br>ash.  | Wines Water, jerupiga, bitartrate of  |
| Preserves Salts of copper, fuchsine, in-<br>ferior fruits.   | potash, substitution of in-<br>ferior wines, brandy, spirits,   |
| Quinine Sulphate of lime, chalk, magnesia, cane sugar, sulphate  | and various other matters,<br>elderberry juice, logwood,<br>Brazil wood, bilberries,                        |
| Rhubarb Turmeric, and inferior varie-  | burnt sugar, black cherries, cochineal, mallow flowers,   |
| Rum Water, cayeune, burnt sugar,   | lead, oak sawdust, catechu,<br>cherry laurel water, car-  |
| Sago Potato flour.   | bonates of soda and potash,   |
| Sauce Freacle, salt, cochineal, Ar-  | artificial flavouring.  |
| menian bole, Venetian red, and other colouring-  | Zinc, oxide of Chalk, carbonate of magnesia.  |
| matters.   | Adulteri'nus. (Adultero, to counterfeit.)   |
| Scammony Chalk, starch, guaiacum, jalap, dextrin.  | False; counterfeited; forged; bastard.  Adum'ba. A species of Ficus. Hab.                                   |
| Senega Ginseng, gillenia.  | Ashantee. The bark and fruit boiled in fish-soup  |
| Senna Leaves of Solenestemma   | with Cardamoms, and a small plant called  |
| argel, Tephrosia apollmea,   | Awhintey-whinting, are said, when two doses are   |
| and Coriaria myrtifolia.  Sherry Sulphates of potash and soda,   | taken in the third month of pregnancy, to produce abortion. (Bowditch and Waring.)                          |
| Snuff Carbonate of ammonia, glass,   | Adunca'tio un'guium. (Aduncus, hooked, from ad, to; uncus, a hook; unguis, a                                |
| sand, colouring-matters. Seda, bicarbonate of Carbonate and sulphate of                                | uail.) Incurvation of the nails. (D.)  Adunciros tres. (Aduncus, a hook;                                    |
| soda.<br>,, carbonate of Sulphate of soda.   | rostrum, a beak. F. adunctiostre.) Applied by Schoeffer to au Order of Birds which have the                 |
| ,, phosphate of Phosphate of lime.   | beak hooked.  Adu'rent. (L. adurens, from ad, to; uro,  |
| Spices Colouring materials, substi-<br>tutions, and different flours.                                  | to burn.) Canstic or vesicant.  Adu'rion. The Rhus coriaria.  |
| Squills Wheat flour.   | Adus't. (Aduro, to burn. F. aduste; 1.  |
| Sugar Sand, flour, tapioca, starch, dextrin, gum.  | adusto, abbruciato; G. verbrannt.) Burnt; scorched; parched. Applied formerly to the fluids                 |
| Sulphur Sulphurous acid (as an impurity).  | of the body, when the serum of the blood was<br>supposed to be dissipated by too great heat in the          |
| Sulphuric acid . Lead, water, arsenic, hydro-<br>chloric acid.   | constitution. (L. adustio, from aduro, to   |
| Tapioca Inferior starches.   | seorch or roast. F. adustion; I. udustione; G.  |

Verbrenning, Anbrennen.) A term formerly employed as a synonym of conterisation, meaning the application of the actual cantery to any part of the body.

Ad u'terum. A synonym of the Oviduct

Adve'hent. (L. adrehens, from ad, to; veho, to carry.) Term applied to vessels conveying fluids to an organ; afterent.

Adventitia capilla'ris. (L. adventitus, foreign; from advento, to come to.) A name given by His to an outer extraneous covering of the capillaries of parts containing adenoid tissue, from the branched cells of which the coat is derived.

A. tunica. The external covering of the blood-vessels. See Artery and Vein.

Adventitious. (L. adventitius; from advento, to come to. F. adventite, adventif; I. adventizio; G. hinzukommend, zufullig.) Extraneous, foreign, not naturally belonging to the person or thing. Applied to what is accidental or acquired, in opposition to what is natural or hereditary.

In Botany, used to denote organs or structures

developed in unusual positions.

A. buds. A term applied to those buds which do not arise, as usual, from the axils of leaves, but from some indeterminate point of the stem, root, leaves, or other organs. They invariably take origin from parenchymatous tissue.

A. cyst. The outer part of an hydatid cyst which is developed from the tissues of the affected animal, and is not a part of the parasite itself.

A. diseas'es. Acquired diseases.

A. mem'brane. A membrane covering a structure which is not a part of the structure itself, but is derived from the surrounding connective tissue.

In Pathology, a term synonymous with false

membrane.

A. mur'murs. Cardiae murmurs which depend upon other causes than defects of the heart structure itself, such as anæmic murmurs.

A. roots. Roots that are not produced by the direct elongation of the radicle of the embryo. They have no leaves or buds, and, when subterranean, no epidermis furnished with stomata. Adventitious aerial roots are, however, frequently furnished with a true epidermis and stomata, and are sometimes of a green colour. In monocotyledons they first appear as conical bodies in the substance of the parenchyma. These break through the tissue that envelopes them, and appear externally at first as parenchymatous clongations, but ultimately with the structure of a monocotyledonous stem. Where they break through they are surrounded at the base by a kind of sheath or collar, called a colcorhiza, and they end in a pileorhiza, which is usually thrown off as development takes place behind it. The adventitious roots of dicotyledonous plants appear as conical bodies near the cambium layer, and ultimately break through the bark. They are provided with a pileorhiza at their extremity, and have a coleorhiza at their base. See Acrial 2001s.

A. sounds. Same as A. murmurs.

Adverse. (Idverto, to turn to another place. F. adverse; G. entgyengesetzt, seitwartsgebogen.) Opposing, or opposite; against.
Adversifoliate. (Adversus, against;

folium, a leaf.) Having leaves opposite, or against each other, on the same stem.

Adversifo'liated. Same as Adversifuliate.

A'dy. A tree growing in the island of St. Thomas, the juice of which ferments into wine. The stone of the fruit contains a kernel, which yields a yellow oil, hardened by cold, and used as butter. The kernels are given, three or four times a day, as a restorative.

Adya'o. A shrub of the Philippine Islands, probably belonging to the Genus Premna, Nat. Ord. Verbenacea, employed locally to relieve headache and colie, and as an application to tumours

and ulcers.

Adynam'ia. ('A. priv.; ¿óvams, power. L. Adynamia; F. adynamie; G. Kraftlosigkeit, Kraftmangel, Schwäche.) A term for the loss, want, or deficiency of vital power or strength, especially the loss of muscular strength in typhus fever and similar conditions.

The term has also been used in systems of classification to include a series of diseases, such as apoplexy, dyspneas, syncope, impotence, in which there is abolition or diminution of the power of sensation or voluntary motion.

A. viri'lis. Impotence.

Adynamic. (Same etymon. F. adynamague; 1. adinamico; G. adynamisch, kraftlas, unvermagend.) Deficient in power; of, or pertaining to, the state of Adynamia.

A. fe'vers. Fevers in which the tendency

is to death by asthenia.

A. state. A term indicating a condition of great weakness and depression of the bodily powers, as in the last stage of typhus fever.

Adynam'ico-atac'ticus. Same as

Adynamico-ataxicus.

Adynam'ico-atax'icus. Pertaining to Adynamia, and Atacia; a term for a form of fever.

Adyn'amon. Same as Adynamum.
Adyn'amum vinum. ('Αδύναμος, deficient in strength, from ά, priv.; δύναμις, strength or power.) Applied to a kind of wine made by boiling down must with water, or by mixing new white wine with water. Given to the sick to whom pure wine was likely to be injurious.

Adyna'sia. Same as Adynamia. Adyna tia. Same as Adynamia.

Adynatoco'mium. ('Αδύνατος, disabled; κομίω, to tend. F. adynatoco'me; G. Invaliden-Haus.) A hospital for invalids.

Adynatodoch'ium. ('Λούνατος, disabled; δέχομαι, to receive hospitably.) Same as Adynatocomium.

Reidiomyce'tes. A Suborder of the Order Basidiomycetes, Class Carposparce, Sub-kingdom Thallophyta. Parasitic fungi, the mycellum of which bears two forms of fruit, acidium and uredo, or some analogous form.

Æcidium. A cup-shaped body, formerly regarded as a distinct species of Fungus, but now believed to be only a development, on a second host-plant, of certain of the Æcidiomycetous fungi. Æcidia are at first round or oval bodies, developed, together with spermogonia, from a invelium resulting from the germination of sporidia produced by a promycelium, which is again the product of teleuto-spores; these oval bodies burst and constitute cup-shaped receptacles, with reflected margins, the walls of which, the peridium, are composed of pseudoparenchyma, short polyhedral closely fitting mycelum cells. At the base of

the Ecidium is the hymenium, a circular layer of short, elongate, clavate cells, or basidia, on each of which rests a series of spores in regular chain-like order, one above the other, the stylogonidia. spores are spheroidal and filled with protoplasm coloured red or yellow by oil. On the bursting of the enclosing peridium of pseudoparenchyma the spores are liberated in a state fit for germination, which takes place in the form of short crooked germ tubes, that penetrate through the stomata of another host-plant, and rapidly produce a new mycelium in the intercellular spaces, which after a few days forms a farther fructification, the uredo fruit. Æcidia affect usually the Compositie, Ranunculaceae, Leguminosae, and Labiatae, but to which they are by no means so destructive as uredo fruits are to the Gramineæ. See Zeidiomycetes, Heteræcism, Teleutospore, and Uredo.

Æ. abieti'num. A parasite of the Abies

excelsa, appearing in June and August.

**Æ. columna're.** A parasite found on the under surface of the leaves of fir trees, appearing in the form of a silvery streak of columnar form, containing a yellow dust (spores). Æ conorum piceæ, Æ. cornscans, and Æ. strobiliana, are all found on fir trees.

E. fruits. A synonym of Ecidium, in

contradistinction to uredo fruits.

Ædep'sos. Greece, in the Island of Eubra, thirty miles from Negropont. Hot springs, well known to the ancients under the names of Ædepsi thermæ and Hereulis lavaera. The place is now called Dipso. Temp. varies from 31° C. (87.8° F.) to 75° C. (167° F.). Here Snlla bathed.

The waters spring from the micaceous and the clay slate in the presence of limestome; they contain sodium and magnesium chloride and sulphate, sodium carbonate, and small quantities of sodium iodide, and magnesium bromide, with free carbonic acid, and some sulphuretted hydrogen. They deposit a plentiful dark sulphurous mud, which is used for general and local baths in rheumatic deposits. The waters are used in rheumatic gout and joint contractions, in gastric catarrh, gallstones, lymphatic diseases and scrofula.

Ædiceri'næ. Å Sub-family of the Family Gammaridæ, Suborder Amphipoda, Order Edriophthalma, Class Crustucca. Anterior antennæ having no accessory branch; seventh pair of legs

very long, armed with claws.

Ædœ'a. (Αἰδοῖα, the privy parts both of men and women.) The genital organs.

**Ædœa'grā.** (Λίδοῖα; ἀγρα. a prey, a seizure. F. αdœagre.) Pain in the genital organs. **Ædœag'raphy**. (Λίδοῖα; γράφω, to write.) Λ description of the generative organs.

**Edeal'ogy.** ( $\lambda i \delta \sigma i u$ ;  $\lambda i \gamma \sigma s$ , a discourse.) A treatise on the organs of generation.

Ædœat'omy. (Λίδοια; τέμνω, to ent.) The dissection of the genital organs.

**Ædœau'xe.** (Λιδοῖα; αὕξη, increase. F. adænικείε.) Enlargement of the genital organs. **Ædœ'ci.** (Λιδοϊκός, of, or belonging to, the genital organs.) Diseases of the generative organs.

Ædœerysip'elas. (Aiĉoĩa; erysipelas. F. ædœerysip'ele.) Erysipelas of the genital organs. Ædœi'tis. (Aiĉoĩa, the pudenda or parts of generation. F. ædoite.) Inflammation of the genital organs.

Ædœoblennorrhœ'a. (Alàoïa; hlennorrhœa. F. ædæoblennorrhee.) A flow of mucus from the genitals.

Æ. femina'rum. Leucorrhoca.

Ædœodyn'ia. (Λίδοῖα; ὁδύνη, pain.) Pain in the genital organs, from whatever cause. Ædœogargalis'mus. (Λίδοῖα; γαφ-

γαλισμός, a tickling.) Masturbation.

Ædœogar galus. (Λίδοῖα; γαργαλίζω. to tickle.) Masturbation; nymphomania.

**Ædeog'raphy.** (Aicota;  $\gamma \rho \dot{n} \phi \omega$ , to write. F. edviographie.) The description of the parts of generation.

**FEdceology.** (Alĉoĩa;  $\lambda \acute{o} \gamma os$ , a discourse; F. ædviologie.) A treatise or dissertation on the parts of generation, their structure, and functions.

Ædœoma'nia. (Aiĉoŭa; mania) Nymphomania.

Ædæomycodermi'tis. (Aiδαία; my-codermitis. F. ædæomycodermite.) Inflammation of the mucous membrane of the genitals.

Edoc'on. The groin. (D.)
Edocop'sia. (Aidoña; ödns, a viewing.
F. adwopsic.) An ocular examination of the

genitals.

Ædœopsophe'sis. Same as Ædwo-psophia.

Ædcopsophia. See Elopsophy. Æ. uterina. Air in the uterine cavity. See Physometra.

**Edceos'copy.** (Λίδοῖα; σκοπέω, to see. F. adaoscopie.) Term for an investigation of the nullends

**Ædcoti'tis.** (Alòoĩa.) Inflammation of the genital organs.

E. gangræno'sa. Gangrenous inflammation of the genital organs.

Æ. gangræno'sa puella'rum. Gangrene of the genital organs in young girls;

Æ. gangræno'sa puerpera'rum. Gangrene of the genital organs in women recently delivered.

Ædœot'omy. (Λίδοῖα; τέμνω, to cut. F. ædocotomie.) The anatomy or dissection of the parts of generation.

Ædop'sophy. (Alĉoia; ψόφοs, a sound. F. adoropsophie, adopsophie.) Term for the sound caused by the escape of wind from the vagina in women, or from the bladder by the urethra in man.

Ædopto'sis. (Aiĉoïa; πτῶσιs, a falling.)
A prelapse of some part of the genital organs.

Æ. u'teri. Prolapse of the uterus. Æ. u'teri inversa. Inversion of the uterus.

**E.** u'teri retrover'sa. Retroversion of the uterus.

E. vagi'næ. Prolapse of the vagina.

Æ. vesi'cæ. Prolapse of the bladder. Æeiglu'ces. See Acigluces.

Regagropilus. (Λίγαγροπίλος, from aίγαγρος, a wild goat, πίλος, hair wrought into felt. F. ægagropile, or égagropile; G. Gemsengel.) A concretion found in the stomach of goats, deer, and cows, composed of hair collected on the tongue of the animal in licking itself, and swallowed; formerly also called bezoar, hecause similarly found within the bodies of animals, and believed to have the same virtues as the medicinal bezoars; described by Geo. Ilieronymus Velschius in Dissert. de ægagropilis.

nymus Velschius in Dissert. de ægagropilis.

Aega'le sepia'ria. Nat. Ord. Aurantinea. A native of Japan. The fruit resembles the orange, is said to be laxative, and a celebrated Japanese medicine is prepared from the dried

rind. (Waring.)

**Ægei'ros.** (Λίγειρος.) The *Populus nigra*, black poplar, the leaves of which soaked in or black poplar, vinegar were used locally in gout, whilst the fruit drunk with vinegar was employed in epilepsy and

other affections. (W.) **E**'ger. (L. *Eyer*, derivation nnknown.

F. malade; G. krank.) Sick; faint; feeble;

weak : unwell.

**Ægias.** (Λlγίς, the shield of Zens, from αισσω, to move violently; also a goat-skin coat.) Name for a white speek on the cornea causing an obstruction of sight, according to Hippocrates, Coac. pranot. ii, 218; so-called because the opacity seems like a cover or shield before the pupil;

also called Zgis.

Ægicera'ceæ. An Order of plants of the Subdivision Epipetala, Subclass Corolliftora. Class Incotyledones; or, according to some, a Tribe of the Family Myrseniacea, Order Primuline, Subclass Gamopetale. It contains one genus only, which grows on sea shores in the tropics, and roots from the seed-vessels, like Rhizophoracea. Anthers dehisce transversely; fruit a follicle; seeds ex-albuminous.

Æ'gides. Same as Ægiøs.

Egidion. Same as Egidium. Ægid'ium. A name formerly applied to a collyrium, probably considered efficacious for the affection Ligius or Ligis, from which its name is drawn; described by Aëtius. Gorræus. See

Langrosopon.

Ægilops. (Λίξ, a goat; τω, the eye; because goats were supposed especially subject to it. F. eyilops, or eyilops; I. eyilope; G. Augenwinkelgeschwür, Geisauge, Thranensachgeschwür.) An abscess of the eyelid opening at the inner eantbus, and so-called from its resemblance to the larmier or infra-orbital glandular sac of goats.

Also a synonym of the Bromus arvensis. Ægi'na. Greece. A warm salt water springing from the chalk and clay strata.

Ægi'næ. A Sub-family of the Family Cymothoidæ, Snborder Isopoda, Order Edriophthalma, Class Crustacea. Antennæ inserted into the frontal border; the four pairs of posterior legs slender, and fitted for walking; foot-jaws long, composed of four to six segments.

Ægine'tia. Name of a species of Orobanche, used in Malabar as masticatory.

Æ. in'dica. Nat. Ord. Orob mchacea. Hab. Nepanl. This plant, when prepared with sugar and nutmeg, is considered an antiscorbutic and a

masticatory

Ægin'idæ. A Family of the Suborder Truchymedusæ, Order Hydroida, Class Hydromedusæ, Subkingdom Calenterata, Medusæ having a flattened discoidal form; diverticula of the alimentary canal reach the border of the nmbrella and produce the sexual elements from the parietes; marginal filaments rigid, traversed by cartilaginous rods formed from the endoderm which penetrate the umbrella; marginal vesicles pedunculated and free.

Ægiph'ila saluta'ris. Nat. Ord. Verbenaceæ. Ilab. banks of the Orinoco. Used by the natives, both internally and externally, as a remedy in snake bites. (Waring.)

Ægi'rinon. Same as Ægirinum.

Ægi'rinum. (Gr. Αἰγείρινον, from A name for a kind of αἴγειρος, the poplar.) A name for a kind of ointment made with the fruit of the poplar tree, described by Paulus Ægineta.

A gis. (Alyis, the shield or breast-plate

of Jove, also a goat's skin.) Another name for the affection of the eye called Ægias, which see. Ægithalli. (Αλγίθαλλος, the titmonse. F. agithalle.) A Family of Passeres which live

upon bees.

Ægithogna'thæ. (ΑΙγιθος, the hedge sparrow; γνάθος, the jaw.) A Suborder, according to Huxley, of the Order Carinutæ, Class Aves, distinguished by the broad vomer, truncated in front, and embracing the rostrum of the sphenoid between its eleft posterior extremity. It includes

the greater number of Passerine birds.

Ægle mar melos. (G. Marmelos frucht, Modjabere; Hind. Bel. Siripul; Tam. Vilva; Tel. Maredoo; Mal. Kuvalum.) Nat. Ord. Aurantiucew, Bael or Bel tree, Bengal Quince. An Indian tree. Flowers 2; petals 4-5 patent. Stamens 30-40. Ovary 8-15 celled, with numerous ovules in each cell. Style short, thick. Stigma capitate. Fruit baccate, with a hard rind. Seed with a woolly coat. The dried fruit, Bael, is imported in vertical slices or in broken pieces consisting of a part of the rind with the adherent pulp and seeds. The fruit is agreeable when ripe; but astringent when unripe, and thence given in diarrhom and dysentery, especially when combined with a scorbutic taint. The bark of the root is given in decoction in intermittent fevers. See Relu.

Ægoc'eras. (Λίξ, a goat; κίρας, a horn; because the pods are like a goat's horns.) A name for the plant Trigonella funum Græcum, or

Ægoleth'ron. (Αἴξ, a goat; ὅλεθρος, destruction; because believed to be poisonous to Old name for a plant, indigenous the goat.) about Heradea in Pontus, supposed to be the Chamærhododendron, or Azalea pontica; by some to be the Ranunculus flammula, by others the Lathræa squamaria.

Ægo'lii. (Λίγωλιος, a nightbird of prev. F. agolien.) A Family of Birds, including the owl. Ægo'ny. (Dim. or cont. Ægophonia, ægophony.) A term proposed for a minor degree of argophony, or a resonance of voice intermediate between well-marked bronchophony and ago-

Ægon'ychon. Same as Ægonychum. Ægon'ychum. (Αἴξ, a goat; ὄνυξ, a hoof.) An old name for the plant Lithospermum officinale, so-called from the hardness of its seed.

Aegoor. An article of the Indian Materia Medica, described as powerfully astringent and bitter, an antidote to poison, and useful in leprosy. Shingirff is given as its Persian name, and it is therefore probably Cinnabar. (W.)

Ægophon'ic. Having the characters of  $\mathcal{L}_{qophony}$ 

**Ægoph'ony.** (Λιξ, a goat; φωνή, the sound of the voice. F. eyophonic; G. Meckerstimme, Zitterstimme; I. and S. egofonia.) A term in anscultation, denoting a modification of bronehophony, in which the voice is sharp, or jerking and fremulous, like that of the kid. is heard best by the naked ear, and most frequently near the lower angle of the scappila in pleurisy, where there is only a small amount of effusion. It would appear to depend upon the arrest by the fluid of the graver tones of the voice while the higher ones are transmitted; it has also been attributed to the natural resonance of the voice in the bronchial tubes being rendered more distinct by the compression of the pulmonary

texture, and by its transmission through the medium of a thin and mobile layer of finid.

**Ægopo'dium.** ( $\Lambda i \xi; \pi o \tilde{v} s$ , a foot; from its likeness to a goat's foot.) A Genus of plants of the Nat. Ord. Umbelliferæ. Goatweeds.

E. podagra'ria. The goatweed, or gout-

weed; it is sedative, and was formerly esteemed in cases of gout and piles.

(Αἴξ; πρόσωπου, α Ægoproso pon. face.) An old name for a collyrium, according to Gorræus; synonymous with Ægidion.

Ægrip'pa. See Agrippa. Ægritu'do. (L. Æger, sick.) Sickness,

ill-health, disease. Æ. ventric'uli. (L. ventriculus, the belly.)

Vomiting.

Ægrota'tio. (L. Æger, sick.) Sickness, disease.

Ægyp'tia moscha'ta. The Egyptian musk. Hibiscus abelmoschus.

Æ. ul'cera. Egyptian ulcers, an old term used by Aretœus for uleers of the fauces and tonsils, which were described as common in Egypt and Syria, thus-Αίγυπτία και Συρίακα έλκεα.

Ægypti'acum bal'samum. Asyn-

onym of the Balsam of Gilead.

Æ. unguen'tum. Name given to several corrosive or detergent unguents; the simple Egyptiacum, however, improperly called an unguent, is composed of verdigris, honey, and vinegar, boiled together to a proper consistence. Egyptium.

Ægyp'tion. Same as Ægyptium.

**Ægyp'tium.** (Αἰγύπτιος, Egyptian.) Old epithet of a white oily ointment (Αἰγύπτιον μόρου), prepared from leaves and aromatic substances; also called Menesium; also applied to the Egyptiacum unguentum simplex; also a term for lint or thread.

**Æ. al'bum.** A synonym of Crinomyron. Æ. medicamen'tum ad au'res.

synonym of the Pharmacum ad aures.

**Æ. o'leum.** An old name of castor oil. Ægyp'tius. (Αίγύπτιος, Egyptian.) Of

or belonging to Egypt.

Æ. pes'sus. The Egyptian pessary; a term for an unguent in form of a pessary, composed of honey, butter, turpentine, saffron, oil of roses or lilies, and sometimes a little verdigris.

Aeichry'son. ('Aεί, always; χρυσός, gold.) The plant Sempervirum tectorum, or houseleek.

Higlu'ces. See Acigluces.

Aeiglu'ces. ('Aεί, ever; γλυκύς, sweet.) A kind of sweet wine or must.

**Aeipathi'a.** ('Λειπάθεια, from ἀεί, always; πάθος, a suffering.) An unyielding or inveterate disease

Aei'thales. ('Aειθαλήs, evergreen.) The Sempervivum tectorum, or houseleek.

Acizo'on. ('Aci, always; Euro's, alive.) The Sempervirum tectorum, or honseleek.

**Ælu'ropo.** (Λίλουρος, a cat; πούς, a foot.) A synonym of Gnaphalium montanum, from the resemblance of its leaves and flowers to a cat's foot.

Æmopto'ica pas'sio. (αἷμα, blood;

πτύω, to spit.) Hæmeptysis. **Æne**'a. (L. Æmus, hrazen.) A catheter. Æneoceph'alus. (.Encus, coppery; κεφαλή, the head. F. anéociphale.) Having the head of a copper-colour.

Ænothion'ic. See Enothionic.

**Æolecthy'ma.** (Δίόλος, variable; from Aloλos, the god of the winds; εκθυμα, a pustule. F. coleethyme.) An old term for a species of varicella.

**Æol'idæ.** A Family of the Section Dermatobranchia, Subclass Platypoda, Class Gasteropodat. Dorsal surface of the body with numerous tufts, often branched, containing prolongations of the alimentary canal; tongue with longitudinal dental plates.

Æollan'thus sua'vis. Nat. Ord. A Brazilian plant used as a diuretic Lauraceæ. in spasmodic strangury.

Æol'lion. Varicella. Varicella.

**E'on.** ( $\lambda i \hat{\omega} \nu$ , one's lifetime.) The age of man from birth to death; life.

Also, the spinal marrow, according to Hippoerates, vii, Epid. lii., 8.

Æone sis. (Λίονησις, from αἰονάω, to sprinkle.) Term for a sprinkling or washing of the whole body, according to Hippocrates, de Humid. usu, i, 8; Erotianus in Onomastic. Hipp.

Eo'nion. (Alώνιος, eternal.) The Sempervivum tectorum, or honseleek.

**Æο'ra.** (Λίωρέω, to raise into the air. F. brandillement.) A form of exercise called by the ancients Gestatio, in which the swinging action was predominant, as in a hammock, in a litter, in a chariot, or in a boat.

Æqua'lis. (Æquo, to make equal or level. F. égal; G. gleich, gleichformig.) Of the same

dimensions or proportions; equal.

**Æqua'tor.** See Equator. **Æ. oc'uli.** A horizontal line on the level of the junction of the closed eyelids; it is below the centre of the eye.

#Eque. (#Zquus, alike, or equal. F. également.) Justly; alike; equally.
#Equilateral. (L. aguus; lateralis, belonging to the side.) Equal sided.
#Equilibrium. (#Equus, equal; libro, to balance. F. équilibre; G. Gleichgewicht.) That rest which occurs when many forces, applied to the same body, are equally opposed. See Equilibrium.

Requival ved. (Equus, equal; valve, folding doors; F. equivalve; G. glichklappig, gleichschalig.) Having equal valves; applied to a dehiscent pericarp when its valves are nearly of the same size.

Æquor'idæ. A Family of the Suborder Calyptoblastea, Order Hydroidea, Class Hydromedusæ, Subkingdom Cælenterata. Large discoidal medusæ, with short and stout buccal peduncle; marginal filaments and radial canals nnmerous, on which are placed the sexual organs.

A'er. ('Λήρ, the atmosphere; F. air; G. Luft.) The atmosphere; atmosphere air. A. fix'us. Fixed air; a term for carbonic

dioxide or carbonic acid gas.

Aera'ted. ('Ano. F. aere.) Applied to liquids that are impregnated with carbonic acid, which was called fixed air.

A. bread. See Bread, acrated. A. waters. See Waters, aerated.

Aera'tion. ('Λήρ.) The charging of a fluid with some gas.

Also a term for ventilation.

A. of blood. The oxygenation of the blood in the lungs.

Aera'tor. (Same etymon.) An apparatus for making acrated waters.

Also a contrivance for fumigating grain in bulk to destroy fungi and insects.

Acrelaterom'eter. The same as Eluterometer.

Aerendocar'dia. (Aer, sir; endocardium.) Air in the interior of the heart. (D.)
Aerenterecta'sia. (Αήρ, air; εντερον,

intestine, and ἔκτασις, dilatatiou.) Tympanitis. FEre'olum. Same as Erolus.

Ære'olus. A term synonymous with Chalcus. Equal to 1-16th of an obolus, or 1-12th of

Ae'reus. (Aër, the air. F. acrien; G. lutting.) Of or belonging to the air; aërial.

Aergia. ('A, neg.; έργον, werk.) Τοιροτ. Aerhæmocto'nia. ( Δήρ, air; alμα, blood; κτόνος, the action of killing. F. aerhemoctonic.) Death by the introduction of air into the veins. This is an occasional accident in surgical operations about the neck, arm, and axilla, when a vein of large or moderate size has been divided in such a manner as to prevent the cellapse of its walls. A suction power is exerted during inspiration and the diastele of the heart, and air enters the vein with a peculiar sibilant or gurgling sound. The patient utters a cry of distress, becomes suddenly pale, and passes into a condition of syncope, which generally proves fatal. The arrest of the action of the heart appears to be due in part to interference with its action by the presence of foam or elastic air in the cavities instead of blood. but chiefly to the pulmonary capillaries becoming blocked by minute bubbles of air.

The treatment which has proved successful is the immediate performance of artificial respiration and electricity applied to the heart and

diaphragm.

Aerhæmotox'ia. ('Ano; alua, blood; τοξικόν, poison. F. aeremotoxie; G. Acramotoxic.) Poisoning, or death from entrance of air iute the blood through the blood-vessels.

**Ae'rial.** ('A $\eta_{\mathcal{P}}$ .) Of, or helonging to, air. **A. ac'id.** Another term for carbenie acid.

A. bulbs. Small conical er rounded fleshy bodies of the nature of bulbs produced in the axils of the leaves of certain plants, as of some species of lily, the coral wort, and pile wort. They differ from ordinary buds in their fleshy nature, by spontaneously separating from the parent and by producing new individuals when placed under favorable circumstances, and from true bulbs in their small size and aerial position.

A. fistula. A fistulous opening into the larynx or truchen, the result of non-union after

operation or accident.

A. leaves. Leaves that are developed and

live entirely or partially in the air.

A. plants. Applied to certain plants which after a time can live by absorption from the atmosphere, without requiring their roots to be

fixed to any place, as the Flos airis.

A. roots. Roots that are not produced by the direct elongation of the radicle of the embryo, hut from the stem or other part of the plant above the ground. Such roots are well seen in the ivv, where they act as mechanical supports, and in the screwpine, Indian fig, and mangrove tree, where they both act as support and as a means of obtaining nourishment.

A. stems. Stems that appear above ground and maintain this position more or less perfectly

throughout life.

Ae'rides tessella'tum. Nat. Ord. Orchidaceae. Hab, Circar forests and other parts of India. It is mentioned in the Taleef Shereef under the name of Bunda, and is stated to be beneficial in disorders of nucus, wind, and blood; also in boils and cutaneous cruptions, and to act

as an alexipharmic. (Waring.)

Aerifaction of lung. (Aër; facio, to make.) A term indicating conditions of the lung in which the amount of air is unnaturally increased, as in emphysema.

Acriferous. (Aer; fero, to earry. F. aérifère; G. luftfuhrend, luftfragend.) Air-bringing or earrying. Applied to the air-passages, as

the windpipe, bronchi.

Aerification. (Air; facio, to make. F. airification; gazification.) Term for the converting of a liquid or solid into the gaseous state.

Aeriflux'us. (Aër, air; fluo, to flew.) The discharge of gas and fætid emanation from the sick; flatulence. (D.)

Ae'riform. (Aer; forma, form er shape. F. aerijorme, gazeiforme; G. luftartig, luftformig.) Having the form of air or gas ; gaseous. Aeriperitonitis. (Air; peritonitis.)
Term by Pierry for tympanitis.

E'ris flo'res. Flowers of copper; ob-

tained in small grains by pouring cold water on fused copper. Formerly used in medicine.

E. squamæ. Flakes of copper, obtained by hammering heated copper. Formerly used in medicine.

**Acritis.** ('Ano, the air, or sky; from its blue colour.) A Greek name for a plant supposed to be Anagallis arvensis; the blue pimpernel, according to Turtou.

Also in Mineralogy the jasper.

Acrobia. (Ano, air; Blos, life. F. aero-

bie.) Term applied to microscopic organisms which require air in order to live, as opposed to the Ancrobia.

**Ae'rocysts.** (Λήρ, air; κύστις, a bag; L. aerocystæ; F. acrocystes.) Term applied to small closed saes containing air scattered over the vegetative organs of certain Algae; sometimes sessile as in the Fucus; sometimes pediculate, as in many Floridia; sometimes basilar. They enable the parts in which they are found to that on or near the surface of the sea. They result from the breaking down of a group of subepidermie cells.

Aerodermecta'sia. ('Λήρ, air; δέρμα, ' skin; έκτασις, dilatation.) Emphysema of the connective tissue.

Aerodiaphanom'eter. The same as Dvaphanometer.

Aerodiaph'thora. ('Δήρ; διαφθορά, corruption.) A vitiated state of the air.

Aerodynam'ie. ('Αήρ, the air; δύναμις, power. L. Aerodynamicus; F. aerodynamique.) Of or belonging to the force or power of the air.

Aerodynam'ics. (Same etymon. F. aerodynamique; G. Aerodynamik, Luftkraft-lehre.) A term for the doctrine of the laws regulating the air and its movements.

Aeroenterecta'sia. ('Αήρ; ἔντερον, intestine; and έκτασις, dilatation.) Tympanitis. **Aerogno'sia.** ('Λήο; γυῶσις, knowledge. F. and G. aerognosie.) That branch of science which treats of air, and the part it plays in nature.

**Aerog'raphy.** ('Aήο; γράφω, to write. Fr. aerographie; G. Luftbeschreibung.) A de-

scription of, or treatise on, the air.

Aerohydrop athy. ('Λήρ; νέωρ, water; affection.) The treatment of disease by πätos, affection.) air and water.

**Aeroli'te.** (' $\Lambda \dot{\eta}_{P}$ , the air or atmosphere;

λίθος, a stone. F. aerolithe; G. Aerolith, Himmelstein, Luftstein, Meteormasse, Meteorstein.) term for certain meteoric stones which fall from the heavens: an aerolith; also termed a Meteorolite.

Aerolithus. Same as Aerolite.
Aerology. ('Αήρ; λόγος, a discourse.
Aerologia. F. aerologie; G. Aërologie.) A
treatise, dissertation or consideration of the nature and properties of air.

Aeroman'cy. ('Λήρ; μαντεία, divination.) Divination by air or substances contained in it. (D.)

**Aeromel'i.** ('Λήρ'; μέλι, honey.) Name for a substance formed on the leaves and boughs of trees, which was believed to fall like dew from the atmosphere; anciently called δροσομέλι; also termed Mel aereum, Mel roscidum, or honeydew; it is the same as manna; used by Aldrovandus, de Insect. i. 2, and Keuchenius, not. ad

Sammonic, p. 147.

**Aerom'eter.** ('Λήρ'; μέτρον, a measure. L. Aërometrum; F. aerometre; G. Luftdichtigkeitsmesser.) An instrument for ascertaining the density of gases. That invented by Dr. M. Hall for ascertaining the mean bulk of air or gases in pneumatic experiments, consists of a glass bulb of a capacity of four and a half cubic inches and a long tube with a capacity of one cubic inch. This tube is inserted into another tube, in which it is sustained at any required height by means of a spring. Five cubic inches of air are introduced into the bulb and tube, of the latter of which it will, at mean temperature and pressure, fill one half. The other half of this tube, and part of the tube in which it is inserted, are occupied by the liquid of the pneumatic trough. The point of the tube at which the air and liquid meet is marked by the figure 5 to denote five cubic inches. The upper and lower halves of the tube are each divided into five parts indicating tenths of an inch, and the external tube has also a scale of inches attached. (Knight.)

Aerom'etry. ('Αήρ; μετρέω, to measure. I. aerometria; F. aerometrie; G. Luftmesskunst, Luftmessungskunde.) The branch of physics which treats of the density of atmospheric air,

and the means of measuring it.

Aeroperito'nia. (Aër; peritonæum F. aéropéritoine; G. Luftbauch.) Term by Piorry for gas in the peritoneum.

Aeropha'ne. ('Λήρ; φαίνω, to appear.)

A light gauze or imitation erape.

**Aeropho'bia.** ('Λήο; φόβος, fear. F. aerophobie; G. Luftscheu.) A fear, or dread of any current of air, because in hydrophobia and some other diseases, as hysteria, of which this is a symptom, it is apt to produce a paroxysm.

Aerophob'ic. (Same etymon.) Affected with Aerophobia.

**Aeropho'ni.** ('Αήρ; φωνή, the voice. F. aërophone.) A Family of Grallatores, that fill the air with their fulness of voice.

Aeroph'orous. ('Αήρ; φέρω, to bear.) Bearing or conducting air.

Aeroph'orum. (Same etymon.) Term applied by Meltenius to elongated glands found

in some Genera of Ferns, especially in Aspidium. **Aeroph thora.** (Aiρ; φθορά, corruption. F. airophthore; G. Luftverderbniss.) Vitiation of the air.

Aerophy'te. ('Λήρ; φυτόν, a plant. F. aerophyte.) A plant that grows entirely in the air. **Aeropleu'ria.** (Λήρ; πλευρά, a rih, in the plural, the side. F. aeropheuric.) Λ synonym of Phoumothorax.

**Aeropneumona** sia. ('Δηρ: πνεύμων, the lungs. F. aeropneumonasse) A synonym of Vesicular emphysema.

Aeropneumonecta'sia. ('Αήρ; πυεύ-μου; ἔκτασις, extension. F. aeropneumonectasie.) A synonym of vesicular emphysem i.

**Aerora** chia. (' $\Delta \eta \rho$ ;  $\dot{\rho} i \chi \iota s$ , the spine.) Accumulation of air in the vertebral canal.

**Aer'oscope.** ('Δήρ; σκοπέω, to examine.) Pouchet's aeroscope is an apparatus for examining the purity of the air microscopically. It consists of a small funnel drawn to a fine point, below which is a slip of glass moistened with glycerin. The end of the funnel and the slip of glass are enclosed in an airtight chamber, from which a small glass tube passes out and is connected by india-rubber tubing with an aspirator. The glycerin arrests any foreign particles in the air.

Æro'se. (L. Erosus, from æs, brass or copper. F. cuivreux; G. kupfirhaltig, kupfericht.) Of the nature of copper; coppery.

Aero'sis. ('Aήρ; G. ausluftung.) Pneumatosis; tympanitis. An imaginary resolution of the blood into vapour, supposed to be necessary for the support of the vital spirits, and to be brought about by the ventilation of the air during inspiration, in the manner that the flame of fuel is kindled by blowing it. (Parr.) **Aerosphe're.** ('Λήρ; σφ ᾶρα, sphere.)

Boerhaave's term for atmosphere.

**Aerostat'ic.** (' $\Delta \eta_{\rho}$ , the air, or atmosphere;  $\sigma \tau \alpha \tau \iota \kappa \eta$ , the science which ascertains the properties of bodies at rest; from  $" \sigma \tau \eta \mu_{\epsilon}$ , to stand. L. aërostaticus; F. aérostatique.) Of or belonging to aerostatics.

Aerostatics. (Same etymon. L. aërostatious; F. aerostatique.) The doctrine of air, its specific gravity and properties while in a state

of rest.

Aerosta'tion. (Same etymon. L. aero-The raising and supporting of machines in the air, by the buoyancy of heated air, or light gases contained in a spherical bag called a balloon. The science of ballooning.

Ero'sus la'pis. A synonym of the stone

called Cadmia lapidosa.

Aerotherapeu'tics. (' $\Lambda \dot{\eta} \rho$ , air;  $\theta \epsilon \rho \alpha$ πεύω, to cure.) A mode of treating disease by varying the pressure, or by modifying the composition, of the surrounding atmosphere. The patient is placed in an air-tight chest or room, provided with adit and exit pipes, and air is pumped in. Three periods are recognised, that of increasing compression, that of fixed or uniform pressure, and that of reduction of pressure or decompression. The first and third of thes: should be executed slowly. The eases in which Aerotherapeutics have been found useful are in pulmonary emphysema, bronchitis, chronic laryn-gitis, catarrhal and nervous asthma, in anomia, slowly developing phthisis, in booping cough, and in catarrh of the Eustachian tube. By means of india-rubber sheeting applied round a limb and connected with a pump, the local variation of pressure can be obtained.

Aerothorax. (Αήρ; θώραξ, the chest. G. Luftbrust). Same as Pneumothorax.
Aerotonom'eter. The same as Tono-

Aerozo'a. ('Aήo; ζοῦον, an animal. F. αὐνοσοċ.) Applied to vertebrated and articulated animals to which air is indispensable. (Lamoureux.)

Æru'a lana'ta. Æru'a lana'ta. Nat. Ord. Amaran-thaceæ. Chaya root. Hab. Bengal. Root mucilaginous; used as an emollient in strangury.

Æru'ca. Believed to be corrupted from Arugo, with which it is in all respects synenymous.

Æru'ginose. (L. aruginosus.) Verdigris green.

Æruginous. (. Erugo, the rust of copper. L. aruginosus; F. erugineux; I. and S. eruginoso; G. kupfergrim, spangrim.) Of, or belonging to, verdigris. A bluish-green colour like verdigris, or the leaves of some pine trees.

Æ. spu'ta. A term given to very green

expectoration.

Æru'go. (L. æs, brass er copper. Æris rubigo, the rust of brass er copper; F. vert de gris; G. Grünspan.) The rust of a metal, but especially applied to that of copper, Verdigris, which is a mixture of several basic enpric acetates.

Æ. æ'ris. The rust, or impure subacetate of copper; Verdigris.

E. crystallisa'ta. A synonym of the Cuprum accticum, G. Ph. Cupric acctate.

E. distilla'ta. A synonym of the Cup-rum aceticum, G. Ph. Cupric acetate.

Æ. factit'ia. A synonym of Æ. praparata. Æ. fer'ri. A synonym of Ferrous carbonate.

E. plumbi. A synonym of Lead carbonate. Æ. præpara'ta. Verdigris earefully pre-

pared so as to be free from impurity.

Æ. ras'ilis. Scraped verdigris. Verdigris made by hanging a copper plate close over vinegar, but not so as to touch it, and after ten days scraping off the incrustation.

Æ. sublima'ta. Sublimed or distilled

verdigris used in painting.

Æ. vir'ide crystallisa'tum. Cupric acetate.

E. vir'ide distilla'tum. Cuprie acetate. Ærum'na. (L. Ærumna, either a contraction of agrimonia, sorrow; or from arumnula, a forked or crooked staff, which travellers used to carry their packs upon.) A term for weariness or unhappiness, conjoined with fatigue, or suffering.

Aer'va. Same as Ærua.

**Æs.** (Sans. Ajas, iron. F. airain; I. rame; S. alambre; G. Erz.) The metal brass, a combination of eopper and zine.

Æ. us'tum. Burnt copper. Thin plates of copper, laid stratum super stratum in a crucible, with sulphur and sea salt, and placed over a hot chargoal fire nutil the sniphur is consumed, and the copper can be reduced to powder. Formerly used as an escharotic, and internally in epilepsy.

Assochni'næ. A Subfamily of the Family Libellulula, Group Amphibiotica, Suborder Pseudo-neuroptera, Order Neuroptera, Class Insecta. Posterior wings larger at the base than the anterior; lateral lobes of the inferior labium little larger than the external lobes and termi-

nated by a movable point.

Æs'chos. (Λίσχός, shame.) Deformity of the body generally, or of any member; used by

Æschromythe'sis. (Λίσχοός, base; μύθος, speech.) A term used by Hippocrates for the obseene language uttered by the delirious, particularly in puerperal mania and phrenitis.

Æschynom'ene. (ΑΙσχόνωμαι, to be ashamed.) The Mimosa, or sensitive plant, be-

cause it shrinks from the touch as if it were ashamed.

Æs'culin. (Æsculus, the horse-chestnut.) 21 Il 24 O 13. A glucoside contained in the bark of the horse-chestnut. A white, slightly bitterish pewder, destitute of smell; soluble in 600 parts of cold and in 12½ parts of hot water; and in 100 parts of cold alcohol. It has a slightly neid reaction. Its watery solution is highly fluorescent, the reflected light being of a light blue colour.

Æs'culus. (L. either from esea, food; er mere probably connected with akulos, an esculent acorn.) A Genus of the Subord. Hippocastanea, Nat. Ord. Sapindacea, Subclass Thalamiflora; or of the Subfam. Sapindea, Fam. Sapindacea, Order Æsculinæ, Series Eucyclicæ, Subclass Choripetalæ, Class Divotyledones. Leaves opposite, digitate; petals five, spreading, with short claws, unequal; stamens seven, declinate; fruit

leathery, three-valved.

E. hippocas'tanum. (F. marronnier de l' Inde; 1. marrone d' India; G. Rosskastanie, wilde Kastanie.) The horse-chestnut. Leaflets seven, seldom five; obovate, caneate, acute, toothed; fruit prickly. The bark of the young branches has been used as a substitute for cinchona; it is astringent and bitter; it contains esculin, paviin, tannin, and some fraxin. The fruit is hitter, and contains much starch, which has been extracted and used; dried and powdered it is used as a sternutatory. An oil is extracted from the fruit by percolation with ether, and has been used as a local application in gont and rheumatism.

E. ohioten'sis. A synonym of E. pavia.
E. pa'via. (F. Pavia rouge.) Red back-Hab. Southern United States. Said to be a febrifuge; the seeds are actively poisonous.

Æ. rubicun'da. A synonym of Æ. pavia. Æseca'vum. (Etymology nuknown.) An old term for brass.

Æs'tas. (Probably akin to αἴθω, to burn; and to æstus, sultry heat. F. cte; G. Sommer.) Summer; hot seorching weather.

Æsta'tes. ( Estas, summer.) Heat-spets; freekles; sun-burnings; Pliny, xxviii, 12.

Æsthe'ma. (Λίσθημα, a perception, or the thing perceived by the senses.) Sensation. Æsthematol'ogy. (Λίσθημα; λόγος, a discourse.) The philosophy of, or a treatise upon, the organs of sense.

Æsthematonu'si. (Λἴσθημα; νοῦσος, a disease.) Diseases affecting the organs of sensation. (D.)

Æsthematorganu'si. (Λίσθημα; οργανον, an organ of sense; νοῦσος.) pathology of the organs of sensation. (1).)

Æsthesiog raphy. (Λίσθησις, sensation; γράφω, to write.) A description of the senses and their organs.

Æsthesiol'ogy. (Λἴσθησις, sensation; λόγος, a discourse.) An account or description of

the senses and of sensation.

**Æsthesiom eter.** (Λἴσθησις, sensation; μέτρου, a measure.) An instrument for determining the tactile sensibility of the skin or mucous membranes. Its value in medicine depends on the circumstance that the eapability of distinguishing two impressions, made upon the skin simultaneously, varies in different regions of the body according to the distance they are apart. In sensitive regions, as the end of the finger, the two points of a pair of compasses can be distinguished at about the one twelfth of an inch apart.

while iu the middle of the back only one point is felt though they are two inches apart (Weber, Hammond). In disease, varying degrees of anæsthesia or loss of sensibility, and hyperesthesia or excess of sensibility, can be readily ascertained by Dr. Sieveking's instrument, which is simply a beam-comp.ss. It consists of a rod of hell metal four inches in length, graduated into inches and tenths of an inch. At one end is a fixed steel point, another steel point is made to slide upon the beam, and can be fixed at any distance from the first by a serew which works at the top of the slide. Dr. Hammond has devised one consisting of a pair of dividers, to one arm of which the arc of a circle in brass is affixed. This are is divided to measure tenths of an inch, and by a slight modification is made very portable. See Tactile sensibility.

Æsthe'sis. (Αἴσθησιε, from αἰσθάνομαι, to feel. F. æsthésie; G. Gcfuhl, Gcfuhlsrcrmögen.) Term for feeling or sensibility; also for

sense or sensation.

**Æsthesod'ic.** (Αἴσθησις; and ὁδός, a path.) A term applied by Schiff to the grey substance of the spinal cord, since through it sensory impressions are conducted to the brain.

**Æsthete ria.** ( $\Lambda l\sigma\theta\eta\tau\eta\rho\iota\sigma\nu$ , an organ of sense.) The faculties of the body.

Æsthete'rion. (Αἰσθητήριον, from αἰσθάνομαι, to feel or perceive.) The sensorium. Esthete'rium. Same as Estheterion.

**Æsthe'tica.** (Alσθητικόs, from alσθάν-ομαι.) Belonging, or relating to, the understanding, or mental perception; applied to an Order of diseases of the Cl. Neurotica in Dr. Good's arrangement.

Æsthetics. (Λίσθάνομαι, to perceive by the senses.) The science of the perception of

the beautiful in nature, art, or literature.

#Estiva'lis. (Estas, the summer. F. cstival; G. sommerlich.) Of or belonging to the summer season.

**Æstiva'tio.** (L. Æstivo, to pass the summer in a place.) See Æstivation.

E. alternativa. See Estivation, alter-

Æ. amplex'a. (G. umfassende.) A term used synonymously with enveloping æstivation.

E. contor'ta. See Estivation, contorted, E. corrugati'va. See Estivation, corrugated.

Æ. equitati'va. Imbricated astivation. Æ. quincuncia'lis. See Estivation, quincuncial.

E. valvativa. See Estivation, valvate. E. vexillaris. See Estivation, vexillary. Æstiva'tion. (Estivo, to retire to a place for the summer season. F. estivation, préfloraison; G. Blumenknospenstand, knospendeckung.) Term for the manner in which the different parts of the flower are folded in the bud.

Æ. alternative. (G. abwechselnde.) A form in which the whorl segments are arranged in two complete circles, one enclosing the other.

Æ. cari'nal. A form of astivation, in papilionaceous flowers in which the keel is folded over the other parts.

A. cir'cular. (F. estivation par juxtaposition.) One of the two chief forms of astivation, in which the individual parts of the whorl are arranged in a circle, and in nearly the same plane; it may be valvate, induplicate, or reduplicate.

A. coch'lear. A modification of quincun-

cial astivation, in which the spiral arrangement is less rapidly twisted, and the fourth and fifth segments of the whorl, instead of forming an inner circle, are almost entirely external, the fifth seg-

meut heing overlapped by the first. **Æ. contor'ted.** (F. estivation tordue; G. gerollt, gedreht.) That form in which the margin of one segment is a little overlapped by another, and the whole is placed obliquely around the

axis, so as to have a twisted look, as in Linum.

E. con'volute. Formerly applied to that form of imbricated astivation in which the parts completely envelop each other; now usually restricted to that form of contorted astivation in which the parts considerably overlap.

Æ.corrugated. (G. zerknitterte.) A form in which the petals are irregularly crumpled, as

in Papaver.

Æ. crum'pled. A synonym of Corrugated æstivation.

A. enveloping. A synonym of Convolute astivation.

**Æ. im'bricate.** (F. imbriquée; G. dach-ziegelige.) A variety of imbricated æstivation, iu which the parts of the whorl overlap like the tiles

of a house, as in the calyx of Camelia.

E.im'bricated. (F. estivation par superposition; G. übergreifend.) One of the two chief forms of æstivation, in which the parts of the whorl are arranged in a more or less spiral manner, and overlap each other at the edges.

**Æ.** indu'plicate. (F. induplicative; G. cinwartsgeschlagene.) A variety of eircular æstivation, in which the sutures formed by the edges of the whorl-segments project inwards, as in the ealyx of Clematis.

Æ. quincun'cial. (F. quincunciale; G. fünfschichtige.) A form of imbricated æstivation occurring in plants having the whorl composed of five parts, which are so much twisted as to form more than two circles, in which two parts are outside, the third partly inside partly outside, the other two quite inside, counting the segments in rotation, as in the calvx of Calvstegia sepium.

\*\*E. reduplicate. (F. reduplicative; G. auswürtsgeschlagene.) A variety of circular astivation, in which the sutures formed by the opposing edges of the parts of the whorl project outwards, as in the calyx of Althea rosea.

H. spi'ral. A synouym of Imbricatea astivation.

E. val'vate. (F. valvaire; G. klappig.) A variety of circular æstivation, in which the margins of the whorl segments touch each other throughout their length, as in the calyx of Tilia.

Æ. vexil'lary. (G. fahnenförmig.) A form of imbricated æstivation in papilionaceous flowers, where the vexillum, or standard, is folded over the other petals.

**Æstivus.** (Æstas, summer.) Of, or relating to, summer.

Æstua'rium. (Æstus, heat.) given to a stove for applying dry heat to all parts of the body at once; also a vapour-bath.

Old name of an instrument for conveying heat to any particular part of the body, in which the Longurius, in a red-hot state, was placed.

Æstua'tion. (Æstus, heat.) The heat of fermentation.

Æs'tus. (Probably akin to aiθω, to burn.) Heat, as well natural heat in an intense degree, as that which is the effect of inflammatory disease.

AE. volaticus. A flitting or inconstant heat; applied to the sudden flushing of the face; also to the Strophulus volaticus, or wild-fire rash of children.

#E'tas. (Contraction of ævitas, from ævum, an age or term of life.) The natural life-time; age. Æ. bo'na. Ádolescence

E. crep'ita. Decrepid age, which was reckoned by the ancients from the 60th year and

upwards, ending in death.

Æ. decrep'ita. Old age. Æ. ma'la. Old age.

E. provec'ta. Old age.
E. senc'ta. Old age.
E. seni'lis. Old age.
E. viri'lis. Virile age, or manhood, which was reckoned from the 35th to the 50th year.

Ete'ide. A Family of the Suborder Chilostomata, Order Gymnolæmata, Class Tubular zoæcia with a subterminal Polyzoa. aperture.

Æthali'ni. Applied to a tribe of Fungi having the Æthalium for their type.

Ætha'lium. (Αἰθάλεος, reddish-brown.) One species of which—viz. Ε. septicum—is commonly known as flowers of tan. The Genus belongs to the Myxomycetes, or slime moulds. Do Bary, who was the first to carefully investigate this group of plants, at one time thought they ought to be classed with animals rather than with vegetables, owing to the circumstance that during a portion of their existence they do not form cells or tissues. A stricter examination into their life history has led him to abandon this view, and they are now acknowledged by all to be of vegetable origin solely. The Æthalia live upon decaying vegetable matter, such as tan or sawdnst, over the surface of which they creep with a streaming motion, and leave a sliny track behind them like that of a snail. This is the vegetative condition of the Æthalia, but when about to enter into the reproductive state the whole of the protoplasm (plasmodinm) becomes transformed into receptacles (cakes), often a foot in diameter and an inch deep. The exterior of this cake is formed of a brittle skip, at first vellow, but afterwards brown, and which is rendered thick by the accumulation of calcareous matter. The interior becomes differentiated into a network of delicate tubes (eapillitinm), the interstices of which are filled with smooth spherical spores. These spores, when set free and brought into contact with moisture, germinate; the thick cell wall bursts, and the whole of the contents of the cell issues forth as an amæboid corpusele, which in a few minutes becomes pointed and furnished with long cilia. These ameeboid corpuscles (swarm spores) increase by division. At the end of two or three days this multiplication by division ceases, and they begin to coalesce two or more together, till at last they form the homogeneous protoplasmic mass known as the plasmodium.

Æ. sep'ticum. Wood Æthalinm. Varionsly coloured; external bark yellow, thin, deciduous; internal mass compact, black.

Æ. vapora'rium. A synonym of Æ. septicum.

E. viola'ceum. A synonym of E. septieum.

Aetheogam'ia. ('Λ, neg.; ηθος, eustom; γάμος, marriage.) A synonym of the Cryptogamia

Æther, Brit. Pharm. See Ether. F. Codex.) Acetic ether. C<sub>2</sub>H<sub>2</sub>C<sub>2</sub>H<sub>3</sub>C<sub>2</sub>. Dry sodium acetate 8 parts, rectified spirit 5 parts, sulphurie acid 10 parts, is distilled, the product added to half its weight of calcium chloride, left 24 hours, decanted and rectified. A colourless liquid, of agreeable edour and pleasant taste; sp. gr. 0.9; beiling point 74.4° C. (166° F.) It dissolves in 12 parts of water, and in all proportions in alcohol. A stimulant and antispasmodic. Dose, 15-40 drops or more in water.

Anst. Ph. This ether is made by distilling a mixture of acetate of soda, alcohol, and English sulphurie acid. Sp. gr. 0.9; 1 part dissolves in 9

of water. Æ. anæsthet'icus, Helv. Ph. Ethyl

chloride, which see. Æ. ara'nii.

A synonym of the Ether anæsthetieus, Helv. Ph.

Æ. cantharida'tus, Helv. Ph. Ten parts of cantharides macerated in 15 parts of ether and strained. Used as a vesicant.

The  $\mathcal{L}$ . Æ. chlora'tus alcohol'icus. chlorhydricus alcoholicus, Belg. Ph.

A. chlorhy dricus alcoholicus, Belg. Ph. Spirit of hydrochlorie ether. Sodium ehloride 334 parts, manganese oxide 125 parts, distilled with sulphuric acid 250 parts, and rectified spirit 1000 parts.

E. chlorhy'dricus chlora'tus. synonym of the \_E. anæstheticus, Helv. Ph.

E. chlo'ricus. Chloric ether. See Spiritus chloroformi.

æther.) Sp. gr. 0:73. (G. gemeiner Anst. Ph.

E. depura'tus, Aust. Ph. (G. gereinigter æther.) Made by neutralising any free acid in the ether crudes with a small quantity of solu-tion of potash. The ethercal is separated from the watery finid by decantation and by calcium ebloride, and finally distilled into a receiver surrounded by ice. Sp. gr. 0.725. Æ. for'tior, U. S. Ph. Stronger ether. A

similar product to the Æ. purus, B. Ph.

Æ. hy dricus. A synonym of Ether. Æ. hydriodicus. Hydriodic ether. synonym of Ethyl iodide.

Æ. hvdrobro'micus. Ilydrobromic ether. A synonym of Ethyl bromide.

Æ. hydrochlo'ricus. A synonym of Ethyl chloride.

Æ. hydrocyan'icus. Hydrocyanie ether. A synonym of Ethyl cyanide.

E. ligno'sus. A synonym of Acetone. Æ. martia'lis. 'The Tinctura sulphurioæthera ferri.

Æ. muriat'icus. Muriatie ether. synonym of Ethyl chloride.

Æ. muriat'icus alcohol'icus. The Æther chlorhydricus alcoholicus, Belg. Ph. Α

Æ. muriat'ieus trichlora'tus. synonym of Ether, chlorinated chlorhydric. Æ. ni'tricus. See Ether, nitric.

Æ. ni tricus alcohol'icus, Belg. Ph. The Spiritus ætheris nitrosi.

Æ. ni'tricus alcoolisa'tus. The Spiritus atheris nitrosi.

E. nitro'sus. A synonym of Nitrie other. Æ. cenan'thicum. See Ether, wnanthic. Æ. petro'lei, Helv. Ph. A limpid, colour-

less liquid. Distilled from American petroleum, boiling from 50° C. (122° F.) to 60° (140° F.)

E. phosphora'tus, llelv. Ph. A solu-

tion of two parts of phosphorus in 120 of

Also a synonym of Ether, phosphoric.

Z. prus'sicus. A synonym of Ethyl

cyanide.

Æ. pu'rus, B. Ph. Pure ether. Twenty parts of ether, after being twice shaken with 10 parts of water in a bottle and decanted, is distilled with one eighth part of recently burnt lime and two parts of dried calcium chloride. The product has a sp. gr. of 720, a vapour density of 2.586, and boils at 35.5° C. (96° F.) Used for purposes of inhalation as an anæsthetic. See Ether.

Æ. pyroace'ticus. A synonym of Ace-

Æ. rectifica'tus. A synonym of Æther purus

Æ. sulfu'ricus alcoolisa'tus. Ether sulfurique alcoolisé, Fr. Codex.

Æ. sulphu ricus. Sulphuric ether. A synonym of Æther. B. Ph.

The Ether sulfurique, Fr. Codex.

The Elixir Æ. sulphu'ricus ac'idus. acidum Halleri.

Æ. sulphu'ricus alcohol'icus. Belg. l'h. Hoffmann's anodyne. Sulphuric ether 468 parts, rectified spirit 532 parts.

Æ. sulphu'ricus eru'dus. A synonym of the Æther crudus of the Aust. Ph.

Æ. sulphu'ricus cum alcoho'li. synonym of Hoffmann's anodyne.

Æ. sulphu'ricus cum alcoho'li aromat'icus. A synonym of the Spiritus ætheris

aromaticus. Æ. terebinthina'tns. See Ether, terebirthinated.

Æ. vegetab'ilis. A synonym of the Æther aceticus of the Aust. Ph.

Æ. vitrio'li. A synonym of the Æther depuratus of the Aust. Ph.

Æ. vitriol'icus. A synonym of Ether. Æthe'rea her'ba. The Eryngium

maritimum. Medicines or drugs Æthe'reo-oleo'sa. which contain an essential oil on which their properties depend.

Ætherola'ta. Ethereal distillations from

Ætherolatu'ra. Ethereal tinctures of

fresh plants. **Æthero'lea.** A synonym of Essential

Æthero'lica. (Æther. F. æthéroliques.) Term for combinations of ether.

Æthiopifica'tio. (Æthiops, and facio, to make.) The discolouration of the skin, caused by the use of silver nitrate, or mercurial ointment.

Æthiopio'sis. Same as Æthiopificatio. Æth'iopis (Λίθιοπίς) of the ancients is referred by Sibthorpe to Salvia æthiopis; by others to Salvia argentea or the silver sage. It was used in affections of the uterus, in sciatica, pleurisy, and some forms of sore throat. (Dioscor., L. iv., c. 105; Paul. Æg., L. vii, s. 3; Pliny, L. xxvii, c. 4.) Another plant, named Æthiopis, is mentioned by Pliny (L. xxiv., c. 102) as being very serviceable in dropsy. It has been referred to an Euphorbium. (Waring.)

Æthiopis'mus. Same as Æthiopificatio.

Æthiopopo'sis. Same as Æthiopificatio. Æth'iops. (Λίθίοψ, an Ethiop, or native of Ethiopia, a region of Africa; also the son of Vulcan, from αίθω, to burn, in reference to the dark complexion of Ethiopians, or as if blackened or charred by burning. F. ethiops.) A name anciently given to several black powders, because of their colour.

Æ. albus. An Albino; also a synonym of Mercurius alkalisatus.

Æ. alkalisa'tus. A synonym of the Hydrargyrum eum Cretà.

Æ. an'imal. The pigment layer of the choroid membrane.

Æ. anima'lis. The powder formed by burning various animals to a cinder, as the hedgehog, sparrow, mole.

Æ. antimonia'lis. A preparation composed of one part of quicksilver to two of sulphuret of antimony; used in skin affections.

A synonym of Hydrargyrum sulfuratum stibiatum, Helv. Ph.; and of the Sulphuretum hydrargyri et antimonii, Belg. Ph.

Æ. autiphthys'icus. An old preparation of mercury with balsam of Pern; used in consumption.

Æ. antirheumat'lcus. An old preparation of mercury with gum guaiacum, used in rheumatism.

Æ. auripigmenta'lis. An old preparation of quicksilver with sulphuret of arsenic.

Æ. diuret'icus. An old preparation of mercury with juniper.

Æ. jovia'lis. An old preparation of tin, quicksilver, and sulphur, rubbed together.

E. martia'lis. The black exide of iron, used formerly as a tonic. A synonym of the Oxidum ferri nigrum, Belg. Ph.; and of the Ferrum oxydulato-oxydatum, Helv. Ph.

Æ. mercuria'lis. Mercury sulphide. A

synonym of Sulphuretum hydrargyri nigrum, Belg. Ph.

E. mercu'rii per se. The Hydrargyri oxidum, or mercury oxide, because formed by merely triturating mercury for a long time while exposed to the air.

Æ. minera'lis. A preparation composed of mercury sulphide with sulphur: the Hydrargyri sulphuretum cum sulphure of the pharmacopeias.

A synonym of the Hydrargyrum sulfuratum nigrum, Germ. Ph. and Helv. Ph.; and of the Sulphuretum hydrargyri nigrum, Belg. Ph.

E. narcoticus. A synonym of Ethiops mineralis.

Æ. pur'gans. An old preparation of mer-

cury with manna or jalap.

E. sacchara tus. See Hydrargyrum saccharatum.

Æthiops. Æ. vegetab'ilis. powder, formed by incinerating the Fucus vesiculosus in a covered crucible; it contains iodine, and was employed in glandular diseases.

Æthmoi'des. See Ethmoid. **Æth'na.** (Aldos, burning.) An old term for subterraneous, invisible, sulphureous fire, which calcines rocks in the earth.

Æth'nici. The fiery meteors emitted from

burning mountains. (R. and J.)

Ethol'ices. (Αΐθω, to burn.) Term for burning pustules on the skin; considered to be furunculi, or boils, by some.

Æthom'ma. (Alθos, burning or shining; σ̃μμα, a sight or spectacle.) An old term for the appearance of flashes of light before the eyes.

**Æth'rioscope.** (Λιθηρ, air; σκοπίω, to see. F. æthrioscope; G. Æthrioshop.) An instrument for measuring the degree of cold arising from exposure under different conditions of the sky. It consists of a differential

thermometer, so placed in the interior of a highly polished cup or concave mirror that one of the bulbs is in the focus of the mirror, and the other not in the focus. The cup or mirror is kept covered by a lid, on the sudden removal of which the liquid in the arm passing to the focus rises. owing to the bulb in which it terminates becoming cooled.

Æthu'sa. (Λίθω, to burn.) A genus of the Sub-tribe Ænantheæ, Tribe Sesciimæ, Nat. Ord. Umbelliferæ. General involucre none; partial involucre long, pendulous, valved; calyx obsolete; fruit ovate; ridges 5, raised, thick, acute, the lateral on the edge and broader; vittle one to each furrow; albumen terete; the bracts longer

than the umbel.

Æ. cyna pium. (Κύων, a dog. F. petite cique, faux persil, ethuse; G. Humlspetersilie. Gartenschierling; I. cienta minore.) Fool's parsley. Root fusiform; stem corymbosely branched, terete, fistular, leaves deltoid; leaflets pinnatifid; umbels small, rays spreading, irregular; bracteoles 3-5, slender; flowers irregular, small; fruit green. A well-known narcotic, acrid, and emetic plant, growing in hadgerows and waste places; the leaves have been occa-sionally mistaken for parsley, and the roots have been eaten for parsnips and turnips. It is very poisonous, death having occurred in an hour, with nansea, vomiting, insensibility, tremors, dilated pupils, and tetanic contraction of masse-ters. It is distinguished from parsley by its stem, which is glaucous, reddish at the base, and slightly spotted with red, while that of parsley is green; by its leaves, which are tripinnate, with numerous narrow segments, while those of parsley are bipinnate, with large trilobed segments; by its absent involucre, while parsley possesses one; by its involucel, which consists of three dependent bracteoles, while that of parsley is composed of 8-10 circularly disposed bracteoles; by its flowers, which are white, while those of parsley are yellowish-green; and by its odour, which is nauseous, while that of parsley is agreeably aromatie.

Æ. me'um. A synonym of Meum athamanticum.

Æthu'sin. A crystallisable poisonous al-kaloid, which is the active principle of the Æthusa eynapium. It forms a crystallisable salt with sulphuric acid.

Æthyle. See Ethyl.

Æthyle'num chlora'tum, G Ph.; Helv. Ph. Dutch liquid. See Ethem chloride. Ætia. (Δίτία, a cause.) A cause; as of

**Ac'tioi phle'bes.** ('Λετός, an eagle; φλεψ, a vein.) Eagle veins; a term for the veins of the temple.

**Ætiol'ogy.** (Λίτία, a cause; λύγος, a discourse. F. etiologie; G. atiologie.) Term for the doctrine of the Causes of disease.

In Biology, actiology has for its object the as-certainment of the causes of the facts of this science, and the explanation of biological phenomena, by showing that they constitute particular cases of general physical laws.

Ætion. (Αἴτιον, a cause.) A cause; as of disease.

**Acti'tes.** (' $\Lambda \epsilon \tau \delta s$ , an eagle; because believed to be carried by the eagle to her nest to assist in the hatching of her eggs.) The eaglestone; a stone, hollow and containing another substance within it; the former, or shell, of clayiron stone; the latter, or nucleus, of variable composition.

**Eto'cion.** Same as Ætolion. **Etolion.** (Λίτώλιος, οτ αἰτώλιος, a night bird of prey; or from άετός, an eagle.) Old namo for the berries of the Daphne mezereum, or widowwail; their colour heing that of the eagle.

Ætomor phæ. ('Αετός, an eagle; μορφή, form.) A Group, according to Huxley, of the Suborder Desmognatha, Order Carinata, Class Aves. The birds of prey. Rostrum more or less arched and hooked at the lip; maxillo-palatine processes united with an ossification of the septum; breadth of the articular surface at the distal end of the quadrate bone greater than its length, the outer condyle extending about as far downwards as the inuer.

**Æton'ychum.** ('Λετόs, an eagle; ὄνυξ, claw.) The plant Lithospermum officinale. a claw.) The plant Same as Ægonychon.

Af abond. A dried mucilaginous fruit, sold in the Bazaars of Upper India, imported from

Khorasan, and employed as a tonic. (Waring.)

Afa'e. The native name in Delhi of the

Echis earinata, one of the Viperidæ.

Afa'i. Same as Afae.

Afe brile. (A, neg.; febris, fever.) Term applied by Liebermeister to cases of typhoid fever in which the temperature rises but slightly or

Af fadyl. ('Ασφοδελος; L. asphodelus.) An old term, replaced in latter times by Daffodil.

The Narcissus pseudonarcissus.

Affec'tio. (L. afficio, to affect.) An affection. A. arthritica cor'dis. Gout at the heart.

A. hypochondri'aca. Hypochondriasis.

A. hyster'ica. Hysteria.

A. sarmatica. A synonym of Pliea polonica.

A. tympanit'ica. Tympanites.

Affection. (L. Affectio; from afficio, to affect. F. affection.) Term applied to the passions or emotions of the mind, as anger, hatred, jealousy, and love.

In Pathology, it is nearly synonymous with disease, as inflammatory, nervous, or rheumatic

affection.

Affective faculties. (F. les facultés offectives.) An Order including Animal Propensities, Sentiments common to man and the lower animals, and Affective Faculties peculiar to

A. insan'ity. A form of insanity, opposed to the ideational, in which the emotions or feelings only are affected. Mandsley and others divide affective insanity, or emotional, as it is sometimes called, into two varieties-impulsive and moral insanity. In both, the lan-guage may be coherent, and the memory and judgment sound and accurate. In impulsive insanity one only, or a few of the moral faculties, sentiments, or feelings, are perverted. There is an irresistible tendency to the performance of some one act or class of acts, as in kleptomania, homicidal mania, or pyromania. In moral ius mity the moral faculties are generally perverted; there is a loss of power of the will to contest the emotions. Affective insanity precedes and ac-companies every other variety of insanity.

A. monoma'nia. Esquirol's term for

emotional insanity.

Affectus. (I. afficio, to affeet.) A state or disposition.

A. an'imi. Mental disorder.

A. fau'cium pes'tilans. A synonym of Cynanche maligna.

A. hydero'des. A synonym of Dropsy. A. spasmodico-convulsi'vus labio'rum. A synonym of Facial neuralgia.

Affen'ah. An undetermined African plant, the leaves of which, with cardamoms and other ingredients, are given by the natives of Ashantee internally, and applied externally in painful affections to swollen parts. (Waring.)

Affenicum. Old term for the Anaim, or

Affeos. Foam; froth; spuma. (Ruland.)
Afferent. (L. afferens, from ad, to; fero, to bear or earry. F. afferent.) Bringing to; applied to the lymphatic vessels (Vasa afferentia), because they bring their contents to the system.

A. im'pulse. The impression conveyed by

an afferent nerve to its centre.

A. nerve. A nerve which conveys impressions from the periphery to the centre. In most cases synonymous with sensory.

Arabic name for Cerussa, or Affidra.

white lead.

Affilia'tion. (L. ad, to; filius, a son.) The legal determination of the paternity of a child. Affinage. The act of refining or purification of metals.

Affin'ity. (L. affinitas; affinis, akin to, related to; from ad, to; and finis, boundary, limit. F. affinite; G. Verwandtschaft.) Relationship; a term nearly synonymous with attraction.

Also used to denote an intimate relationship between animals or plants in regard to their structural organisation.

A. appro'priate. Same as Intermediate

affinity.

A. chem'ical. (F. affinité; G. chemische Kraft; Verwandtschaft.) The force by virtue of which bodies of dissimilar nature unite together to form compounds of definite eonstitution which cannot be destroyed by mechanical agencies; as contradistinguished from the attraction between molecules of hke kind, which is cohesion. It is exerted only at inappreeiable distances and always between definite and iovariable weights of the combining substances.

A. elec'tive. A term employed to indicate the greater attraction which a substance, when brought into contact with other substances, often

has for one in preference to others.

A. com'pound. Applied to the uniting of three or more bodies, by their mutual affinity, to

form one homogeneous body.

A. dispo'sing. Applied to the tendency of many bodies to enter into combination, by being presented with a third substance, exerting a strong attraction to the compound they form, but which may be withdrawn whenever the combination is established.

A. divel'lent. That which tends to arrange the particles of a compound in a new form,

producing decomposition.

A. doub'le. See Attraction, Double elective. A. interme'diate. The affinity of an intermedium; used when two substances of different kinds, showing no compound affinity for each other, combine by the aid of a third, and unite into a homogeneous whole.

A. of aggrega'tion. The force by which two substances of the same kind tend to unite without alteration of their chemical properties;

attraction of cohesion.

A. of composition. The force by which substances of different kinds unite and form matter, the properties of which are different from those of the substances before their combination.

A. quies'cent. That which tends to maintain the elements of a compound in their

present state.

A. recip'rocal. An old term explained thus: a body consisting of two principles may be separated by unother, which, with one of the principles of the first, forms a new compound; but the separated principle, after some time, will effect a separation of the new union.

A. sim'ple. See Attraction, simple elective. A. vi'tal. The power by which the various solids and fluids of organised bodies are formed from the common circulating fluids.

Af'fion. Arabic name for opinm.

Af'fium. A term borrowed from the Orientals, who apply it to the unmixed opium tears which collect around the incisions in the capsules of the poppy, and given to the indigenous opium of France.

A. d'Aubergier. An extract of the capsules of the Papaver rigrum containing 5 per

cent of morphia.

Affla'tus. (L. afflo, to blow upon.) A blowing or breathing upon; a blast. Applied to a species of erysipelas, from the suddenness of its attack, as if caused by an unwholesome blast.

Af fluent. (L. ad, to; fluo, to flow.) Flowing into; applied to a stream which runs into

another. Afflux. (L. affluo, to flow towards, from ad, to; fluo, to flow, Gr. ἐπἰρροια. F. afflux; G. Anfluss, Zufluss; I. afflusso.) The abundant flow of the blood or other fluid to a particular region or organ of the body. The congestion of the vessels of the mammary gland when the infant takes the breast is a good example of the affinx of blood to a gland.

Afformas. An old name for glass. (R.)
Affrodile. The Narcissus pseudonar-

Affrodina. ('Aφροδίτη, Venus.) Alchemical name for the metal Cuprum, or copper. Affroni'trum. (Ar. Baurach; G. Glasgalle.) Sandiver. Spuma nitri; Cappadocian salt. Af'frotron. (L. Spumeus; G. Schaumig.) Frothy, foamy.

Affun nena. A plant of Guinea, which, boiled in wine, proves purgative. (W.)

Affu'sio. (L. from affundo, to pour upon.) A pouring upon; affusion.

A. trig'ida. A cold affusion.

A. orbicula'ris. A synonym of the Placenta. Affu'sion. (Affundo, to pour upon. F. affusion; G. Aufguss.) The pouring of water or some liquor repeatedly on a substance to cleanse it. Term applied to a remedy in fevers, consisting

in the pouring on the patient a quantity of water, varying in temperature according to his state, but usually from 50° to 60° or 70° F.; the duration of the affusion varies from two to ten minutes. It has a powerful action in reducing febrile heat and in calming nervous symptoms. The occurrence and degree of reaction should be watched.

Afo'ba. A plant of Guinea, which, bruised with oil, is used as a cure for scabies. (Waring.) Afœtal. (L. A, neg.; fætus, progeny.)

Having no fœtus. Afragar. (Arab.) Verdigris.

Af'rican ammonia'cum. See Ammoniacum, African.

A. bdel'lium. A gum resin obtained from Balsamodendron africanum; and by some also said to be derived from Amyris commiphora, both of which are Amyridaceous plants.

A. black pep'per. The fruit of the Piper Afzelii. (Lind. cubiba clusii, Mignel.) It closely resembles cubebs, but contains piperin, and not cubebin.

A. co'pal. A kind of gum resin found on the Island of Zanzibar and the neighbouring mainland, embedded in loose soil and touchwood. It is the product of vast extinct forests.

A. cu bebs. See Cubebs, African.

A. hemp. A fibre derived from Sanseviera

zeylanıca, a Liliaceous plant.

A. ki'no. A concrete juice, resembling dragon's blood, obtained from the Pterocarpus erinaceus.

A. mil'let. An edible grain obtained from the Penicillaria spicata, or Panicum spicutum. A. oak. A synonym of African teak.

A. olib'anum. A gum resin obtained. according to Dr. Birdwood, from the Boswellia Carterii, B. Bhan-Dajiana, and B. Frereana, all natives of the Soumali country, and belonging to the Nat. Ord. Amyridacea.

A. saffron. The flowers of the Lyperia

crocera. A Scrophnlariaceous plant, and a native of South Africa. They closely resemble true saffron in smell and taste, and have similar medicinal properties. They yield a fine orange dye.

A. teak. A valuable timber, obtained from the Oldfieldia africana, a Euphorbiaceous plant.

A. trag'acanth. A gum obtained from the Sterculia tragacantha, a Sterculiaecous plant, and a native of Sierra Leone.

A. tur'meric. A rhizome resembling ordinary turmeric; probably obtained from the Canna speciosa, a Musaceous plant.

Af'rob. (Arah.) Plumbum, or lead. Af'ros. Spuma; foam, froth. (Ruland)

After-birth. (F. arrièrefaix; 1. seconda; G. Nachgeburt.) Common term for the placenta. cord, and membranes, otherwise called the secundines, because they are expelled together after the birth of the child, which expulsion completes what is termed delivery.

A. damp. (F. mofettes; I. mefita; S. mofeta; G. feuriger Schwaden, böses or todtenden # etter.) The product of the partial combustion of coal gas. It contains a large proportion of carben dioxide or carbonic acid gas, and proves very fatal to miners after explosions.

A. fe'ver. Term applied by Biermer to those brief paroxysms of tever which are not relapses, and not dependent on any local disease,

in typhoid fever.

A. im'ages. (F. images accidentelles ou consecutives; G. Nachbilder.) The retention of a vivid impression on an organ of sense, but especially by the retina, when the original stimulus has eeased to act. When the afterimage is simply a prolongation of the sensation, it is termed a positive after-image, as when, on closing the eyes after looking at a window, the bars are seen of a dark colour and the panes illuminated. This is probably due to the continued vibration of the retinal elements in response to the previous stimulus. After a short period a reversal takes place, the bars appearing bright and the panes dark. This is termed the bright and the panes dark. negative after-image. In the case of colonred objects regarded fixedly for some time, the eyes being then directed to a white, the negative after-image is of a complementary colour; a red wafer, for example, giving a green image. This reversal is usually attributed to fatigue of the retinal elements, and consequent inability to perceive the red light proceeding from the white surface, the complementary tint green being alone perceived by the exhausted or less sensitive part of the retina. Dr. Hartshorn, however, attributes the negative after-image to the interference of the continued retinal vibrations with those rays of the same colour in the light reflected by the white surface looked upon, so that only the com-plementary rays are seen. The after duration of sensations consequeut on impressions on the retina explains the appearance of a circle of light produced by moving a luminous body in a circle before the eyes, as well as that of the confusion of the images of the spokes of a rapidly revolving

After-images may also be experienced in the ease of smells, tastes, tones, and impressions of contact. This term is applied to those impressions on the organs of sense which continue to be perceived by the mind after the original stimulus has ceased to act-a persistence, as it were, of the vibration into which the nerves were primarily thrown by the application of their appropriate stimulus.

The duration of after-images is very variable, but seems to augment with exhaustion of the nerve, and perhaps with the advance of age. Newton suffered for many years from an after-image of the sun, caused by incautiously looking

at it through a telescope.

A. pains. (F. tranchies uterines; I. ossia dopo il parto; G. Nachwehen.) Term for those pains generally felt, and which are more or less severe for a time, after the birth of the child and expulsion of the after-birth, from the contractile efforts of the nterns to expel clots.

After-pains usually are more severe in those who have borne children previously; they are increased at the time of suckling, and by distension of the rectum or bladder. Occasionally they are very severe and of a neuralgic character. An aperient, with opium and warm sedative fomentations to the hypogastrium, generally give relief. Anodyne applications to the breasts have been recommended.

A. sensa'tion. The continuation or prolongation of an impression made on the special nerves of touch, taste, smell, hearing, or sight, when the stimulus producing the impression has ceased to act.

A. shaft. The secondary shaft of the feather of a bird growing immediately above the upper umbilions at the junction of the barrel with the rachis.

Af'to. A cruciferous plant of Guinea, which, dried and powdered, is regarded as a good errhine in headaches.

A'gah. Intermittent fever.

Agalactatio. Same as Agalactia. Agalac'tia. ('A, neg.; γάλα, milk. F. agalactie; G. Milchmangel.) A want or doficiency of milk after child-birth. It is a frequent result of acute febrile disorders occurring in the puerperal condition, and is then often of evil omen. If the disorders improve, the secretion of milk frequently returns, and its reestablishment may be promoted by warm fomentations. Local applications of the leaves of the Ricinus communis and of a decoction of tho Jatropha curcas have been recommended.

In deficiency or threatened loss of the milk secretion, good diet, malt liquors, milk, conger cel soup, infusions of fennel and aniseed, and electricity, have been advised.

Agalac'tos. ('Αγάλωκτος.) Applied by Hippocrates to a woman who has no milk after child-birth (de Natur. Puer. xi, 19, 20).

Agalac'tous. ('Λ, ueg.; γάλα, milk; G. milch-her, milch-vertreibende.) Without, or having no milk.

Agalax'ia. The same as Agalactia.
Agalaxis. Same as Agalactia.
Agallochum. ('Αγάλλοχον. F. agalloch, bots d'alves; G. Adlerhotz, Alochotz.) An old name for the wood of the aromatic aloe, Aquillaria agallochum.

Agal'lugen. A synonym of Agallochum. Agal'lugi. A synonym of Agallochum.

Agalorrhœ'a. ('A, neg.: γάλα, milk; ρέω, to flow. F. agalorrhee.) Cessation of the flow of milk.

**Agam'ia.** ('A, neg.; γάμος, marriage.) Term formerly applied to the *Cryptogamia*, because they were thought to be destitute of sex.

Agam'ic. (Same etymon.) Having crigin

without sexual intermediation.

Agam'idæ. (G. Erdagamen.) A Family of the Suborder Vermilingues (Rhiptoglossi, Wiegm., Dendrosaura, Gray), Order Sauria, Class Reptilia. Body flat and broad, with short legs, spinons integument, and short tail. Many have a toad-like aspect, live on the earth, and are capable of changing the colour of their skin. The excrements of some species, as of the Stellio vulgaris, have been used in medicine.

Agam'ius. A synonym of Agamia. Agamogen'esis. ('Α; γάμος ; γέψεσις. an origin.) An asexual generation : as in plants, when multiplication takes place by bnds; in the lower forms of life when the body divides into two parts, each of which may grow into the exact similitude of the parent; and in other low organisms when a hud sprouts from the parent hody, separates, and grows into an individual of like nature.

Agamone ma. (A, neg.; γάμος, marriage; νῆμα, a tbread.) A term under which Diesing has included all the agamous nematode worms, which migrate to their final host.

A. alau'sæ. In the intestine of the Alausa vulgaris.

A. a'pri. In the mesentery of Capros aper. A. as'pii. In the peritoneum of Aspius

A. belo'ne vulga'ris. Encapsuled in the

walls of the intestine of the Belone rulgaris. A. bi'color. Encapsuled in the peritonenm

of Perca fluviatilis.

A. capsula'ria. In the peritoneum of Belone acus, and in the intestine, and encapsuled in the peritoucum of Alosa sapidisoma, in the peritoneum of Trigla gurnardus, and elsewhere.

A. caran'cum. In the mesentery of Caranx brachurus.

A. chrysoph'rydis aura'tæ. ovary of Chrysophrys aurata.

A. commu'ne. In the liver of Sebastes

A. cys'ticum. Encapsuled in the muscles of Synbranchus laticaudatus.

A. fa'bri. In the peritoneum of Zous faber. A. li'chiæ glau'cæ. In the peritoneum of Lichia glauca.

A. lo phii piscato'rii. Eucapsuled in the stomach of Lophius piscatorius.

A. merlu'cii vulga'ris. In the peritoreum of Merlucius vulgaris.

A. mul'li. In the abdominal cavity of Mullus burbatus.

A.ova'tum. In the liver of Gobio fluviatilis A. papillig'erum. In the peritoneum of Scomber scombrus.

A. rhom'bi bos'cii. In the mesentery of Rhombus Boscii.

A. scombro'rum. In the intestines and pylorie appendages of Scomber scolias.

A. scorpæ'næ cirrho'sæ. In the peritoneum of Scorpana cirrhosa.

A.serra'ni cabril'læ. In the peritoneum of Serranus cabrilla.

A. sparoi'dum. In the peritoneum of Box vulgaris.

A. syngna'thi pelag'ici. In the mesen-

tery of Syngnathus pelagicus.

A. tin'cæ. In the mesentery of Tinca vulgaris.

A. trig'læ hirun'dinis. In the peritoneum of Trigla hirundo.

A. trig'læ linea'tæ. In the peritoneum of Trigla lineata.

A. umbri'næ vulga'ris. In the peritouenm of Umbrina vulgaris.

A. wach'niæ. In the peritoneum of Gadus wachniæ.

A. ze'nis. In the abdomen of Zeus faber. Agamonemato'dum. (Same etymon ) Larval forms of Nematode worms, of which specimens have been found in the intestines or abdominal cavity of species of Armadillo, Gobius, Blaps, Geotrupes, Passalus, and Pecten.

Ag'amous. ('A, neg.; γάμος, marriage.)
Term applied to the forms of reproduction occurring in animals and plants in which the sexes are not differentiated.

Also to the production of young by virgin mothers, as in parthenogenesis.

Also to living things having no sexual organs. Ag'amus. A synonym of Agamia.

Aganacte'sis. (Gr. from 'Αγανακτέω, to ache.) Severe pain in any part.

Agapan'theæ. A Tribe of the Nat. Ord. Liliuceæ, having fibrous or tuberous roots, a tubular six-partite perianth, perigynons audrœcium, and a membranous and pale episperm.

A'gar. Arabie name for Calx.

Agaracine. The same as Agaricin. Agar-agar. (F. algue de Java.) A kind of glue which is prepared from the Gelidium corneum or Fucus spinosus, and from the Gracilaria or *Plocaria lichenoides*. It is the object of a large trade in Java, and also between the E. Indies and China. It is used for dressing silks, and as a food. It is said that the swallow (Collocalia esculenta) which makes the edible bird's nest uses this alga for the purpose. The nests are, however, composed of the inspissated saliva of the birds, and only have a little vegetable matter on their surface.

Agarea. A Tribe of the Family Laminarea; stipitate, canlescent, large-growing and regularly perforated.

Agardh, Carl Adolph. A Swedish botanist. Born 1785, died 1859. The son, Jacob George, also a botanist, was born in 1813, and is still living (1878).

Ag'aric. Touchwood; spunk; tinder. This is the product of different species of Polyporus. See Amadou.

A. ac'id. An acid obtained from Poly-

porus officinalis by extracting with ethers. It. crystallises in fine white needles, fuses at 145.7° F., does not sublime, dissolves easily in strong alcohol, less in chloroform, and still less in ether, acetic acid, sulphide of carbon, benzole, and water. It is emetic and purgative.

A. amadou'vier. (Fr.) A synonym of

the Polyporus officinalis.

A. aux mousses. (Fr.) A synonym of the Agaricus muscarius.

A. à ver'rues. (Fr.) A synonym of the

Agarwas bulbosus,
A. blane. The French officinal name for the Polyporus officinalis, or Fungus of the Larch.

A. brû'laut. (Fr.) A synonym of Agarieus urens.

A. causti'que. (Fr.) A synonym of Agurious rufus.

A. comesti'ble. (Fr.) A synonym of the Agarieus campestris.

A. de l'oliv'ier. (Fr.) A synonym of the Agaricus olcurius.

A. des méd'ecins. (Fr.) A synonym of Polyporus officinali.

(Fr.) The Polyporus A. du chêne. fomentarius, from which Amadon is prepared.

A., fe'male. A synonym of the Polyporus fomentarius.

A. femel'le. (Fr.) A synonym of Polyporus fomentarius.

A. meur'trier. (Fr.) A synonym of the Agaricus necator.

A. mouche. (Fr.) The Agaricus mus-

A. meuch'eté. (Fr.) A synonym of Agaricus muscarius.

A. od'orant. (Fr.) A synonym of the Trametes suaveolens.

A. of the eak. The Polyporus fomentarius. A., pur'ging. The Polyporus officinalis. A. printan'nier. (Fr.) A synonym of the Agaricus bulbosus.

A. res'in. A resin obtained from Polyporus officinalis by extracting with other. It is of a brown colour, insoluble in water, easily soluble in other, absolute alcohol, and ammonia; also in methylic alcohol, chloroform, and acetic acid, insoluble in beuzol. It is slightly bitter, and fuses at 32° C. (89.6° F.)

A. tête de medu'se. (Fr.) Asynonym of the Agaricus annularis.

A. vénéneu'se. (Fr.) A synonym of Agaricus bulbosus.

A., white. The Polyporus officinalis. Agaric'ic. Relating to or belonging to

A. ac'id. A synonym of Agaric acid. Agaricic'olus. (Ayaricum; colo, inhabit. G. fewerschwammbewohnend.) Living in agaries, as Boletophagus aguricicola.

Agariciform. (Agaricum; forma, likess. F. agariciforme; G. feuerschwammforig.) Like an agaric. Applied to many Polyparia, as Millepora agariciformis.

Agaricin. A peculiar concrete fatty substance, analogous to cholesterin, found by M. Gobley in the edible mushroom.

It has been used as a synonym of the poisonous principle amanitin.

Agaric'ini. (G. Blätterschwämme.) Fam. of the Subord. Hymenomycetes, Ord. Basidiomycetes, Div. Fungi, Class Thallophytes, Subkingdom Cruptogamia. The Mushroom family. They are distinguished from other Hymenomycetes by the hymenium being always inferior and spread over the surface of gills, which radiate from the stem. The gills may be either simple or branched, and attached to, or distinct from, the stem. The spores vary in colour, but one colour is constant, as a rule, to a genus. The stem is sometimes cartilaginous, and sometimes fleshy, and varies in colour according to the species and the age. In some genera and subgenera a ring or annulus is to be found on the stem, which is the only remains of a veil or covering, velum partiale, which united that part of the stem with the outer edge of the cap or pileus, but was ruptured on the expansion of the latter. In some genera (Volvaria, Amanita) the whole fungus is enclosed at first in a volva, velum universale, which, on bursting, falls away and is independent of the cuticle on the upper surface of the pileus, but remains attached to the base of the stem. Sometimes, as in Amanita, both forms of veil are found together. The stem is not always central. The species are usually terrestrial.

Agaric'inous. (F. agaricin; G. fenerschwammig.) Resembling, living in, or growing

upon, agaries.

Agaricoi'des. ('Αγαρικόν; εξδος, form. F. agaricoule; G. feuerschwammahnlich.) Applied by Persoon to a Division of mushrooms having the Agaricus for their type.

Agar'icum. ('Αγαρικόν, a tree fungus used for tinder.) The old Pharmacopæial name

of the Polyporus fomentarius.

Agaricus. Mushroom. A Genus of the Family of Agaricini. The structure, usually called the fungus, is the receptacle which sprouts from a mycelium vegetating in the ground or on wood, or some other substance. The receptacle is at first a solid pear-shaped body, composed of young hyphæ, all similar to one another. At an early stage the tissue of hyphæ gives way beneath the apex, leaving an annular air cavity, the upper wall of which forms the under side of the pileus, and from this the radial hymenial lamellae grow downwards, filling up the air eavity. The outer houndary of this constitutes the volva. The substance of the lamella, called the trama, consists of rows of long cells occupying the central portion, external to which are several rows of short and rounded cells, from which spring the club-shaped cells attached at right angles to the surface of the lamella, which form the hymenial layer; many of these remain sterile, and are called paraphyses; others produce the spores, and are the basidia. The basidia put forth two slender branches, each of which swells at the end; the swelling increases, becomes a spore, and drops off, and germinating, gives rise to the mycelium. In some species the hyphæ unite to form laticiferous vessels.

Bentley gives the following general characters distinguishing edible from poisonous mushrooms. Edible mushrooms grow solitarily in dry airy places; are generally white or brownish; have a compact brittle flesh; do not change colour, when cut, by the action of the air; have a watery juice, an agreeable odour, and their taste is neither bitter, aerid, salt, nor astringent. Poisonous mushrooms, on the contrary, grow in clusters in woods and dark damp places; are usually of a bright colour; have a tough, soft, or watery flesh; acquire a blue, green, or brown tint when cut and exposed to the air; the juice is often milky; the odour commonly powerful and disagreeable; and have an acrid, astringent, acid,

salt, or hitter taste.

A. (Stropha'ria) ærugino'sus. Verdigris mushroom. Pileus subumbonate, covered with green slime, which soon gets washed off by the rain, flaked with white scales; stem hollow, tinted with blue; lamella adnate, brown, tinged with purple. Poisonous.

A. (Tricholo'ma) albel'lus. Confluent Tricholoma. Pileus first conical, then expanded, smooth, moist, mottled; disc compact, subumbonate; margin thin, even; stem solid, somewhat silky; lamellæ adnexed without a tooth, crowded, entire, white. On the ground. Edible.

A. al'bus. A synonym of Polyporus offici-

Also a synonym of the officinal Fungus larieis. A. aiuta'ceus. A synonym of Russula

alutacea.

- A. ama'rus. (F. agaric amer.) Pileus at first convex, then flat, afterwards concave, dry, reddish yellow; laminæ serrated, unequal, greyish green, then black; stem yellowish, with an imperfect ring; odour agreeable; bark very bitter. Emetic and purgative.
- A. annula'ris. A synonym of A. melleus.
  A. aquifo'lii. An edible mushroom used in France.
- A. (Psallio'ta) arven'sis. (G. Schafchampignon, Gugemuke.) The horse mushroom. resembling the A. campestris, but larger, with the gills browner, and with the stem inclined to be hollow. Edible.

A. aura'tus. A synonym of A. amarus. A. auric'ulæ for'ma. A synonym of

- Hirncola auricula—Juda, or Jew's ear fungus.

  A. (Tricholo'ma) bre'vipes. Shortstemmed mushroom. Pileus fleshy, soft, convex, then plane, even, umber; stem solid, brown, very short; lamellæ emarginate, crowded, ventricose, brownish, then dirty white. In plantations. Edible.
- A. (Amani'ta) bulbo'sus. (F. amanite bulbeux.) bulbeux.) Pileus convex, citron or olive coloured, fleshy, moist; lamellæ numerous, large, unequal, detached, white; stem cylindrical, bulbous at the base, where it is surrounded by a ring, stuffed, then hollow; ring large, very complete, regular, moist; odonr nanseous. Poisonons.

A. bulbo'sus ver'nus. A synonym of the A. vernus.

A. (Psilocy'be) bulla'ceus. Pileus ginch in diameter, at first hemispherical, subsequently flattened, striated near the centre, dark brown; lamellæ decurrent, triangular, at first greyishyellow, subsequently reddish-brown; stem 3 inch high, yellowish, hollow, fibrous. Found in summer and autumn on dung heaps.

A. cæsa'reus. Pileus smooth, wartless, crimson; lamellæ yellow; stem stout, white. The species commonly eaten in Italy.

known in England.

A. (Panæ'olus) campanula'tus. Pileus about 3 inch in diameter, bell-shaped, at first brown, then reddish brown, dry, somewhat polished; lamellæ speckled with grey and black spots; the stem slender, reddish brown, the upper part dusted with black and striated. Found on dung beaps.

A. (Psallio'ta) campes'tris. champignon; I. pratojudio; G. Feldschwamm, Brachpilz, Treutschling.) The common mea-dow mushroom. Pileus 2 to 5 inches in dia-meter, at first hemispherical, subsequently flattened; flocculent and silky, or with fine scales

on the surface; with firm white flesh, becoming faintly rose-coloured on exposure; gills at first white, then pink, and ultimately brown and moist; stem two to four or five inches high, solid, smooth, white, with well-marked white woolly ring. Found in summer and autumn throughout Europe

in fields and woods. Edible.

A. cantharellus. (F. chanterelle.) A synonym of Cantharellus cibarius; a mushroom

much esteemed in France.

A. (Pholio'ta) capera'tus. (G. Runzel-schwamm.) Pilens 2 or 3 inches in diameter, at first egg-shaped, then expanded, with whitish tloceuli, and becoming wrinkled with age; lamellæ adherent; stem 3 inches high, solid, with a membranous ring. Found in woods in summer and autumn. It is eaten in Thuringia.

A. casta'neus. A synonym of Cortinureus

castuneus.

A. chirurgo'rum. A synonym of Palyporus fomentarius.

A. cinnamo'meus. A synonym of Cor-

tinarius cinnamomeus. The brown mushroom, which has a pleasant smell.

A. coma'tus. A synonym of Coprinus comatus.

A. (Psathy'ra) cor'rugis. Pileus 1 inch in diameter, bell-shaped, membranous, somewhat wrinkled, smooth, rose red, but subsequently becoming paler. Lamellæ ventricose, of a violet-black colour; stem 2-4 inches bigh, white. Found with tolerable frequency in gardens.

A. (Hebelo'ma) crustulinifor'mis. (G. Ekelschwamm.) Incrusted mushroom. Gills pale, spores umber brown; odour disagrecable. Autumnal. Poisonous.

A. (Clitocy'be) dealba'tus. Ivory or white firwood mushroom. White; pileus convex, afterwards revolute, smooth, shining; stem stuffed, thin, subpruinose above, ringed at the base; gills adnate, thin, white. Fir woods. Edible.

A. delicio'sus. (G. Reizger.) The delicious mushroom, so called because it has the flavour of a roasted mussel. A synonym of Lactarins deliciosus.

A. ebur'neus. A synonym of Hygrophorus churneus.

A. ed'ulis. A synonym of the A. campestris.

A. emeticus. A synonym of Russula

emetica. A. (Collyb'ia) esculen'tus. (G. Nagelschwamm.) Nail mushroom. Pileus nearly plane, obtuse, smooth; stem fistulose, straight, rooting, smooth, clay-coloured; lamelle adnate,

lax, whitish. In pastures in spring. Edible.
A. (Lepio'ta) excoria tus. Flaky mushroom. Pileus fleshy, soft, subumbonate; cuticle thin, sealy; stem hollow, short, white; ring movable; lamellæ rather distant. Pastures in May to September. Has been eaten, but not recommended.

A. exquis'itus. A synonym of A. campestris.

A. (Hypholo'ma) fascicula'ris. Büschelschwamm, Schwefelkopf.) Bundled stump mushroom. Found everywhere in groups at the bases of old trees. Pileus subumbonate, smooth, ochre yellow; flesh yellow; the stem is hollow, and the gills are greenish and subdefiquescent; odour heavy; taste bitter and repulsive. Poison-

A. (Hebelo'ma) fastib'ilis. (G. Ekel-

schwamm.) Pileus about 2 in. in diam., firm, rather flat, sticky, smooth; at first white, then yellowish; lamelle few, excreting watery drops; stem 1 or 2 in. high, often hollow, knobby, scaly; mycelium distinct. Smell and taste disagreeable. Summer and autumn in moist woods.

A. (Psilocy'be) foenise'cii. Pileus at first bell-shaped, then tlat, 1-2 inches in diameter, dry, greyish brown, then paler and foxy red; lamelle adherent to the stem; umber coloured, with rather wide intervals between them. Stem 2-3 inches high, hollow, smooth, paler than the cap. Found from May to November on meadows.

A. (Clitocy'be) fra'grans. mushroom. Pileus with an odour of ause, ochraceous, convex, then plane; hygrophorous; stem stuffed, then hollow, clastic, smooth; lamelke subdecurrent, rather crowded, distinct, whitish. In woods. Edible,
A. (Collyb'ia) fu'sipes. Spindle-stem

mushroom. Pileus fleshy, smooth, vinous brown; stem stuffed, then hollow, contorted, rooting; lamellie adnoxed, broad, distant, white.

stumps. Edible.
A. (Tricholo'ma) gambo'sus. Pomonaschwumm.) The St. George's mushroom. Pileus white, or slightly tinged with ochre, thick, convex, moist, spotted or eracked; stem solid, flocculose at apex; lamellæ emarginate, with an adnexed tooth, ventricose, yellowish-white. Grows m spring. Edible.

A. Georgii. An indigenous variety of the

A. arvensi

A. (Clitocy'be) geotru'pus. Trumpet mushroom. Pileus fleshy, white, infundibuliform, umbonate, smooth; stem solid, fibrillose; fiesh white; lamella decurrent, crowded, white, then tan-coloured. First smelling of garlic, and then of hitter almonds. Grows in rings near fir trees. Edible.

A.(Clitocy'be) gigantc'us. Giant mushroom. Pileus infundibuliform, flocculose, white; stem equal, thick; lamella white, then yellowish, shortly decurrent. In wet weather, on grassy banks in August. Edible.

A. (Lepio'ta) gracilen'tus. Slender mushroom. Pileus campanulate, subumbonate; cuticle thin, splitting into large scales; stem

holtow, long, rather bulbous; lamellæ distant, broad, pale. In pastures. Edible.

A. (Psathyrel'la) grac'ilis. Pileus ½ an inch in diameter, conically bell-shaped, yellowish-brown, finely striated, when dry paler and unstriated, frequently reddish; lamelle broad, adherent, greyish-black; stem 2 inches high, stiff, naked, pale. By hedges, where they occur in groups, in summer and autumn.

A. heterophyl'lus. A synonym of Russula

heterophylla.

- A. (Lepio'ta) holoseric'eus. Silky lepiota. Pilcus large, fleshy, soft, silky, floccose; stem solid, bulbous; ring superior, persistent, reflexed; lamella free, ventricose, white. In moist woods. Edible.
- A. horten'sis. The cultivated variety of the A. campestris.
- A. ignia'rius. A synonym of the Polyporus fomeutarius.
- A. lari'cis. A synonym of the Polyporus officinalis.
- A. laterit'ius. A synonym of A. amarus. A. (Pholio'ta) leochro'mus. Pileus fleshy, convexo-plane, then depressed, soft,

emooth; stem, solid, even; ring persistent, tawny; lamello rounded, adnate, pallid, then cinnamon coloured; spores profuse. On stumps. Edible.

A. lep'idus. A synonym of Russula lepida. A. (Amani'ta) map'pa. Delicate mush-Piteus without separable cuticle; flesh white; stem stuffed, then hollow, nearly globose at the base; volva with its free margin acute and narrow; ring membranaceous; lamellæ adnexed. Under trees. Poisonous.

A. (Clitocy'be) max'imus. Sowerby's Clitocybe. Pileus broad, fleshy, dry, silky, broadly infundibuliform; stem stuffed, compact, attenuated, pubescent; lamella decurrent, whitish. Meadows and woods, in September.

Edible.

A. (Armilla'ria) mel'leus. (F. agaric annulaire, tête de méduse.) Honey-coloured mushroom. Pileus fleshy, with fibrous scales; margin striate; stem stuffed, fibrillose; ring floccose; lamellæ adnate, ending in a decurrent tooth, spotted, mealy with profuse spores. In dense tufts on dead stumps. Eaten largely, under the name of Hallimaseh, in Vienna.

A. minera'lis. Marga, Lae Lunæ. (G. Bergmilch, Montmilch, Bergmehl.) A term applied to a pure native carbonate of lime, found in the fissures of limestone rocks, used internally

and externally as astringent.

A. (Tricholo'ma) monstro'sus. Monstrous Tricholoma. Pileus fleshy, at first convex and umbonate, then waved and lobed, opaque; margin inflexed; stem compressed, solid, white, squamose; lamella cream coloured. On the ground. Probably edible.

A. (Amani'ta) musca'rius. (F. agaric monche or monchete amanite, fansse orange; G. Fliegenpilz, Blatterschwamm; Dan. flueswamp; Dut. Flieg doodende kampernæljse; Swed. Dut. They doodende Kamperwayse; Sweu. flugswampen.) Fly mushroom, or Bug-agarie. Pileus 3-7 inches broad, warty, reddish orange, viscid when moist; flesh yellowish; margin thin, striate; stem hollow, or internally floculent, bulbons at base; volva adnate, sealy; lamellæ white, sometimes adnoxed. It coutsins a poisonous alkaloid, Muscarin, and also, according to Harnack, a non-poisonous alkaloid, Aman-itine. Hab. Woods of Europe, especially birch woods. Milk, in which it has been infused, kills flies. In Russia, Tartary, Kamschatka it is used as a stimulant, and the plant being eaten the toxic principle is eliminated by the urine, which is drunk again and again to keep up the debauch. It has been recommended for paralysis, in epilepsy, and in chorea. It has also been used for dressing cancerous uleers.

A. (Pholio'ta) mutab'ilis. (G. Stock-schwamm.) Pileus 1—2 inches in diameter, smooth, einnamon coloured, and then brown, occasionally somewhat scaly; lamellee adnate, decurrent, at first pale, then cinnamon colour; stem 1 in. high, at first solid, then hollow, slightly soaly; ring white, then brown. Summer and autumn, on trunks or on the ground. Edible,

A. (Clitocy'be) nebula'ris. The clouded mushroom. Pileus convex, then expanded, at first clouded grey, then lead coloured; stem stuffed, stout, striated; lamella decurrent, areuate, white. In woods. Edible.

A. neca'tor. (F. aguric meurtri r. rafoult.) Pileus reddish brown; margin reflexed, hollow in the centre, sometimes with deeper coloured concentric zones, covered when young with dark scales; stem eylindrical, dirty white; juice aerid, white or yellowish. Woods in

autumn. Poisonous.

A. (Clitocy'be) odo'rus. Sweet mushroom. Pileus plano-eonvex, smooth, dullish green; stem stuffed, unequal, smooth, base tbiekened; lamellæ adnate, broad, pale. In woods in Angust to November. Smells of newmown hay. Said to be edible.

A. olea'rius. (F. agarie d'olivier.) Pileus large, irregular, flexuous, brownish red; lamellae decurrent, golden vellow; stem short, eurved, excentric, reddish. In tufts on the roots of olive and other trees; phosphorescent. Very poisonous.

A. op'timus. A synonym of Polyporus

officinalis.

A. (Clitopi'lus) orcel'las. Plum mushroom. A variety of A. prunulus, than which it is somewhat smaller and less fleshy; with a short flocculent stem, and growing in more open places. Largely eaten in the south of Europe.

A. ore'ades. A synonym of Marasmius

oreades.

- A. (Pleuro'tus) ostrea'tus. (G. Buchenpilz; Austernpilz; Drehlingpilz.) Oyster mushroom. Pileus soft, fleshy, sub-dimidiate; stem short or wanting, firm, strigose at the base; lamelke decorrent, white; spores white; on trees, especially elm and laburuum, in groups; autumm and winter. Edible.
- A. palome'tus. (F. palomet.) An edible mushroom used in France.

Masked mushroom. A. persona'tus. Has a blac band round the upper part of the stem; gills white; stem ringless and rough; pileus smooth. Grows in the autumn. Edible.

A. (Amani'ta) phalloi'des. Matrixbearing or stinking mushroom. Pileus first wellshaped, then expanded, ohtuse, variously coloured; margin regular; stem hulbous below, becoming more slender upwards; volva with the margin free; lamellæ ventricose; odour offensive; very poisonous. Common everywhere.

A. pipera'tus. The pepper agaric, or mushroom; also called Fungus piperatus albus. A species which has proved fatal when taken in quantity. The powder has been recommended in

diseases of the lungs.

A. polynices. A synonym of A. melleus.

A. præpara'tus. A synonym of Amadou.
A. praten'sis. (G. Wæsenschwamm)
A variety of the A. campestris; sometimes called the champignon. Scales of pileus small and reddish; flesh pinkish. It has little smell, is dry, but when cooked has an agreeable flavour,

A. (Lepio'ta) pro'cerus. (F. conumelle; I. bubbola maggiore; S. cogomelos, G. Parasol-schwamm.) Parasol or sealy mushroom. Pileus 3-7 inches broad, fleshy, umbonate; cuticle thick. very scaly; stem hollow, bulbons, spotted; ring movable; gills far removed from the insertion of the stem. Pastures. Edible.

A. (Clitopi'lus) pru'nulus. (F. monsseron; I. prugnuolo; G. Moosschwamm.) Plum mushroom. Pileus fleshy, at first convex, then expanded, dry, pruinose; stem solid, ventricose, striated; lamellæ strongly decurrent, white, then flesh-eoloured, running far down the ringless stem. The flesh with a fresh smell of meal. In woods, from June to October. Edible.

A. pseu'do-auranti'acus. A synonym

of A. auruntiacus.

A. (Pholio'ta) pudi'cus. Modest mushroom.

Pileus fleshy, convex, then expanded, obtuse, even, dry, smooth; stem solid; lamellae adnate, ventricose, whitish, then tawny. On elder trunks and on the ground. Edible.

A. pyrog'alus. A synonym of A. rufus. A. querci'nus præpara'tus. A synonym of the Agaricus chirurgorum of the Aust.

A. quer'cus. A synonym of the Polyporus fomenturius.

A. (Lepio'ta) racho'des. Large grey broom. Pileus soft, fleshy, globose when mushroom. young; cuticle thin, scaly; stem bollow, smooth, unspotted; flesh red when bruised; lamella remote. In shady pastures. Said to be edible.

A. (Amani'ta) rubes'cens. (G. Palschwamm.) Reddish mushroom. Pileus convex, then expanded, with unequal mealy warts; flesh when broken becomes red; stem stuffed, scaly; ring entire; lamellae thin, white. In woods. Edible.

A. rufes'cens. A variety of the A. campestris of a rufous colour, the flesh of which turns bright red when hruised; lamellæ at first white.

A. ru'fus. (F. agaric caustique, calulos.) Pileus bright red, convex, depressed in centre, with black circles; lamellæ un qual, reddishyellow, decurrent; juice yellowish, caustic. Very poisonons.

A. (Pleuro'tus) salig'nus. Willow mush room. Pileus compact, subdimidiate, substrigose; stem short, white, tomentose; lamellæ decurrent, somewhat branched, eroded. Trunks of trees; October to January. Said to be eaten in Austria

A. scorodo'nius. A synonym of Marasmius scorodonius.

A. (Stropha'ria) semigloba'tus. (G. halbkugelichter Blutterschwamm.) Slimy dung mushroom. Pileus hemispherical, yellowish slimy; stem slender, hollow, glutinous, yellowish; lamella adnate, broad, mottled with the purple-brown spores. Very common; poisonous.

A. (Psilocy'be) semilancea'tus. Liberty-cap mushroom. Pileus submembranaecous, acutely conical, moist; stem medullate, tough, smooth, pale; lamellæ adnexed, ascending, purple black. In rich pastures. Poisonous.

A. (Nauco'ria) semiorbicula'ris. Pileus fleshy, hemispherical, smooth, rather viscid, at length rivulose; stem slender, ferruginous; lamellæ adnate, broad, crowded, pale, then ferrugi-nous. On pastures. Doubtfully edible.

A. semipetiola'tus. A synonym of A. stypticus.

A. (Psallio'ta) silvat'icus. (G. Waldchampignon.) I'ileus 2 or 3 in. in diameter, first bell-shaped and with brownish scales, subsequently expanded, naked, whitish, the flesh quickly becoming rosy; lamella tender, dry, attenuated at each end, at first red, then brown; stem 3 or 4 in. high, hollow. Frequent in woods Often mistaken for the common mushroom.

A. silvic'ola. A variety of the A. campestris, with a smooth shining pilens, and clongated bulbous stem. Woods.

A. (Entolo'ma) sinua'tus. Poisonous forest mushroom. It grows to a large size. Pileus fleshy, convex, then expanded; the top is a little downy, pinkish buff; stem solid, whitish; lamellæ adnexed, nearly free, rose-coloured. It smells like fresh meal, and grows in woods; autumnal. Poisonous.

A. (Amani'ta) strobilifor'mis. Fir-

Pileus with large scales like cone mushroom. those of a fir cone; flesh white, compact; stem solid, bulbous, ring well defined; lamella free. Borders of words. Edible.

A. styp'tleus. (F. Oreille d'homme.) Pileus einnamon coloured, ohlong, reniform, margin deflexed; laminæ equal, white or red, easily separating, decumbent; stem excentric, bulbous above, mealy; odour slight; taste aerid, bitter, astringent. Purgative.

A. (Hypholo'ma) sublaterit'ius. (G. Bitterschwamm.) The olive-gilled mushroom. The pileus 2-3 inches in diameter, first convex, then flattened, leathery, dry, smooth, reddish yellow or brown or yellow, pale at the margin, with whitish flesh; lamelle at first white, then olive-tinted, closely applied to each other; stem 3-4 inches high, stuffed, fibrous, thinner below; yellow or reddish brown; taste hitter. Doubtfully poisonous.

A. (Tricholo'ma) sulfu'reus. Sulphury mushroom. Pileus fleshy, subumbonate, unequal, at first silky, then smooth and even; laminæ distant, sulphur coloured; stem firm and sulphur coloured. The plant has a disagreeable, pene-

trating smell, like gas-tar. Poisonous.

A. sylvaticus. A syuonym of the A.

campestris.

A. theiog'alus. A highly poisonous species of mushroom, having a yellowish coloured juice. A synonym of Lactarius chrysorrhæus.

A. tormino'sus. A synonym of A. necator. A. (Pleuro'tus) ulma'rius. Elm mush-

Pileus fleshy, smooth, spotted, moist; room. stem stout, subtomentose; lamellæ adnexed, broad, whitish. On elm trunks; September to December. Harmless.

A. u'rens. (F. agaric brulant.) Pileus at first convex then flat, occasionally concave, dirty reddish grey spotted with black; lamellæ numereadish grey spotted with once, and readish; stem rous, thin, unequal, detached, reddish; stem eylindrical, smooth, bulbous at base, striated, stuffed: flesh white; taste acrid. Very poi-

A. vapora'rius. A variety of the A. campestris, with an even pileus, having a brown pilose

A. (Amani'ta) ver'nus. (G. Frühlingschwamm.) Poisonous spring mushroom. Pileus at first evate, theu expanded, viscid; stem floccose, bulbous at base; volva close-sheathing; ring reflexed; gills free. Grows in woods in the spring, and is white in all its parts. Poisonous.

A. ves'ca. A synonym of Russula vescu. A. villaticus. A very scaly variety of A. arrensis.

A. viola'ceus. A synonym of Cortinarius violaceus.

A. vires'cens. A synonym of Russulu virescens.

A. virgin'eus. A synonym of Hygrophorus virginius.

A. (Lepio'ta) vittadl'na. Great white Pileus fleshy, obtuse, rough; stem Lepiota. solid, cylindrical, concentrically squarrose, ring large; lamellie free, ventriesse, thick. Pure white. In pastures. Poisonous.

A. vole'mum. A synonym of Lactarius volemum.

Agas'siz, Louis John Rudolph. A great naturalist, especially devoted to Ichthyology. B. 1807, d. 1873.

Agas'tor. (Gr.) A twin. Also an animal without a stomach.

**Agastra'rius.** ('Λ, neg.; γαστήρ, the belly. F. agastraire.) An organised body without a proper intestinal eaual, whose functions are limited to exhalation and absorption, as the sponges. (Blainville.)

**Agas tree.** ('Λ, neg.; γαστήρ, the belly.) A synonym of the Cestoda.

Agas tric. (Same etymon. F. agastrique; G. ohne Bauch.) Destitute of an intes. tinal canal.

Agastroner'via. ('A, neg.; γαστήρ, stomach; νεῦρον, nerve.) Defective nervons supply to the stomach. Want of tone in the stomach.

Agastrozo'on. ('A, neg.; γαστήρ, the belly; ζώου, an animal.) Synonymous with Synonymous with Agastrarius.

Agastrozo'um. Same as Agastrarius. Agasyl'lis gal'banum. (Αγασυλλίς, the Herneleum gummiferum of Dioscorides.) A synonym of the Bubon galbaniferum.

Ag'ate. ('Λχάτης, so called from the river Achates, now the Dirillo, in Sieily, where it was first found. Lachates; F. agate; 1. agata; G. Achat. A semi-pellucid mineral, chiefly (98 per cent.) composed of silica, stained with a little oxide of iron, or other metallic oxides. The silica is partly amorphous, partly in form of quartz and tridymite.

Ag'athis al'ba. A synonym of Dammara orientalis.

A. austra'lis. A synonym of Dammara australis.

A. damar'ra. A synonym of Dammara orientalis. Hab. E. Indies. Yields a kind of turpentine.

A.loranthifo'lia. A synonym of Dammara orientalis.

**Agathis'tega.** (' $\Lambda \gamma u \theta i s$ , a ball of thread;  $\sigma \tau i \gamma \eta$ , a roof.)  $\Lambda$  Fam. of Foraminifera, so called from the appearance of the folding of the segments.

**Agathodæ'mon.** (Αγαθοδάιμων.) A god augel or spirit. 2. The healing serpent. good augel or spirit. Serpent of Kneph.

Agatho'des. A synonym of Agathotes. A term employed in Botany to express a nebulous transparency like that of the Agate.

**Agatholep'is.** ('Αγαθός, good ; λεπίς, a scale.) A term applied in Botany to plants with

brilliant or coloured bracts or scales.

Agatho'nis antido'tus hepat'ica. Agathon's antidote for the liver, composed of gentian six drachms, elecampane, wormwood leaves, and Indian spikenard, of each one dracbm.

Agathophyl'lum aromaticum. ('Aγαθόs, good ; φύλλον, a leaf. F. noix de Girofte ; G. Nelkenmuskatnuss.) Nat. Ord. Lauraceæ. A plant of Madagascar, yielding a kind of false nutneg, sometimes called the Ravensara nut. The fruit is of the size of a small nut, spheroidal, blackish, light, smooth, and contains a six or eight-lobed almond. The summit is obtuse and terminated by a kind of button, which, however, is not very prominent. It has been employed as a tonic, cordial, and aromatic. The leaves have similar properties.

Agathos ma. ('Αγαθός, good; οσμή, a smell.) A Genus of the Tribe Eudiosmew, Nat. Ord. Rutacea. The leaves of several species of this genus, as well as of the genus Barosma, are collected by the Hottentots, who value them on account of their odour; and under the name of bookoo, or Buchu, rub them in the state of powder

iuto their greased bodies.

A crena'ta. A synonym of the Barosma erenata.

**Agathot'es.** ('Αγαθότης, goodness.) Α Genus of the Nat. Ord. Gentionaceæ. Æstivation of corolla left-handed; style absent; corolla naked at the base, with glandular pits covered in by a fringed scale; stamens monadelphous.

A. chirayta. (Tam., Shayraet; Duk. and Ilind. Chiraeta; Tel. Sheelassettoo; Mal. Kiriyatha.) Chirayit Gentian. Hab. Nepaul, Northern India. An annual, 3 ft. in height. Flowers tetramerous; corolla longer than the calyx; leaves ovate and cordate, smooth. A tonic and febrifuge, four drachms of the root being infused in a pint of cold water. It does not cause constipation. It promotes the discharge of hile; especially useful in gout and scrofula. From its efficacy as an anthelmintic it is termed the wormseed plant. It is useful in diarrhoea, dysentery, and intermittent fevers. The hot infusion causes violent headache. The Ophelia chirata of the B. Ph.

Ag'ati grandiflo'ra. Nat. Ord. Leguminosæ. (Tam. agathee; Tel. anisay; Mal. agati; Beng. buko.) An Indian tree, 30 ft. high. The bark is bitter and tonic, and an infusion of the leaves a useful cathartic. At Patna it is employed in the form of infusion as a febrifuge, and by the inhabitants of Malabar in cases of catarrh. The juice of the flowers is squeezed into the eyes in amblyopia.

Aga've. A Genus of the Nat. Ord. Amaryllidacca. Caulescent; flowers funnel-shaped, persistent, with erect or revolute tubes; capsule

coriaceous, loculieidal.

A. america'na. (G. Pracht-aloe, Baumaloe.) The American aloe, Maguey or hundred years' plant, being erroneously supposed to flower but once in a century. It closely resembles an aloc in its general aspect. Leaves very large, stiff, perennial, spiny on the edge; scape lofty, branched; stamens longer than the perianth. It is naturalised in some parts of S. Europe, and on account of its large spiny leaves is planted to form fences. From this and other species is obtained Pita hemp, or Pité thread, a valuable fibre. The juice of the leaves contains, in 100 parts, levulose, 2.6; saccharose, 6.2; malic acid, 0.3; gum, 0.6; alhumen, 1; ashes, 0.6; water, 88.7. This juice, collected just before the plant flowers, and called Aquamiel, or Honey-water, is fermented, producing a drink termed Pulque. From this a spirit called Mescal is distilled. The roots and leaves of the plant are reputed to possess alterative, diuretic, and antisyphilitic properties. The juice is an excellent antiscorbutic, and is used as a substitute for soap. A thin slice of the leaf forms a good poultice.

A. cuben'sis. The roots of this species

constitute one of the varieties of false sarsa-

parilla.

A. foe'tida. In Spain a species of aloes is prepared from this plant.

A. mexica'na. In Mexico the viscous inice of this plant is used as a detergent.

A. pul'que. A species of aloes, from which a sweet fermentible jnice is prepared in Mexico.

A. ramo'sa. A synonym of A. americana. A. sapona'ria. This plant is a useful detergent, and the roots are employed in Mexico

as a substitute for soap.

False aloc, or RattleSynthem States A. virgin ica. False aloc, or Rattle-snake's master. A native of the Southern States of America. The root is bitter, and has been used in the form of tineture as a carminative in colic, and as a remedy in the bites of ser-

A. vivip'ara. (Karata ceratoe.) A common plant in the W. India Islands and in South America. The juice of this plant acts as a powerful emmenagogue, diurctic, and lithontriptic. The extract relieves the pain of gout. The root chewed is said to be serviceable in diarrhea.

Aga'veæ. (G. Agavengewächse.) A Family of the Order Ensatæ, having a sixpartite perianth, fibrous roots, and a leafy stem.

Agdes'tidæ. A Family of the Nat. Ord. Phytolaccaceae. Carpels four, inferior, united to each other on a concave receptacle; stamens, epigynous; stem climbing, herbaceous.

Age. (Ger.) See Axin. Age. (F. age, from L. atas; G. alter.) The term age has a double signification; one referring to various periods arbitrarily defined in the lifetime of the individual, as the embryonic age lasting uine months, the age of infancy lasting to the third year, of childhood 3—12 years, adolescence 12—25 years, maturity 25—50, and decline 50 onward; and the other more strictly limited to the last-named period, namely, that of decline or senility. The periods of life might otherwise be divided into the period of growth and development (up to 25 years), the stationary period (25 to 50 years), and the period of degenera-tion (50 years onwards). The embryonic age is that period when growth and development are most rapid, and the succession of the changes that then occur must be looked for under the head of Development of embryo. The embryo is liable to arrest and abnormalities of development; to some diseases received directly through the blood of the mother, as smallpox and syphilis, and to other affections, the etiology of which is less cortainly known, as pleurisy and peritonitis. At birth, when some die, pulmonary respiration commences, the umbilical vessels cease to convey blood, the communications between the two auricles, and between the pulmonary artery and aorta are closed. During the early weeks of life a condition, termed by Lorain the purulent diathesis, exists, characterised by tendency to crysipelas, ophthalmia, phlebitis, peritonitis, pleurisy, &c. The diseases that attack the infant at a later period are chiefly those resulting from the administration of improper food, exposure to cold, or the processes of deutition, or associated with the development of inherited disease. In childhood, growth and development are still in full activity, and at this period the infectious diseases, as hooping-cough, measles, scarlet fever, smallpox, are most common. Adolescence is marked by the sudden development of the sexual organs; the whole frame acquires solidity and vigour; the capability of acquiring knowledge is at its height; and disease, except, perhaps, typhoid fever, and the like, becomes more rare, the system being better able to resist harmful influences. Adult age is marked more by changes in the mind than in the body, which remains comparatively stationary. Though less rapid and keen in observation the faculties are better under control, and judgment predominates over all. The diseases are those which result from overwork or accident in men, from childbearing in women. In old age the powers of the system undergo slow but steady dccay; loss of the

teeth, followed by impairment of the digestive powers, paves the way to imperfect nutrition of the blood, enfecbled action of the heart, fatty and atherematous degeneration of the arteries, loss of generative power; and finally, impairment of the function of all parts of the nervous system, death taking place in a large number of cases from apoplexy, and from pulmonary and cardiac affections.

A., anthropozo'ic. A synonym of the Quaternary or Post-tertiary age.

A., archæolithic. A synonym of the

Secondary age.

A., archæolog'ical. Archæologists admit three nges in the history of the race of man-thage of stone, the age of bronze, and the age of iron. The stone age seems to have been the first stage of evolution of the human race in every part of the world. Lartet divides it into four periods; the first contemporaneous with the cave bear and lion; the second contemporaneous with the mammoth and tichorine rhinoceros; the third contemporaneous with the reindeer; and the fourth contemporaneous with the anrochs. Another elassification is that adopted by Professor Renevier, viz.—1. The antiglacial epoch, when man was contemporaneous with the Elephas antiquus, the rhinoceros, hemitocchus, and the cave bear. 2. The glacial epoch, when man was contemporaneous with mammoth, rhinoceros, and cave bear. 3. A postglacial epoch, during which man lived contemporaneously with the mammoth and reindeer. And 4, a final epoch, or epoch of lake dwellings, during which man lived contemporaneously with the great elk, the aurochs, and many domestic animals of the present day. In the early periods of the stone age the stone instruments were exceedingly rough, but by degrees the forms became more varied, the workmanship greatly improved, sharpness, symmetry. and polish being attended to. In the later periods the knowledge of the art of making pottery seems to have been acquired, and some knowledge of the art of drawing. The age of bronze seems to have been more limited in its occurrence, and in some instances it has been preceded by the age of

A., archæozo'ic. A synonym of the

Secondary age.

A., cænolith'ic. Same as A. cainolithic. A., cænozo'ic. Same as A. cainozoic. A., cainolith'ic. (Καινός, new; λίθος, a

stone.) A synonym of the Tertiary age.

A., cainozo'ic. (Καινός, new, fresh; ζωϊκος, of er belonging to animals.) A synonym of the Tertiary age.

A., crit'ical. A term occasionally used to denote the period of the cessation of menstrua-

tion; synonymous with Menopause.

A., educa'tional. In the countries in which education is made compulsory by the State, children are required to attend elementary and advanced schools for certain periods. Austria the age is from 6-11; in Denmark, 7-14; England, 5-13; France, 6-13; Germany, 5-14, though with some differences in different states; Wurtemburg, for example, requiring attendance from 7-14; the Duchy of Oldenburg from 6-15 for boys, and 6-14 for girls; Greece, 5—12; Italy from the age of 6; Portugal, 7—15. In Sweden the entry of no child can be postponed beyond the ninth year. In the United States obligatory attendance is, in by far the greater number of states, from S-II years, and this may be continued to the twentyfirst year.

A., in'fluence of, on tem'perature. At birth the temperature is 37.75° C. (99.95° F.) in the rectum; in the course of the first few hours it facts to 37° C. (98.6° F.), but in the course of the subsequent ten days rises again to 37 2°-37.6° C. (98 96°-99.68° F.), and remains at this level till puberty. From this period it gradually falls to the age of fifty years, when it reaches the minimum, 36.9° C. (98.4° F.), to again gradually riso in old age.

A., mesolithic. (Μέσος, middle; λίθος, stone.) A synonym of the Secondary age.

A., mesozo'le. (Μέσοε; ζωϊκός, of animals.) A synonym of the Secondary age.

A. of adoles cence extends from puberty to the completion of the growth of the body, or from the fifteenth to the twenty-fifth year.

A. of an'imals. This is usually determined in the horse, ox, pig, and dog, by an examination of the teeth, which furnishes data that are tolerably reliable in youth, but which diminish

in value as age advances.

In the horse there are from 40-44 teeth. The median ineisors, nippers, or gatherers, appear about the 16-18th day, sometimes before birth; the two adjoining incisors, or first intermediates, from the 30-10th day; the two outside ineisors, or corner teeth, about the 9th month, or n little earlier or later. The canine teeth appear at 6 months; the first three or temporary molars before or some days after birth; the fourth molar about the 12th month; the fifth at 2-25 years; the sixth at 4-5 years, soon followed by the seventh. The first and second permanent molar appears about the middle of the third year; the third molar about the middle of the fourth year. The eruption of the inferior incisors of the second set takes place at 21-3 years; the nippers at 2½ years; the intermediate teeth and the corner teeth at 31-42 years. The canine appear before the fifth year. The infundibulum disappears between the 6th and 10th year in the inferior nippers, between the 10th and 11th year in the intermediates, and between the 11th and 12th year in the eerner teeth. The table or grinding surface, hitherto circular, becomes first transversely oval and then triangular, assuming the latter form about the 13-14th year for the nippers, 14-15th year for the intermediates, and 15-16th year for the corner teeth. At a still later period the table again becomes oval, with the principal diameter in the antero-posterior direction, and this occurs about the 17 -19th year for the nippers, 19-21st year for the intermediates, and 21-23rd year for the corners.

In the dog, which has 42 teeth, the temporary teeth are cut by the end of the sixth week, and the eruption of the permanent teeth is completed

by the seventh month.

In the sheep, which has 32 teeth, the cruption of the caducous nippers takes place between birth and the third week. The permanent nippers appear from the 15-18th month; and the rest of the permanent teeth appear by the end of the fifth year.

In the pig, which has 44 teeth, the molars, corner teeth, and the eanines are cut at birth; the other incisors appear before the 4th month. The permanent teeth are all cut by the end of the third year.

In the steer, which has 36 teeth, the caducous central incisor teeth appear between birth and the 20th day. The permanent nippers appear from the 19-20th month; the milk intermediates appear soon after birth; the permanent intermediates from 42-48th month. The permanent corner teeth appear from 41 years to 5 years. The three temporary molars are present at birth; and all the permanent molars are cut between the 6th or 9th month and the fifth year.

A. of boy hood and girl hood lasts from the period of second dentition to puberty, or from the seventh to about the fourteenth year.

A. of child'hood lasts from the occurrence of the first to that of the second dentition, or from

nine months to seven years.

A. of in'fancy lasts from birth to the first dentition (seventh or minth month). This is a period of energetic growth, the length of the body

increasing by 2-3rds.

A. of matu'rity, or adult age, lasts from the termination of adolescence until involutiou occurs in woman, and until retrograde changes occur in man, or from the twenty-fifth to the forty-fifth year.

A. of new-born chil'dren. See under

Fætus.

A. of senil'ity. This is the age of gradual retrograde changes, commencing about the fiftieth year and lasting until death.

(Παλαιός, older in A., palæolith'ic. years; λίθος, a stone. F. age paléolithique.) A

synonym of the Primary age. **A., palæozo'ic.** (Παλαιός; ζωϊκός, of animals. F. paléozoique.) A synouym of the Primary age.

A., post-ter'tiary. A synonym of the

Quaternary age.

A., primary. The period succeeding to the primordial age. It is divisible into three periods, the Devouian, the Carboniferous, and the Permian. The strata forming it are estimated by Haeckel to have an aggregate thickness of 42,000 feet. It is essentially the age of Fishes and of Ferns, and in the latter period of some Reptiles.

A., primor'dial. The age of the Acranians and of Algæ. The period during which all the invertebrate aucestors of the human race, from the Monera upwards, are by some believed to have been developed. During the whole of this age, Haeckel remarks, the population of the earth was purely aquatic. Estimating the whole thickness of the geologic strata at 130,000 feet, 70,000, or more than half, is attributable to this age. He divides it into three periods, the Laurentian, the Cambrian, and the Silurian.

A., quater nary. The age of the human race, extending from his first appearance on the earth to the present time. It constitutes an earth to the present time. extremely small proportion, Haeckel estimates it at only one half per cent., of the whole period represented by the geological strata. Equivalent to Post-tertiary age.

A., sec'ondary. The period intervening between the Mesolithic and the Cainolithic Ages. It is divided into three sections, the Triassic, the Oolitic, and the Cretaceous, the aggregate thickness of these strata being 15,000 feet. This is

the age of Reptiles and Coniferæ.

A., tert'iary. The fourth great period of terrestrial organic history. The strata deposited during this period had only an aggregate thickness of about 3000 feet, and it was therefore of short duration. It is divided into three periods, Lower, Middle, and Upper, or into Eccene, Miocene, Pliocene, and Pleistocene. The placental mammifers constitute at ouce the most remarkable and the predominant group of animals that appeared in this period.

Age de re'tour. (F.) The period of

involution, or commencing old age.

Age vita. The name of an antidote; it is a medicated wine made with galangal root, long and white pepper, sage, ginger, cinnamon, safiron, and cloves, boiled in wine. (Parr.)

Ag'edoite. A term applied by Caventou to a crystallizable substance obtained from liquorice

root; it is identical with asparagin.

Ageing. A term indicating the mental and bodily signs of advancing senility.

Agelæ'us. ('Αγελαίος. G. gering, gemein,

grob.) Small, coarse, common.

Ageleni'dæ. The same as Ageleninæ.

Ageleni'næ. A Subfamily of the Family Tubitelaria, Group Sedentaria, Suborder Di-pneumones, Order Araneidea, Class Arachnida. Feet with an accessory claw, having five to eight teeth.

Agenei'os. ('A, neg.; γενειάς, a beard.) Destitute of a beard.

Agene sia. ('A. neg.; γένεσιε, a generatiou; au engendering; from γίγνομαι, to be boro. F. agénésie; G. Nichtzeugung.) A form of Homogenesis, in which sexual products are formed, but these are absolutely iocapable of fertilising each other, or individuals of the maternal race.

Applied by Breschet to anomalies of organisation, consisting in the absence or imperfect de-

velopment of parts.

In Botany, it denotes a monstrosity of flowers in which the reproductive parts are altogether

Also impotence. (F. impuissance; G. männliche Unvermögen.)

Also female sterility. (F. sterilite; G. Un-

fruchtbarkeit.) A. dyssper'mia. Imperfect emission of

the seminal fluid. A. im'potens. Impotency of the male,

which may be organic or atonic.

A. incon'grua. Sterility supposed to depeud on a want of litness of the semen for the sexual organization of the special female.

Agen'esis. (Same etymon.) Imperfect development of the body or any part of it.

Also the same as Agenesia.

Age'nia. See Agenosoma. Agenne'sia. ('A, neg.; γέννησις, an cngendering; from γεννάω, to generate.) Impotence, sterility.

Agen'nesis. Same as Agennesia.

Agenoso'ma. ('A, neg.; γενεάω, to beget; σωμα, the body.) In Teratology, a monster which presents medium or lateral eventration, affecting principally the inferior part of the abdomen, and in which the urino-genital organs are absent or reduced to simple rudiments.

A'gent. (L. Ago, to act, or do. F. agent; I. aud S. agente.) A body or force capable of induencing directly or indirectly the state of another; agents are spoken of as physical, chemical, therapeutical, psychical, morbifie, and such like.

Agera'sia. ('A, neg.; γῆραs, old age. F. agerasie; G. Altersfrische) The non-appearance of the effects or infirmities attendant upon old age; a green old age. (Castellus and Galen.)

Agera'teæ. A Subtribe of the Tribe Eupatoreæ, Nat. Ord. Compositæ, having radiated

flowers with anthers having an appendage at the summit; achene with five ribs, the secondary

ones feebly marked.

Age raton. ('Αγήρατου.) This plant is referred by Fée to Achillea argentea, and by Littré to Hypericum origanifolium, but was probably the Achillea ageratum. It was employed in the form of baths and fumigations, as a diurctic, and as a remedy in uterine diseases.

Agera'tum. ('Αγήρατος, not growing old; the flowers continuing a long time.) A

Genus of the Nat. Ord. Composite.

A. altis'simum. A synonym of the

Eupatorium ageratoides.

A. cenyzoi'des. Hairy ageratum. Hab. India, Madagascar, and the Mauritius. This plant has a strong and unpleasant smell. In the Mauritius a decoction of the roots is used in certain cutaneous affections, and is esteemed a good remedy for an endemic disease known under the name of Tambau. In the I. of France it is named Herbe antiepileptique. (Waring.)

Age ratus la pis. ('Αγήρατος, a stone nsed by shoemakers for polishing women's shoes.) Employed by the Greeks as astringent and discutient; mentioned by Galen. (Castellus.)

A'ger natu'ra. (Ager, a field; natura,

nature.) The uterus.
Ages. Palm. (D.)

Ageu'sia. Same as Ageustia.

Ageus'tia. (A, neg.: γενσις, taste. G. Geschmacklosigkeit.) Diminution or abolition of the power of perceiving the flavour of sapid substances; absence of the sense of taste. It occurs in lesions of the glossopharyngeal nerve; in certain cases of lesion of the fifth nerve; and sometimes when there is evidence of disease affecting the portio dura of the seventh nerve. Loss of taste occurs in local catarrhs, in insanity, and in lysteria, and may be the result of suppressed secretion of saliva. Also the fasting state.

A. febri'lls. The loss of taste produced by

the febrile condition.

A. paralyt'ica. The loss of taste depending on nervous disease.

Agged'ulæ. A term applied by Hoffmann to either the receptacles or the whole plant of some cryptogams, as to the Æcidiæ.

some cryptogams, as to the *Æcidiæ*. **Ag'ger-Ag'ger.** A synonym of *Agar-*

Agglom'erate. (Agglomero, to form into a heap. F. agglomero'; G. geknauelt, gesammelt.) Crowded together. Synonymous with Aggregate. In Botany, applied to stamina when collected in a globular form; also to amenta, similarly disposed.

globular form; also to amenta, similarly disposed.

A. glands. A synenym of Peper's glands.

A. individ'uals. A term applied to animals having a common centre from which they

spring, as the Sertularia.

Agglom'erate. (Same etymon.) Formations of angular fragments of compact scoriaceous and compact lavas, often intermixed with granite, and sometimes with fossiliferous limestone, produced by volcanic eruptions.

Agglomeration. (Same etymon. G. Aufwickelung.) The collecting or mingling together of substances or of particles of the same

substance into one mass.

Agglutinant. (Agglutino, to glue on to. F. agglutinant; I. conglutinativo; G. verbinkend, anklebend.) Adhesive; applied to external applications of a gluey or gummy nature, which favour the healing of parts by keeping them together.

Agglu'tinate. (Same etymon. F. agglutine; G. Zusammengeleimt.) To cause to adhere. Stuck or glued together.

Agglutina'tion. (Same etymon, F. agglutination; G. verklebing, anheiling.) A gluing or joining togetber; also the action of an agglutinant substance

A., imme'diate. Union by the first intention, of the flaps after amputation, or of the lips

of a wound.

A., me'diate. The interposing, for a certain space of time, of some foreign substance between the lips of a wound, or the flaps after amputation; as agaric, charpie, or lint, on which cerate is first spread.

Agglutina'tio pilo'rum. An old term for a mode of treatment of inversion of the eyelsahes by means of glutinous matter on a probe, by which they were reduced to their proper order.

Agglu'tinative. Same as Agglutinant.
A. lan'guages. (G. agglutinirende Sprachen.) Polysyllabic languages in opposition to monesyllabic and inflective languages. They are represented by the idioms of the American, Basque, Berber, Mongolian, Finnish.

Agglutinatives. (F. agglutinatifs.) Substances which by their adhesive property are fitted either by direct application, or when spread on linen, silk, or leather, to retain the edges of wounds in apposition. The chief are caoutchone, collodion, dextrin, starch, paste, gum arabic, gutta-percha, plaster of Paris, and resin.

Aggrave'ment. (F.) A term applied by French veterinary surgeons to a disease of the foot of the dog, consisting in an inflammation of the capillary net work of vessels situated beneath the pads. It follows exercise on hot and stony country, and may be treated by cold fomentations and the application of astringents.

Ag'gregatæ. (L. agyregatus, from aggrego, to add together as a flock, collect together. G. Haufblithige.) An Order of the Tribe Epigynæ, Subseries Anisocarpeæ, Series Gamo- or Sympetalæ, of the Division Tetracyclæ of Dicotyledonous plants. Itincludes the Families Rubiaeææ, Caprifoliaeææ, Valerianaeæ, and Dipsaeææ.

Flowers actinomorphic or zygomorphic, generally in capitula or close inflorescences, usually pentamerous or tetramerous; stamens equal to the parts of the corolla, epipetalous; calyx often rudimentary or a pappus; carpels 2—5, united.

In Zoology, a synonym of Ascidiæ compositæ.

Aggrega'te. (Same etymon.) An as-

semblage of particulars.

A term employed in a special signification by Spencer to indicate differences of morphological composition. Thus, an organism consists of units constituting an aggregate of the first order; these units may be aggregated into a mass by the addition of unit to unit, constituting an aggregate of the second order; or they may be united into groups and the groups joined together, forming an aggregate of the third order; or these groups of groups may be combined so as to form a doubly compound aggregate of the fourth order; and so on in increasing complexity.

The first order of aggregation, or the primary aggregate, is that in which each aggregate is formed of physiological units united into a group that is structurally single, and cannot be divided without destruction of its individuality. Such aggregates may exist as independent organisms; as Protococcus, Desmidia, and Diatoma.

In secondary aggregates, the compound indi-

viduality is more or less dominant, whilst the simple individualities are proportionately more or less obscured. Secondary aggregation occurs when a greater or less number of morphological units are held together in one mass which has a compound individuality; or in other words, a secondary aggregate is an organised group of primary aggregates. Aggregates of the second order, or secondary aggregates, may be formed by linear aggregation, as in Youth performance in Gonum pectorale; or by spherical aggregation, as in Gonum pectorale; or by spherical aggregation, as in Tolvox globator.

Aggregates of the third order, or tertiary aggregates, are produced when two or more aggregates of the second order, well individualised by their forms and structures, are united together;

as in Sargassum.

An ordinary branched flowering plant is an aggregate of the fourth order, for it consists of secondary shoots growing from primary shoots, which are composed of tissues consisting of small

masses of protoplasm or cells.

In chemistry, when substances of the same kind are combined, producing one larger substance, it is called aggregate, its chemical properties not differing from those of the original substances of which it is formed.

Ag'gregate. (Same etymon.) Collected together.

A. an'imals. A term applied to those enclosed in one and the same envelope, as Pennatularian corals.

**A. flow'ers.** Those which arise by distinct pedicels from the same part of the stem; also the heads of the *Compositie*.

A. fruits. Fruits formed by the combination of the carpels of several flowers. A synonym of Anthocarpous fruits.

A. glands. A synonym of Peyer's glands. A. hairs. The hairs of the endocarp which form the fleshy part of the orange and such like fruits.

A. pills. A term applied to pills containing a variety of substances, the properties of which were supposed to be combined.

Aggrega ted. (Same etymon. F. agrègé; G. angehäujt.) Gathered, or associated together, aggregate.

In Botany, applied to flowers which have a number of smaller flowers collected into clusters.

Aggregation (Aggrego, to add together as a flock. F. agrégation; G. Zusammenfügung, Zusammenhüufung.) The state of several parts or things added together to make a whole.

A., state of. (G. aggregatzustand.) A term noted to denote the differing relationship of the atoms of a substance according as to whether it be in the gaseous, liquid, or solid condition.

in the gaseous, liquid, or solid condition.

Agheus'tia. The same as Ageustia.

Ag'houl. A Persian shrub yielding manna; the leaves are purgative. Probably the Alhagi magrayum.

Agiaha'lid. An Egyptian and Ethiopian shruh similar to Ximenia. The Ethiopians use it as a vermifuge. The fruit is purgative. (D.) Agiha'lid. The same as Agiahalid.

Ag'ila wood. A fragrant resinons substance of a dark colour, contained in the interior of the trunk of the Aquilaria ovata and A. agallochum. It is considered a cordial by some Asiatic nations, and has been prescribed in Europe in gout and rheumatism.

Agil Tochum. Same as Agallochum. Aginin. A bright yellow amorphous friable substance resulting from the decomposition of axinic acid. It is insoluble in water, alcohol, and ether.

A'gios kyril'los. Island of Icaria, Mediterranean Sea. Here are ferruginous and sulphuretted springs.

A'gis. An old name for the thigh.

Agist'ment. A dike or embankment to prevent the overflow of land abutting upon a stream or the sea.

Agitation. (L. Agitatio, from agito, to trouble. F. agitation; I. agitazione; S. ugitation; G. heftige Bewegung, Unrahe, Aufregung.) The act of putting into motion by quickly repeated action. Agitation of the body was formerly used for the cure of toothache and deafness.

General excitement of the mental or bodily powers. Perturbation, mental emotion, or disturbance arising from the violence of some prevailing passion.

Agita'tor. A rotating beater or armed shaft for mixing and disturbing particles me-

chanically suspended in water.

Agitato'rius. Convulsive.
Aglacta'tio. Same as Agulactia.
Aglai'a odora'ta. Nat. Ord. Meliacca.

Aglaia odora'ta. Nat. Ord. Meliacex. The flowers of this plant are sometimes used to give a perfume to certain varieties of tea.

Aglaopho'tis. (G.) The Pacony.
Ag'lia. ('Δγλαόs. F. aglie.) A term of
Hippocrates, interpreted by Galen to be a
whitish cicatrix on the eye, or a compact tumour
on the cornea.

Aglithes. ('Aγλιs, used in the plural to signify a head of garlie which is made up of several cloves.) A synonym of Allium.

Aglobulia. (A, neg.; globulus, a globule. F. aglobulie.) A state of decrease or diminution in the quantity of red blood-corpuscles, along with an increase of the normal quantity of serum. The skin becomes pale yellow, there is palpitation, anemic cardiae bruit; sometims adema and purpuric spots; the ungual furrow is well marked. This condition has been described as a result of dyspepsia.

Aglos'sa. (A, neg.; γλώσσα, the tongue.) A Group of the Order Batrachia. Tongueless frog. Body flat; the Eustachian tubes usually with a common opening; tympanum hidden; hind feet with a swimming membrane.

**Aglos'sia.** ('A, priv.; γλῶσσα, the tongue. F. aglossie; G. Zungenmangel.) Term for absence or privation of the tongue.

**Aglossosto'ma.** ('Αγλωσσα; στόμα, a mouth. F. aglossostome.) In Teratology, a monster having a mouth without a tongue.

**Aglossostomograph'ia.** (Same;  $\gamma \rho \dot{\alpha} \phi \omega$ , to write.) A description of a mouth without a tongue. The title of a work by Roland.

**Aglos'sus.** ('A, neg.; γλῶσσα, the tongue. F. aglosse; G. ohne Zunge.) Without a tongue.

Aglot'tia. A synonym of Aglossia.
Aglutit'ion. (A, neg.; glutio, to swal-

low.) Inability to swallow, from whatever cause. **Aglyph'ia**. (A, neg.; γλυφή, earving, a hole cut.) A Division of the Order *Ophidia*. Equivalent to non-venomous snakes.

**Aglyphodon'tia.** ('A, neg.; γλυφή; δδών, for δδούς, a tooth.) A Group of the Order Ophidia, which do not possess channelled teeth. Usually united with the Opisthoglyphia in the Suborder Colubriformes.

Ag'ma. ('Λγμός, a fracture.) Aa old term for a tracture.

**Agmatol'ogy.** (Άγμός; λόγος, a discourse) A treatise on fractures.

Ag'mc. Same as Agma.

Ag'mina digito'rum. The phalanges of the digits.

A. membra'na. The amnion.

Ag'minate. (Agmen, a multitude) Applied to organs, like the glands forming a Peyer's patch, which are collected together in a mass.

A. follicles. A synonym of Peyer's glands. Ag'minated. (Agmen, a maltitude.)
Grouped together. A term applied to the acinous glands aggregated to form a Peyer's patch.

A. glands. A synonym of  $P(yer's glands, Ag'mos. (A_7)\mu os, a fracture)$  A term formerly used for fracture, employed by Hippo-

rates. (Castellus.)

Ag'nacal. The Persea gratissima, growing about the isthmas of Darien like a pear tree; the pulp of the fruit of which is highly provocative of venery. (Quincy.)

Ag'nacat. Same as Agnacal. Ag'nail. (Sax. ange, angry.) A term applied to the shreds of epidermis which separate from the skin covering the root of the nail, and which, on being torn, give rise to a painful state of the fingers.

Italy, near Pozzuoli. A lake Agna'no. occupying the basin of an extinct crater, the waters of which are constantly agitated by the escape of gas. There are here remains of ancient baths (the Anianæ thermæ of the Romans), into which the vapours are conducted, having a temp. of 50° C. (122° F.) These vapours contain hydrogen salphide.

Also, a village three miles from Pisa, in Tuscanv, remarkable for a grotto, from the interior of which

issues thermal acidulated water.

**Agna'thia.** ('A, neg.; γνάθος, the jaw.) A malformation from arrest of development, in which one or both jaws are defective; the mouth is either absent or closed posteriorly, and with this is commonly conjoined imperfect development of the upper jaw, palatine process, and vomer. The two temporals are brought into proximity or contact, and the ears are closely approximated.

Agna'thous. ('A, neg.; γνάθος, a jaw. F. agnathe; G. ohne Kinnbacken.) Having no jaws.

Agna'tus. See Adnate.

Ag'neau de scy'thie. (F.) The Polypodium or Cibotium barometz.

Agni'na membra'na. The amnion. A. tu'nica. The lamb's coat; a term for the amnion.

A. pellic'ula. The amnion.

Agni'nus. (Agnus, a lamb. F. agnin; lammartig.) Belonging to a lamb. See G. lammartig.) Agnina tunica.

Agnoe'a. ('Αγνοια, from ἀγνοίω, to be ignorant. F. aqnoie; G. Besinnungslosigkeit, Unwissenheit, Unkunde.) State of a patient who does not recognise the persons or things around him.
Agnoia. The same as Agnæa.

Agnos'tidæ. A Family of the Order Trilobita. Extinct trilobites of small size; head and tail covered by nearly equal and similar shields; body rings two; eyes and facial suture waating.

Agnos'tus. (Άγνωστος, unknown.) A Genus of small Trilobites, of the Family Agnostidæ, interesting as being one of the first manifestations of life known to have existed on the earth. It is supposed to be peculiar to the Cambrian rocks of the primary or palæozoic period.

Ag'nus. (Ayvos, chaste. F. agneau; G. Lamm.) A lamb; the young of Oris aries.

A. cas'tus. ('Αγνος, from άγνος, chaste; castus, chaste. F. gattilier commun; I. agno casto; G. Keuschlamm strauch.) The duplication of the term chaste has probably arisen from the intercalation by a commentator of the term castus into the Greek text. All ancient authors laud its anaphrodisiac virtue, but modern writers speak of it as an aphrodisiac. It was formerly employed in hepatic and splenic diseases. Pliny speaks of it as a febrifage, diaphoretic, diaretic, and emmenagogue. The fruit, which is the part used, is a globular berry, of the size of a grain of pepper, surrounded at the base by the calyx of the flower. See Vitex agnus-castus.

A. Scythicus. (F. agneau de Scythie.)

Scythian lamb, a term for Polypodium or Cibotium barometz, from some fancied resemblance to

a lamb.

Ago'as Bellas. Portugal; between

Lisbon and Cintra. A salphur water.

Agoge. ('Αγωγή, a treatment of a subject, from άγω, to lead. F. agoge; G. Fuhrung, Leitung.) The order, ways, reason, and conduct, the whole condition and tenor of a thing; consideration and purpose of life. Applied similarly by Hippocrates to the consideration of diseasc. Specially, it denotes the state or condition of the atmosphere.

Agomphi'asis. ('A, priv.; γόμφωσις, a bolting together, the mode of insertion of the teeth into their sockets. G. Zahnwackeln.) Looseness of the teeth in their sockets.

Agom'phious. ('A, priv.; γομφίος, a grinder tooth. F. agomphe.) Destitute of teeth.

Agom'phius. (Same etymon.) Without teeth. A term applied by Ehrenberg to those Rotifers in which the mastax is destitute of teeth.

Agompho'sis. The same as Agomphiasis.

Ag'one. ('A, neg.; γόνος, offspring.) Old name for Hyoscyamus niger, because it was supposed to produce sterility.

Agon'ia. ('Αγονος, sterile. F. stérilité; G. Unfruchtbarkeit.) Sterility, unfruitfulness, or barrenness.

Ago'nia bark. The bark of the Plumifera lancifolia. Nat. Ord. Apocynacea. It is largely used as a febrifuge.

Agonia din. C<sub>10</sub>H<sub>14</sub>O<sub>6</sub>. A glycosido contained in the Agonia bark. It crystallises in silky needles, destitute of smell, and of very bitter taste. They are scarcely soluble in cold water, ether, or benzol, but with greater facility in hot water, alcohol, and carbon bisalphide. They melt at 155° C. (311° F.), and decempose at a somewhat higher temperature. It dissolves in sulphuric and nitric acids, with golden yellow coloar.

Agon'ic line. ('A, neg.; γωνία, an angle.) An irregularly curved imaginary line connecting those parts of the earth at which the magnetic coincides with the geographical meridian. It is sometimes called the line of no variation. Such a line cuts the east of S. America, and passing east of the W. Indies, enters N. America near Hadson's Bay; thence it passes through the North Pole, entering the old world cast of the White Sea, traverses the Caspian, cuts the east of Arabia, turns then towards Australia, and passes through the South Pole to join itself again. **Ago'nious.** ('Λ, neg.; γωνία, an augle. **F**. agone; G. ohne Winckeln.) Without angles.

Agonis'ma. ('Αγώνισμα, a contest.)

Agonis'mus. ('Aywviouos, rivaley.)

Agony. Agonis'ticon. ('Αγωνιστικόν, mastery.) Applied anciently to the coldest water, which was given freely in fevers, that it might thus strive against the excessive heat of the blood. (P. Ægineta and Castellus.)

Agoni'zans. (L. agonizor, to struggle.)

Moribund, dying.

Ag'onos. ('A, neg.; yóvos, seed.) Sterile.
Agonous. ('Ayovos, unfruitfal. F.
sterile; G. unfruietfal. Barren; sterile; unfruitful; opposed to Gonimus.

**Ago'ny.** ('Αγωνία, from ἀγών, strife for the mastery, anguish or sorrow. F. agonic; 1. and S. agonia; G. Todeskampf.) The struggle which sometimes precedes death.

Also, fear and sadness of mind.

**Agorapho bia.** ('Αγορά, an assembly, a market place; φόβος, fear. F. pew des espaces.) The fear of space. This neuropathic condition occurs without any loss of consciousness, and is quite distinct from vertigo; there is a feeling as if the heart were grasped and caused to beat violently, the face flushes, the limbs tremble, and the surface generally is cold and moist. special antecedent nervous symptom has been noted, but epilepsy and insanity in the ancestors have been observed.

Agos'tus. ('Αγοστός, the flat of the hand.) The palm of the hand; or the haud with the ulna

and radius.

Agou'ti. (L. dasyprocta agouti. F. lievre doré; G. Steiszthier, Goldhase.) Ord. Rodentia. Class Mammalia. Tail short; posterior extremities with three toes; clavicles imperfectly developed. Native of West Indies, Guiana, and Brazil. For-merly much used as an article of diet by the Indians. The flesh is white and tender.

Agra'fe de Val'entin. A kind of clamp with parallel limbs, employed by Valentin to keep the lips of the wound together after the

operation for harelip.

Agraha'lid. Same as Agiahalid. An Egyptian vermifuge.

Agrammatis'mus. γράμματα, letters.) Inability to form a grammatical sentence. See Akataphasia.

**Agraph'ia.** (A, neg.; γράφω, to write.) Inability to form the letters in writing, a kind of paralysis; the patient possesses the capability of thinking and speaking, but not of writing.

A. absolu'ta. A condition in which the patient is unable to write a single letter.

A. amnemon'ica. The form in which letters or words can be written, but they convey no meaning; due to loss of memory.

A. atac'tica. The form in which the power of writing the separate letters is lost; due to loss of the power of co-ordinating the muscles.

A. litera'lis. A condition in which the

patient is unable to write a single letter.

A. verba'lis. The condition in which the patient can write a series of letters readily enough, but these convey no sense.

Agree ment. (F. agreer, from gré, free goodwill to do a thing; from the root of L. gratia, grace, favour.) Concord, accordance. The consciousness of agreement has been called the second fundamental property of intellect; it implies an identifying process or a feeling of recognition.

Agres'ta. The juice of unripe grapes, expressed, strained, and placed in tubs, then preserved in a closed vessel, according to Schröderus.

**Agres'tis.** (L. ager, a field or manor. F. agreste, G. wild.) Belonging to a field: applied as the specific name of many plants. Also used to denote exceeding malignity in a disease.

Agres'ton. (F. agriste.) Old term for

tartar before it is purified.

A'gria. ("Λγριος, wild or barbarous.) pustular eruption, accompanied with redness and erosion; so named from its intractability.

Also applied to forms of lichen and herpes.

Also a name for the *Hex aquifolium*. **Agriam'pelos.** ("Λγριος; ἀμπελος, the vine.) Name for Bryonia alba.

Agricola'tion. (L. ager ; colo, to culti-Tillage; husbandry.

**Agric'olous.** (L. ager, a field; colo, to iuhabit. F. agricole; G. feldbewohnend.) Living

in the fields. Agricultu'ra. (L. ager; cultura, husbandry, or tillage. F. agriculture, labourage; G. Ackerbau, Feldban, Landwirthschaft.) The cultivation of the earth; farming; tillage;

husbandry. A'gridæ. ('Ayptos.) A Section of Dipterous insects found in arid and rocky places.

Agriclæ'a. (Αγριος, wild; ελαία, the olive tree.) The same as Agriclaia.

Agriclaia. ('Αγριελαία.) The oleastrum of the ancients, generally referred to Elæagnus spinosus, Linn., the wild olive. The leaves were deemed astringent, and employed in this character both externally and internally in a great

variety of diseases.

**Agrielco'sis.** ("Αγριος, wild; ἔλκωσις, ulceration. F. agrieleose.) Malignant ulceration. Agrifo'lium. (Prohably corrupted from Aquifolium.) A synouy'u of the Holly, Ilex aquifolium.

Agrimo'nia. (Perbaps a false reading for Argemonia, a plant mentioned by Celsus; by some derived from aypos, a field; μονίας, living alone. 'Aγρεμώνη, was a kind of poppy, mentioned by Dioscorides.) Agrimony; egremoine. A Genus of the Suborder Rosea, Nat. Ord. Rosacea. Calyx 5-eleft, without bracts; tube at first fleshy, afterwards tough, covered with hooked

F. aigrémoine, herbe nig; Dan. agermaane; Dnt. Leverkrund; Swed. Herb Agrimony, officinal in F. Ph. Characterised by the leaves being interruptedly pinnate, serrate, downy beneath. Calyx of the fruit obconic, outer bristles spreading. It grows in fields and roadsides. The decoction of the leaves being slightly aromatic, hitter, and styptic, it has been used in gargles, and internally in inflammations of the mouth and throat, and in diarrhœa; the root is regarded as a vermifuge.

A. odora'ta. A synonym of A. eupatoria. A. officina'lis. A synonym of the A. cu-

A. parviflo'ra. Sweet seented Agrimony. Hah. United States. Used as Agrimonia cupatoria. Ag'rimony, com'mon. The Agri-

monia eupatoria. A., hemp. The Eupatorium Cannabinum.

A., small-flow'ered. The Agrimonia narriflora.

A., sweet-scent'ed. The Agrimonia par-

viflora.

Agriocar damum. ("Aypios, wild; κάρδαμον, the nasturtium, or cress. F. agriceardamon; G. wilde Kresse.) Wild cardamum; a kind of cress or nasturtium. Eaten as food.

**Agriocas' tanum.** ( $^{\prime}\Lambda\gamma\rho\iota\sigma s$ ;  $\kappa\acute{a}\sigma\tau a\nu\sigma s$ , the chestnut.) Name for the field chestnut, Bu-

nium bulbocastanum.

**Agriccin'ara.** ('Λγριος'; κινα artichoke.) Name for Cynara scolymus. ('Αγριος; κινάρα, the

Agriococcime lea. ("Αγριος, κόκκος, a kernel;  $\mu\tilde{\eta}\lambda o\nu$ , an apple.) Name for *Prunus communis*, var. *spinosa*, the sloe plum or blackthorn. Agriomela. ('Αγριος'; μῆλον, an apple.)

Name for Pyrus malus, the wild or erab apple. Agrion. (Αγριου, n. sing. of αγριος.) Name for Silaus pratensis, the pepper saxifrage. Also the *Ilex aquifolium*, or holly.

A grio-orig'anon. ("Αγριος, wild; όριγανου, marjoram.) The αγμιορίγανου of Dioseorides, identified by Sibthorpe with Origanum creticum. The leaves and flowers were administered in wine as an antidote to venomous hites. (Waring.)

Agriopastina'ca. (L. agrius, wild; pastinaca, a carrot.) Wild carrot or parsnip.

**Agriophyllum.** (Άγοιος; φύλλου, a leaf.) Name for Silaus pratensis.

**Agriophy'ma.** ('Αγριος; φύμα, a tumour. F. agriophyme.) A malignant swelling. ( Aypios. G. Wildwachsend.) Ag'rios. The same as Agrius.

Agrioseli'num. ( Αγριος, σέλινον. parsley.) A synonym of Smyrnium olusatrum, or wild parsley.

**Agrioste'ari.** ("Αγριος: στέαρ, paste of wheat flour.) Old name for wild field corn; a

species of Triticum.

Agrio'tes. (G. Schnellkufer, Schmiede.)
A genus of beetles. Fam. Elaterida, of the Ord. Colcoptera, Class Insecta. Body elongated, flattened; head depressed; antennæ 11- or 12jointed; prothorax with a mental process and a spine at its base, and freely movable on the mesothorax.

A. sege'tis. (G. Suatschnellkäfer.) The larva of this species known as the wireworm (G. Drahtwurm), is very destructive to plants. It is cylindrical in form, horny, short-legged, and destitute of eyes.

Agriothym'ia. ('Λγριος, wild; θυμός,

disposition). Furious insanity.

A. ambitio'sa. The insanity of conquest, or the irrepressible desire to subjugate or exterminate nations.

A. hydrophob'ica. The irrepressible desire to hite which exists in rabies.

A. religio'sa. The irrepressible desire to destroy other religions and those cultivating them. Agripal'ma. ('Αγριος; palma, a palm tree.) A synonym of Leonurus cardiaca, or motherwort.

A.gal'lis. (F. agripaume; G. Herzgespann.) A synonym of Leonurus cardiaca, or motherwort.

Agripaume. (Fr.) The Leonurus

cardiaca, or motherwort.

Agrip'pa. (As if Ægrippa, from ægrè partus, born with difficulty, or ægritudine ex pedibus; G. Verkehrtgeborne, Fuszgeburt.) One born feet foremost; also a name for foot presentation, or a case made footling by turning.

Also, au ointment described by Nicolaus.

Agrip'pæ par'tus. A term for foot

Agrippi'nus par'tus. A term for foot presentation.

Agrium. An impure mineral alkali, probably nitre.

Ag'rius. ("Αγριος, wild, fieree.) A term applied to denote violence or malignity in disease.

A'grom. An Indian term for a rough and eracked condition of the tongue.

**Agron'omy.** ('Αγρός, a field; νόμος, law. L. agronomia.) The consideration of affairs proper or pertaining to tillage or farming.

**Agropy'rum.** (Άγρός, a field; πυρος, wheat.) A Genus of the Nat. Ord. Graminaceæ.

A. acu'tum. A variety of A. repens. A. jun'ceum. A variety of A. repens. A. lævis'simum. A variety of A. repens.

A. pun'gens. A variety of A. repens.
A. re'pens. (F. chiendent commun, ou petit chiendent; G. Queckenwurzel, Graswurzel, Quitah.) Couchgrass. A perennial, with creeping rhizome. Spike distichous; spikelets about five-flowered, parallel with the zigzag rachis; glumes 2, nearly equal; palese 2, lanceolate, 5nerved, acuminate not ventricose, rachis usually seabrous; leaves rough, with lines of points on the upper side. A common weed in waste places in all parts of Europe, in Asia as far as the Caspian, and in both North and South America. The rhizome is long, stiff, one tenth of an inch in diameter, occasionally branching, and marked at intervals of about an inch with nodes. As found in the shops, it is cut up into short, shining, straw-coloured, many-edged, cylindrical pieces, which are without odour, but have a sweetish taste. The juice yields triticic acid, malates, and occasionally mannite. It is a domestic remedy in repute in France, being taken as a demulcent and sudorific in the form of tisane. A decoction is recommended in mucous discharge from the hladder. A synonym of the Triticum repens. B. Ph.

Agros'teæ. ('Αγρῶστις.) Α synonym of Agrostideæ.

**Agrostem'ma.** ('Αγρός, a field; στέμμα, a garland.) A Linnæan Genus of plants having a calyx with five long leafy teeth, ten stamens, and five styles.

A. githa'go. (F. nielle des bles ; G. Kornrade.) The corn cockle. A synonym of Githago

segetum.

Agrostem'min. An alkaloid alleged to exist in the seeds of Githago segetum. Obtained by extracting with alcohol of 40 per cent. containing acetic acid, and by precipitating with calcined magnesia. The precipitate to be treated with alcohol and left to crystallise. Yellowish white, minute scales, fusible by heat and slightly soluble in water, very soluble in alcohol, of perceptibly alkaline reaction, and yielding crystallisable salts with acids. It is identical with Sa-

Agrostid'eæ. (Άγρωστις, a grass, from άγρός, a field.) A Subtribe of the Tribe Poaceæ, Series Euryantheæ, Nat. Ord. Graminaceæ. The spikelets are 1-flowered, with sometimes a rudimentary upper glume; empty glumes two, eonspicuous; floral glumes often awned; styles very short; fruit ovoid, not compressed.

Agrostiographia. (᾿Αγρωστις; γράφω, to write.) See Agrostographia.
Agros'tis. (᾿Αγρωστις. G. Feldgras,

Windhalm.) A Genns of the Subtribe Agrostideæ, Tribe Poaceæ, Series Euryantheæ, Nat. Ord. Graminaceæ. Bent grass. Empty glumes membraneus, awnless; floral glumes membraneus, with few er no basal hairs.

Also, an old term for the Bryonia alba.

A. verticilla'ta. The Andropogon muricatum.

Agros'tographia. (Άγρωστις, grass; γράφω, to write.) A treatise on grasses.

Agrostology. ('Αγρωστις, grass; λόγος, a discourse. F. and G. Agrostologie.) A treatise on grasses.

Agro'tidæ. A Family of the Group Nocturna, Order Lepidoptera. Body well developed; abdomen conical, without a tuft; proboscis strong; tibie of the middle and posterior legs with spines. Larvæ thick and naked.

Agru'mina. Au old term for leeks and

onions.

Agru'na. The Prunus communis, var.

Agrune'la. The Prunus communis, var.

Agrune 1a. The Trunus communis, spinosa.

**Agryp'nia.** ('A, neg., or αγριος, restless; υπυος, sleep. L. υισοπαία, perrigilium; F. agrypnie; G. Schlaflosigkeit.) Sleeplessness, watchfulness, or wakefulness.

A. excita'ta. Sleeplessness from mental excitement, with listlessness as to surrounding

objects.

A.pertæ'sa. Sleeplessness from bodily disquiet, with attention alive to surrounding objects.
A. senilis. The sleeplessness of old age.

**Agrypnoco'ma.** (Αγρυπνος, sleepless; κωμa, lethargy. G. Wachschlufsucht.) A lethargic state of wakefulness generally attended with low mnttering delirium, often occurring in the more severe cases of typhus; aptly expressed by the term Coma viqit.

**Agrypno'des.** ('Αγρυπνώδης, making sleepless.) Agrypnode fever. A fever that prevents sleep.

Agrypnotic. ('Αγρυπνία, sleeplessness. F. agrypnotiques; G. schlafraubende Wachmittel.) Agents which produce wakefulness. They are used to rouse from torpor or from coma, whether pathelegical or toxic. Coffee, tea, small doses of the essential oils or essences. as of cleves, canella, mint, and vanilla, balm (Melissa officinalis), and the electric bath, are reckoned among the most effectual agrypnotics. In some special

eases opium in small doses produces the same effect.

Agua'i-gua'ree. Species Arbol del Estorague. Nat. Ord. Styraceæ. A tree of Paragnay. Yielding on incision an aromatic resin. A balsam

is prepared from the bark. (Waring.)

Agua'pi-gua'zie. Species Camalote.

Nat. Ord. Hydrochartdaeeæ. A plant of Paraguay.

An infusion of the flowers, according to Paradi, is used as a diuretic, emollient, aphredisiae, and sedative. (Waring.)

Agua ra-qui'ya. The Brazilian name of a Solanum, probably S. oleraceum, which is regarded as a sedative. The leaves are applied to wounds.

Aguar'dient de ma'guey. A very intoxicating spirit or brandy, obtained by the Mexicans frem pulque, or the fermented jnice of the leaves of the Aguve Americana.

A'guas Calien'tes. Mexico; State of Jacateeas. Here are not springs issning from granite, at a temperature of 90° C. (194° F.),

and forming the source of the river of the same name. (llnmboldt)

A'guas de Comangil'las. Mexico; State of Guanaxuato. Here are thermal springs, 96·4° C. (206° F.), issuing from basalt. (Ilumboldt.)

Agua'sem. A poisonous serpent of the Philippian Isles.

A gue. (F. Aigu, sharp, acute. Διαλείπων πυρετός; L. febris intermittens, frigida febris; F. fièvre intermittente, fièvre tremblante, dialcipyre; I. febbre intermittente; G. Wechsel-fieber, aussetzendes Fieber, kaltes Fieber.) A specific, non-contagions, malarial fever, having more or less regular paroxysms, consisting of a hot, cold, and sweating stage in succession, with a distinct remission, and accompanied by splenie engorgement. The febrile parexysm, which may oceur suddenly or after some days of headache, pains in the limbs, quickness of pulse, and general malaise, commences with chilliness, which soon passes into shivering; the teeth chatter, the skin is shrivelled and dusky, and the nails blue; the pulse is small and often irregular, the breathing is quick and panting, often with cough and præcordial oppression; nansea and sometimes vomiting occur; there is a frequent passage of pale urine, and headache; but the thermometer indieates a heightened temperature, as high, it may be, as 41° C. (105.8° F.) In a short time, this cold stage gives place to the hot stage; the sensations of cold are intermingled with flushes of heat; the latter grow more frequent and stronger, until there is a violent burning; the body becomes swollen and red, the urine is high coloured, the pulse and heart beat fiercely, the temples throb violently, the headache increases, delirium may occur, and the temperature may rise still further. Presently the sweating stage succeeds, in which the distress gives place to a feeling of comfort, the hot and dry skin becomes relaxed, gets moist, pours out profuse sweat, the nrine deposits lithates, the pulse gets slower and softer, the breathing is tranquil, the headache goes, and after a sleep, it may be, there is only more or less weakness, more or less paller, left to tell of what has goue before. The different stages vary in absolute and relative durations; the cold stage may vary from half an honr to four or five hours; the hot stage varies from half an henr to twenty hours; the sweating stage may be very slight or very prolonged. When the paroxysm is over, a certain time clapses before another occurs; this is the *intermission*. The period between the commencement of one paroxysm and that of a second is the interval, and it's length determines the epithet describing the form; as quotidian, tertian, quartan. When the interval between two parexysms tends to grew shorter the agne is said to anticipate, and is probably increasing in severity; when the interval be-comes longer the ague is said to postpone, and is probably improving. Ague is not often fatal, and is generally curable, but it imprints a distinct and often permanent character on the body, tending to an easy reproduction of the attack by slight influences, and modifying materially the progress of subsequent diseases. It is probable that the sympathetic nervous system is the main chaunel through which the poison of ague, whether organic or organised, exerts its influence. The one constant condition seen after death is enlargement of the spleen, with some induration, and a deposit of pigment, probably resulting from disintegration of the colouring matter of the red bloodcorpuscles. The liver is apt to undergo similar changes, and pigmentary deposits in other organs are not rare. The blood in ague has been found to contain more albumen, more salts, and more fat than in health. The excretion of urea is largely increased during the bot and cold stages, decreased during the intermission; uric acid is increased during the paroxysm, and sodium chloride very largely so, whilst the amount of phosphoric acid is diminished. Albumen and renal casts and blood are sometimes found in the urine passed during the paroxysm. Ague is not contagious, but is endemic, and takes its origin in some product developed in marshy districts. For a further account, see Malaria.

The attacks of ague vary in severity; sometimes it is by no means severe, at others it becomes of most serious moment. Occasionally it is abortive or irregular in its progress; the cold stage may be predominant and most severe, producing collapse; the sweating may be premature, profuse, and persistent, with great depression of temperature and extreme debility; coma and convulsions may occur prior to perspiration; harmorrhage into an organ or from the intestinal or genito-urinary canal may supervene. Sometimes the chief symptom is intense neuralgia.

Ague has been observed in the horse, cow, pig,

and dog.

Quinine is the chief specific for ague; it is given either in very large doses, twenty or thirty grains, either just before or just after the commencement of the parexysm, or during the sweating stage; or it is given in smaller doses, three to five grains, three or four times a day. Arsenic is by many considered equal to quinine, and is given in the form of liquor arsenicalis, in doses of five minims or more, three or four times a day. The administration of either drng is usually prefaced by a calomel purge. During the cold stage warmth, hot drinks, ether, and ammonia, have been advised, and sometimes emetics; during the hot stage bleeding has been recommended by some; a dose of calomel, tartar emetic, and directics are sometimes advised, and in both stages opium has been given with some advantage. Liver and other complications are to be treated on their own ments. An essential of success to any great degree is removal of the patient from the malarial district. Other remedies, which have been used with some success, but with much less effect than quinine and arsenie, are, opium in full doses during the cold or the hot stage, apiol, encalyptus, ammonium ehloride, ipecacuanha, piperin, camphor, cascarilla, ehamomile, hyposulphite of soda, narcotine, quassia, salicine, salicylic acid, and bebeerine. burg's tineture, a powerful antipyretic, is of most service in the remittent form of malarial fever.

A., A'den. A synonym probably of  $Dengue_{\star}$ 

A., anticipa'ting. A form in which each paroxysm occurs some time before its proper period.

A., brass'founder's. An affection occurring in brass founders, and believed to depend ou the inhalation of the fumes of zinc oxide. The symptoms are tightness and oppression of the chest, with indefinite nervous sensations, followed by rigors, an obscure hot stage, and profuse sweat-

A., brow. (G. Larvirtes Wechselfieber.) An irregular form of ague in which the chief symptom is neuralgia of the supraorbital branch of the fifth nerve.

A. cake. (G. Milzanschwellung.) Enlargement of the spleen, the effect of protracted ague. A., catena'ting. A term formerly used to

describe an attack of ague associated with foreign symptoms or other diseases, as lumbago, epilepsy.

A., chron'ic. Persistence of the disease in a more or less regular form, which may occur as a result of continued residence in a malarial district or of renewed attacks of the disease. Under these circum-tanees splenic and hepatic enlargements are common, and the maturial cachexia is strongly developed. Jaundice, ascites, and meliena are frequent results.

A., dead. An ague in which the paroxysms

are obscure.

A. doub'le quar'tan. (F. fièvre doublequarte; G. doppeltviertagig.) That form in which the febrile paroxysms occur in two sets within one interval, each set having the usual seventytwo hours' interval.

A., doub'le quotid'ian. (F. double quotidienne.) An ague in which there are two

paroxysms every day.

A., double ter'tian. (F. double tierce; G. doppeltdreitagig ) That form in which the paroxysms occur every-day, but the alternate ones only are similar to each other.

A., doub'le une'qual ter'tian. A double tertian agne, in which one set has a more perfect,

the other a less perfect, intermission.

A. drop. A solution of arseniate of potash in water, known as Fowler's tasteless ague-drop, and for which the Liquor arsenicalis is a substitute; ealled also Fowler's solution.

A. drop, taste'less. A synonym of the

Liquor arsenicalis.

A., dumb. An ague in which the paroxysms are obscure.

A., du'plicated quar'tan. A quartan ague having two paroxysms on the regular day with the normal interval.

A., du'plicated ter'tian. (F. tierce doublie.) That form in which two paroxysms occur every other day, and none on the intermediate days. A., face. Facial neuralgia of malarial origin.

A. grass. The Aletris furinosa.

A., hebdom'adal. (F. fièrre hebdomadaire.) A variety in which the paroxysms recor every seven days.

A., irreg'ular. Another name for Browague, A., leap'ing. A synonym of Dancing mania. A., mask'ed. (F. fièvre larvée, or masquée.) An irregular form of agne in which some serious symptom, especially pain, returns at definite intervals instead of the ordinary paroxysm.

A., par'tial. A term formerly applied when the attack was confined to a partieular part or organ, and usually accompanied by distressing

A. plant. A term applied by Dr. Salisbury to delicate cottony flocculi in the urine, which he believes to be developed in the organism of patients suffering from intermittent fever. He was led to this opinion by examining the secretion of the mouth, and finding amongst other extraneous bodies, such as zoosporoid bodies, desmids, and algoid cells and filaments, one only constant presence, minute oblong cells, single or aggregated, with a distinct nucleus, a smooth cell wall, and a clear intervening space, which he helieves to be a Palmella. Similar bodies he has found in a hog in an aguish district, and he

suggests that these taken into the body produce the disease, and are eliminated by the urine as the above-mentioned cottony flocks. He names the plant Gemiasma. These observations have not been confirmed.

A. poi'son. See Malaria.

A., protrac'ted. The form in which the paroxysm is prolonged beyond the usual period, so that there is little or no intermission.

A., quartan. (L. quartus, the fourth. Gr. τεταρταΐος; F. quarte; I. quartana; S. cuartena; G. viertägige.) That form of ague in which the paroxysms occur every third day, and last usually about six hours. It has the longest cold stage and the shortest hot stage. The interval is seventy-two hours.

A., quin tan. (L. quintanus, the fifth. Gr. πεμπταίος; F. quintane; I. and S. quintana; G. Quintanficber.) A form in which the paroxysm occurs every fourth day, not counting the first day

of paroxysm.

**A.**, quotid'ian. (L. quotidie, daily. Gr. άμφημερινός, καθημερινός; F. quotidienne, I. quotidiana; S. cotidiana; G. tägliche Fieber.) That form of ague in which there is a daily paroxysm, the mean length of which is about sixteen hours. It has the shortest cold stage and the longest hot stage. The interval is twenty-four hours.

A., retard'ing. A form in which each

paroxysm delays its attack for some time.

A. root. The Aletris farinosa.

A., sep'tan. (L. septem, seven. F. septane.) A form in which the paroxysm returns at the end of seven days, counting both days of paroxysm.

A., sex'tan. (L. sextanens, the sixth. F. sextane.) A form in which the paroxysm returns every six days, counting both days of paroxysm.

A., tertian. (L. tertius, the third. Gr. rριταΐος; F. tierce; I. terziana; S. terciana; G. dreitägige.) That form of ague in which the paroxysms recur every second day, the average duration of the paroxysm is ten hours; the cold stage is longer and the hot stage shorter than that of the quotidian. The interval is forty-eight hours.

A., third-day. A synonym of Tertian aque. A. tree. Common name for the Sassafras officinale, because of its febrifuge virtues.

A., trip'le quar'tan. A quartau ague with a regular paroxysm, and a slight attack on each of the intermediate days.

A., trip'le quotid'ian. (F. triple quotidienne.) A form in which the paroxysm returns three times in the twenty-four hours.

A., trip'le ter'tian. That form in which there are two paroxysms on alternate days and one on the intermediate days.

A., trip'licated quar'tan. A quartan ague having three paroxysms on the regular day aud a normal interval.

A. weed. The Eupatorium perfoliatum.

Ague'da. See Santa Agueda.
Ague'tree. The Sassafras officinale.
Ague'tree. The Sassafras officinale.
Agu'ios. ('Ayvoos, from a, priv.'; yvuov, a limb.) Having no limbs, chiefly referring to the hands or feet. Applied by Hippocrates to the fœtus. Also weak, imbecile, feeble.

A'gul. A Persian shrub, Alhagi maurorum.

Agunie char. An article of the Indian Materia Medica. The produce of Western India, highly esteemed in rheumatic affections. (W.)

Aguoma'da. The Plumifera lancifolia.

Agya'gos. Austria-itungary, .... Zemplin County. A mild sulphur water, having a temperature of 25° C. (77° F.)

Agy'ion. ('A, priv.; yullow, a limb.) With-

out limbs, especially hands and feet; applied by Hippocrates to embryos. (Castellus.)

Agy'ium. Same as Agyion.

Agynaire.) A term given by De Candolle to those flowers which are formed of floral integuments and transformed stamma, but in which the pistil

Agynique.) Applied to the stamens when they

are adherent to the pistil.

Agy'nous. ('A, priv.; youn, a woman. G. unheweibt.) Having no female organ.

A. flower. A flower without a pistil.

Agyra'tæ. A synonym of Danæaeæ.

Agy'rate. (A, neg.; γῦρος, circle.) A term used in Botany to denote that which is not

rounded or disposed in a circle. Agyria'cel. A Family of Thecasporous Fungi of the Order Discomycetes, having a tuber-

culous or warty pedicellated receptacle. Agy riæ. Ectothecal Thecasporous Fungi, described by Léveillé as forming a Section of the Tribe Cyathidæ, having a fleshy, sessile, convex, or flat receptacle.

Agyrias. (Αγυρις, a congregated multitude.) Formerly employed for opacity of the cornea, or of the lens, supposed to proceed from

the aggregation of foreign particles.

**Agyr'ta.** ('Αγύρτης, a collector, a fortune-teller. F. agyrte; G. Marktschreier.) Originally applied to mountebanks and jugglers, who pretended to indict and cure diseases by incantations and mysteries of sacrifices, according to Plato, but latterly to all quacks and pretenders to medical knowledge. (Stephanus.) **Agyrti'a.** ('Λγυρτεία, begging. G. Quack-salberei.) Charlatanry.

Agyr'tria. (Same etymon.) A female

Ahalim. The same as Ahaloth.

Ahaloth. The Hebrew name of Aloes wood. Ahamel'ia. A synonym of Acmella. Ahe'num. (G. Kessel.) A vessel or boiler

made of brass or copper or iron. **Ahia-endote.** The name in Southern Abyssinia of a species of *Phytolaeca*, employed in syphilis. The seeds are also used as a charm

against hydrophobia.

Ahioli. Turkey; a short distance from Constantinople. Several sources of mineral water springing from the chalk and mica slate at the foot of Mount Hermus in the Balkan range. Temperature 38° C. (100 4° F.) They contain sodium, magnesium, and calcium chloride, with some oxide of iron. Úsed in liver obstructions, glandular diseases, and anæmia.

Ahius. (Arabic.) Name for rock salt.

(R. and J.)

Ahmel'la. A synonym of Acmella. Aho'ra. ('A, neg.; ωρα, manhood.) Retarded development of the organs. (D.)

Ahou'ai. A name common to two plants belonging to the Nat. Ord. Apocynacea, one of which is the A. of the Antilles, Thevetia nerii-folia, the other the A. of Brazil, Thev. ahouai, or Cerbera ahovai. Both are large trees with highly venomous milky juice. The fruit is a dry drupe, the hard stone of which contains four seeds that are very poisonous.

Ahu'ber. A berry sold in the bazaars of Scinde, from Khorassan, of terebinthinate flavour; according to Stocks, the fruit of Juni-perus Phanicea. It is said to be very effective in gastralgia; and infused in oil it is used externally in rhenmatism. (Lord; Waring.)

Ahund madoo. Abyssinian name of a species of Chenopodium. Used, according to Kirk, as an application to ulcers. (W.)

Ahusal. (Arabic.) Name for orpiment. (R. and J.)

Ahyp'nia. ('A, neg.; υπνος, sleep.) Sleep-

lessness.

Painful crepitation of the tendons. Дi. name given by the Gascon peasantry, and by Velpeau, to a swelling accompanied by a peculiar creaking of the sheaths of tendons, a condition not untrequently seen affecting the tendons of the tensors of the thumh. It results from strain or overwork of the parts. Once begun, the inflammatory symptoms increase for six or eight days, remain stationary for a week, and then subside. The essential treatment is rest.

Aiarazath. (Ar.) Plumbum, lead. Aiault. (F.) The Narcissus pseudonar-CIRRIES

Ai'ben. The name given in Tartary to the fermented milk of the cow. (Waring.)

Ai'bi. A Brazilian palm, from the trunk of which exudes a liquor which is rendered alcoholic by fermentation; either an Llais or Bactris. (Jussien.)

Aib'ling. A spa two miles from Munich, Bavaria. Altitude 1700 feet. Sool or strong salt baths; there are also mnd baths.

Aich. Germany; upper region of the anube. A carbonated calcie water. (D-F.)

Ai'dion. The dried testes of the stag drunk with wine. Used as a remedy by the ancients for the bites of vipers. (Waring.)

Aidoi'ci. (Alôoĩa, the genital organs.) Diseases of the generative organs.

Aidoioma'nia. (Alôoĩa, the generative organs; mania.) A synonym of Erotomania, which includes satyriasis and nymphomania.

Ai'dos. A town of Turkey in Europe, about sixty miles from Adrianople, at the foot of the Balkans and near the Black Sea. The waters are sulphuretted, temp. 48° C. (118° F.), and are of very ancient reputation.

Aier'sa. The Iris Germanica.

Ai'gle. Switzerland. Salt springs. See Bex. Aigret'te. (Fr.) The pappus of Composite

Aig'ta. A tribe of men of the Negrito type occupying the Philippine Islands; they are of low stature, have woolly hair and a black skin, and are somewhat brachycephalous.

Aigues-bonnes. See Eaux-bonnes.
Aigues-caudes. See Eaux-chaudes.
Aiguille. (F.) A needle. In Geology,
applied to the sharp peaks of high mountains. Crystalline rocks, as gneiss and quartz, most usually assume this shape.

Aiguillonnée. (Fr.) Armed with spines or prickles. In Botany, applied to the surface of

stems.

(Fr.) The Allium sativum, or garlic. Ailan'thic ac'id. An acid prepared from the bark of the Atlanthus exectsa. It is reddish brown, very bitter, and forms a deliquescent mass of waxy consistence, very easily soluble in water, less in alcohol and ether, and insoluble in chloroform and benzol.

Ailan'thus. A Genns of the Nat. Ord. Xanthoxylacea, ar, according to others, of Simarubacea.

A. excel'sa. A large Indian tree. The aromatic bark is used in dyspepsia, and regarded as a powerful febrifuge and tonic. It has been recommended in the early stages of cholera.

A. glandulo'sa. (Aylanto, Amboyna word, signifying "tree of heaven." F. faux vernis du Japon.) Nat. Ord. Simarubacca. The juice of this tree is said to be febrifuge. bark of the fresh root has been recommended in diarrhea and dysentery, and as an anthelmintic. The leaves supply food to the Bombyx cynthia, or Chinese silkworm, The analyses of Payen and Hetel show that the plant contains lignine, chlorophyll, yellow colouring matter, pectin, bitter substances, aromatic resin, essential oil, nitrogenised fats, and some salts. The powder of nitrogenised fats, and some salts. the bark may be given in doses of seven grains; the powder of the leaves and the watery extract of the bark in doses of four grains; the oleo resin in doses of three grains; and the resin in doses of six grains. These preparations act as emetocathartics, as well as taniafuges. Neither the bark nor the oleo-resin produce vomiting in man, unless the vapour is inhaled.

A. malabariea. An Indian tree. The bark is given in dyspepsia, and is a tonic and febrifuge. It yields a fragrant resinons jnice, known as Mnttee pal, or Matti pawl, which, reduced to powder, mixed with milk, and strained, is given in small doses in dysentery and bron-

chitis.

Aile. (Fr.) Wing; ala.
Ailé. (Fr.) Winged; alate.
Ailmad. (Arab.) Name for antimony.

Ailuroi'dea. (Αλουρος, a cat, a weasel.) Λ Group of the Order Carnivora, which includes the Felidæ, Viverridæ and Hyænidæ,

Ai'mauq. A race of men; one of the four branches of true Mongols. Also called Hazara.

Aimorrhœ'a. Hæmorrhage. Aimorrhœ'is. Hæmorrhoids.

Ain. This word in Arabic signifies spring or fountain, and is often found in maps of Africa and Arabia, either as the name of a place or in composition indicating the site of thermal or mineral springs, as Ain-el-Mouza (Arabia), Ainel-Hammam, Ain-Melah, Ain-Merdja, Algeria.

Ain-el-Mouza. Arabia Petras. A hot sulphurous spring, the water escaping in jets,

Ain-Nouizy. Algeria, Province of Oran, Arrondissement of Mostaganem. About forty miles from Oran. A saline sulphuretted spring,
Ain cille. Upper part of the valley of

Cize, Basse Pyrénées, France. The mineral waters are strongly impregnated with sodie chloride. Temperature cold.

Ain'hum. (Ainhum, Negro term, meaning to saw.) A disease peculiar to the Negro race, consisting in the spontaneous amputation of the little toes, nuaccompanied by any other disorder of the system. The disease commences by a not quite semicircular furrow in the digito-plantar fold, without marked inflammation, pain, or ulceration. Gradually the furrow becomes deeper and sometimes slightly ulcerated, and extends to the dorsal surface. The toe in front of the now circular groove becomes swollen to twice or thrice its natural size, and forms an oval or round knob. The epidermis becomes rough, but the nail is not materially changed. If left to itself it is either tredden off or becomes gangrenous.

The progress of the disease is very slow, lasting cometimes for ten years. The sensibility of the toe is not lost. As soon as both the small toes are removed, neither any other toe nor any other part of the body becomes affected. (Weber.) The cause of the disease is unknown. In a specimen shown at the Pathological Society in 1868, the osseous tissue and joints were healthy, the substance of the true skin was hypertrophied, and there was enlargement of the calibre, with great thickening of the walls of the blood-vessels permeating it.

Ain'os. A people of Japan, chiefly in the Island of Jeddo. The allophyle branch of the white races of man. They possess strongly marked supraciliary arches, and a great development of hair over the body. They resemble the European type.

**Aiophyllous.** (Λιών, one's lifetime; φύλλον, a leaf. F. aiophylle.) A hotanical term

φυλλου, area. Γ. αορημαε.) A botament term applied to trees having their leaves persistent. **Aipathia.** ('Αειπάθεια; ἀεί, always; πάθοs, disease. G. relative Gesundheit.) That conception of health which considers every living body as being always more or less unhealthy. As Galen expressed it, the seeds of all forms of disease are in us; it is only ou account of their smallness that they pass unnoticed. By subsequent writers the term was applied to persistent and ineurable disease.

Ai'pi. Ancient name for Jatropha manihot. Aipi'ma coxe'ra. Same as Aipi.

Aipim'ia. Same as Aipi. Aipipo'ca. Same as Aipi.

Aipysu'rus. A Genus of poisonous water snakes, helooging to the Family Hydrophide.

Air. (ἀήρ, from ἄω, to blow. L. Aer; F. air; I. aere; Sp. aire; G. Luft.) The matural or atmospheric air. Also a term applied to any gas or æriform fluid.

A., al'kaline. A synonym of Ammonia. A., atmospheric. The gaseous envelope or covering of the earth. Its composition, when dry and freed from earbon dioxide, is singularly uniform, but it is a mixture of gases, not a chemical compound. It consists of 77 parts by weight, or 79:10 by volume, of nitrogen, and 23 parts by weight, or 20:81 parts by volume, of oxygen in every 100 parts. The volume, of oxygen in every 100 parts. The carbon dioxide varies from 3.7 to 6.2 parts by volume in 10,000 of air. The amount of aqueous vapour is variable, depending upon the temperature, and there is a trace of ammonia. Ozone is present in pure air, but usually absent in towns and dwelling-rooms. Organic vapours and other matters occur as impurities. A litre of pure and dry air at 0° C. and 760 mm. pressure weighs 1.29366 grains; 100 cubic inches at 60° F. and 30 inches barom, weigh 30.935 grains, hence a cubic foot weighs 536.96 grains, which is 813.67 times lighter than a cubic foot of water at the same temperature. The pressure of the atmosphere at 32° F, and 29.905 barom, at London is nearly 143 lbs. on the square inch, or 1.033 kilos, on a square ceutimètre. There are two regions of high pressure, the one north, the other south, of the equator, passing completely round the globe as broad belts, and there are three regions of low pressure, one at each pole, and an equatorial belt. Atmospheric pressure is more regular throughout the year over the ocean than over the land, if we except the higher latitudes. It is more uniformly distributed over the globe in April and October than in any of the other mouths In May and November the great annual rise and fall occur. There are two maxima of pressure during the day, one from 9-11 a.m., and one from 9-11 p.m., and two minima, occurring from 3-6 a.m. and 3-6 p.m. See Atmosphere.

A. bag. Same as A. bladder.

A. bath. An arrangement of a vessel or chamber into which a limb or a part of the body, or the whole body may be introduced, and varying pressure of air exerted by the establishment of a connection between the cavity of the chamber and an exhausting or condensing pump.

Also, an arrangement for drying chemical substances, consisting of a metallic chamber heated by a lamp from below, and having a shelf on which the substance to be dried is placed; a thermometer introduced from above gives the actual temperature. Air baths may be made

self-regulating.

A. battery. Dr. Gladstone and Mr. Tribe's. In this form of battery pieces of copper and silver in contact are immersed in a (6 per cent.) copper nitrate solution in presence of oxygen. A deposit of cuprous oxide takes place on the silver plate, with a corresponding solution

of the copper plate.

A. bed. A mattrass-like sack composed of leather, Mackintosh fabric, or vulcanised india rubber, which is divided into compartments, each of which can be inflated by bellows, the escape of air being prevented by a valve. A drawing of an air bed is given in 'Knight's Dictionary of Mechanies,' taken from a German work dated 1511. Linden's air bed has an outside flap of enamelled cloth, which forms a coverlet to the person lying on the bed. When collapsed it folds into the form of a knapsack.

A. blad'der. (L. Vesica natatoria; F. vesicule natatoire; G. Schwimmblase.) Aa organ present in many fishes, and most highly developed in the Dipnoi. In the Physostomi it is connected with the esophagus by means of a short tube, the ductus pneumaticus. In Physoclisti there is no such communication. It is absent in the Leptocardia, the Cyclostomi and Plagiostomi, and in some Teleostei. It is filled with air, the composition of which varies, and it appears to have a hydrostatic function, or the regulation of the specific gravity of the animal. In the mud fish, Lepidosiren, it acts as a respiratory organ. It differs from true lungs in being only sparingly supplied with vessels, and in these vessels being derived from the aorta. The walls are muscular.

A. brick. (F. brique creuse; G. Hohlziegel; I. grato dello spiraglio, della sfialatoro; S. ladrillo perforado.) A brick of ordinary size, built into the walls of a house, but perforated to admit air under the floors or into the rooms.

A. ca'nais. (F. Lacunes; G. Luftkanäle.) Intercellular passages in the stem of plants which

contain air.

A. cavities of plants. (F. Lacunes; G. Lufthohle.) A term given to the intercellular spaces of water plants; they are usually of con-siderable size, and are enclosed by regularly arranged cells. They diminish the weight of the plant and so enable it to retain a position on the surface of the water.

A. cells of an'imals. (F. vesicules pulmonaires; G. Lungenbluschen.) monaires; G. Lungenblaschen.) A series of depressions which open into and are grouped around the ultimate terminations of the bronchial tubes, the air sacs. They vary in size in different animals; in man they average 100 of an inch in

diameter; they are larger at the apex and the thin edges of the lung than in the interior; in man than in weman; and in old age than in the infant. The walls consist of connective tissue containing some corpuscles, of some elastic tissue, and a few muscular fibre cells, among which lie the ultimate capillaries of the lung; the air cells are lined by delicate tesselated epithelium and contain not infrequently granular, rounded ameeboid cells, with particles of carbonaceous material.

A. cells of plants. A term used syno-

nymously with Air earities.

Also applied to the spaces formed by the obliteration of the contiguous walls of cells, as in the

pith of plants.

A. chamber. (F. chopinette, trachee, reservoir d'air ; 1. serbatoio d'aria ; S. camara de aire; G. Windkessel, Windraum.) A cavity containing air to act as a spring for equalising the tlow of a liquid in pumps and other hydraulic machines.

A. cham'ber of egg. (F. chambre à air.) A space existing between the two layers of the shell membrane at the obtuse end of a bird's egg; it is not present in a perfectly fresh egg, but soon appears and increases in size, whether the egg is incubated or net, as the white shrinks from evaperation.

A., complemen'tal. That volume of air which, after the termination of an erdinary inspiration, can still, by an effort, be inhaled. It amounts to rather more than 100 cubic inches.

A., conden'sed. For its therapentic indu-

ence, see Bath, compressed air.

A., dephlogis ticated. A synonym of

Oxygen.

A. drain. (F. conduite d'air ; I. condotto d'aria; S. alcantarilla para la conduccion de aire; G. Luftcanal.) A cavity in the external walls of a building to prevent dampness.

A. duct. A synonym of Air canal.

A., empyr'eal. A synonym of Oxygen. A., factitious. A synonym ef Carbonic acid gas.

A. du fcu. (Fr.) A synonym of Oxygen. A., filtered. Air which has been made to traverse a layer of cotton wool, with the object of arresting tangible impurities. This plan is employed to purify the air admitted to the Houses of Parliament.

A., fix'ed. (L. Aer fixus.) Carbonie aeid gas. A. gas. Air mixed with the higher and velatile paratins, formed by passing air through petroleum, which contains them, and used for illuminating purposes.

A. gate. (Fr.) A synonym of Nitrogen. A. gra'ting. An iron grating in a wall to allow of ventilation.

(Fr.) A synonym ef A., hépati'que. Hydrogen sulphide.

A., inflam'mable. A synenym of Hydro-

gen gas. Also, of Carburetted hydrogen.

A. in the veins. Air has been observed in the veins, especially in those of the pia mater, very soon after death; it is still doubtful whether it is exclusively the result of post-mortem changes. Air has been found in the iliac veins in a case

of sudden death after delivery

For the entrance of air into the veins during operation see Acrhemoctoma.

A. mephiti'que. (Fr.) A synonym of Carbonic acid gas.

A., moun'tain. See Mountain air.

A. of sew'ers and drains. See Sewer air. A. pas'sages. A term including the larynx, trachea, bronchi, and bronchial tubes. Also, a synonym of Air canals in plants.

A. pes'sary. See Pessary, air.
A. pipes. (F. ventilateurs conduits or carreau a air; I. tubi dell'aria; S. ventiladores; G. Luftröhren.) Pipes used to draw foul air from a ship's hold, mines, and ether close places.

A. plants. A synonym of Epiphytes. Examples are found amongst the Tillandsias and Orchids. Air plants require a high temperature, diffused light, a large amount of moisture, and freedom from stagnant water.

A. port. An opening in a ship's side for air, closable by a shutter side light, or dead light,

according to circumstances.

A. pu'ant. (Fr.) Hydrogen sulphide. A. pump. (F. pompe à air; I. mac-china pneumatica; G. Luftpumpe.) An engine by which the air contained in vessels placed in communication with it may be drawn out, or expansied. It consists essentially of a eylinder, having a valve at the bottom, opening away from the vessel to be exhausted, and a close fitting piston, also provided with n valve opening in the same direction. pisten is drawn out its valve closes and the air contained in the receiver enters the cylinder through the lower valve in a rarefied condition, whilst when the piston is forced down the cylindervalve cleses and the piston-valve opens, permitting the escape of the air, but preventing any

return by closing as the piston is again drawn out. A., pure. A synonym of Oxygen. A. recep'tacle. A synenym of the Air

sacs of birds.

A., reser've. That volume of air which, when an ordinary expiration is completed, can still by an effort be expelled from the lungs. amounts to rather less than 100 cubic inches.

A., resid'ual. The air which remains in the lungs after the most complete expiration possible. It varies with the size of the chest, but amounts on the average to about 100 cubic inches.

A. sacs. Elongated cavities constituting the ultimate branches of the air tubes in the lungs of mammals; their walls present pits, which are the air vesieles or alveeli. They are arranged in groups radiating from the end of a bronchial tube, with which they communicate by a circular opening. Their walls contain a large amount of clastic tissue, and are lined by a layer of tesselated epithelium. The pulmonary capillaries ramify over their surface, as well as over the air cells.

A. sacs of birds. (F. Réservoirs or sacs à air, cavités aériennes.) Large cavities, nine in number, lined by mucous membrane, independent of each other, but connected with the lungs. These reservoirs are the thoracic sac, situated at the anterior part of the thorax; two cervical reservoirs situated at the base of the neek; two anterior diaphragmatic reserveirs placed between the two diaphragms; two posterior diaphragmatic reservoirs also placed between the two diaphragms, but behind the preceding; and lastly, two abdominal reservoirs placed against the superior wall of the abdomen. Of these nine reservoirs, the first only is single and symmetrical; the others are in pairs, and are similarly arranged on each side of the median plane. All the reservoirs, with the exception of the diaphragmatie, communicate with the interior of bones; the bones receiving air from the thoracic reservoir are the claviele and coracoids, the sternum, scapula, humerus, and sternal ribs; from the cervical reservoirs, the cervical and dorsal vertehræ, and all the vertebral ribs; from the abdominal reservoirs, the sacrum, coccygeal vertehre, the iliac bones, and the femurs. walls of the reservoirs are composed of connective tissne with much elastic tissue. The blood-vessels proceed from the aorta, and are therefore systemie; they are destitute of lymphatics. They contain vitiated air, expand in expiration, and contract in inspiration, diminish the weight of the body, and augment the range and volume of the voice.

A. sacs of hydrozo'a. See Pneumato-

phore.

A. sacs of in'sects. (F. sacs à air; G. Tracheenblasen.) Large eavities found in the thorax and abdomen of insects, which communicate with the tracheæ.

A. sacs of plants. Small membranous sacs or ponches, with a funnel-shaped opening closed by a valve, and lined with glandular hairs, found in the Utricularia, or bladder-wort.

A. sacs of rep'tiles. (G. Nebensäcken.) Narrow prolongations of the lungs among the abdominal viscera, which are found in chameleons and some other reptiles.

A., sea. See Sea air.

A. shaft. (F. puits d'aérage, buse d'aérage; I. pozzo di mina; S. pozo de ventilacion; G. Luftschacht, Wetterschacht.) A passage for air into a mine, usually opened in a vertical direction and meeting the adit, to effect free circulation of air.

A. si'nuses. A term for the cavities in the ethmoid, frontal, sphenoid and superior maxillary bones, which communicate with the nasal channels.

A., sol'id of Hales. A synonym of Carbonic acid.

A., sta'tionary. A synonym of Residual air.

A. stove. (F. calorifére à air chaud; I. calorifero; S. calorifero de aire caliente.) enclosed fireplace, so constructed as to admit a stream of air to pass round it or through it; and this hy connection is carried upwards and warms the apartment.

A., supplemen'tal. A synonym of Reserve air.

A. thermom'eter. See Thermometer, air. A., ti'dal. That quantity of air which is alternately inspired and expired in the ordinary acts of respiration. It amounts to about 30 cubic inches on the average.

A. trap. An air-trap is immersed in various ways in water to prevent foul air rising from

sewers or drains.

A. tube. (G. Luftröhre.) A synonym of Bronchial tube.

Also, a term applied to the whole length of larynx, trachea, bronchi, and bronchial tubes. Also, a term applied to the large abdominal tracheæ of certain aquatic larvæ of insects.

A. valve. (F. soupape à air; 1. valvola di sieurezza per il vuota; S. valvula de aire; G. Luftventil, Luft-klappe.) An air-valve is a safetyvalve fixed at the top of a steam hoiler and opening inwards, to prevent rupture from the pressure of the atmosphere upon the sides of the hoiler, should a vacuum occur within from partial or complete condensation of the steam.

A.ve'sicles. The rounded terminations of

the bronchial tubes in the lung; sometimes termed

A. ves'sels. A synonym of the Trachea of insects.

A. vicie'. (Fr.) A synonym of Nitrogen.

A. vi'tal. A synonym of Oxygen gas. A. way. (F. air airien; I. corso dell'aria; S. conducto de aire; G. Luftung.) A tubular passage for air flowing in pipes.

Aira. (Aipa, a weed in wheat, darnel. F. canches; G. Schmiele.) A Genus of the Subtribe Avenacea, Tribe Poacea, Group Euryanthea, Nat. Ord. Graminacea. Hair-grass. Ploral glumes small, usually two, awned, both bisexual.

Ai raj. The native name in Orissa of the

venomous snake Ophiophagus claps.

A.gah'man. The native name at Puruliah Msunbhoom of the Naja tripudians.

The Vaccinium myrtillus, Airelle. (Fr.) or bilberry.

Air'threy. Scotland, near Stirling. Tho spring is close to Bridge of Allan, and it generally goes by that name. A saline cathartic spring, containing sodium, calcium and magnesium chloride, and calcium sulphate. Used in disorders of the digestive organs.

Aisthe'sia. (Αισθησις.) Sensation; sense or feeling

Aisthete'rium. The same as Esthete-

Aithomo'ma. ('Ai $\theta$ w, to hurn. L. ravi oculi, leoninus oculi.) This term is explained by Fernelius and Banister to mean redness of the eye, or an aspect of eruelty "resembling sparks of tire, as we behold in a lion, and in them which have the leprosy." Kühn, however, derives the word from aidos, fiery, and considers that it indicates the state of the eye in which the patient sees sparks and flashes; others, again, deriving it also from allos, one meaning of which is burnt, and so dark brown, regard it as indicating a black state of the humours

Aitiol'ogy. (Airia, cause; λόγος, a discourse.) Ætiology.

Aito'ra. Italy; in Tuscany, near Montecatini. Sulphuretted waters springing from the clay slate; temperature 18° C. (64 4° F.) They contain also sodium chloride, sodium, calcium, and magnesium carbonate, and carbonic acid gas. Used as baths in rheumatism, gout, and skin diseases; and internally for intestinal worms, urinary deposits, and vesical eatarrh.

(Arab.) Term for autimony. Ai'truad. (Fallopius, Castellus.)

Aix.

(Aιξ.) A goat. France; Department Bonches-du-Aix. Rhone; seventeen miles north of Marseilles; known also as Aix-en-Provence. An old Roman bath; Aqua sextiæ. A saline mineral water. Temp. 25°-30° C. (77°-86° F.); the chief constituent is calcium carbonate; employed in the form of baths in chronic rheumatism.

Aix-la-Chapel'le. Germany; a town of 75,000 inhabitants in Rhenish Prussia, altitude 534 feet. Surrounding scenery hilly and pretty; objects of interest in the town numerous. Celebrated for its mineral waters-six sulphur springs and one chalybeate—which are resorted to at all seasons, and used in the form of inhalation, vapour baths, and douches; and are also taken internally. The sulphur springs are divided, internally. from their situation, into upper and lower. The upper springs are the hottest; to these belong the Kaiserquelle, temp. 55° C. (131° F.), the

Elisenbrunnen, and the Quirinusquelle, which has a temperature of 49° C. (120° F.) The lower and cooler springs are the Rosenquelle, temp. 47° C. (116° F.); the Corneliusquelle, temp. 45° 4° C. (118°, 7° F.); and several minor ones. Used in chronic skin diseases, in ulcers, gunshot wounds, in chronic rheumatism and gout, in uterine diseases, and in advanced syphilitic diseases, especially when complicated with mercurial cachexia.

Aix les Bains. France; department Alpes-maritimes; known also as Aix-en-Savoie. Formerly known as Aquæ Allohrogum and Aquæ gratianæ. Altitude 792 feet, in the beautiful valley of Chambery. It is somewhat hot and close in summer, and occasionally wet; the neighbourhood is picturesque, well wooded, and hilly; the bath arrangements are good and varied, and the accommodation excellent. The chief water is that from the Source de soufre, having a temperature about 45° C. (113° F.) It contains sodium, maguesium and calcium sulphate, calcium and iron carbonate, aluminum sulphate, sulphuretted hydrogen, carbonic acid, and nitrogen. The Source d'alun, or de St. Paul, of a temperature of 47° C. (I16.6° F.), contains no sulphuretted hydrogen, and is the one usually employed internally. The chief use is as a bath, and in the form of douche in chronic rheumatism, in chronic gouty thickenings of the joints, in syphilitic and scrofnlous affections of the skin and joints, in sciatica, in old wounds and ulcers, and in nervous diseases. Mud baths are also used.

Aizoa'ceæ. A Family of the Order Opuntinæ. Herbs or bushes, usually with fleshy, juicy leaves, without stipules; flowers hermaphrodite, separate or in clusters, sometimes inconspicuous; sepals 4-8; petals, indefinite; anthers 4 or indefinite; carpels 4-20, with indefinite amphitropal ovules; seeds with an endosperm. The Mesembryacea, and the Tetragoniacea of some authors

Aizoi'deæ. A synonym of the Tetragoniacea.

('Aεί, always; ζωσν, alive. G. Aizo'on. ('Aεί, always; ζφον, alive. G. Hauslaub.) Name for Sempervicum tectorum,

as well as generally for evergreen plants.

A'ja-A'ja. The Gelidium corneum.

Ajac'cio. France; in the island of Corsica. In a beautiful situation, protected from the north winds by mountains 6000 to 8000 feet high; the chief wind is the south-west, which often brings moisture, although rainy days are not common. The average temperature of November to March inclusive is about 12°C. (53 6° F.), with comparatively small daily variations; the nightly dewfall is considerable, but the rainy days few in number. As a climatic health resort for consumptives, Ajaccio might stand in the first rank if the conveniences and comforts of living were better attended to. There is a certain amount of ague in the autumn.

A'jas. Turkey. A place near Angora in the ancient Galatea. Here, on the road leading to Constantinople, are hot springs, whence the former name *Therma*. In repute for discases of the skin. There is accommodation for visitors.

Aja'va. (Portuguese.) A drug brought from Malabar, and celebrated in the Last Indies as a remedy for colic. See Ajowan fruit.

A. seeds. See Ajowan fruit. Aja'zarath. (Arabic.) Name for Plumbum, lead

Aj'esch. See ljas.

Ajicuba. A Japanese tree, the fruit of which is edible.

The Hindustani name of the Ai'mud. fruit of the Carum (Ptychotis) Roxburghianum. Used as a carminative and stomachic.

Austria-Hungary; in the Ajnac'sko. Austria-Hungary; in the Gömorer County. A chalybeate water containing both sulphate and carbonate of iron, with calcium, magnesium and sodium carbonate, some iodine, a large amount of carbonic acid, and some sulphuretted hydrogen. Used in gout and rheumatism, hepatic congestions, hæmorrhoids, scrofula, and anæmic conditions.

Aj'one. (F.) A common name for several species of Ulex.

Aj'ouain fruit. See Ajowan fruit. Aj'owan fruit. Semen Ajavæ or Ajouain. True Bishop's weed. Omum. The fruit of the Ammi capticum, L., or Ptychotis coptica, or Carum Ajowan, D.C. Nat. Ord. Umbelliferæ. A native of Africa, and much cultivated in India. The fruits vary in size, the largest resembling that of parsley, having a length of 1-16th to 1-10th of an inch. They are greyish brown, plump, very rough on the surface. Each mericarp has five prominent ridges, with one vitta beneath each intervening channel. The commissural side has two vitte. The fruits exhale a strong odour of thyme, and have a biting aromatic taste. They yield 5-6 per cent. of an agreeably aromatic volatile oil, and in addition there collects on the surface of the distilled water a crystalline substance or stearoptene, named by the natives Ajwain-ka-phul, or flowers of Ajwain. Ajowan is much used in India as a condiment. The distilled water is a carminative, and a good vehicle for nanseous medicines.

Aj'uga. (Etymology doubtful.) Λ Genus of the Tribe Ajugoideæ, Nat. Ord. Lab atæ. Bugle, Calvx ovoid, 5-cleft; upper corolla-lip entire or notched. The genus contains 30 species; occupying temperate regions of the old world.

A. chamæ pitys. (F. ivette; I. came-pizio; G Schlag-Kraut, Feldcypresse.) Ground pine. Annual, villons plant; cauline leaves 3-partite; flowers solitary, in the axil of leaflike bracts, yellow. Chalky fields; flowers May-September. It possesses a strong, resinous, aromatic odonr, and is described by Linnæus as tonic, stomachic, and emmenagogue, and as being useful in rheumatism, gout, and fever. The flowering tops are officinal in the French Codex.

A. dealsin'gii. A plant growing in the Himalayas, where it is employed as a remedy in quartan ague.

A. decum'bens. Hab. Himalayas, Nepaul, and Cashmere, where it is called djan i-adam, i.e. the life of man, from its manifold virtues.

A. frutico'sa. A synonym of the Anisomeles malabarica.

A. i'va. (F. Ivette musqee; G. Bisamgünzel.) A plant in high repute amongst the Arabs in cholera, and much used by them as a remedy in other diseases. It is officinal in the French Codex. See Iva moschata herba.

A. pyramidalis. (F. Bugle; Guldengunsel; Dut. Pyramidale Sene groen.) Mountain bugle. Bugula or upright bugloss. A perennial plant. Pilose, with soft, jointed hairs; leaves obscurely crenate; whorls in a compact pyramidal spike, upper bracts appressed, flowers blue. It has been employed as an astringent and bitter in phthisis, cynauche, and aphtha.

A. rep'tans. (F. Bugle; I. erba mora,

morandola; S. bugula; G. kriechender Günzel, Wiesengünzel.) Common bugle. A perennial plant; almost glabrous, stoloniferous; leaves repand-crenate; whorls in a loose spike, with spreading bracts; flowers blue. Used in lung and liver diseases. The leaves are officinal in the French Codex.

Aju'geæ. A synonym of Ajugoideæ. Ajugoi'deæ. A Tribe of the Nat. Ord. Labiatæ. Stamens four, parallel, ascending, exserted, two npper shorter; nutlets connate; base oblique, reticulate, and rugose.

Aj'utage. (F. ajutage, ajutoir; I. tubo d' aggiunta; G. Aufsatz.) A cylindrical or conical tube through which water is discharged from a receptacle, as the ajutage of a fountain. It greatly increases the rapidity of the flow as compared with a simple aperture.

Aj'wain-ka-phul. Flower of Ajwain. The native name of a stearoptene, derived from the distillation of Ajowan fruit. It is identical

with Thymol.

Aka'kia. A synonym of Acacia arabica. Akat'alis. The berries of the Juniperus

**Akatapha'sia.** ('Λ, neg.; καταφαίνω, to declare.) A term applied to syntactic disturbances of speech, as opposed to the faulty use of words. Inability to form a perfect sentence. The correct diction of a sentence in the grammatical languages presupposes three thingsunbroken flow of words, perfect grammatical diction, and correct arrangement of words; when any one of them is absent akataphasia results. (Kussmanl.)

Akate'ra. The herries of the Juniperus

communis.

A'ka tree. The Metrosideros scandens. Nat. Ord. Myrtacca. The clubs and weapons of the South Sea Islanders are made from this and

other species of the genus.

Akaz'ga. Bonndu. The ordeal poison of the Gaboon country in West Africa. It is obtained from a plant growing in marshy places to a height of eight feet, and probably an nn-described species of the Genus Strychnos.

**Akaz'gia.** An alkaloid obtained by Dr. Fraser from the *Akazga*. It is a colonrless difficultly crystallisable alkaloid, soluble in alcohol, ether. chloroform, benzol, and bisulphide of carbon, but nearly insoluble in water. Its physiclogical effects are precisely those of strychnia.

Akaz'gin. A synonym of Akazgia. Ake'bia. A Genns of Chinese and Japanese climbing plants of the Nat. Ord. Lardizabalacea, or Berberidacea. The flowers are monœcious, with a petaloid calyx; male flowers with about six stamens, with extrorse anthers; female flowers with sterile stamens, and from 3-12 carpels; ovary with numerons anatropal ovules; fruit a large fleshy follicle; seeds avillate, with abundant alhumen and excentric embryo.

A. quina ta. Hab. Japan. The fruit is nsed as an emollient.

A'kee tree. Blighia, or Cupania sapida. Nat. Ord. Sapindacea. The succulent aril of this tree is an article of food; the fruits boiled down with sngar and einnamon are used in diarrhœa; and the distilled water of the flowers is regarded by Negro women as a cosmetic, probably owing to the large amount of saponaceous matter contained in it.

Ake'omine. A synonym of the Teinture de noix de galle composée.

Ak'hil Alme'lech. A Leguminons plant in high repute amongst the Arabs as a medicine. It is probably the *Trigonella hamosa*, L., or *Medilotus ægyptius* of Alpinns. It was formerly so much esteemed by the Arabians that it was reserved for the royal use.

Ak'ho. The principle of conscience, one of the five parts or principles of which, according to Zoroaster, the soul of man consists. See Boe,

Feroher, Jan, and Ronan.

A'kibot. (Arah.) Term for Sulphur. (Ruland.)

Akidopeiras'tics. ('Akis, a point; πειράω, to explore.) A term applied by Middeldorpf, of Breslan, to a method of exploration by means of needles, or other pointed instruments. Amongst the more important means included under this head are some that have been long in use, as the exploring needle, trocar, grooved needle, trephine, and drill, and others, as the harpoon needle, so nseful in extracting small portions of muscular tissue, with the view of establishing the diagnosis of trichinism, and galvano-puncture, which are of modern introduction.

Akidur'gia. ('Aκls, a point; ἔργον, a

work.) A term for operative surgery. **Akine** sia. The same as Acrossia. **Akine** sic. ('A, neg., and κονέω, to set in motion.) That which is opposed to movement;

the diastole as opposed to the systole of the heart. **Akine** sis. ('Λκινησία; ά, neg.; κινέω.) Absence or defect of movement, hence applied to the diastole of the heart.

Akiurgia. ('Aκls, a point; ἔργον, a work.) A title given to a treatise on surgical operations, Ak'kas. A race of African Negroes.

Akmel'la. Same as Acmella.

Ak'na-Ra'ho'. Austria-Hungary; in the Marmaroser County. An alkaline chalybeate water having a local reputation.

A .- Su'gatagh. Austria-Hungary; in the Marmaroser County. A strong salt spring. Used

as a bath.

A.-Szlati'na. Austria-Hungary, Sool or concentrated saline baths in connection with the salt mines of Szlatina.

Ak'ne. A synonym of Acne.

Akue'mia. ('A, priv.; κνήμη, the leg. F. aknémie.) A monstrosity, characterised by the absence of legs. (Breschet.)

Aknes'tis. (Gr.) A synonym employed by Dioscorides of the Cneorum tricoccum.

Ako'ko. The native name in the Sandwich Islands of a species of Euphorbia, the milky jnice of which, according to Bennett, is applied

mice of which, according to be meth, is applied to ulcers, and removes the feetid odonr of the discharge. (Waring.)

Akol'ogy. Same as Acology.

Akoria. ('Asopia, from āsopos, untiring. G. Unersattlichkeit.) In Hippocrates, 1180 F., moderation in eating; but in Aretæus, Cor. M. Acat. 2—2, it is used in regard to drink in the suppose of insertiable desire. Bullimia sense of insatiable desire. Bulimia.

Akos moi. A synonym of Acosmia. Akratope'gæ. Same as Acratopegæ. **Akratother'mæ.** ('A, neg.; κράτος, rength; θέρμη, heat.) Indifferent thermal strength;  $\theta i \rho \mu \eta$ , heat.)

Ak'rott. Bengali name of Bancoul, the Alcurites moluccana.

Ak'sis. A synonym of Intermittent fever. Akulka'ra. The Arabic name of the Pellitory root.

Akulo'nion. (Gr ) A synonym in Dioscorides of the Lychnis.

A'kum. A synonym of Mudar.

Ak'umite. ('Λκυμος for ἀκύμαυτος, not washed by the waves.) A term applied to those laminated clays and sands which immediately overlie the boulder clay, and which appear to have been formed during a period of repose. Synonymous with the brick clays of the Post-tertiary epoch.

A'kund. Hab. India. The inspissated milk of the root and bark of the Calotropis gigantea; it is a powerful alterative and purgative; used in cases of leprosy, elephantiasis, and intestinal

worms, and venereal affections.

Aku'ron. (Gr.) A synonym in Dioscorides of the Alisma.

**Akyanoblep'sia.** ('A, neg.; κυάνος, dark blue; βλέπω, to see.) Incapacity to distinguish a blue colour.

**Akys'tica.** (A, priv.; κύστις, a bag.) Applied by Latreille to a group of fishes which

have no natatory bladder.

A1. (Arab.) A syllable of nearly the same import as the English definite article; used as a prefix by way of eminence, or to denote essence, as alkali.

(Etymology doubtful, perhaps from ago, to put in motion, to move. F. aile; G. Flügel.) A wing.

Applied to certain parts, from a supposed resemblance to wings, as Ala nasi, wings or lateral cartilages of the nose.

Also, the arm-pit.

Also, a synonym of Pterygium.

In Botany, applied to the side petals of papilionaccons flowers.

Also, to the angles formed by leaves or stalks with the branches from which they proceed. Also, to a membrane added to a seed-stalk.

A. au'ris. The wing or upper and outer cartilaginous part of the external ear; the Pinna. A. cine rea. The projection in the floor of the fourth ventricle on each side of the median line, formed by the nucleus of the vagus

A. extre'ma. (F. aileron.) The bastard

wing of a bird.

A. pon'tis Varo'lii. A small band of nerve fibres, represented by Reichert as passing obliquely downwards and backwards from the side of the pons Varolii, between the auditory and facial nerves, and crossing over the upper end of the posterior pyramids. It is probably part of the Liquia.

A. vespertilio'nis. (F. aile de chauve-souris; G. Fledermausflugel.) Wing of the bat. That part of the broad ligament of the womb lying between the Fallopian tube above and the ovary with its ligament below.

A. vul'væ. The Labia pudendi.
Alaba'ma. One of the southern of the
United States of N. America, in which several sources of mineral waters are found. The waters of the Tallahatta springs contain sulphur and Bailey's spring is an acidulous sulphuretted chalybeate. The most noted is *Bladon's spring*.

Alaban'dicus la'pis. A blackish stone intermixed with sallow spots, so called from Alabanda, the place from whence it was taken. Actius says that its powder makes grey hairs black. (Parr.)

Alaban'dine. (F. Manganblende.) Sul-

phuret of manganese occurring in veins in a crystalline or granular condition, and of a black semimetallic lustrous appearance.

Alaban'dinus la'pis. The same as Alabandicus lapis.

Alab'ari. (Arab.) Name for Plumbum. (Ruland.)

Alabas'ter. ('Αλάβαστρος, more correctly ἀλάβαστος, gypseous alabaster, a kind of stone. F. albâtre; I. alabastro; G. Alabaster.) A mineral of which there are two varieties, calcareous alabaster, white or yellowish white, found as a stalagmite or stalactite, and consisting of earbonate of lime; and gypseous alabaster, CaSO<sub>4</sub>.2H<sub>2</sub>O, a semitransparent granular crystalline variety of gypsum or sulphate of lime, sometimes pure white, often coloured. The former is the alabaster of the aucients, employed in sculptural works.

Alabas'tri cappar'idis. The flower buds of the Capparis spinosa. are treated with salt and vinegar, and form a pickle which is said to be very useful in senryy.

Alabas'tron. A name of an ointment of old times.

Alabas'trus. ( Αλάβαστρον, οτ άλάβαστρος, gypseous alabaster, and also that which is wrought of it; a box for ungnents. L. alabaster; F. alabastre, bouton; G. Blüthenknopf.) Applied to the five green leaves forming the calyx of some flowers before the expansion of the bud, from its resemblance to alabaster vessels or boxes.

**Alabe.** ('Aλάβη, a kind of ink.) Carbon; soot. That which on being touched makes dirty

or unpleasant.

Also, a fish, probably electrical, of the Nile. Al'acab. (Arab.) Name for Sal ammoniacum. (Ruland.)

Alachil. Arabie name of Scilla maritima. Alac'tia. A synonym of Agalactia.

Alacuoth. (Arab.) One who, while in

coitu, at the same time expels the fæees. Alæ anti'cæ. (G. vorderflügel.) anterior pair of wings in insects possessing two

A. cor'dis. A series of clastic ligaments which pass from the cardiae surface of the perieardial or auricular membrane in Arthropoda, to attach themselves to the wall of the heart, their function being probably to open by their recoil the venous orifices which each systole of the heart closes. They may also serve to suspend the heart in the pericardial sinus.

A. diaphrag matis. Term applied to the three lobes of the central or cordiform tendon of

the diaphragm.

A. inter'næ mino'res clitor'idis. The Nymphæ.

A. mag'næ. The Labia pudendi.

A. majo'res. (F. grandes ailes ; G. grosse Flügel.) The great wings of the sphenoid bone. The alæ majores and the external pterygoid processes form the Alisphenoid bone.

A. mino'res. (F. petites ailes; G. kleine Flügel.) The small wings of the sphenoid bone, also called the wings of Ingrassias.

Also, a synonym of the Nymphæ.

A. mulic'bres mino'res. The Nymphæ. A. na'si. (F. ailes de nez; G. Nasenflugel.) The wings or lateral parts of the extremity of the nose; that part which bounds the nostril externally. It is composed of skin, thin expansions of muscles, tendons, cartilage, and mucous membrane.

A. orbita'lis os'sis sphenoide'i. (F. petites aules du sphenoid ; G. Augenhohlenflügel.) The smaller wings of the sphenoid bone.

A. os'sis sphenoida'lis mino'res. (6 Augenhohlenflügel; Schwertfortsutze.)

lesser wings of the sphenoid bone.

A. os'sis sphenoide'i descenden'tes. (G. Gaumenflugel) The pterygoid plates or processes of the sphenoid bone.

A. os'sis sphenoide'i mag'næ. (G. Schlafenfligel.) The great wings of the sphenoid bone.

A. palati'næ os'sis sphenoide'i. (G. Gaumenflugel; flugelformigen Fortsatze.) The pterygoid processes

A. par'væ Ingras siæ. (F. apophyses d'Ingrassias.) The lesser wings of the sphenoid houe.

A. par'væ os'sis sphenoide'i. petites ailes du sphenoid; G. Augenhohlenflügel.)
The lesser wings of the sphenoid bone.

A. posti'cae. (F. ailes posterieures; G. Hinterflugel.) The posterior pair of wings io

insects possessing two pairs.

A. proces'sus vermifor'mis lob'uli centra'lis. (G. Flugel des Centrallappehens.) The six or eight short lamellæ which are attached to the central lobe of the superior vermiform process of the cerebellum.

A. ptcrygoide'æ. (F. apophyses ptcrygoides; G. Gaumenflügel.) The pterygoid pro-The pterygoid pro-

cesses of the sphenoid bone.

A. puden'di mulie bris. pudendi.

A. pulmo'num. The lobes of the lung.

A. sep'ti cartilag'inis na'rium. (F. cartilages lateraux; cartilages de l'aile du nez; G. Seitenplatten, Flügel des Nasenscheidewandknorpels.) The superior and inferior lateral or triangular cartilages of the nose.

A. tempora'lis os'sis sphenoide'i. (F. grandes ailes du sphénoid; G. Schlufenflügel.) The greater wings of the sphenoid bone.

A. vespertilio'num. See Ala vespertilionis.

A. vo'meris. (F. ailes du romer.) An everted process of bone on each side of the mesial depression of the upper and anterior part of the vomer which receives the septum nasi.

Alæform. (Ala, a wing; forma, resemblance. F. aileforme; G. flugelformig.) Re-

sembling wings.

Al'afi. (Arab.) Alchemical term for the substance now called alkali. (Ruland and Johnson.)

Al'afor. Same as Alufi. Al'afort. Same as Alufi.

Alareg. (Arah.) A species of Cerussa.

Alagao. A sbrub of the Philippine Islands, probably a species of Premna; used in cataplasms for tumours and ulcers.

Al'agas, os. Old came for the Sacrum and

Coccyx. (Hooper.)

Alag-taga. The Dipus jaculus. A species of Jerbou, considered by some to be the coney of the Scriptures and the mouse of Isaiah. It is called by the Arabs the Lamb of the Israelites.

Alahabar. (Arab.) Aucient name for Plumbum, according to Ruland; Calx, according

Alahic. Alchemical term for an oven, and also, according to some, for coal or earbon.

Al'ais. France; Department of Gard, Arrondissement d'Alais. Cold chalybeate springs, one of which is named Le Comtesse, the other La Marquise. Alakre'atin. The same as Isokreatin. Alakreat'inin. The same as Isokrea-

Ala'lia. ('A, neg.; \aa\i\o,\ to talk. F. alalie; G. Sprachlosigkeit.) A condition in which, from more or less complete paralysis of the muscles concerned, articulation is impaired or lost. It is a symptom of bulbar paralysis. When the loss of power is confined to the lips, b, p, f, m, v, o, and u, are the letters lost; when the tongue is affected, r, s, l, h, g, t, d, n, and e, are impossible of correct pronunciation; and when all the letters are gone the alalia is said to be complete.

A. litera'lis. Incapacity to pronounce the

letters properly; stammering.

Al'amad. An old name for Antimony. Alamam'dina. Supposed to be another name for the Alabandicus lapis. (Parr.)

Alam'bic. Same as Alembic.

Alam blc. Same as Aumorc. Also a synonym of Hydrargyrum, mercury.

Alame'da de Cerve'ra. Spain; Province of Ciudad-Real. Chalybeate waters, containing iron bicarbonate. Temperature, 15° C. (59° F.)

Alam pes. (Αλαμπής, obscure, G. undeutlich.) Indistinct, not obvious; πυρετόι αλαμπεςς, febres lente, little fevers. Arctæus πορος πορος τους τους λαμθάνουστες, concealed names such fevers πυρετόι λαυθάνουτες, concealed or masked fevers.

Ala'na ter'ra. The earth ochre, of a pale red or yellow colour; used as an astringent. Also, (L. argylla tripolitana; G. Trip-plisstein, or Trippel) Tripoli stone. Alan'dahal. Arabian term for Citrullus

colocynthis, or bitter cucumber. Quincy readers

it-bitter apple.

Alanfu'ta. (Arab.) A vein between the chin and lower lip, which formerly was opened with the intention of correcting a fætid breath. (Avicenna and Castellus.)

Alanga'zi. South America. A village at the foot of the volcanic mountain Cotopaxi. A simple thermal water of 36.7° C. (98° F.). It is of extreme purity. Near the foot of the mountain

are several hot sulphurous springs.

Alan'ge. Spain; Province of Estremadura, near Merida. An ancient Roman station. A salt water, of a temperature 28° C. (82.4° F.), containing free earbonic acid. The baths are recommended in rheumatic and neuropathic affections, in atonic ulcers, and abdomiual congestions.

Alangia'ceæ. Sometimes regarded as a Tribe of the Nat. Ord. Combretaceae. Trees or shrubs. Leaves alternate, entire, exstipulate, without dots; calyx superior, 5-10 toothed; petals 5-10, linear, reflexed; stamens equal to, or 2 or 4 times as numerous as, the petals; anthers adnate; ovary inferior, 1—2 celled; ovules simple, pendulous; fruit drupaceous; seed solitary, pendulous, with fleshy albumen and large leafy cotyledons.

Alangie'æ. A synonym of the Alan-

Alan'gium. A Genus of the Nat. Ord. Alangiacea

A. decapet'alum. The East Indian tree Angolam; the sage-leaved Alangium. The juice of the root is said to possess medicinal qualities, purgative and vermifuge, and the powdered root is a reputed antidote in snake bites.

A. hexapet'alum. A synonym of A.

decapetalum.

A. tomento'sum. A synonym of A. decapetalum.

Al'anin. A synonym of Lactamidic acid. Alani'nes. A synonym of the acid ami des called Amw acids.

Al'ant cam'phor. C<sub>10</sub>H<sub>16</sub>O. Found in the root of *Inula helenium*. It melts at 64° C. (147.2° F.), and tastes and smells as peppermint.

Alan'tin. A synenym of Inulin.

Alaos. (Λλαός, incapable of seeing, said to be from ἀ, neg.; and λάω, to behold; but more probably from ἀλαόμαι, to stray.) Blind.

Alaot'ocous. ('Αλαός, and τόκος, childhirth.) Producing young that are blind at birth,

as in the instance of dogs and cats.

Al'ap. Austria flungary; near Stuhl-weissenburg. The town consists of Felső-Alap and Also'-Alap, each of which has a distinct spring.

Al'so-Al'ap. A stronger water of the same character as the following, and used in the same

cases.

Fel'sö-Alap. A saline water, containing magnesium iodide. It is a purgative, and is used in abdominal congestions, disorders of mucous membranes, and chronic lepra.

Alaque ca. Indian name for a sulphuret of iron, supposed to arrest homorrhage when externally applied. It is found in small polished fragments at Balagatch in India.

**Alar.** (Ala, a wing. Gr. πτερυγώδης; F. ailė; G. flügelformig.) Belonging to a wing;

wing-like in form.

A. chest. (G. gefligelten Schultern.) A small chest with projection of the angles of the scapula, giving the appearance of wings and indicating a predisposition to phthisis.

A. ligaments. (G. Flügelbänder.) Two lateral folds of the synovial mucous membrane of the knee joint, lying in the space between the

patella and the tibia and femur.

A. odon'toid ligaments. The lateral ligaments of the odontoid process of the axis which are attached to the inner side of the condyles of the occipital bone.

A. thorac ic artery. A somewhat inconstant branch of the axillary artery which supplies the glands and the fatty tissue of the armpit.

A. vein. A vein which, after collecting blood from the axilla, joins the axillary vein.

Alara'ri. (Arab.) Name for Plumbum. Alaraz. Spain; Province Avila. A sulphur water, warm in winter and cold in summer. Used in gastralgia, bysteria, amenorrhæa, nervous disorders, migraine, chronic rheumatism, and skin diseases.

Ala're externum. (L. alaris, belonging to the wing; externus, outside.) A synonym of the external pterygoid muscle.

Ala'res mus'culi. A synonym of the Pterygoid muscles.

A. ve'næ. (L. ala, the armpit.) The basilie and median basilie vein, because it is connected with the axilla.

Ala'ria. A Genus of the Nat. Ord. Fucaceæ; or of the Family Laminariæ, Order Fucoideæ. Frond membranous, with a stout midrib; stem

pinnated; spores pear-shaped.

A. esculen ta. (F. Laminaire comestible.)
Bladderloeks. Frond 2'-12' long, olive green;
stem 4"-S" long, pinnated, with several short,
that, narrow leaflets. It contains mannite; the
holled midrib is eaten when the thin part is stripped off. Before being cooked it requires soaking
in fresh water. It is also made into a pickle.

Ala'ria os'sa. The wing-like bones. The lateral processes of the sphenoid bone.

Alar'tar. (Arab.) Name for oxide of

copper. (Ruland.)

Alary muscles. (Ala, a wing.) The delicate triangular sheets of muscular fibre which are attached in pairs by their bases to the wall of the pericardial chamber in insects, whilst their apices are inserted into the hypodermis. They occupy the interspaces, in the cockroach, left by the principal dorsal branches of the trachea, which form arches on each side of the heart.

Alas'alet. (Arab.) Name for Sal am

montacum. (Ruland.)

Al'aset. An old term for sal ammoniae. Alas'tar. Another spelling for Alartar. Alas'trob. Same as Alahabar.

Alatan. Arabic for litharge.

Alatar. A synonym of \( \mu E\_V \) ustum.

**Alate.** (L. alatus, from ala, a wing. Gr. πτερυγωτός; F. aile; G. actlüactt.) Winged, or having lateral appendages, as certain stems and leaf stalks that are winged with membranes.

A. inflores'cence. A synonym of In-

florescence, definite.

A'late-pin'nate. A pinnate leaf having a winged petiole.

Alater'nus. The Rhamnus alaternus.
A. latito'lius. The Rhamnus alaternus.
Ala'ti. (L. alatus, winged. Gr. Πτερυγώεις.) An old name for persons whose chests were compressed and whose scapulæ were prominent.

A. processus. The great wings of the

sphenoid bonc.

Ala'tion. (L. ala, a wing. G. Beflügelung.) Term for the general manner in which the wings are configured or disposed on the body.

Al'aton. Arabic for Lithurge of gold.
Alau'da. A genus of the Family Alaudidæ,
order Passeres. Class Ares.

Order Tasseres, Class Ares.

A. arven'sis. (F. alouette des champs; I. allodola; G. Feldlerche.) The skylark. Used as an article of food.

**A.** crista'ta. The crested lark. This species has been identified with the Alauda or Gallerita of the Romans, and the  $\kappa o \rho v \partial \delta s$ , or  $\kappa o \rho v \partial a \lambda \lambda \delta s$ , of the Greeks. A broth made from its flesh was used as a remedy in colic.

Alau'didæ. A Family of the Group Conirostres, Order Passeres, Class Aces. Beak of moderate length, wings long and large, usually with six primaries; tail short; nares transverse, usually covered with hristles; tarsus scaly on its anterior surface. Example: Common lark, Alauda arvensis.

Alau'rat. (Arabic.) Salnitrum, or nitre. Alau'sa. Same as Alosa.

Alba pituita. White phlegm. A synonym of the old term Leucophlegmasia.

A. sim'plex. A synonym of Ocimastrum, a kind of hasil.

A. ter'ra. White earth. The Lapis philosophicus, a compound of mercury and sulphur.

A. tu'nica. The sclerotic.

Alba'ca. The Peruvian name of a fragrant

Alba Ca. The Fruvian name of a fragrant plant (Sweet Basil), which, according to Dr. A. Smith, is applied to the nostrils for the purpose of dislodging maggots, an affection not uncommon in some districts of that country. (Waring.)

Albadaran. Arabic for the sesumoid

Albadaran. Arabic for the sesamoid bones of the great toe, to which extraordinary virtues were attributed. Bartholin, Anat. de Ossib, libell. iv, p. 22.

Albagen'zi. (Arab ) Name for the saerum, according to Hooper.

Albagia zi. The sacrnm, according to Fallopins, Expos. de Ossib. i, c. 22, p 515.

Albamen'tum. The white of egg.

Al'ban. A white crystalline powder, which is deposited from a hot alcoholic extract of gutta percha on cooling. It melts at 160° C. (321° F.), and is entirely liquid and transparent at 175° - 180° C. (347°-356° F.). It is violently attacked by concentrated nitric and sulphnric acids, but not by hydrochloric acid, nor by dilute acids or alkalies. It is soluble in benzol, oil of turpentine, carbon bisulphide, ether, and chleroform. Alban forms from 14 to 16 per cent. of gutta percha. (Payen.)

Alban, St. France; Department of the Loire. Situated in a wild, romantic district. Chaly beate waters of 21° C. (69.8° F.), containing also traces of sodium iodide and arsenitte. Used in anæmia, disorders of menstruation,

nervous debility, and hysteria.

Alba'nians. One of the European brown

races, sometimes termed Pelasgian.

Alba'no. Italy; a small town in the Roman Campagna. Here are saline and ferruginous springs having a temperature of 30° C (86° F.), which are used in the form of mud baths in rheumatism. The place was much frequented by the ancient Romans.

Alba'num. The saline portion of the urine. Albara. A Brazilian plant, probably Canna angustifolia. The leaves are used as a valuerary; the roots are eaten, and used locally as a means of promoting suppuration. (Waring.)
Also, a name of the Populus alba.

A. al'ba. (Arab.) A species of leprosy.
A. al'ba. A synonym of Lepra alphoides.
A. ni'gra. A synonym of Lepra grecorum. Alba'ra. Alba ræs. A synonym of Lepra alphoides. Alba'ras. A synonym of the Leprosy of the Greeks.

Also, the Arabic name for arsenic.

A. al'ba. A synonym of Lepra alphoides. A. ni'gra. A synonym of the form of

Lepra, anciently called nigricans.

Albaros. A synonym of Lepra alphoides. Albas'trum. (L. album astrum, white star.) An old name for Antimony; so called

from its stellate or foliated appearance.

Alba'tion. (L. albus, white. F. albation; G. Bleichen.) A Spagiric term in reference to the transmutation of metals, particularly of copper into silver; meaning the blanching or whitening of metals, and synonymous with albi-

Al'batross. (F. albatros; I. albatro; G. Kriegsschiffsrogel, Schiffsfügler.) The Diomedea exulans, the flesh of which is eaten as food by the New Zoolanders as well as the eggs food by the New Zealanders, as well as the eggs.

Albe'do. (L. albus, white.) Whiteness. The same as Albation, and Albor.

The term was specially used to describe urinary conditions, which were called the crystalline, the snowy, the hiny, and the limpid albedo.

A. un'guium. The lunula of the nails.

Al'bens. France; Savoy. On the road from Aix-les-Bains to Annecy. A carbonated chalyheate spring; the waters of which are used by the women of the country for their supposed emmenagogue powers, and by calculous patients for their diuretic and lithotriptic properties.

Al'beras. (Ar.) A name given to Staphi-

sagria, because it was able to remove those pustules on the face which have the same name.

Also, an old term for pustules on the face. Alberik. Arabic for the whitening or

blanching of brass or copper. Albert coal. A synonym of Albertite.

Incorrect, inasmuch as the mineral is a form of asphalt and not a coal.

Alber'tia. A Genus of the Family Albertuide. Rotatory organs absent, or reduced to a straight ciliated hand on the frontal margin.

A. cal'vus, Clap. Parasitic on the skin of Oligochæta.

A. crystalli'na, M. Sch. Found in the intestine of the Nais.

A. vernic'ulus, Duj. Found in the visceral cavity of earthworms, and in the intestine of smails.

Alberti'idæ. A Family of the Class Rotifira, Subkingdom Vermes. Parasitic vermiform rotifers having no foot.

Al'bertite. A bituminous mineral occurring in New Brunswick; it is very brilliant, conchoidal in fracture, and strongly electric. It consists of carbon \$5.4, hydrogen 9.2, nitrogen

3.0, oxygen 2.2, ash 1.20, and a trace of sulphnr.

Albes'cent. (L. albesco, to begin to be white.) Growing or becoming white.

Albes'ton. Arabic for quicklime. Albetad. Arabic for Galbanum.

Albi. (L. albus, white.) An old term for corrosive sublimate, mercuric chloride.

Albian. (L. albus, white.) An albino. Albibar bis. (L. albus, white; barba, a beard.) White hearded.

Al'bicans. (L. albico, to grow white.) Growing, or becoming white; being somewhat

Albicant. (L. albico, to make or grow white.) Becoming or growing white.

Albican'tia cor'pora. See Corpora albicantia.

Albica'tion. (L. albus, white.) Whiten-Albication consists in the appearance of spots of variable form, rounded, elongated, linear, or forming a continuous zone along the border of a leaf. The shade varies from the purest white to yellow. This anomaly is hereditary; a good example of it is afforded by the Phalaris arundinacce which presents bands alternately of white and green. It is not yet certainly known whether albieation is a pathological change or not.

Albicau'dus. (L. albus; cauda, a tail.) Having a white tail.

Albicau'lis. (L. albus; caulis, a stem.) Applied to plants the stem of which is covered with a thick whitish down.

Albiceps. (L. albus; caput, the head.)
Whiteheaded; the head capped with white.

Albicera'tus. (L. albus, white; cera, wax.) Of the colour of white wax; yellowish white

Albic'eris. (L. albus; κέρας, a horn.) Having white antenna.

Albicollis. (L. albus; collum, the neck.) Having a white neck.

Albic'omus. (L. albus, white; coma, bair. G. Weisshaarig.) A term applied to petals having white hairs.

Albicor'nis. (L. albus; cornu, a horn.) Having the antennæ white or pale.

Albicosta'tus. (L. albus; costa, a rib.) Applied to white-ribbed shells.

Albidipen'nis. (L. albidus, white; penna, a wing.) Having white wings.

Albidu'ria. (L. albidus, white; urina, the urine. L. Loucuresis; F. albinurie; G. Weissharnen.) White urine. An old term for a morbid state of the urine in disease of the kidneys, at the crisis of acute diseases, and during the course of some bilious affections.

Albification. (L. albus, white; facto, to make.) Whitening; term synonymous with Albation.

Albiflo'rous. (L. albus; flos, a flower.) Having white flowers.

(F. rouille; G. Mehlthau.) Albi'go. Mildew.

Albila bris. (L. albus; labrum, a lip.) Applied to Crustacea having the rostrum spotted with white, and to univalve shells having their border white.

Albima'nus. (L. albus; manus, a hand.) Having white hands, as the Lemur albimanus.

Al'bimec. Arabic for orpiment. (Quincy.) Albiner'vius. (L. albus; nervus, a

nerve.) Having white nervers of the leaves.

Albines. (Fr.) Small bodies associated with aleuron grains. They are usually spheroidal and colonrless, and present a vacuole. According to M. Hartig, the aleuronic mass is composed of two concentric vesicles in contact everywhere except in one point, where they are separated by these peculiar corpuscles. See Aleuron.

Albinism. (L. albus, white. F. albinisme; G. Albinismus; I. and S. albinismo.) A congenital anomaly, characterised by the absence of pigment in the body, rendering the skin very fair, the hair white or yellowish-white, the iris of a pale bluish-red colour, and the choroid red 1t occurs both in man and animals, as in rabbits, nuce, some birds and fishes; and also in plants.

Albinis'mus. (Same etymon.) The same as Albinism.

A. partia'lis. Albinism occurring in eirenmscribed patches.

A. universa'lis. General albinism.

Albi'no. (Portuguese, from L. albus, white.) A term originally applied by the Portuguese to those Negroes in whom there was a congenital absence of pigment in the skin, hair, and irides.

Albinos are called Bedas, Kakerlaken and Dondos. The absence of pigment in the iris causes them to suffer from great intolerance of light, hence they have been termed heliophobes, in that they see better by night than by day. They are indolent and weakly.

Albino plants may be obtained by causing them to germinate and grow in a dark place. No chlorophyll is formed, and they are said to be etiolated.

A. skin. A synonym of Albinism.
Albi'no, St. Italy; in Tuscany. A sulphnretted and carbonated chalybeate water springing from iron-holding chalk strata at a temperature of 15° C. (59° F.) lt contains calcium, magnesinm, and sodium sulphate, iron carbonate, and 100 volumes of the gas is composed of carbonic acid 39, sulphuretted hydrogen 12, oxygen 14, and nitrogen 56 parts.

Albinois mus. The condition Albinism. Albi'num. (L. albus, white.) An old name for the species of Gnaphalium used in medicine, from the whiteness of its flowers or its pappus.

Also, a term for Album gracum.

Albinu'ria. Same as Albiduria.

Al'bion. A synonym of Albino. Albio'neæ. (F. albionicus.) A Family of Leeches, according to Moquin-Tandon, having very distinct rings, an opaque body, red blood, and a unilabiate buccal sucker.

Albipen'nis, Same as Albidipennis. Albiper'le. (Fr.) A term given by Moretti to a material obtained from a calculus found in the abdominal parietes; probably mar-

Al'bipes. (L. albus; pes, a foot.) Having white feet.

Albiros'tris. (L. albus; rostrum, a beak.) Having a white beak or shout.

Al'bisbrunn. Switzerland. A cold water establishment in the Canton of Zurich, on the west side of the Albis chain of mountains, accessible by rail; altitude, 1960 feet.

Albitar'sus. (L. albus; tarsus.) Having white tarsi.

Al'bite. (L. albus, white.) A Felspar containing sodium instead of potassium. It is of a greyish-white colour, and is a frequent constituent of granites, syenites, and green-tones.

Albitu'do. The condition Albinism.

Albive nius. (L. albus; vena, a vein.) Same as Albinervius.

Albiven'ter. (L. albus, white; venter, the belly. F. albiventre.) Having a white belly; applied to birds and other animals.

Albiven'tris. Same as Albiventer.
Albiz'zia. A Genus of the Nat. Ord. Albiz'zia. A Genus of the Nat. Ord. Leguminoscue, differing from the Acaciae in the filaments of the stamens being united at the

A. anthelmin'tica. An Abyssinian tree, the powdered bark of which, named museum or besenna, is an effective tæntafuge in doses of two ounces. See Musenna bark.

A. Leb'bek. (Hind. siris; Tam. kattu-vagai; Tel. dirisana; Mal. velu vake; Beng. sirisgachh.) Sirissa tree. An Indian tree, thirty to forty feet high. The seeds are used in the treatment of piles, and as an astringent in diarrhæa. The dowers are used in the cure of boils, eruptions, and swellings, and also as antidotes to poison. The leaves are said to be useful in ophthalmia, and the powdered bark in ulcers and snake-bites. The oil from the seeds is given in cases of white lepros

Al'bo-flaves'cens. (L. albus; flaresco, to become yellow. F. jaunatre; 1. giallustro; S. alga-amarillo; G. weissgelblich.) Yellowish or vellowish white.

Albo gutta tus. (L. albus; gutta, a drop. F. tachete; I. macchiata; S. manchado; G. weissgefleckt.) Speckled with white.

Al'bo-lactes cens. (l. albus; lactesco, to turn to milk. F. blanc-de-lait; G. weissmilchend ) Milk white.

Al'bo-pubes'cens. (L. albus; pubesco, to reach the age of puberty. G. weissflaumhaurig ) Having short, downy, white hairs.

Al'bo-tomento sus. (L. albus ; tomentum, a stuffing for cushions. G. weissfilzig.) Having long, downy white hairs.

Albo-variegatus. (L. albus; variego, make of various colours. G. weissgescheckt.) to make of various colours. Spotted or speckled with white.

(L. albus; villue, a Al'bo-villo'sus. tuft of hair. G. weisszottig.) Having shaggy or tufted white hair.

Al'bo-vitta'tus. (L. albus; vitta, a fillet

or band. G. weissstriemig.) Having white bands.

Albor. (L. from Albus, white.) Whiteness; the same as Albedo; more specially it signifies albumen; also, the urine.

A. o'vi. The albumen of the egg.

Albora. (Arab) Paracelsus gives this

name to a disease stated to be a mixed species of malignant scabies, formed by Morphea, Serpigo, and Lepra.

Albor'ca. Arabic for Hydrargyrum, or mercury.

Al'bot. Arabic for a crucible.

Al'botai. Arabic for Terebinthina, or

Al'botar. (Arab.) Castellus's spelling of Albotat.

Albotar'sus. Same as Albitursus.

Al'botat. Arabic for Cerussa, or white

Al'botim. Arabic for Terebinthina, or

Albuca'sis. An Arabian physician who lived in the eleventh century. He wrote several excellent works, and has described many instruments and operations of his time

Albugin'ea. (L. albus, white.) Of a white appearance, or like the selerotic coat of the eye; also, of or belonging to albumen, or white of egg. Applied to a membrane or tunic of the eye, also to a covering of the testieles, each named Tunica albuginea, and to other tissues of like character, from their similarity to the white of the eye.

A. oc'uli. The selerotic. A. ova'rii. The tunica albuginea, or fibrous investment of the ovary.

A. tes'tis. The tunica albuginea of the testiele.

Albugin'eous. (Same etymon.

\*\*Thursine.\*\*) Having a white appearalbugo; 1. albugine.) ance, like the selerotic.

Also, having the properties or appearance of albumen.

A. fi'bre. One of Chaussier's four elementary fibres. The fibrous bundles which form the tendons, ligaments, and aponeuroses

A. tis'sue. A term formerly applied to white fibrous tissues, as aponeuroses, the fibrous structure of the skin and serons membranes, and generally to those tissues which could be reduced to a gelatinous e-ndition by boiling.

Albugini'tis. Inflammation of white fibrous tissue.

Albugino'sus hu'mor. A synonym

Albugino sus of the eye. of the Aqueous humour of the eye.

(Albus, white. Gr. ἄργεμον; G. Augenwolkehen, weisser Fleck) opacity of the cornea, not superficial, but affecting its very substance; also called the pin and web. See Leucoma.

Also, a synonym of the white of egg.

A. cap'itis. (G. Kopfschuppen.) A scaly eruption on the scalp.

A. corallii. A synonym of an old remedy,

the Magistery of coral.

A. oc'uli. The selecation.

A. oculo'rum. The same as Albugo. A. o'vi. The white of egg.

Albuhar. Arabic for Cerussa, or white lead

A nitrogenous body found Albuka'lin. hy Reichhardt in the blood of leukhæmic patients, identical in composition with a substance obtained by These from the action of potassium on albumen and vitellin, which has the formula  $C_8H_{16}N_2O_6+H_2O$ .

**Al'bula.** A synonym of Leucoma.

Al'bula. Italy; near Tivoli. Albunia fons or Albulæ aquæ of the Romans. A mild sul-phuretted water of 24° C. (75.2° F.) It contains sodium and calcium carbonate and sulphate, calcium, magnesium, and sodium chloride, and sulphuretted hydrogen gas; used in atonic conditions of the body, in mucous diarrheea and urmary catarrh, in chronic diseases of joints, in atonic ulcers, and in skin diseases.

Al'bulæ a'quæ. See Albula.

Al'bum bal'samum. White or copaiba halsam.

Also, the name of an old remedy composed of solution of acetate of lead and oil of roses.

A. ca'nis. The same as A. græcum.
A. ce'ti. A synonym of Spermaceti.
A. græ'cum. (G. weisser Hundskoth.)
Term for the dung of dogs, and other bone-eating camivora, which becomes white like chalk on being exposed to the air, consisting chiefly of phosphate of lime; formerly applied when mixed with honey to the outside of the throat in quinsy.

A. hispa'niæ. A mixture of oxides of tin and bismuth, formerly used as a cosmetic.

A. jus. A white soup made from fish with aniseed and leeks; considered very nutritive.

A. ni'grum. (G. Mausekoth.) The dung

of mice; formerly employed in epilepsy, and as a purgative.

A. o'lus. The white pot-herb; the plant Valerianella olitoria.

A. Rha'zis. An ointment of white lead and hog's lard; named after Rhazes, the Arabian physician.

(F. albumen, endosperme, Albu'men. (F. albumen, endosperme, perusperme; G. Sameneiweiss.) In Botany, the term is used to denote the material which surrounds the embryo in those seeds in which the embryo does not constitute the whole kernel. It is a nutrient material consisting of starch and fatty matters, and is developed in the interior of the embryonal sac from cells; the cell contents vary in density and quality, and produce varieties, such as mucilaginous, horny, oily, and farinaceous albumen. It may also be uniform in structure or vacuolated.

For an account of the albumen of animal origin, see, among others, Albumins and Albuminoid principles and their subheadings.

A., ac'id. See Acid-albumin.

A., al'kali. See Alkali-albumin.
A., cel'loid. A term applied to the albuminous substance which may be found in pus or cancer juice, in the form of globular masses resembling cells; also to the envelope which may be found surrounding groups of blood corpuseles in hæmorrhagic apoplexies.

A., cer'ebral. Same as Neurinc.

A., cir'culating. The fluid, unassimilated blastema of the body.

A., fi'broid. A term sometimes given to the deposit which occurs in fibroid degeneration.

A., mem'branous. Laminated deposits of albuminous material occurring in cavities or vesicles into which serous effusion has taken

A., molec'ular. That form of granular albaminous matter which may be found in certain degenerations, as in induration of the brain, vellow albuminous deposits in the kidney and spleen, and some forms of tubercle.

A. of egg. See Albumen ori and Albumin, ovna.

A. of pancreatic juice. A term for Panerentine.

A. of plants. See Albumin, plant.
A. of sali'va. A synonym of Ptyalin. A. of seros'ities. A term for Metalbumin.

A. of se'rum. See Albumin, scrum. A. of veg'etables. See Albumin, plant.

A. pro'cess. The form of photography in which the negative image in the camera is received and fixed on a transparent film of iodised albumin on a glass plate.

A., solution of. A test solution of the Brit. Ph., consisting of the white of one egg triturated with four ounces of distilled water and filtered through tow. It should be recently prepared.

A. store. Albumen which is assimilated and forms part of the structures of the body.

A., tis sue. Albumen of the solids, as distinguished from that of the liquids.

Albu'men ioda'tum. (G. Jodeiweiss.) One part of finely divided iodine dissolved in water with eight parts of white of egg, spread on a flat surface and dried. Given in doses of 10 to 5.0 grammes.

A. oc'uli. A synonym of Albugo.

A. o vi. (B. Ph.) The liquid white of the egg of Gullus Banckiva, var. domesticus. A glairy transparent fluid surrounding the yolk, and lying immediately beneath the shell membrane. It contains 12 per cent. of albumen, 1.5 of fatty and extractive matter, 5 of sodium and potassium chloride, with phosphates and sulphates, and 86 of water. A white of one egg mixed with four ounces of water and strained is given in poisoning by metallie salts, and as a demulcent in dysentery and other diseases. It is used to clarify liquids.

Albu'menate. Same as Albuminate. A synonym of Albu-Albu menoid.

Albu'men-pep'ton. See Pepton. Albumen'tum. The white of egg.
Albumenu'ria. A synonym of Albu-

Albu'min. The generic term for the several varieties of the Albumins.

A., mus'cle. (F. albumine des muscles;
Muskelalbumin.) A peculiar form of albumin is believed to exist in muscular tissue, though it has not been isolated. When voluntary muscular fibre is treated with cold water, the extract contains an albuminoid matter which is not precipitated from a neutral solution, and which separates in floreuli at 47° C. (116.6° F.) It appears to approach in character to the coagulated albumins.

A. of egg. See A., ovum. A. of plant. See A., plant.

A. of se'rum. See A., serum. A., o'vum. (F. albumine de l'auf; G. Eieralbumin ) Egg albumin or ovalbumin. It is obtained by diluting the white of egg with distilled water, straining through linen, filtering, evaporating somewhat, and then dialysing. When dried it has the same appearance as serum albumin, and it is equally soluble in water; but its rotatory power is less, being — 35 5°, according to Hoppe-Seyler, or — 38.08°, according to Haas. Absolutely pure solutions are not coagulable by heat or alcohol, but a very small saline con-

tamination will produce a precipitate with these agents. Carbonic acid produces flocculent masses, but does not precipitate this form of albumin; acetic acid in sufficient quantity and strength produces a transparent gelatinous mass; hydrochloric acid does not at first produce coagulation, but increases the rotatory power to  $-57.5^{\circ}$ ; a further quantity produces a flocculent deposit, with difficulty soluble in water and saline solutions, and only slowly and incompletely in the concentrated acid. Dilute nitric acid acts as on serum-albumin. Caustic potash produces a transparent, gelatinous mass, potassium albuminate. When free from salts it is not precipitated by ether; in their presence a precipitate results. When ovumalbumin is injected into the veins or hypodermically, it passes out by the urine without change. By some it is believed that ovumalbumin is a compound of several forms of albumin, two of which are said to have been separated, one with a left rotatory power of — 45.23, and the other with one of — 26°.

A., plant. The juices of plants, albuminons seeds, and tubers, contain this variety of albumin. It is eoagulable by heat, and possesses generally the properties of ovumalbumin.

A., sal'ivary. A term for Ptyaline.
A., se'rum. (F. albumine du serum; G.
Serumalbumin.) Seralbumin or serine. The form of albumin found in the scrum of blood, in lymph, chyle, exudations, the fluid of cysts, in albuminuria from whatever eanse, and in the colostrum. It is obtained from the scrum of blood by precipitation with lead acetate, washing with water, suspending the precipitated lead compound in water, decomposing by earbonic anhydride and filtering; a cloudy solution of scrom albumin results. It may be obtained also by adding drop by drop diluted acetic acid to blood serum until a flocculent deposit is produced, which does not disappear on agitation; the fluid is filtered and evaporated to a much smaller quantity; it is then neutralised by sodium earbonate, and placed in a diffusion apparatus, when by renewal of water it may be obtained free from saline matter. When carefully evaporated the albumin is left as a yellowish, transparent, brittle, hygroscopie sub-tanee, which, when quite dry, may be heated to 100° C. (212° F.) without decomposition. It is soluble in water; its specific rotatory power for yellow light is - 56°; it is said to be precipitable from aqueous solution by alcohol only when it contains saline matters, which it usually does; when the alcoholic precipitate is retained for a while in the alcohol it becomes changed into globulin and coagulated albumin, and finally entirely into the latter. It, is not precipitated by carbonic, acetic, phosphoric, or tartaric acids, or by small quantities of very dilute mineral acids; it is precipitated by strong mineral acids and by most metallic salts; the hydrochloric acid precipitate is readily dissolved in excess of the reagent. It coagulates at 72°—73° C. (161.5°—163.4° F.) Ether precipitates it from solutions free from salts, but not when saline matters are present.

A., veg'etable. Same as plant albumin. Albu'minate. The combination of albumin with certain bases, in which the albumin plays the part of a very feeble acid.

Also, a synonym of Alkali, albumin. A. of i'ron. A preparation made by dissolving the freshly precipitated exides of iron in a filtered solution of albumen.

A. of i'ron and potas'sium. Thirtysix parts of a solution of 5 per cent. Banmé of iron persulphate is precipitated by 100 parts of a solution of white of egg; 2 parts of potassium hydrate, dissolved in 50 parts of water, are added, when the precipitate dissolves; 11 part of its weight of sugar converts the solution into a syrup, which contains one per cent. of anhydrous sesquioxide of iron. Proposed as an easily assimilated form of iron.

A. of i'ron and so'dium. White of egg is treated with solution; of sulphate of iron and of caustic soda; sulphuric acid is removed by lime water, and the lime by carbonic acid. Proposed as a form of iron, which would be easily taken up

in the alimentary canal.

Albu'minated. Term applied to any body covered or impregnated with albumen.

Albuminim eter. (L. albumen ; μέτρου, a measure.) A polarising apparatus serving by the measurement of the amount of rotation to determine the quantity of albumen contained in a liquid.

Albumini'na. Name by which Couerbe designated what he afterwards called Ooning.

**Albuminip'arous.** (L. albumen; pario, to bring forth, to produce.) Secreting or producing albumin.

Albu'minoid. (L. albumen; elôos, form.) Of the nature of, or resembling albumin.

A. ammo'nia. Λ term used to describe the ammonia which may be obtained from water or air after the free or saline ammonia, that which is in solution or which forms part of easily decomposable substances like urea, has been removed or its amount determined. It largely represents contamination with animal substances, but it may be yielded by vegetable matter also.

A. degenera'tion. A synonym of Lar-

daceous degeneration.

A. derivatives. According to v. Gorup-Besanez, the nearest derivatives of albumin include muein, spermatin, keratin, fibroin, spongin, clastin, collagen, glutin, chondrigen, chondrin, the peptones, and some ferments. They are very similar to albumin in constitution; they are all nitrogenous; most contain sulphur, swell up in water, and are prone to putrefaction. Being burnt they leave an ash containing an alkaline phosphate, as well as ealeium phosphate. Their behaviour to reagents is very similar to that of albumin. Many are constituents of organie tissue, others are found in the fluids of the body, and some are powerful animal ferments.

Some authors include under this term all forms of albumin, making it synonymous with albu-

minous principles.

A. prin'ciples. That division of the Albuminous principles which by some anthors is called Proteids; they form the chief part of the organs and tissues of the animal body, and occur in most parts of plants, especially in the seeds.

The proportion of the elements in these various substances differs within moderate limits; the earbon ranges from 52.7 to 54.5 per cent., hydrogen 6.9 to 7.3, nitrogen 15.4 to 16.5, oxygen 20.9 to 23.5, and sulphur 0.8 to 2.0 per cent.

The empirical formula C72H112N18O22S has been constructed as approximatively correct; but although as yet no certainty has been arrived at as to their exact constitution, some recent experiments seem to show that urea or a urea-like substance may be the centre around which the compound molecules are grouped, while others have suggested the notion that many different

radicles go to their formation.

They are amorphous and colloid, having low diffusive powers, traversing membranes with difficulty, capable of being dried, when they form a yellowish mass like gnm arabic, tasteless and odourless. In solution they coagulate at a temperature of about 70° C. (158° F.), rotate a polarised ray of light to the left, and possess a certain amount of opalescence. They are precipitated from their aqueous solutions by mineral acids in excess, by potassium carbonate when added to saturation, tannic acid, boracic acid, and many metallic salts; most are precipitated by alcohol, but not altogether in the presence of alkalies or their carbonates. They dissolve in strong acetic acid, and are precipitated from the solution by potassioferrous and potassio-ferric cyanide. On boiling with concentrated hydrochloric acid they dissolve, giving a violet-red colour to the fluid, and on boiling with nitric acid they give a vellow colour (xanthoproteic acid), becoming orange on the addition of ammonia. Iodine colours them intensely brownish yellow, which is a useful reagent in microchemical research; and mercury nitrate (Millon's reagent) with the application of a gentle heat gives a red colour. With sulphuric acid containing molybdic acid they assume a dark blue tint.

They are divisible empirically into the following classes: Albumins, Globulins, Febrius, Derived albumins, Congulated albumins, Peptones,

and Lardacein or Amyloid.

The term Albuminoid has been loosely used: sometimes as synonymous with proteids, the manner here adopted, and occasionally as synonymous with what in this work are called Gelatinous principles.

Albu'minoids. A synonym of Proteids,

or Albuminoid principles.

Albu'minose. A series of bodies derived from albumen by the action of pepsin in weak acid solutions. They are crystalloid, are not precipitated by acids, nor by boiling, and turn the plane of polarisation to the left. See Peptone.

Albumino sis. A condition of the blood in which the proportion of albumen is increased.

A., chrôn'ic. A synonym of I'lethora. Albu'minous. (L. albuminosus. G. eiweissartig, eiweisshaltig.) Of or belonging to, having, full of, or of the nature of, albumen,

A. concre'tions. A term given to certain concretions very rarely found loose in the abdomen, consisting of layers of albuminous substance.

Also, the concentric layers of aneurismal eoagula.

A. degenera'tion. A synonym of Lardaceous degeneration.

A. expectora'tion. A term used to describe the expectoration of tenacious albuminous matter in acute cedema of the lung, which occasionally results from the sudden removal of pleuritic effusions by thoracentesis.

A. foods. See Foods, albuminous.

A. gland. An elongated, triangular-shaped, tubular gland found in the Tania, situated just above the inferior transverse branch connecting the longitudinal vessels between the vitelligene and inferior or posterior border of the segment. The ducts are convoluted, and unite first into three or into five collecting tubes, which again unite to form one that opens into the oviduet.

A. prin'ciples. Under this term a large

number of substances found in both animals and vegetables are included, composed of earbon, hydrogen, oxygen, nitrogen, and, in some, sulphur. Some contain phosphorus, but this is believed to be an extraneous substance, resulting from the difficulty of separating the calcium phosphate.

The albuminous principles are contained in the solids and fluids of the body in the following proportions:-In 1000 parts of cerebrospinal fluid there are 0.9 of albumen, in aqueous humour 1.4, liquor amnii 7.0, intestinal juice 9.5, pericardial fluid 23.6, lymph 24.6, pancreatic secretion 33.3, synovia 39 1; milk 39 4, chyle 40 9, blood 195 6. In the solids of the body: spinal cord 74.9, brain 86 3, liver 117 4, thymus (of ealf) 122 9, fowl's egg 134.3, muscle 161.8, middle coat of arteries 273.3, crystalline lens 383.0.

Albuminous compounds are in great part prepared by vegetables and consumed by animals. They minister to the nutrition both of the solids and fluids alike, and after performing their function are reduced by oxidation to lower and lower planes of chemical composition till they are discharged from the body; their nitrogen being

eliminated chiefly in the form of urea. They are extremely useful in some forms of poisoning, as in that by corrosive sublimate, and other metallie salts.

These bodies are divided into Albuminoid principles and Gelatinous principles. There appears to be no essential difference in their constitution, and pending further knowledge the division is mere matter of convenience.

The term albuminous is by some authors restricted to the class of bodies described under

restricted to the value Albuminoid principles.

Albuminoid principles.
The term under which the term as the term a Abernethy described what is now known as myeloid or giant-celled sarcoma.

A. seeds. Seeds which possess albumen in addition to, and surrounding the embryo.

A. sub'stances. A term used to designate the different forms of albumin. Same as Albuminous principles.

Albu'mins. (L. album, whiteness. F. albumine; G. Eiweisstoff.) One of the artificial divisions of Albuminoid principles. They occur in animal and vegetable tissues, and are soluble in water; they are not precipitated by very dilute acids, by alkaline carbonates, by sodium chloride, nor by platino-hydroevanic acid. These solutions are precipitated by boiling and by alcohol in the presence of alkaline salts; but in the absence of salts, the solutions are said to be neither precipitated by boiling nor by alcohol.

A. coag'ulated. (F. substances albuminoides coagulees; G. coagulirte Euccistoffe.) Also called coagulated proteid. According to Hoppe-Seyler, neutral solutions of several forms of albumin, as syntonin, fibriu, myosiu, are converted by boiling or by the prolonged action of alcohol into these substances; alkaline solutions of these bodies are not thus changed. Ovum albumin is thus converted by the action of hydrochloric acid or by agitation with ether. The albuminates and casein when precipitated from their solutions after neutralisation are changed by heat into coagulated albumin. Their chemical properties are not well known; they are said to be insoluble in water, alcohol, and other indifferent fluids, soluble with difficulty in the caustic alkalies, especially in ammonia. acetic acid they swell up and, little by little, dissolve. Most, if not all of them, are insoluble in

dilute hydrochloric acid, except when mixed with pepsine, when they are slowly transformed into peptones and syntonin. Concentrated hydrochlorie acid dissolves them with the production of syntonin and substances analogous to peptones, which have left-handed polarisation and are not precipitated by heat. Caustic alkalies form albuminates with them. These solutions in acetic acid in the presence of concentrated saline solutions are precipitated by cold, and their ammoniacal solutions by heat.

A. deri'ved. Products of the action of acids and alkalies on albumins. They are combinations of albumin with acids and alkalies, the albumin acting in the one case as an acid, and in the other as a base, are insoluble in water and in solutions of sodium chloride, but are soluble in dilute acids and alkalies. They consist of acidalbumin or syntonin, alkali albumin or cascin, and legumin.

A., na'tive. A term used synonymously with Albumins.

Albuminu'ria. (L. albumen; ovpov, urine. G. Eiweissharnen.) Albumen may appear in the urine as the result of modification in the mechanieal conditions of the renal circulation, as after ligature of the renal vein, or the injection of a large quantity of water into the veins, in pregnancy when pressure is exerted on the renal veins, in the later stages of certain cardiac diseases, in the cold stage of agne, in cholera, and in paralysis

ef the sympathetic nerves supplying the kidney.

As the result of changes in the blood, such as are consequent on the absorption of raw albumen introduced in too large proportion into the alimentary canal, or injected directly into the vessels, or such as result from the exclusion of salt from the food, or from dyspepsia, or such as accompany diseases of the respiratory organs, pyæmia, septicæmia, and purpura.

As the result of changes in the blood associated with lesion of the kidneys, such as are seen in pyrexia, scarlet fever, diphtheria, measles, smallpox, erysipelas, typhoid, yellow, and typhus fevers. After the introduction of various poisonous agents into the system, as lead, turpentine, canthorides, and oil of mustard; in eachexie, and after the retention of excremental products in the blood; in burns.

As the result of lesion of the renal organs themselves, such, for example, as occur in acute and chronic interstitial nephritis, in amyloid, lardaceous, and fatty degeneration of the kidneys, in eaucer and cirrhosis, in cholera, in pyelitis and renal cysts, and in the acute parenchymatous nephritis of pregnancy.

Albuminuria is commonly associated with the appearance of renal casts in the urine, consisting, in order of relation, gravity, and importance, of detached epithelial cells, of epithelial cylinders, colloid evlinders, either with or without normal epithelium, granular-fatty cylinders, fatty cylinders, and hyalin casta.

The presence of albumen in the urine is indicated when, on boiling the suspected urine, a turbidity appears which is not dissolved by nitrie acid. If the urine be alkaline, it must be acidified by aeetic acid before boiling, or the albumeu may not be eoagulated If a small quantity of nitric acid be added before boiling the albumen may not be thrown down. If there be an excess of phosphates in the urine, these may be thrown down by boiling, and thus simulate albumen; but the sediment may be distinguished by being soluble in nitric acid. The addition of nitric acid to urine may produce a deposit simulating albumen; but a microscopical examination will show it to be uric acid, or it may possibly be nitrate of urea. A turbidity simulating albumen may be produced by the action of mitric acid on urine containing resinous substances, as copaiba; but in this case no deposit is produced by boiling.

The term albuminuria was at one time used synonymously with Bright's disease; but it is now restricted to the symptom—the presence of

albumin in the urine.

A., acu'te. A synonym of acute Bright's disease, or of acute desquamative nephritis.

A., chron'ic. A synonym of chronic Bright's disease, or of those various morbid conditions

which were formerly grouped under that name.

A., critical. The albuminuria which occurs in the course of pneumonia and typhus

A., des'quamative. A synonym of acute or chronic desquamative nephritis.

A., inflam'matory. A synonym of scarlatinal nephritis.

A., ir'ritative. Albuminnria dependent upon the passage of cantharidine, or other irri-

tating substance, through the kidneys. A., per'manent. Albuminuria dependent upon organic disease of the kidney.

A., sat'urnine. Albuminuria resulting

from lead porsoning.

A., tem porary. Albuminuria dependent upon congestion of the kidney or other condition not involving permanent structural change.

Albuminu'ric. Of or pertaining to

A. retini'tis. Applied to the peculiar form of retinitis which is associated with albuminuria. See Retinitis albuminurica.

Albuminurorrhœ'a. urorrhæa, a flow of uriue.) Term by Piorry for the Morbus Brightii.

Al'bumor. A synonym of the white of

Albu'nea fons. See Albula.

**Alburnum.** (L. albus, white. F. aubier; I. alburno; G. Splint.) The young wood of trees; a soft colourless substance found between the inner bark and the wood; the white or sap wood, the cells of which have as yet undergone little lignification, and contain sap.

A. pi'ni. A synonym of Cortex piece vul-

garis interior.

Al'bus. (F. blanc; I. bianco; G. weiss.) The absence of colour. Applied to several parts of the body, from their whitish appearance. Applied also to certain diseases, or symptoms of such, as Fluor albus

A. li'quor. The white of egg.

A. Roma'nus pul'vis. A synonym of Magnesia.

Alca'cas. The Portuguese name of the Liquorice plant.

Al'caes. A synonym of Alcahest.

Alcafu'che. Portugal; Province of Beïra. A village about ten miles from Vizeu. The water is sulphurous, and the temperature 46° C. (115° F.) Used in chronic syphilis and skin diseases.

Al'cahest. (Supposed Arabic, a universal salt; or as if Alkali est.) Term for a liquor supposed to be capable of removing every kind of morbid obstruction.

Also, applied to a universal solvent supposed to

be capable of reducing all substances in nature to a state of purity.

A. glaube'ri. A thick liquid obtained by detonating nitre on hot coals, producing potassium carbonate.

A. respu'rii. A product formed by detonating uitre with metallic zinc, and treating the residuum with water, which was then said to contain the alcahest.

A. zwel'feri. A former term for acetic

acid distilled from verdigris.

Al'cahol. A synonym of Alcohol. Alcala del Rey. Spain; Prov. of Mancha. The waters are used in disorders of digestion.

Alcalam'ides. A term given to bodies which are derived from ammonia by the replacement of two of the hydrogen atoms by an alcohol radicle and an acid radicle.

Alcales'cence. See Alkalescence. Alcales'cent. See Alkalescent. Al'cali. See Alkali.

Alcal'igene. (Alkali; γεννάω, to beget. L. ulkaligenium; G. Alkalizeugende.) The alkali producer. A term formerly applied to Nitrogen.

Alcalinity. See Alkalinity.

Alcalinu'ria. (Alkali; οὐρον, urine.) See Alkalınuria.

Alcalisa'tion. (L. alcalisatio. G. Alkalistrung.) The addition of an alkali to any fluid or substance. Also the conversion of a neutral substance into an alkali, as by roasting chalk to form lime.

Al'caloid. See Alkaloid.

Alca'mo. Sicily; not far from Pulermo. Sulphur waters of a temperature 74° C. (165° F.) Used in rheumatism, joint affections, and skin diseases.

**Alcampho'ra.** A Brazilian synonym of the *Croton perdicipes*. Employed as a remedy in syphilis, and in the bites of snakes.

Alca'na. The Anchusa officinulis.

Alcan'na ma'jor latifo'lia denta'ta. The Prinos verticil atus.

A. orienta'lis. The Lawsonia incrmis.

A. spu'ria. The Anchusa tinctoria. A. ve'ra. The Lawsonia incrmis.

Alcan'tud. Spain; Province of Cuenca, District of Priego. A ferruginous bicarbonated spring, temperature 20° C. (68° F), on the banks of the River Guadiela. These waters have a local reputation for the treatment of paralysis and rheumatism.

Al'caol. A name for the Lac acctesum, or mercurius, or phi'osophorum; the solvent for the preparation of the philosopher's stone.

Alcapar'ra. (Ar.) A synonym of Cap-

Alcap'ton. An amorphous substance resembling grape sugar found in the urine of a patient by Bödeker. It is a pale yellow, glazy, amorphous substance, burning with a pale tlame, and giving off a urinous smell; and when heated with calcium nitrate gives off ammonia; it is soluble in water and alcohol; and reduces copper and silver oxides in the presence of free alkali, but not bismuth oxide. It is not fermentible.

**Al'car.** ("Αλκαρ, a safeguard) term for a remedy. (Castellus.)

Alcarad. An Egyptian tree yielding gum Arabie, probably Acacia arabica or nilotica.

Alca'ras. Spain; Province of Albacete. A town at the foot of the mountains of the same name. A cold sodium chloride water.

Alcarra'za. (Sp.) A porous earthen

vessel used to cool water. Evaporation of the fluid takes place by the percolation through the walls, which cools the contents.

Alcas'sus. The Brazilian name of the Pervandra dulcis. A Leguminous plant sought after by the Indians for its sweet root.

**Al'ce.** ('Αλκη. G. Starke, Kraft, Hülfe Wehr.) Power, strength, defence, a remedy.

Al'cca. The Abelmoschus moschatus. A. Egypti'aca villosa. The Abelmoschus moschatus,

A. in'dica. The Abelmoschus moschatus. A. ro'sea. The Althwa rosea.

Al'ceæ ægypti'acæ. The seeds of the Abelmoschus meschatus; Semen abelmoschi,

Alcebi'adum. Ancient name of the Echium vulgare.

Arabie for Sulphur vivum. Alcebris. (Ruland and Johnson.)

A synonym of Hal-Alcedin'idæ.

Alce'do. A Genus of birds of the Family Haleyonida, Group Levirostres, Order Passeres. Beak long, straight, compressed; nostrils covered with a feathered scale.

A. his'pida. (F. martin-pecheur ; I. uccello di San Martino; G. Eisrogel.) The kingtisher. This bird was at one time highly esteemed in medicine; when dried it was worn as an amu-

let, and its heart was used in epilepsy. Al'ces. A Genus of the Family Cervidæ, of

the Order Ungulata, Class Mammalia.

A. mal'chis. The A. palmatus.

. A. palma'tus, (F. ilan; I. alee; G. Elenthier.) The elk or moose. The hoofs were used as a remedy for epilepsy; the flesh is used as food.

A. un'gulæ. (G. Elensklauen.) hoofs. Formerly used in epilepsy.

Alchab'ric. Arabic for Sulphur vivum.

(Quinev ) Alchachen'ge. The Physalis alkekengi. Al'chachil. Arabic for the plant Rosma-rinas, or rosemary. (Quincy.)

Alchaest. See Alcahist.

Al'charith. Arabie for Argentum vivum, or quicksilver. (Johnson.)

Alchemil'la. (So named from Arabie alkemetych, alchemy, from its supposed use.) A Genus of the Suborder Sanguisorbea, Nat. Ord. Rosaceae. Lady's mantle. Annual or perennial herhs. Leaves orbicular, divided; flowers small in scorpioid cymes; calyx inferior, urecolate, persistent; petals 9; stamens 1—4; filaments jointed; carpels 1—5, basal in the calyx-tube; nchenes one to four.

A. arven'sis. Parslev piert, Breakstone. Leaves cuneate or fan-shaped, 3-tobed, lobes cut. A decoction of 1 part to 20 has been used, in twoounce doses, in retention of urine, and in calculus; and it was eaten raw or pickled for the relief of the same diseases.

A. vulga'ris. (F. alchemille vulgaire, piedde-lion; 1. piede di leone; S. aquincila; G. Lowen-fuss, Francimantelkrant.) Lady's mantle, Lion's foot. Leaves reniform, plaited, 6-9-lobed, green beneath. The root is black, fibrous, of a disagreeable odour and an astringent taste. The whole herb is used as a vulnerary and an astringent.

Al'chemist. One who practised alchemy, Alchemy. A chimerical art which pro-posed to find out the means of effecting the transmutation of metals, and to prolong life by preparing a remedy for all diseases; also spelled alchymy

Alcher'mes. See Alkermes.

Al'cheron. (Arab) An ancient name for a stone or calculus in the gall-bladder of the bull, or cow, or ox, otherwise termed Bezoar borinus.

Al'chien. An Arabic word, anciently employed to signify that power in nature by which corruption and generation are effected.

Alchim'ia. See Alchemy.

Alchimilla. See Alchemilla.
Alchit'rum. (Arab.) Arsenie prepared
by washing. (Ruland and Johnson.)

Also, an ancient name for oil of juniper. (Castellus,)

Also, the impure liquid resia of the Pinus

sulvistris. Alchitu'ra. The impure liquid resin of the Pinus sylvestris.

Al'chool. See Alcohol.

Alchor'nea. A Genus of the Nat. Order Euphorbiaceæ growing in the Antilles, Brazil, and Senegal, which was formerly believed to yield the Alcornoco bark.

Alchor'nine. A bitter principle obtained from the Bowditchia virgilioides.

Al'chur. Same as Alcubrith. Al'chymist. See Alchemist.

Al'chymy. See Alchemy.

Al'chytran. A term for the residuum after distillation.

Also, a dentifrice or medicament for the teeth. Alcib'ium. A synonym of Echium.

Alcicor'nis. (L. alces, the elk; cornu, a horn.) Elk-borned. Having borns like the elk, or having the appearance of clks' horns.

Al'cidæ. (F. alques; G. Alken.) A Family of the Order Palmipedia or Natatores, Class Ares. Wings recurved, short, and unfitted for flight; feet placed somewhat back, palmate; beak strong, compressed. Represented by the Guillemot, Uria troile, and Puffin, Mormon arcticus.

Al'cimid. Arabic for Antimonium, or

Alciop'idæ. A Family of the Suborder Nercida, Order Polychata, Class Aunelida, Sub-kingdom Vermes. Body cylindrical, transparent; cephalic lobe distinct, with two large prominent eyes and short tentacles; the last ring of the cephalic lobe bearing tentacular cirrhi, but no bristle-bearing ear; feet simple, one-eared, with an acicule and a tuft of bristles; ventral and dorsal cirrhi lamellar; proboscis protractile; larve parasitic on Cydippidæ.

Alcip'pidæ. A Family of the Suborder Abdominalia, Order Cirripedia. Body having a slightly developed pedicle; feet in four pairs, the first pair palpiform, the two last simple; sexes distinct, females parasitic in the shells of Mollusea; males small, destitute of mouth, stomach, and cirrhiform feet.

Al cob. Arabic for Sal ammoniacum. Alcoc'alum . A name of the Artichoke.

Al'cofol. Arabic for Antimonium. Al'cohol. (Arab. al, the; kahol, by this phrase antimony very finely lævigated was described, and hence anything very subtle. F. alcool, esprit de vin; 1. alcool, spirito di vino, acquardente; S. alcohot, aquardiente; G. A/kohol, Weingeist; Ar. probehubiz; Tur. charab rouhon.)  $C_2\Pi_5O=C_2\Pi_5(O\Pi)=C\Pi_3.C\Pi_2(O\Pi)$ . Ethylic alcohol, hydroxyl-ethene or methyl carbinol. Spirit of wine, usually known by the term alcohol simply, ethylic being omitted, is a product of the alcoholic fermentation of saccharine fluids from which it is obtained in a state of purity by distillation. It is formed by the mixture of ethene gas with strong sulphuric acid, ethyl sulphuric acid is produced, which, when distilled with water, yields alcohol and sulphuric acid; and also by the action of moist silver oxide on ethyl chloride, bromide, or iodide. Alcohol when distilled from fermented fluids contains a considerable quantity of water; redistillation reduces the amount greatly, but the strongest rectified spirit still contains 13 per cent. of water. The whole of the water may be removed by distillation with quicklime, when

the result is absolute alcohol.

Ordinary alcohol is a colourless, limpid, volatile fluid, of pungent taste and agreeable suell, varying in sp. gr. according to the amount of water it contains. It burns with a pale blue, smokeless flame, and when anhydrous boils at 78-4° C(173° F.), or a few degrees higher in proportion to its dilution with water. It absorbs moisture from the air and from organic substances placed in it; when mixed with water it contracts in volume and rises in temperature; it is a good solvent and forms crystalline compounds, alcoholates, with some salts; 100 volumes of alcohol absorb 7 of hydrogen, 28 of oxygen, 13 of nitrogen, 52 of methene, 353 of ethylene, and 433 of carbonic anhydride. When passed through a red-hot tube it is resolved into metheue, hydrogen, and carbon monoxide, which partly recombine into ethene, benzene, and naphtbalene, with a deposit of earbon. By oxidation it is converted into aldehyde and water, and then into acetic acid.

When alcohol is treated with potassium bichromate and sulphuric acid, a green colour is obtained; mixed with a little potash and sufficient iodine to make it yellow, hexagonal plates of iodoform are produced; treated with a little strong sulphuric acid and a drop or two of butyric acid, ethyl butyrate is formed, and may be recognised by its smell of pine apple; when burned it does not blacken white porcelain. But all these tests are uncertain, especially when alcohol is mixed with other substances. Probably the use of Geissler's vaporimeter is the best mode of

determining its presence and proportion. Alcohol may be absorbed into the body by the stomach, or by the rectum, possibly through the umbroken skin, and subentaneously as a fluid; and by the lungs as a vapour. When taken by the stomach a small amount seems to be then and there converted into acetic acid, but by far the greater part in this and also in the other modes of administration is absorbed unchanged. Its further course is a much disputed point. Many investigators have contended that under all circumstances it is given out again from the body without chemical alteration; but late experiments have invalidated this position, and the truth would seem to be that up to a certain extent, probably to the amount of one and a half to two ounces of alcohol taken properly diluted in the twenty-four hours, it is oxidised in the body; the discrepancy arising from two chief causes, first, that when alcohol has been observed in the excretions it had been given in larger doses than that mentioned, an amount which all admit cannot be disposed of by oxidation; and secondly from the fact that in the urine of some persons who have never taken alcohol, and in the brain, liver, and muscles of some animals, a substance has been found in small quantities which

gives the reaction of alcohol. It is said that alcohol escapes as such by the breath of drunkards, but it is probable that acetone and other derivatives of the accompanying ethers are the cause of the supposed alcoholic odour. It may, then, be taken as certain that a large amount of absorbed alcohol is exidised in the body, but in what part this process takes place, or into what new forms it is changed, is as yet unknown. Aldehyde, oxalic and acetic acids, have been supposed to be the resulting products; but evidence is strongly against aldehyde, oxalic acid has not been discovered, and the presence of acctic acid is by no means demonstrated, even in the form of a carbonate, which it would probably ultimately assume. When an excess of alcohol has been administered, it is in great part got rid of by the kidneys and probably none by the breath or skin, but its exact progress has not yet been traced.

The action of alcohol on living structure is

The action of alcohol on living structure is conditioned by its faculty of abstracting water from the tissues, of precipitating albumin, pepton, mucus, and gelatin from their solutions, of dissolving fat, and of arresting fermentation and digestion. These actions are effected only by strong alcohol; when it is diluted with water they are less pronounced, and by extremely dilute solutions they are not manifested at all. The mode of action, too, varies according to circumstances; it may be local, on the organ through which it is administered; reflex, through the action of sensory nerves; or direct, on the central nervons system itself, after absorption into the blood, or on any other organ through which the

blood containing alcohol may flow.

Strong or slightly diluted alcohol, when applied to the skin and its evaporation prevented, produces redness, heat, and destruction, and whitening from albuminous coagulation, of the epidermis; coldness, paleness, diminution of perspiration, and some anaesthesia when allowed to evaporate.

The action on the mucous membranes varies according to the alcoholic strength; heat and intense burning of the mouth, gullet, and stomach, varying to a pleasant sense of warmth, is produced, according as the alcohol is concentrated or diluted; and the physical appearances vary in a similar manner; there is slightly increased redness, with the weaker dilutions, almost an inflammatory condition with the stronger fluid, and whitening and shrivelling, from coagulation of albumen and absorption of water, with the strong alcohols.

When drunk in moderate quantities and in a dilute form there is a sensation of local warmth. which gradually becomes diffused over the body; the sceretion of saliva and of gastrie juice is immediately increased, and the muscular action of the gastro-intestinal canal is intensified. When a larger quantity or stronger alcohol is taken digestion is made difficult, or, it may be, arrested in consequence of coagulation of the albuminates and peptons, and of the arrest of the secretion of gastrie juice from the contraction of the blood-vessels; thus, fermentation of the stomach contents may take place and the poisonous action of fatty acids and other matters resulting therefrom may produce their own symptoms. If the irritation be continued, mucus is poured out, there is loss of appetite, nausea, and perhaps vomiting. Very concentrated alcohol produces acute pain and inflammation of the gastric mucous membrane, with dysenterie diarrhæa, aud death from exhaustion or from reflex stoppage of the heart's

action. In these cases the gastric and duodenal mucous membrane has been found in a state of hemorrhagic softening and the blood coagulated

in the vessels.

Absorption in all probability takes place chiefly through the veins, and occurs in the stomach and duodenum when taken in the usual manner. In order that this should happen the alcohol must not be sufficiently concentrated to be able to coagulate the blood. Soon after taking alcohol little is found in the blood, for the reason that many of the organs absorb it with great avidity. It would appear that it is taken up first by the parenchyma of the brain, then by the lungs, afterwards by the kidneys, muscles, and liver, and it is only when these are saturated that the blood becomes equally charged. When death has occurred from asphyxia the blood is found darker in colour, but not under other circumstances. Some have observed an increase of fat in the blood, others have found sugar. It is said that the presence of absorbed alcohol in the blood of living animals increases the size of the red corpuscles, in consequence of accumulation of their oxygenated contents, and that the movements and changes of form of the white corpuscles are diminished. When strong alcohol is added to blood withdrawn from the body coagulation is produced, and this probably from the abstraction of water, for the coagulated albumen may be redissolved; and the oxyhæmoglobin is said to be retarded in its conversion to hemoglobin by reducing substances.

The action of absorbed alcohol on the voluntary muscles is little known; it appears to diminish muscular power, but whether by its direct influence on muscle structure or by its indirect action through nerves is uncertain. A solution of myosin is rendered opaque by alcohol vapour.

The breathing is at first slightly quickened after taking alcohol, and then slowed, partly from its action on the respiratory centres, partly as a

consequence of respiratory changes.

The organs of circulation resist the poisonous action of alcohol longer than all others; the heart's action is the last to be destroyed. When a small amount of alcohol is taken there is a slight increase of heart's action depending partly. probably, on direct stimulation of the accelerating nerves or their centres, in part as a result of the increased activity of the body generally; there is increased warmth of the surface and a redder colour of the skin, in part, no doubt, from this influence on the cardiac accelerating nerves, in part also on depression of the vaso-motor system, and so a dilatation of surface capillaries. The further action is the reverse of this, the heart beats slower and weaker, and so the blood pressure sinks, in consequence, it is believed, of the direct action of the spirit on the cardiac ganglia, and on the cerebral centre of the vagus nerve.

In moderate doses little or no change occurs in the temperature, at first it may be a little increased; in large doses the temperature falls.

The nervous system is that which is most manifestly affected by alcohol. The age and manner of lite of the person taking it, and the nature and quality of the alcoholic beverage taken, modify the effect. Small quantities produce, in most persons, a short lived increase, apparent or real, of the mental and bodily faculties, but in many the immediate result is to lessen muscular force, to diminish the acuteness of the senses, and to obscure in some degree the

powers of the mind. In intoxicating quantities there is over-distension of facial capillaries, heat of head, increased volume and rapidity of pulse, excitement of the spirits, want of control over the museles. To this follow confused and uncertain speech, unsteadiness of gait, great diminution of sensibility. Then succeed nausea, often vomiting, and a heavy sleep. When a fatal dose has been taken there is violent delirium, succeeded by, or alternated with, stupor; sometimes a turgid face and staring eyes, sometimes a pale countenance and closed lids. The muscles lose all power, the lips are blue, the breathing becomes stertorons, the skin cold and perspiring, and death ensues from asphyxia.

It is probable that alcohol effects some change in the grey matter of the nervous system, but on which of the constituents it acts is unknown; its first action is usually on the cerebrum, hence the excitement; soon succeeded, or it may be preceded, by its influence on the cerebellum, from whence arises the unsteadiness of movement; the spinal cord is then affected, and so the disturbance of impressions on the motor and sensory nerves; and lastly the medula oblongata, when respiration

ceases.

Tissue metabolism, as indicated by the excretion of urea, phosphates, and carbonic acid, is said to be lessened, but here, again, there is conflicting

evidence.

In regard to the use of alcohol as a diet much difference of opinion exists. There are some who contend that, even in the smallest quantity, it is injurious as an habitual beverage. Perhaps the view of the majority may be thus stated: that a large number of young healthy persons, the number decreasing as age advances, do not need it; that of these many may take a moderate quantity, say a diluted beverage representing an ounce and a half or two ounces of alcohol daily, without absolute harm; that a considerable number of persons, especially those who bave much mental wear and tear in the professions or the business of a large city, and those who perform much physical work with a somewhat small amount of animal or other food, are benefited by a moderate amount; that a very large number of persons take an amount of alcoholic stimulant, which, along with excessive eating, insufficient exercise, and an otherwise unhygienic life, produces degeneration of tissue, and gouty and other diseased conditions.

The therapeutic uses of alcohol are many, both local and general. It is used as a refrigerant lotion in bruises and strains, and to produce cold in inflamed or too hot parts; as an astringent in the form of lotion for cracked nipples and threatened bedsores; in the form of gargle for relaxed throat; as an irritating injection in hydrocele and nævi; and as an astringent and antiseptic in the treatment of wounds and ulcers, and in chronic otitis. Internally its chief use is as a stimulant and a nutrient to assist in the digestion and in the economy of food, and in the rousing up of nerve power in the convalescence from acute disease, and in the course of many wasting disorders. Alcohol has been largely given in the treatment of fevers; it is said to lower the temperature and to increase perspiration by its power of producing paralysis of the vaso-motor nerves, and the consequent dilatation of the skin capillaries; by its undergoing exidation instead of food; and also by its power of lessening oxidation of tissue, and so preventing waste. It is not

now so much used, and indeed doubts have been thrown on its power as a cooling agent.

Alcohol is employed in Pharmacy to dissolve

and to preserve medicinal substances

A., ab'solute. Pure alcohol free from water. The B. Ph. orders carbonate of potash I' oz., and rectified spirit 1 pint, to be put into a stoppered bettle for two days. Slaked lime, 10 oz., having been exposed to a red heat for half an hour and cooled, is put into a flask, into which the supernatant alcohol is poured; the pure spirit is then distilled off, the first 13 oz. which passes over being rejected. It is colourless, free from empyreumatic odour, of sp. gr. '795; entirely volatilised by heat, is not made turbid when mixed with water, and does not turn anhydrous sulphate of copper blue.

A., amyl'ic. (F. alcool amylique, bihydrate d'amylene, paramylène, essence, or huile de pomme de terre; G. Gahrungs-amyl alcohol, Amylqlucol.) Amylic alcohol, fousel or fusel oil. C5H12O= (CH<sub>3</sub>)<sub>2</sub>C<sub>3</sub>H<sub>5</sub>OH. An alcohol of the pentacarbon series, which may be obtained pure by fractional distillation of the impure alcohol or fusel oil. It is an oily, colourless, mobile liquid, having a penetrating oppressive smell and a burning acrid taste. Its sp. gr. is 818 at 15.5° C. (60° F.), 825 at 0° C. (32° F.); it boils at 132° C. (269.4° F.), and solidities at — 20° C. (-4° F.) It makes a greasy stain on paper, which is not permanent, is insoluble in water, soluble in alcohol and ethers. It occurs in two forms, one of which exercises no influence on the plane of polarised light, and yields on oxidation valeric acid; the other produces a right rotation, and yields on oxidation lower carbon acids. It may be known by its smell; on mixing it with two parts of potassium acctate and one of sulphuric acid, the jargonelle pear-like odour of amyl acetate is smelt; and on adding potassium bichromate and sulphuric acid, the green chromium oxide is formed. Its vapour produces great irritation of the throat, respiratory organs, and eyes, and giddiness. It is much more intoxicating than ordinary alcohol, and is said to produce nervous symptoms, especially tremors, at a much earlier period. It has been used as a stimulant in feeble scrofulous children, and in bronchial affections, when it is said to moderate the cough and diminish the expectora-

As used in Pharmacy it contains a small propertion of other spirituous substances, as propylic, butylic, and other alcohols, and sometimes ethylic

It is used to prepare valerianate of soda.

A., anhy'drous. A synonym of Absolute alcohol.

A., glycer'ic. A synonym of Glycerine. A., mesit'ic. A synonym of Actone.
A., methyl'ic. See Methylic alcohol.

A synonym of Phenol or A., phenyl'ic. Carbolic acid.

A., phloryl'ic. A synonym of Phlorol.
A., poi'soning by. See Drunkenness, Alcohol, and Alcoholism.

A., pyroxyl'ic. A synonym of Methylic alcohol.

A. thermom'eter. See Thermometer, alcohol.

A., wood. A synonym of Methylic alcohol. Al'cohol, Br. Ph. The officinal term for Alcohol, absolute.

U.S. Ph. Spirit of the specific gravity 0.835.

The term alcohol is used as a synonym of Spiritus or Tinctura.

A. ace'ti. A synonym of Acetic acid. A. ammo'niæ et guai'aci. The Tinetura guaiaci ammoniata.

A. ammonia'tum. The Spiritus ammoniæ, U.S. Ph.

A. ammonia'tum aromat'icum. The Spiritus ammoniæ aromaticus.

A. ammoniatum fœ'tidum. Spiritus ammoniæ fætidus.

A. amyl'icum, Br. Ph. See Alcohol amylic.

A. camphora'tus. A synonym of the Alcool camphr

A. camphora tus debil ior. A synonym of the Eau-de-vie de camphre

A. castoria'tum. The Tinetura cas-

A. cum al'oe perfolia'ta. A synonym of the Tinctura aloes.

A. cum aromatibus compos'itus. The Tinctura cinnamomi composita, P. L.

A. cum aromat'ibus sulphurica tus. The Acidum sulphuricum aromaticum.

A. cum croto'ne cascaril'læ. Tinctura cascarillæ.

A. cum fer'ri sulpha'te tartariza'tus. The Ferri potassio-tartras.

A. cum gual'aco officina'le ammonia'tus. The Tinctura guaiaci ammoniata. A. cum o'pio. The Tinctura opii.

A. dehydrogena'tus. A synonym of Aldehyde.

A. dilu'tum. U.S. Ph. Alcohol mixed with an equal measure of distilled water. The sp. gr. is 0.941.

A. ethe'reus ferra'tus. A synonym of

the Tinctura sulphurico-etherea ferri.
A. ferra'tus. The Tinctura ferri sesquichloridi.

A. for'tius. Un. St. Ph. Spirit of the specific gravity 0.817.

A. io'dii. The Tinctura iodi.

A. mar'tis. A synonym of the Ferrum pulveratum, G. Ph.

A. sulfu'ris. A synonym of Carbon bisulphide.

A. sulphurica'tum. A synonym of the Elixir acidum Halleri.

A. sulphu'ricum. A synonym of the Elixir acidum Halleri.

A. vi'ni. Rectified spirit.

Alcohola'ta. (G. destillirte Weingeiste.) A term applied by Bèral to spirits distilled from any remedial agent.

Al'coholate. Term employed to signify a definite crystalline compound in which alcohol has taken the place of the water of crystallization, as  $ZnCl_2.2C_2\hat{H}_6O$ .

Also, applied to pharmaceutical preparations containing alcohol.

Alcoholativa. (F. alcoolatif; Wein-wistlosungen.) Name given by Bèral to alcoholic medicaments, simple or compound, prepared by solution, maceration, or digestion, and which were used chiefly as an external agent.

Alcoholatura. (G. Weingeistauszüge.) Beral's term for tinctures or chixirs made with

alcohol.

Organic bases pro-Al'cohol-ba'ses duced by the substitution of alcohol radicles for the hydrogen in ammenia.

Alcohol'ea. (G. Weingeistauflösungen).

A term applied by Beral to solutions in spirit of various remedies.

Alcoholic. Of or belonging to, mixed with, or of the nature of alcohol.

A. bev'erages. Fluid articles of diet which contain alcohol as part of their natural composition, such as beer, wine, spirits, eider, perry.

A. co'ma. Same as A. narcotism.

A. fermenta'tion. The conversion of sugar under the influence of ferments into carbonic diexide and ethyl alcohol (C6H12O6=2CO2+2C2 II<sub>6</sub>O<sub>2</sub>) The temperature most favorable to the process is 21°-26°C. (70°-80°F.) Other produets make their appearance coincidently, as glycerin, succinic acid, cellulose, fats, and occasionally lactic acid. The best ferment is yeast. It is probable that the yeast plant grows at the expense of the sugar, which it decomposes, applying part to the growth and formation of its own tissues, whilst the remainder breaks up into the above-mentioned compounds. See Fermentation. A. insan'ity. See Insanity, alcoholic.

A. nar'cotism. A term expressing the

extreme stage of Drunkenness.

Alcohol'ica. (L. alcohol. F. alcoiliques; G. Weingeistverbindungen.) Term by Beral of Paris for combinations of alcohol, as Alcoholuta, or distillations with aromatic substances; Alcoholatura, or tinetures, elixirs; Alvoholica, or solutions of acids, alkalies, oils; Alcoholativa, or solutions by distillation and maceration, for liniments and embrocations.

Alcoholisa tion. (F. alcoolisation; G. Alcoholisirung.) The development of the characteristic properties of alcohol in a liquid.

The saturation or mixture of a substance with

alcohol.

The act of obtaining alcohol from a fluid by distillation.

Al'coholism. (G. Sunfereachexie, Alkoholdyscrusic.) A term now generally used to express the destructive changes which occur in the body from the drinking of alcoholic liquors to excess. The first organ to suffer is the stomach, the appetite is bad, nausea and vomiting, especially in the morning, occur, the tongue is foul, and the breath offensive and peculiar in smell, from acetone and similar products; diarrhea is not uncommon, occasionally there is constipation. Sometimes there is emaciation, sometimes fatness; there is often paleness of skin, and frequently acne and tubercles on the nose. The respiratory organs often suffer; chronic bronchitis and emphysema are not rare; cirrhotic diseases, especially of the liver, kidney mischief, and arterial degeneration, gout, epilepsy, delirium tremens, and insanity, are common consequences.

The constant drinker sellom long escapes indications of serious disorder of the nervous system; tremor is commonly early in appearance, first of the hands and facial muscles, then of the mouth; afterwards the muscles of the legs are affected, memory fails, the speech becomes thick, the sensations are blunted, and paralysis may occur, or attacks of an epileptic character may ensue. The mental condition is gradually weakened, and the moral state degraded. The post-mortem changes consist of congestion of the membranes of the brain, with scrous effusions and opacities, and atheromatons or other degeneration of the walls of the blood-vessels, which also pervades those of the whole body; interstitial thickening or selerosis is not infrequent. cranial bones are hardened and thickened. The lungs, liver, and kidneys undergo cirrhotic and other changes.

Capsicum and gentian have been given to stop the craving for drink; morphia along with stomachies before a meal is said to relieve the nausea and gastrie pain; phosphorus and arsenic have been recommended; bromides, lupulin, and tonics, are also of service.

See also, Delirium tremens, Dipsomania. A., acu'te. See Alcohol and Drunkenness. Also, a synonym of Delirium tremens.

A., chron'ic. The term has been used to express the condition described under Alcoholism; and also as a synonym of Alcoholic insunity.

Alcoholized. Containing or relating to alcohol.

**Alcoholom'eter.** (Alcohol; μέτρου, a casure.) An instrument for ascertaining or measure.) measuring the quantity of alcohol in any alcoholic fluid. It is essentially an hydrometer graduated so as to indicate the percentage of alcohol present, either when the determination is made at a given temperature, to which the liquid which is tested is to be reduced; or at any temperature, when the amount is determined by reference to a scale which has been constructed. Also called Arcometer.

**Alcoholophil'ia.** (Alcohol; φιλέω, to love.) An overpowering desire for intoxicating liquids.

A. period'ica. Paroxysmal attacks of drunkenness.

Al'cohol-rad'icle. The hydrocarbon radicle which forms the basis of the composition of alcohols; as the hydrocarbon radicle ethyl, H<sub>5</sub>, which is the root of the structure of ethyl alcohol, which may be considered as water, 11,0, in which one equivalent of H is replaced by the radicle,  $C_2H_5$ , which by uniting with OH, forms  $C_2H_5$ .OH, or  $C_2H_6$ O.

Al'cohols. Organic compounds which are derived from hydrocarbons by the substitution of one or more of the contained atoms of hydrogen by an equivalent number of hydroxyl atoms, and are thus compounds of hydroxyl with hydrocarbon-radicles, which are thence called alcoholradicles; or they may be looked upon as water in which one atom of hydrogen is replaced by an alcohol-radicle. They are monatomic, diatomic. triatomic, or otherwise, according to the number of hydroxyl groups which they contain, or according to the equivalent values of their hydro-curbon radicles. Monoacid, diacid, are equivalent terms to monatomic, diatomic. Ethyl alcohol, C<sub>2</sub>H<sub>6</sub>O, is considered to be composed of the radical ethyl, C2II5, and hydroxyl, OII, and its rational formula is CoH5OH. When the hydroxyl is replaced by chlorine, bromine, iodine, or duorine, the resulting compound is a haloid ether; thus ethyl alcohol,  $C_2H_3OH$ , treated with hydrochloric acid, HCl, yields  $C_2H_3Cl+H_2O$ , ethyl chloride and water. Ethers may thus be looked upon as salts; and so while from a monatomic alcohol one ether only can be formed, from a triatomic alcohol three ethers can be formed, and so on. The hydroxyl of an alcohol may be replaced by an oxide of a metal, as potash or potassoxyl; thus ethyl alcohol, C2H5OH, yields potassium ethylate, C2H5OK. These compounds are called oxygen ethers.

A., aromat'ic. Alcohols formed by the substitution of an hydroxyl group, OH, for an atom of hydrogen in benzeue, toluene, and the higher benzene homologues. The substitution may be of one, two, or three atoms, forming monatomic, diatomic, and triatomic alcohols.

A., caus'tle. A term which has been applied to sodium and potassium ethylate from their action on the tissues.

A., conden'sed. A term applied to sugar and amylaceous substances.

A., diatom'ic. Alcohols containing two

hydroxyl groups replacing two hydrogen atoms. A., monatom'le. Alcohols containing one group only of hydroxyl in substitution for a

hydrogen atom.

A., pri'mary. Alcohols in which one or two only of the four hydrogen atoms existing in the type methane, CII4, is replaced; in the first instance by hydroxyl forming CH3OH, methyl, and in the second instance, another atom is replaced by a hydrocarbon, as C. CH3H2OH, ethyl alcohol. Primary alcohols on oxidation yield aldchydes.

A., sec'ondary. Alcohols in which three of the hydrogen atoms in the type methane, CH4, are replaced; one by hydroxyl and two by hydrocarbons, as C. CH<sub>3</sub>.CH<sub>2</sub>.H. OH, propylic alcohol.

Secondary alcohols on oxidation form ketones.

A., ter'tiary. Alcohols in which all the hydrogen atoms in the type methane, CH<sub>4</sub>, are replaced; one by an hydroxyl group, and the three others by hydrocarbons, as C. CH<sub>3</sub>. CH<sub>3</sub>. CH<sub>2</sub>.OH, butylic alcohol. Tertiary alcohols on oxidation give rise to acids.

Alco'homel. A pharmaceutical preparation composed of one part of alcohol and three of

Al'col. (Same word as Alcohol.) An old

name for Acetum, or vinegar.

Al'cola. (Arab.) A term for Aphtha, according to Avicenna, l. i. fen. 2. doct. 3, c. 3. A term also for the tartar, or sediment of the urine, being of three forms, in solution, sandy, or mucilaginous; used by Paracelsus.

Al'colæ. A synonym of Aphtha. Alcolis'mus. Ancient name for the reduction of anything to powder by corresion

Alcol'ita. A name for the urine; according to Paracelsus, de Urina jud. l. i. tr. 2, c. 1, 2, 3, to indicate that it contained a sediment.

Al'cone. (Arab.) An old name for the metal Ls, or brass. (R. and J.)

Alco'ol. The same as Alcohol.
A. camphora'tus. The Alcool camphre. Fr. Codex.

A. camphora'tus debil'ior. The Eau-

de-vie camphrée, Fr. Codex. A. cam'phré. Fr. Codex. Camphor 100, alcohol of 90 per cent. 900 grammes. Dissolve and filter.

A. repurga'tus. The Alcool rectifié, Fr. Codex.

Al'coolat. A French term for the product of the distillation of alcohol with medicinal substances.

A.ammoni'acal féti'de. (F. essence unti-hysterique.) Castor 40, asafætida 20, oil of amber 10, oil of rue and of savin, of each 5, alcohol 800 parts. Marerate four days, and distil; to the product add camphor 5, ammoniacal spirit of hartshorn 80 parts Distil to dryness. Anti-hysteric. Used by friction over the epigastric region, by inhalation, and internally.

A. antiscorbuti'que. The Spiritus ar-

moraciæ composita, P.B.

A. aromati'que ammoni'acal. Fresh rind of oranges and of lemons 100, vanilla 30, cloves 10, canella 15, sal ammoniac 500, carbonate of potash 500, eau de cannelle 500, alcohol 500. Macerate three or four days, and distil 500 parts. Stimu'aut, diaphoretic, carminative, and emmenagogue. Dose, 5 to 30 drops.

A. aromati'que de Syl'vius. See Al-

coolatum aromaticum Sulvii

A. d'ab'sinthe com'posé. The Alconlatum absinthii compositum.

A.d'a'nis. Fr. Codex. Aniseed 1000, ale shol of 80 per cent. 8000 grammes. Macerate for two

days and distil off.

A. d'au'née com'posé. (F. elixir americain de courcelles.) Compound spirit of elecampane. Roots of elecampane 640, of birthwort and of sugarcane of each 480, of Arundo donax 30, of asarabacca 10, leaves of Persea gratissima 160, of St. John's wort 320, of elder 80, of Croton balsamifera 40, of rosemary 20, of Justicia pectoralis 20, orange flowers 40, bark of Bois de fer 60, juniper berries 30, lime flowers 20, opium 25, half a fruit of the Crescentia cujeté, ashes of the above plants 240, alcohol 2000 parts, water q.s. An antilactic.

A. de bad'iane. Fr. Codex. Spirit of star-

anise. Made like A. de cannelle.

A. de bergamot'te. Fr. Codex. Made

like A. d'écorces d'orange.

A. de cannelle. Fr. Codex. Ceylon canella bark 1000, alcohol at 80 per cent. 8000 grammes. Macerate for four days, and distil the

A. de cannel'le com'posé. (F. esprit de vie de Mathiole.) Canella 30, galanga, marjoram, mint, cubehs, aloes wood, ginger, zedoary, cloves, nutmeg, mace, of each 15, sweet flag 8, thyme, wild thyme, sage, rosemary, red-rose petals, of each 8, yellow sandal wood, small cardamom, anise, fennel, of each 4, lemon peel 45, alcohol 3000 parts. Distil all the spirit.

A. de car'vi. Fr. Codex. Spirit of caraway.

Made like A. d'anis.

A. de ce'drat. Fr. Codex. Spirit of citrons. Made like A. d'écorces d'orange.

A.de ci'tron. Fr. Codex. Spirit of lemous. Made like A. d'écorces d'orange.

A. de ci'trons com'posé. Eau de Cologne. A. de cochlea'ria. Fr. Codex. Spirit of scurvy grass. Fresh leaves of scurvy grass 3000, fresh root of wild horseradish 400, alcohol of 80 per cent. 3500 grammes. Macerate for two days, and distil 3000 grammes.

A. de cochléa ria com posé. The Al-

coolatum cochlearia compositum.

A. de cochléa'ria et de cres'son composé. (F. cau de Madame de la Vrilliere.) Fresh scurvy grass, fresh watercress, of each 160. canella 40, fresh lemon peel 30, red-rose petals 20, cloves 15, alcohol 960 parts. Macerate four days, and distil. A favourite remedy for toothache.

A.d'écor'ces d'oran'ge. Fr. Codex. Spirit of orange peel. Fresh orange peel 1009, alcohol of 80 per cent. 6000 grammes. Macerate for two days, and distil the spiritnous part.

A. de corian'dre. Fr. Codex. Spirit of coriander. Made like A. d'anis.

A. de fen'ouil. Fr. Codex. Spirit of fennel

seed. Made as A. d'anis.

A.de Fioravan'ti. Fr. Codex. Balsam of Fioravanti. Turpentine of the larch 500, elemi. tacamahaca, amber, liquid storax, galbanum, and myrrb, of each 100, aloes 50, laure1 berries 100, galanga, ginger, and zedoary roots, of each 50, Ceylon canella, cloves, nutmeg, and leaves of

Dictamnus of Crete, of each 50, alcohol of 80 per cent. 3000 grammes. Macerate the roots, canella, cloves, nutmegs, and laurel berries, for four days in the alcohol, then add the remainder, and macerate for two days more, and distil 2500 grammes.

A. defleurs d'oran'ger. Fr. Codex. Spirit of orange flower. Made as A. d'écorces d'orange.

A. de four mis com posé. (F. eau de magnanimité.) Red ants 720, alcohol 1080 parts Macerate for five or six days, distil to dryne ... and infuse in the product canella 90, cubebs 15, cloves 22, zedoary 38, cardamoms 22 parts. Distil again to dryness. It contains formic acid. Cordial, stomachie, and diuretic. Used also externally in paralysis and weakness of the joints. Dose, 4-8 grammes.

A. de Ga'rus. Fr. Codex. See Alcoolatum Gari.

A. de genie vrc. Fr. Codex. Spirit of

juniper. Made as the A. de cannelle.

A. de geniè'vre com'posé. (Spiritus juniperi compositus, P. L.) Juniper berries 500, caraway and fennel seeds, of each 60, alcohol 4000, water 1000 parts. Distil to 4000 parts. Diuretic and stomachic.

A. de giro'fle. Fr. Codex. Spirit of cloves.

Made as the A. de cannelle.

A. de lavan'de. Fr. Codex. Spirit of lavender. Made as the A. de romarin.

A. de mélis'se. Fr. Codex. See Alcoolatum melissæ compositum.

A. dementhepoi'vrée. Fr. Codex. Spirit of peppermint. Made as A. de romarin.

A. de ro'marin. Fr. Codex. Fresh leaves of resemany 1000, alcohol of 80 per cent. 3000, water of rosemary (Eau distiller de romarin) 1000 grammes. Macerate for four days, and distil 2500 grammes.

A. de térében'thine com'posé. See Fioravanti, balsam of.

A. de theria que com posé. Root of angelica, elecampane, Cyperus longus, of each 60, root of contrajerva, Imperatorix Ostruthium, serpentary, valerian, zedoary, and galanga, of each 30, canella, cloves, fresh orange peel, fresh lemon peel, juniper berries, laurel berries, tops of rosemary, of rue, and of sage, of each 14, treacle 250, alcohol 1500, water of walnuts 1500 parts. Macerate the dry material in the alcohol, add the other substances, and distil the spirituous part. Sudorific, cordial, stomachic. Dose, 2-15Dose, 2-15 grammes.

A. vulnéraire. Fr. Codex. See Alcoolatum vulnerarium.

Alco'olate. Same as Alcoholate.

Alcoola'tum. (F. alcoolat; S. espiritus; G. Geist.) An essence or spirit. A pharmaceutical preparation, consisting of alcohol charged with the volatile and other principles of drugs obtained by distillation. Alcoolata are simple and compound; of the former are those of wormwood, aniseed, canella, castoreum, pyrethrum, saffron, vanilla, and many others.

A. absin'thii compos'itum. Fr. Codex. Absinthium 2000, juniper berries 250, canella 60, angelica root 15, alcohol 8500 parts; distil twice to 5000 parts. Stimulant, tonic, stomachic.

A. ani'si. The Alcoolat d'anis, F. Codex. A. antiscorbu'ticum. (F. esprit de raifort composée.) The compound spirit of horseradish, P.B.

A. aromat'icum ammoniaca'ie. The Alcoolat aromatique ammoniacal, Fr. Codex.

A. aromat'icum Syl'vii. (F. esprit carminitif de Sylvius.) Dried leaves of basil, marjoram, rosemary, and rue, of each 24, seeds of angelica, anisced, and lovage, of each 8, laurel berries, untmeg, canella, angelica root, of each 6, galança root, ginger, cloves, orange peel, of each 3, alcohol, 760 parts. Cordial and stomachic. Dose, 6—8 grammes.

A. bryo'niæ compos'itum. Belg. Ph. Castor in coarse powder 7 grammes, alcohol of 75 per cent. sufficient to form 50 grammes of tineture; add to the marc of the easter, fresh leaves of rue 81, of savin 7, of pennyroyal 7, of basil 7, of matricaria 7, of catmint 7, orange peel 14, myrrh 14, fresh bryony root 168, alcohol of 50 per cent. 336, and water 2000 grammes. Distil 950 grammes, and add it to the fincture of castor.

A. cochlea'riæ compos'itum. Fr. Co-Fresh leaves of scurvy grass 3000, fresh roots of wild horseradish 400, alcohol 3000; macerate two days, and distil 3000 parts. Antiscorbutic. Dose, 1—4 grammes. Used also as a gargle.

A. cor ticis cinnamo'mi. The Alcoolat de cannelle, Fr. Codex.

A. cor'ticum fruc'tuum auran'tii. The

Alcoolat d'écorces d'orange, Fr. Codex.

A. de ero'co compos'itum. A synonym of the Elixir of Garus.

A. fra'grans. Ean de Cologne.
A. Ga'ri. Fr. Codex. Socotrine aloes and saffron, of each 5, myrrh 2, canella 20, cloves 5, nutneg 10, alcohol 5000; macerate four days, filter, add a litre of water, and distil over the spirit. Used to prepare the Elixir of Garus.

A. melis'sæ compos'itum. Fr. Codex. (F. caude melisse à Carmes.) Fresh balm 900, fresh lemon peel 150, canella, cloves, and nutmeg, of each 80; coriander seeds 40, angelica root 40, alcohol 5000; macerate four days, and distil the spirituous part. Excitant, stimulant, nervine. Dose, a teaspoonful to a tablespoonful. Used also externally.

A. rosmari'ni. 'The Alcoolat de romarin, Fr. Codex.

A. vulnera'rium. Fresh leaves of basil, calamint, hyssop, marjoram, balm, mint, origanum, rosemary, savory, sage, wild thyme, thyme, wormwood, angelica, fennel, rnc, tops of hypericum, and lavender flowers, of each 100, alcohol 4500 parts; macerate six days, and distil 3000 parts. Stimulant and vulnerary. A popular remedy in bruises, contusions, and wounds of the head. Used internally and externally. Dose, 8-15 grammes.

Alcoolatu'ra. See Alcoolature.

A. de aconi'to. The Alcoolature d'aconil, Fr. Codex.

Alcoolatu're. (Fr.) An alcoholic tiucture

prepared with fresh plants.

A. d'ac'onit. Fresh leaves of the Aconitum napellus collected at the beginning of the flowering of the plant 1000, alcohol of 90 per cent. 1000. Bruise the leaves, add the alcohol, and in ten

days express and filter.

In the same manner are prepared, according to the Fr. Codex, alcoolatures of leaves of pulsatilla, belladonna, hemlock, spilanthes oleracea, digitalis, henbane, lactuca virosa, rhus radicans, stramonium, flowers of arnica and colchicum, and bulbs of colchicum.

Alcoolé. (Fr.) An alcoholic tineture prepared by dissolving medicinal substances. Alcoolom'eter. A synonym of Alcohol-

Alcoom'eter. A synonym of Alcohol-ometer.

Alcoothio'nic acid. (Alcohol; θεῖου, sulphur.) Applied by Magnus to œnothionic acid.

Al'cophyre. A substance once supposed to be a definite albuminoid priociple, but now believed to be a mixture of several substances.

Al'cor. (Arab.) Old name for the oxide

Al'cor. (Arab.) Old name for the oxide of copper or burnt copper. (R. and J.)

Al'core. Arabie for a stone said to have spots or streaks like silver. (R. and J.)

Alcor'nin. Name of a peculiar substance

Alcor'nin. Name of a peculiar substance discovered by Biltz in the alcornoco bark, and which he supposed to be intermediate between fat and wax.

Alcorno'co. See Alcornoque bark.

Alcorno que bark. (F. ecoree d'alcornoque.) The hark of the Bouditchia virgilioides, Tribe Sophoreæ, Fam. Papilionaceæ, Nat. Ord. Legaminosæ, a S. American tree formerly prescribed for phthisis; now disused. It gives a yellow colour to the saliva, and a strong decoction acts as an emetic.

**A., Amer'ican.** A bark used in tanning, said to be the produce of Byrsonima lawifolia, B. rhopalæfolia, and B. coccolobæfolia; together with the bark of the Bowditchia virgilioides.

A., Brazilian. (Fr. alcornoque de Brésil.) The bark of the Bowditchia major. Used in rheumatic pains, syphilis, and dropsy.

A., Europe'an. The name applied in Spain to the bark from the small branches of the cork tree, Quercus suber.

Alcruel'la. Nat. Ord. Compositæ. Several species are aromatic aud sialogogue.

Alc'te. An old name for a plant mentioned by Hippocrates, which was supposed by Föesius to be the elder tree.

Alcu'ba. (Arah.) Term for crude butter. Alcu'brith. Arabie term for sulphur. Al'cyon. ('Αλκυών, the kingfisher, often

Al'cyon. (Alkavów), the kingfisher, often written άλκυόω; from its supposed derivation from äls, the sea;  $\kappa i \omega_n$ , to conceive; because it was supposed to hatch its eggs in the sea. F. salangane.) A synonym of the Collocalia esculenta, a swallow, whose nest is eaten. See Bird's nest, edible.

Alcyona'ceæ. A synonym of Alcyoniidæ. Alcyona'ria. (G. Rinder., or Fieder-corallen.) An Order of the Class Actinozoa, Sub-kingdom Cælenterata. Polypes and colonies of polypes provided with eight bipinnate tentacles in ooe series, and the same number of uncalcified mesenterioid folds. Corallum external, spicular, or with a sclerobasic axis, or consisting of rigid calcareous tubes.

Alcyo'niæ. A Subfamily of the Family Alcyonidæ having the polypary formed by lateral budding, constituting lobed or ramified masses.

Alcyonidiidæ. A Family of the Suborder Ctenostomata, Order Gymnolamata, Class Polyzoa, Subkingdom Vermes. Zooæcium united into fleshy colonies of an irregular form.

Alcyoni'idæ. A Family of the Order Alcyonaria. Polypary fixed and fleshy, having no axis, and only a small number of calcareous spicules. The general cavity of each polype directed to the hase of the econosarc.

Alcyo'nium. (For Halcyoneum, fancifully said to be the foam of the sea indurated, wherewith halcyons make their nests.) A Geous of the Family Alcyoniidæ, Order Alcyonoria, Class Actinozoa, Subkingdom Calenterata. Dead

men's fingers. Polypary spongy, digitate; having stellate apertures, through which the polypes can be entirely retracted. Corallum consisting of cruciform spiculæ scattered through its substance. Its ashes were used as a dentifrice, and as a remedy for haldness; also to promote the growth of hair. Several species were employed.

Aldaba'ram. Another spelling by Joh.

Van Horne, Mierocosm. s. 59, of Albadara.

Al'dehyde. (Al, the first syllable of alcohol; dehyd, the first two of dehydrogenatus, deprived of hydrogen.) Usually applied specially

to acetic aldehyde.

A., acetic. C<sub>2</sub>H<sub>4</sub>O. (G. athylaldehyde, athyladenoxyd, acetaldehyde.) Acetic aldehyde, or acetaldehyde, is formed from the oxidation of ethyl alcohol. Six parts of sulphuric acid, four parts of rectified spirit of wine, and four parts of water, are mixed and poured upon six parts of powdered manganese dioxide; six pints of fluid are distilled over, and then redistilled twice with calcium chloride; the product is mixed with twice its volume of ether, and saturated with ammonia gas; the resulting crystalline compound of ammonia and aldehyde, when washed with a little ether, is dried in the air; it is then distilled in a water bath with sulphurie acid, diluted with an equal quantity of water, and the distillate rectified with calcium chloride. It is hmpid, colourless, of characteristic ethereal odour, and mixes well with alcohol, ether, and water. Density 0.807, at 0° C. (32° F.), boils at 21°—22° C. (69.8°—71.6° F.), and is very inflammable. On further oxidation it is converted into acetic acid. It is found in first runnings of beet sugar spirit, and potato spirit, probably from oxidation during the filtration through charcoal. It is an energetic reducing agent.

It is an antiseptic when diluted with thirty parts of water; applied undiluted it is an irritaut, and eauses inflammation of the parts, at times it has even a caustic action. When taken internally in a diluted form it produces intoxication, anæsthesia, andaspbyxia. When inhaled it soon produces insensibility; in large amounts it arrests the breathing at first, soon afterwards this is re-established and becomes very quick; there is often vomiting and convulsions; the heart's impulse and the bloodpressure are increased, and it is believed that the excitability of the cardiac fibres of the vagus is extinguished; death occurs from suspension of the respiration, whilst the heart's action persists; aldehyde is found in the blood, in the urine, and

in the breath, after administration.

A., acryl'ic. A synonym of Acrolein.
A., ani'sic.  $C_6H_4(OCH)_3$  COH. Formed by the oxidation of anisic alcohol or of the volatile oils of anise, fennel, and tarragon.
An oily liquid of fragrant odour, of sp. gr. 1·123 at 15° C. (59° F.), and boils at 247° C. (476·6° F.)

A, benzo'ic. The oil of bitter almonds.  $C_7H_6O = C_6H_5$ .COH. It is produced by the oxidation of benzylie alcohol; by distilling a mixture of calcium benzoate and formate; by the oxidation of amygdalin with nitric acid; and by digesting bitter almonds in water. It is a colourless mobile liquid, of great refractile power, of sp. gr. 1.063 at 0° C. (32° F.), boiling at 180° C. (356° F.), soluble in alcohol and ether and in thirty parts of water. It forms crystalline salts with the alkaline bisulphites.

A., cinnam'te.  $C_9H_9O=CH(C_6H_5)$ .CH. COH. The essential part of the oils of cinnamon and cassia. A colourless, heavy oil, which

y

rapidly absorbs exygen on exposure to moist air, and is converted into cinnamic acid.

A., etha'lic. A synonym of Cetyl alcohol or Spermaceti, which is also called ethal.

A., methoxybenzo'ic. A synonym of Anisic aldehyde.

A., me'thyl-protocatechu'ic. A syno-

nym of Vanillin.

A., cenanthyl'ic. CH<sub>3</sub>.(CH<sub>2</sub>)<sub>5</sub>.CHO. A substance formed during the dry distillation of castor oil; also called cenantbol.

A., oxybenzo'ic. A synonym of Salicylic aldehyde.

A. res'in. A brown resin-like substance obtained from aldehyde when heated with caustic potash.

A., salicyl'ic.  $C_7H_6O_2$ . A thin, colourless fragrant oil, occurring in the flowers of the meadow sweet, Spiræa ulmaria, and other species of the same genus. It is formed by the oxidation of salicin and populin. It has a sp. gr. of  $1\cdot1725$  at  $15^{\circ}$  C.  $(59^{\circ}$  F.), solidifies  $*t-20^{\circ}$  C.  $(-4^{\circ}$  F.), and boils at  $196^{\circ}$  C.  $(384\cdot8^{\circ}$  F.) It is soluble in alcohol and ether, slightly in water. It forms salts, salicylites, with alkalies.

A., trichlorina ted. A synonym of Chloral.

A., vi'nic. A synonym of Acetic aldehyde. Aldehy dene. A name given to the radicle C<sub>2</sub>ll<sub>3</sub>, derived from ethylene by the ab-

straction of hydrogen.

Aldehy'des. Bodies containing the bivalent group CO, associated, on the one band, with a monatomic alcohol radicle, and on the other, with hydrogen, as H-CO-CH<sub>2</sub>, acetic aldehyde; H-CO-C4ll9, valeric aldehyde. They are derived from primary alcohols by elimination of one or more equivalents of hydrogen (H<sub>2</sub>) without introduction of an equivalent quantity of oxygen, so that they hold a position intermediate between the primary alcohols and the corresponding acids. They contain two atoms of hydrogen less than the alcohols, and one atom of oxygen less than the corresponding acids. The aldehydes are derived from monatomic alcohols by the withdrawal of two units of hydrogen, and from diatomic alcohols by the withdrawal of four Aldehydes are easily converted by units. oxidation into the corresponding acid, whilst nascent hydrogen converts them into the corresponding alcohols. Many of the oxygenated essences are aldehydes; ordinary camphor, for example, is campholic aldehyde. Aldehydes are powerful reducers.

A., aromat'ic. Aldehydes of the benzene group, of which benzoic aldehyde is the repre-

sentative

Aldehyd'ic. (Same etymon.) Belonging to or having the nature of aldchyde.

A. acid. (F. acide lampique.) A synonym of what was supposed to be acetous acid, but which is now known not to differ from acetic acid. It obtained this name because it was a product of the oxidation of aldehyde as well as of alcohol.

Alder. The Alnus glutinosa.

A., American. The Alnus serrulata. A., ber'ry-bearing. The Rhamnus franqula.

A., black. The Rhamnus frangula; also the Prinos verticillatus.
A., Europæ'an. The Alnus glutinosa.

A., tag. The Alnus incana.

A., white. The Clethra almfolia.

Al'dide. The generic name applied by L. Gmelin to the aldehydes, the latter term being by him restricted to acetic aldehyde.

Ale. (Sax. cala, cale, or aloth; Gael. ol, to drink.) An ordinary English alcoholic beverage made or brewed from pale malt and hops. London ale contains 6.20 per cent. of alcohol, Edinburgh ale 6.22, and Burton ale 3.88. Burton ale contains about 14 per cent. of extract of malt, Edinburgh ale about 10 per cent. Pale or bitter ale is well fermented, so that it contains little sugar, and great care is taken so as to preserve the aroma, and to obtain it clear and bright. The same may be said of Bavarian ales. See Beer.

A., Dev'onshire white. The wort, prepared in the ordinary way, is boiled with hops and crushed groats; it is then strained and set aside to ferment. It is drunk in a state of effervescence, and is considered untritive, but some-

what relaxing.

**A'1e.** (Αλή, a wandering; G. Geistesver-wirrung.) Perplexity or confusion of mind.

Ale berry. An old nutritive stimulant, consisting of toasted bread soaked in hot ale in which spices and sugar had been hoiled.

Al'ec. Arabic for Sulphas ferri, or vitriol. (Quincy.)

Alec. (G. Fischlake, Häringslake.) The same as Alex.
Alech. Same as Alec.

Alech'arith. Arabic for Hydrargyrum, or mercury. (R. and J.)

Ale cost. (Ale; κόστος, an unknown The Balsamita suaveolens, so aromatic herb.) called because it was used for flavouring ale.

**Alec'tor.** ('Αλέκτωο, a cock.) Term applied to one who watches or is unable to sleep. Alecto'ria. (Same etymon.) Same as Alectorius.

Alecto'ria. (Same etymon.) A Genns of the Nat. Ord. Lichenes.

A. ar'abum. Oschnah. Said to be sedative and soporific.

A. crina'lis. A species which is used by the edible swallow, Collocalia esculenta, to form the interior of its nest. It grows on the ground. and consists of white, cylindrical, very fine filaments.

A. juba'ta. A species which yields a colouring matter like litmus.

A. usneoi'des. Used as tonic, demulcent, and nutrient.

Alecto'ria gem'ma. Lapis Alectorius. A stone from the intestine of the cock. See Alectorius.

**Alector** idæ. ('Αλέκτωρ, a cock.) **A** Family of the Order Grallatores, Class Ares. **A** link between Grallatores and Natatores. Beak strong, short, and bulged, the borders of the mandible overlapping those of the maxilla; wings strong but short, and not well fitted for flight. often armed with a spur; legs long, strong; toes short, often with a rudimentary web; hind toe rudimentary. Dwell in marshes in bot countries. Representative the Screamer, Palamedea cha-

Alecto'rioid. (Alectoria, a Genus of Lichens; ¿loos, form.) Being filiform, like the thallus of Alectoria.

Alecto'rious. (L. alectorius.) Of or belonging to a cock.

Alecto'rius. ('Αλέκτωρ, a cock.) Name for a stone said to be transparent, and about the size of a beau, and to be found in the stomach of a cock, or capon, after it is four years old; it was said also to possess great virtues, rendering those who wear it rich and brave. It acts as a philtre, and restrains thirst.

**Alectorol'ophus.** ('Αλέκτωρ, a cock; λόφος, the cock's comb. G. *Hahnenkamm*.)

The Crista galli of the ethmoid hone.

Also, a plant used by the Romans in cough and opacities of the cornea, identified with Rhinan-thus Crista Galli. (Pl. 27, 5, 23.)

Alectoromor phæ. ('Αλίκτωρ, a cock; μορφό, form.) A synonym of Gallinæ.

Alec'trides. (Same etymon.) The Crista galli of the ethmoid bone.

**Alec'tros.** (Gr.) Same as *Alectrus*. **Alectru'rous.** (Αλέκτωρ, a eoek; οὐρά, a Cock-tailed; having a tail like the cock's. **Alec'trus.** ('A, neg.; λέκτρον, a hed. G. chelos.) Without a bed; unmarried.

Alectryoman'tia. ('Αλέκτωρ, a cock;

μαντεία, prophecy.) Divination from the order in which a cock picked up grains distributed upon an alphabet.

Ale'gar. (Ale, and F. aigre, sour.) Vinegar. Ale gill. Ale in which the leaves of the Nepeta glechoma, the ground ivy, have been infused.

Ale'hoof. (Ale; A. S. hufa, a crown.) The

Aleim'ma. ('Αλείφω, to anoint.) An ointment of any kind.

**Aleiph'a.** (Άλει $\phi$ a, anointing oil; from ἀλεί $\phi$ ω, to anoint.) Name for an ointment made with medicated oils. Used by Hippocrates, l. ii, de Morb. xxvi. 14.

Aleipte rium. ('Αλειπτήριου.) place for anointing in the gymnasia.

Aleip'tron. ('Αλείπτρον, for εξάλειπ-τρον.) A box for ointments.

Alelæ'on. ('Αλέλαιον, from åλs, salt; ἔλαιον, olive oil.) A term for a compound of salt and oil to be applied to tumours; used frequently by Galen. (Quincy.) **Ale'ma.** ('Αλημα, from ἀλέω, to grind.)

Fine flour.

Alem'bic. (Arab. article al; ἄμβιξ, a cup r pot, from ἀμβη, a projecting lip, or, perhaps, from ἀμβαίνω, for ἀναβαίνω, to ascend. F. alambie; G. Destillirkolben.)

Name for a utensil made of glass, metal, or earthenware, by means of which distillations were conducted; consisting of a body, the cucurbit, with a conical head, the capitol, adapted to it, from which a beak descends to be inserted into a receiver, or condenser; a moorshead; a capitulum.

Also, an ancient name for Hydrargyrum, or

mercury.

Alem'broth. (Chald. The key of art.) The preparation Sal alembroth; also called salt of wisdom, HgCl2.2NH4Cl.H2O, a chloride of mercury and ammonium, corresponding to the Hydrargyrum præcipitatum album of the late London Pharmacopæia.

A. desicca tum. A term for Sal tartari,

the carbonate of potash.

Alemzadar. Arabic for Sal ammoniacum, native ammonium chloride.

Alemzadat. Same as Alemzadar.

**Ale'non.** Ancient epithet, Gr. ἄληον ελαιον, of oil of almonds, according to Aëtius, vii. 69. (Gorræus.)

Aleocharides. A Subfamily of the Family Staphylinides, Group Pentamera, Order

Colcoptera. The antennæ inserted on the inner border of the eyes.

**Al'cos.** ('Aλεός, for ἀλεωνός, lying open to the sun, from ἀλέα, warmth.) An old word sometimes signifying heat, according to Hippoerates, i, de Morb. Mul. xiv, 6, 8.

**Alepido'tus.** ('A, neg.;  $\lambda \varepsilon \pi i s$ , a scale. G. schuppenlos.) Without scales.

Alep'po but'ton. The Aleppo evil.

A. boil. A synonym of A. ceil. A. e'vil. (F. bouton d'Alep; G. Aleppo-beule; Arab. Habab et seuch.) A tuberentous exanthem developing in the subcutaneous cellular tissues, and subsequently attacking the skin, which ulcerates underneath scabs. The duration of its evolution is a year; it chiefly attacks the face and extremities. There is little or no accompanying pain or fever. Common in Aleppo, but seen also in Bagdad, Ispahan, Egypt, and other eastern places. Occurs at all ages, is not contagious; due to endemic causes; sometimes single; it sometimes appears in crops. No treatment appears to be effective; energetic cauterisation has been recommended. It appears to be of the same nature as the Delhi sore.

Late observations would seem to show that cases of syphilis, scrofulous disease, lupus, and other disorders, have been confounded with the

true Aleppo evil.

A. pus'tule. The Aleppo evil.

A. scam'mony. A name formerly given to the better kinds of scammony.

A. ul'cer. The Aleppo evil.

Al'es. ("Als.) Old term for a compound salt. Adjectively this word means heaped or collected together; sometimes it means contracted, as when applied to the uterus in that state; Gr. ales, the tonic form of ales, used by Hippocrates, iv. Epid. xxix, 10.

Alesh. Old term for the Alumen plumosum.

(Quiney.) Al'et. France; Depart. de l'Aude; Arrond. de Limoux. Bicarbonated calcic waters. There are three warm springs, of which, the hottest, is 28° C. (82.4° F.), and one cold and ferrugunous. They are easily digested, and are used in dyspepsia.

Al'eth. Same as Alet.

**Ale'ton.** ('Aλητον, that which is ground; from άλεω, to grind.) A term for meal or farina. Ale'tris. A Genus of the Nat. Ord. Hamo-

Also, the former pharmacopæial name, U.S., of

the root of the Aletris farinosa.

A. al'ba. A synonym of A. farinosa. A. au'rea. Hab. United States.

similar properties to A. farinosa.

A. farlno'sa. Star grass. Hab. United States. Leaves sessile, entire, lanceolate, smooth; flowers in a slender scattered spike; calyx absent; corolla oblong, tubular, six-partite, white. The root is small, crooked, branched, blackish, intensely bitter. Does not precipitate salts of iron. In small doses, ten grains, tonic and stomachic. Used in colic, dropsy, and chronic rheumatism. It sometimes produces nausea, and in large doses it is cathartic, emetic, and slightly narcotic. It is said to have an action on the uterus.

Aletu'do. (L., from alo, to nourish. G. Fettsein.) Obesity; fatness of the body.

('Αλευρίτης, of wheaten **Aleuri'tes.** ('Αλευρίτης, of wheaten meal. G. Gummilachaum.) A Genus of the Nat. Ord. Euphorbiacvæ.

A. am'binux. (F. alcurite des Moluques.) A synonym of the Croton moluccanum.

A. corda'ta. (F. arbre à l'huile, arbre à vernus; Jap. Wa-lung.) Abrami of Kampfer. This plant yields an oil that is extensively used as a varnish to preserve woods and textile and other fabrics.

A. gomes'ii. A Brazilian species having

similar properties.

A. laccif era. A Cingalese plant yielding gum lae.

A. molucca'na. (F. bancoulier des Moluques, noix de Bancoul.) Yields the Bancoul nuts; an efficient purgative. A synonym of

Croton moluccanum.

The Candlenut tree, the A. trilo ba. Tutui nut, Bancoul, Belgaum, or Indian walnut. Hab. Moluccas and the Sandwich Islands. Fruit a nut as large as a walnut, with a thick shell. and a kernel yielding nearly half its weight of oil, Kekune or Belgaum walnut oil. The nuts. strung on fibres of the palm leaf, are used as candles. The oil is very liquid, of an amber colour, insoluble in alcohol, solidifying at 0° C. (32° F.) It is a simple eathartic, like castor oil. and does not produce nausea; dose, half an ounce to an ounce. The nuts are said to be aphrodisiac. The tree exudes a gummy substance, called by the natives Tahitichew.

Aleuroman'tia. ('Αλευρον, meal; μαντεία, divination.) Divination from meal or

flour

Aleurom'eter. ('Αλευρον, meal ; μέτρον, a measure.) An instrument for estimating the increase of volume that a portion of gluten undergoes on being heated. It resembles an ordinary syringe, and the gluten is placed below the piston, the rod of which is graduated. The whole is placed in a bath of oil, and the amount of swelling, which is the greater the better the quality of the gluten, is easily read off.

Aleuron. (Αλευρου, wheaten flour; from άλεω, to grind. G. Weizenmehl.) A word used by Hippocrates, I. de Natur. Mul. ci, 3, signifying faring or meal, but properly, that of wheat or

A. grains. (F. aleurone ; G. Aleuronhörner, Klebermehl.) Amorphous granules of an albuminoid or proteinous nature, enclosed in a thin amorphous envelope, found in the endosperm and cotyledons of the seeds of certain plants replacing or accompanying starch. They are soluble in water, weak acids, and alkalies; they are insoluble in oil, alcohol, and ether. The surface of the granules is foveolated, sometimes warty, and they are stained brown by iodine tincture. They have no action on polarised light. They frequently contain crystals of calcium exalate, or granules of calcium and magnesium phosphate. Aleuron masses or crystals are found in the vitellus of the ova of fishes and other vertebrata, and have received the name of vitelline plates or scales.

**urote** sis. ('Αλευρότησις, a flour The process of, or the apparatus for, Aleurote sis. sieve.)

separating bran from meal.

Aleu'tian Isles. Forming the Archi-pelago of Russian America, in which are several active volcanos. Hot springs burst through the frozen soil of the Islands of Oumanak, Kanagli, and Ounalaschki.

Aleu tians. A Mongolian race inhabiting the Aleutian islands, a chain of volcanic islands, treeless, and generally enveloped in fog, lying between the peninsulas of Alaska and Kamtschatka. They are good sailors. They approximate somewhat in character to the Esquimaux;

the cephalic index is 78.

Alex. (G. Fischlake.) A preparation of the small fish called Aphna, with oysters, acalephs, and other marine animals; in use by the ancient Romans both as a condiment and as a vulnerary in bites and burns, also as a cure for the scab in

sheep. (Waring.)

Alexan'ders. The Smyrnium olusatrum.

A.,round-leav'ed. The Smyrnium rotun-

Alexan'dersbad. Bavaria; near Wunsiedel, in a charming neighbourhood, 1750 feet above sea level. An earthy saline chalybeate water of 11° C. (52° F.) Used as a tonic internally and as baths. There is a whey-cure establishment and pineleaf baths.

Alexan'dersquelle. Russia; in the nucasus, near Piätigorsk. Seven springs of Caucasus, near Piätigersk. carbonated saline waters, arising from the chalk, in which tufa, traclite, and basaltic conglomerate appear. Two contain a very small quantity

of sodium iodide.

Alexan'dri antido'tus aurea. Alexander's golden antidote. A compound of some seventy kinds of animal, vegetable, and mineral substances. Used in apoplexy.

A. emplas trum. A garlic plaster invented

by the same Alexander.

Alexan'dria. Italy; Piedmont. Five springs, one calcareous, in the Valley of Andusia; a second, sulphuretted and saline, in the district of Camagna; a third and fourth, of an hepatic odonr, in the valley of Saus; and the last, sul-

phurous, in the valley of Firata.

Alexan dria. Egypt. A town situated in the low sandy sea shore close to Lake Marcotis. The climate is very damp; malarious fevers and dysentery are commonly present. It is an unfit

residence for invalids.

Alexan'dria. (Alexanaria, inc. anomorphism of the Prunus lauro-cerasus, of its growth.) common laurel.

Alexan'drian laur'el. The Prunus lauro-cerasus, common laurel.

Also, the Kuscus aculeatus of Linnæus.

Also, the Calophyllum inophyllum.

A. sen'na. See Senna alexandrina.

Alexan'drine. The Emplastrum Alexandri, or Garlie plaster.

Alexan'thi. The Flos æris.

Alexeterium. ('Αλεξητήριον; from aλέξω, to repel, to ward off. G. Heilmittel.) A term employed by the Greeks for a remedy of whatever kind, but especially an alexipharmic medicine; the term was specially used to describe those remedies which counteracted the action of poisons when applied externally.

Alex'ia. ('A, neg.; \lambda \tilde{\xi}\_{\text{is}}, a word.) Loss of the comprehension of written symbols; inability

to understand writing.

**Alexic'acum.** ('Λλεξίκακος, keeping off ill; from ἀλέξω, to drive away; κακόν, evil.) Old term for an amulet or antidote to resist the effect of poisons.

Alexiphar macum. ('Αλίξω, to repel; φάρμακον, a poison. F. alexipharmaque; G. Gegengift.) A medicine against poison; an antidote.

**Alexiphar mic.** (' $\Lambda \lambda i \xi \omega$ , to repel;  $\phi \dot{\alpha} \rho \mu \alpha \delta \nu$ , a poison.) Having power to neutralise the effects of poison; applied to medicines supposed to have this power.

**Alexipyretic.** (Αλίξω, to repel;  $\pi \nu \rho \varepsilon \tau \delta s$ , a fever. G. fieberwiding.) llaving power to drive off fevers; febrifoge. ('A\(\xi\xi\xi\omega\),

Alex'ir. A synonym of Elixir.

Alex'isbad. Germany; near Bernburg, about two hours' drive from Quedlinburg. Altitude 1350 feet. The Selke spring (for baths) contains iron sulphide, but no CO<sub>2</sub>. The Alexis spring, the drinking water, contains iron carbonate and free carbonic acid. There are pine-needle baths, and the whey cure can be carried out.

Alexiterian. The same as Alexiteric.
Alexiteric. (G. Giftwidrig.) Having the properties of an Alexeterium; antidotal.

Alexite'rium. Same as Alexeterium.
A. chlo'ricum. Fumigation by means of chlorine evolved from sodium chloride, manganese oxide, and sulphuric acid.

A. ni'tricum. Fumigation by means of nitrous acid evolved from potassium nitrate and

sulphurie acid.

Alezaram. Term for the washing of lead. Alfac'ta. A former term for distillation. Alfad'idom. (A.) The scoriæ of gold, iron,

or copper; also the oxide of copper, or burnt copper.

Alfatide. Arabic for Sal ammoniac.

Alfiano. Italy; Piedmont, Province of Casale. Sulphur waters springing from the tufa, rich in sulphates; but little used.

Al'fides. (Arab) Old term for Cerussa. Alfol. Arabie for Sal ammoniae.

Alfo'rian race. The Alfurs.

Alfour ous. The same as Alfurs. Al'furs. A people of the island of Celebes, Moluceas and Philippine islands, believed to be Malays, or the predecessors of the Malays. They are dark, have black, thin, lank hair, very flattened nose, projecting cheek-bones, large eyes, prominent teeth, thick lips, and wide mouth.

Alfu'sa. (Arab.) Old name for Tutia or

tutty. (R. and J.)

Al'ga bucca'lis. The Leptothrix buccalis.

A. car'agaheen. The Chondrus crispus. A. digita'ta. The Laminaria digitata.

A. gemias'ma. A term given to the supposed Ague plant.

A. helminthochor'ton. The Alsidium helminthochorton.

A. mari'na. A synonym of Pila marina.
A. morbil'ii. A cryptogam which Dr. A. mari'na. Salisbury believed he had discovered to be the cause of measles.

A. Ordo'nel. A name given to a fungus which was supposed by M. Ordonez to exist in

certain heteradenic tumours.

A. spino'sa A synonym of Agar-agar. A. vesiculo'sa. The Fucus resiculosus.
A. zeylan'ica. The Ceylon Moss.

Alga'ceæ. A synonym of Algæ.
Al'gæ. (Algor, coldness, from their being constantly in the water; or alligo, to entangle, from the entangled appearance of particular species. F. algue; G. Meergrass, Tang.) A Nat. Order of the Sub-kingdom Thallophyta. They consist of a thallus, which may be foliaceous and branched, filamentous or pulverulent; it contains chlorophyll, which may be green, red, or brown. The tangles or algæ are parenchymatous cellular plants living in salt or fresh water, and form the first and most imperfect of the great provinces or branches of the vegetable kingdom. The complete body is a mass composed of simple cells, which is called a lobe or thallus, such thallus not vet being differentiated into true axial organs, stem and root, and leaf organs. The difference between the epidermie and central structure lies in the fact that the outermost cells are smaller with thicker walls, but the parenchyma and cambium of higher plants are equally wanting; growth takes place from a single apical cell. The cell wall consists of cellulose, which in many species becomes gelatinous. Many of the sea-weeds contain deposits of calcium carbonate, and the Diatoms have a siliceous enve-

lope.
The algae, whilst largely composed of very simple forms, include some that are highly developed. Reproduction is either asexual by means of motionless or motile spores; or sexual by fertili-sation, or by conjugation. It may be effected by fission, as in the Diatomaceæ; by budding, either of single cells or of groups of cells, as in the Floridea; by zoospores, cells provided with two or more vibratile cilia, which, after escaping singly or in numbers from the rupture of a cell of the parent plant in which they bave been developed, exist in an active moving condition for a while, then rest, and develop into a new plant like the parent; and by oospores, from which new plants grow, and which themselves arise in several ways, either by the conjugation of two apparently similar cells, or by the coming together and coalescence of two unequalsized zoospores, from which the oospore-bearing cell arises; or by the fertilisation of a female cell. or germ-cell from which the oospores arise, by male cellules, or anthorozoids. Some species present more than one of these modes of reproduction, and alternation of generations results.

The chief divisions of the Algæ, as given by

Sachs, are:

Family 1. The Nostochineæ, including the Genera Nostocaceæ, Rivularieæ, Chroococaceæ, Hydrodictyeæ, and Volvocineæ.

Family 2. The Conjugatæ, comprising the Desmidiæ, Zygnemeæ, Diatomaceæ, Siphoneæ.

Family 3. The Fucaceæ, including Ædogonicæ, Coleochatæ.

Family 4. The Florideze, including Corallina, Chondrus.

Some recent botanists have given a different signification to the term Algæ, in that they have discarded it as one of the divisions of Thallophytes, and make use of it to include under each class these forms which contain chlorophyl, in contradistinction to those other forms of each elass which contain none, and to which the term Fungi is now applied.

**Algæsthe'sis.** (Άλγος, pain; αἴσθησις, perception.) Term by C. H. Schuitz for a sense

of pain; pain, especially painful disease.

Al'gal alli'ance. One of Lindley's Divisions of Thallogenous plants. Cellular flowerless plants, nourished through their whole surface by the medium in which they vegetate; living in water, or very damp places; propagated by zoospores, coloured spores or tetraspores.

Al'gali. (Arab.) Old name for Nitre. (R. and J.

Al'galic. (Arab.) Same as Algalic. Al'galic. (Arab.) A catheter or sound.

(James.) Al-gam-bay. The Burmese name of a bitter root, used as a tonic in infusion (3xj to Oj

of water), (Waring.) Al'gamet. (Arab.) Charcoal. (R. and J.) Algarah. (Arab.) An old term for the disease Anchilops. (James.)

Algaro'ba. The fruit of the Prosopis dulcis. A tree growing to the height of 40 feet. Indigenous in Catamurca, a province of the Argentine Republic; the long pods are pounded, sifted, and made into cakes, which are dried in the sun, and called Patay. In some parts it forms the exclusive food of the people.

Also, a synonym of Carob.

A. bean. The frnit of Ceratonia siliqua, the Carob tree, consumed in the South of Spain by horses, and imported into this country as a substitute for oilcake. The dry pulp in which the seeds are imbedded is very nutritions, and being supposed to have been the food of St. John in the wilderness, has been called Locust tree and St. John's bread.

Algarobia. A Genus of the Tribe Mi-

moseæ, Nat. Ord. Leguminosæ.

A. glandulo'sa. A small American tree. Yields the Mesquite gum, which closely resembles gum arabic. The fruit is a long compressed pod, containing a sweet pulp, which is used as food.

A. ferrugin'ea. The bark of this species

A. ferrugin'ea. The bark of this species added to jaggery water is distilled in India as an

intoxicating liquor.

A. julæflo'ra. The leaves and branches of this species are said to be poisonous to cattle. A. leucophæ'a. The bark of this species

is used as that of A. ferruginea.

Al'garoth, pow'der of. (Fictor Algarotti, a physician of Verona, its inventor. F. mercure de vie; G. Algarothpulver.) A compound of antimonious chloride and oxide, produced by dissolving antimonions chloride in strong hydrochloric acid and pouring it into water, when the powder falls as a bulky white precipitate, which after a short time becomes crystalline and of a fawn colour. It is an emetic, purgative, and diaphoretic, but very uncertain, and is now disused. Is powerfully emetic in doses of two or three grains.

Algarot'ti, Vic'tor. Au Italian phy-

sician of the sixteenth century.

Algarovilla. The very bitter and astringent medulla of the fruit of Inga Marthæ. Algarro'bo. A synonym of Algaroba.

Alga'sef. (Arab. alasaf, filth.) A term

for papular or vesicular emptions.

Algebra. (Ar. al-dschebr.) The union or combination of different parts into one whole. Also applied to the union of fractures. Hence the Spanish term algebrista, applied to a bonesetter.

Also, combination and comparison.

**Alge'do.** ('Aλγοs, p cin.) A violent pain about the urethra, testes, bladder, perinenm, and anus, caused by a sudden stoppage of a severe gonorrhœa.

Algefa'cient. (L. algus, coldness; facio, to make. G. Kalte-crzeugend.) Cooling; having

the power to make cold. **Algema.** (Algama, from  $\dot{a}$ \ $\gamma \dot{\epsilon} \omega$ , to suffer pain.) A term for pain, and also the disease which causes the pain, according to Hippocrates, Aph. iv, 11, and vi, 7; Feësius de Econ., p. 27.

Algeria. A French colony on the northern coast of Africa, lying between Morocco and Tunis, about 600 miles long and from 100 to 300 miles broad. It is divisible into three regions -a coast region bordering the Mediterranean, an elevated woody plateau with numerous peaks, and extensive salt marshes in the south hordering the Great Desert. The chief rivers are the Schehf the Seybouse, and the Summam. It

produces in abundance corn, oil, tobacco, wine, and cotton. The population in 1875 amounted to about 2½ millions, of which about 159,000 were French and the rest Mahomedans. The climate of the northern region is generally healthy and temperate, but when the dry khamsin or southerly wind blows, the thermometer rises to 38°C. (100-4 F), or more. Dr. Shaw knew the thermometer reach 0° C. (32° F.) only twice during twelve years' residence in Algiers, but the extreme dinrual variation is considerable, especially during the summer months. From April to September the prevailing winds are from the east, and during the rest of the year chiefly from the west. The heavy rains are in November and December. The mouths of January and February are generally very fine; and the fields are bright with verdure in April. In the summer months the surface of the country is parched. Ophthalmia and cutaneous diseases are common, and elephantiasis is not unfrequent. Algeria possesses numerons springs and mineral waters, some of which were known to the Romans and highly prized by them. Thus, at Hammam Berda, between Bône and Constantine, near an ancient grove of olives, still called the "Sacred Wood," are the remains of vast circular huildings surrounding a basin, about 50 feet long by 36 wide, containing numerous hot springs. Similar ruins exist near the vestiges of the ancient Julia Cæsarea, now called Cherchell.

Algerie. (Arab.) Old term for Calx, or lime. (R. and J.)

Algeroth. See Algaroth.
Algeria. ( Αλγησις, a sense of pain.) A synonym of Hyperwsthesia.

Alge'sis. (Gr.) Same as Algedo. Alget'ic. ('Λλγέω, to feel pain.) Pro-

ducing, or having relation to, pain.

**Algeticus.** ('Αλγέω'.) Very painful; or often, or ordinarily painful. Applied to diseases attended with pain, as epilepsia algetica, phthisis algetica.

**Algia.** ("Αλγος, pain. F. douleur; I. dolore; G. Schmerz, Leiden.) Pain.

Al'gibic. An Arabic name for Sulphur vivum.

Al'gide. (L. algeo, to be grievously cold. F. algide; G. kalt.) Become cold; chilled with cold.

A synonym of Epidemic A. chol'era. cholera.

Also, the term Algide is used for a stage of

Epidemic cholera, that of collapse.

Al'gid fe'ver. (F. Fièvre algide.) type of pernicious intermittent fever, characterised by iev coldness on the surface, continuing from the beginning to the end of the paroxysm; the rigor is very intense, and lasts many hours; the temperature is low; the face is cadaveric, and the pulse slow.

Algid'ity. (Same etymon. F. algidité.) A state of coldness and collapse, as in epidemic cholera and fevers, or in the agony of death.

A. progres'sive. A condition of collapse and lowering of temperature, occurring in infants during the course of wasting diseases.

Al'giers. Africa. The capital of the French Colony, Algeria, lying on the southern shore of the Mediterranean, about 36 to 40 hours from Marseilles. The town stands on a declivity facing the north; the old part is dirty, with narrow tortuons streets; the new town is well built and clean, and the hotel accommodation good. Mean temperature of winter is given by Helft as

11.07° R. (56.4° F.), by others variously as 55° F. and 62° F.; daily range 5.5° C. to 6.6° C. (10° F.—12° F.). The average annual fall of rain is about 32 inches, of which some 27 inches fall in the six winter months, not on many days, but a heavy rainful during few days. The temperature is not very suddenly variable, the air is bright, but in the evening it is often laden with moisture. Malarial fevers are not uncommon. It is said that phthisis is rare. The climate is somewhat bracing. The soil is light, and dries very rapidly. It is generally considered that Algiers is more fitted for cases of chronic bronchitis than for those of any of the forms of pulmonary consumption, especially when in the later stages. Chronic winter cough, emphysema, and heart disease, are said to be benefited, but not nervous diseases.

There are mineral springs in the neighbourhood of Algiers. See Hammam-Melonane, Oroun Sekhakhna, Humman-R'ira.

Al'goid. (L. alga, sea weed; ɛlòos, like-ess.) Resembling sea weed.

ness.)

Al'go-li'chen hypoth'esis. An hypothesis promulgated by Schwendener to the effect that all lichens are algals, which have collected around them a parasitic fungal growth, and that those peculiar bodies which, under the name of gonidia, are considered as special organs of lichens, are only imprisoned Algæ.

**Algology.** (L. alga;  $\lambda \delta \gamma o s$ , a discourse.) The science or knowledge of Alg a, or sea weeds.

Algon'kins. A tribe of Indians of North America, formerly dwelling in the territory near the sources of the Missouri, in the neighbourhood of the Rocky Mountains.

Al'gor. (L. algee, to be grievously cold.)
The sense of coldness experienced in the onset of

fever; chilliness, rigor.

Al'gos. (Gr.) (G. Schmerz, Leiden.) Pain. Algospas mus. ("Αλγος, pain : σπάσμος, a spasm.) Paintul contraction of muscles.

Al'gous. (L. alga, seaweed.) Of the nature of, or resembling, an Alga or seaweed. Alguada. (Arab.) A name for the disease

Al'gue de fain. (Fr.) The Gelidium corneum.

Austria-Ilungary; in the Al-gyogy. Siebenburg. Three springs of thermal mineral waters, the chief of which is named Apa-Bad, containing sodium, magnesium, and calcium carbonates, and magnesium sulphate. They are used in chronic catarrhs. They were known to the Romans, and were formerly in high repute, though now neglected.

Alha'gi. A Genus of the Suborder Papilionaceæ, Nat. Ord. Leguminosæ.

A. mammif era. A synonym of Alhagi maurorum.

A. mauro'rum. (F. alhagi à la manne.) A thorny Arabian and Persian shrub; yields a

kind of manna. See Alhagi-manna.

Alha'gi-man'na. The produce of the Alhagi maurorum. It occurs in the form of small brown tears, mixed with leaflets and stalks. It is of a yellow-green colour, nauseous odour, and sweet taste, and is a purgative.

Alha'ma. Spain; in the Province of urcia. Mild chalybeate waters of 38° C. Murcia. Mild chalybeate waters of 38° C. (100.4° F.) containing calcium and magnesium sulphate and iron carbonate; a neighbouring spring has a temperature of 13° C. (55.4° F.), and is a stronger chaly beate. Used in nervous

diseases, hemicrania, chlorosis, menstrual troubles, and mucous discharges. The stronger water is especially used in weakness of digestion, pyrosis, and aniemic uterine diseases.

Spain.

mineral water, containing sodium chloride, some iron, and carbonic acid gas. Temperature 32° C. (89° F.) Employed in rheumatic and calculous affections, in asthma, and in skin diseases, both internally and in baths. Season, middle of June to the middle of September.

Alha'ma de Grana'da. Spain. A saline mineral water. Temp. 43° C. (109 4° F.) Recommended in rheumatic affections. Season, April to June, and September and October.

Alha'ma di Mur'cia. Spain. Saline mineral water at 41°C. (105°8° F.), containing calcium and magnesium sulphate, with a little iron carbonate. Recommended in rheumatic affections, in anomic and neurotic affections, and in intermittent fevers. Season, April to June, and September and October.

There is a second spring of the same general character, but containing more iron, which is used in atonic dyspepsia, pyrosis, and uterine

diseases.

Alhan'dal. (Arab.) A name of the Citrullus colocynthis. (James.)
Alhan'na. The same as Alana terra.

Alhasba. (Arab.) A name for the disease Rubeola, or measles. (Hooper.)
Alhasef. (Δr.) Ilidroa. Vesication.

Albenna. The same as Henna, the root of the Lawsonia inermis.

A'li. Sicily; on the sea coast between Messina and Taormina. Sulphuretted waters of a temperature 38° C. (100 4° F.). They contain small quantities of calcium sulphate and carbonate, a trace of iron, with carbonic acid and sulphuretted hydrogen. Some calcium and sodium chloride percolate from the sea water. Used in sciatica, rheumatic pains, and skin diseases.

Alia squil'la. ("Aλιος, belonging to the sea; σκίλλα, a squill.) An old name for the Prawn

Al'ibert. A French physician. A.'s ke'loid. See Cheloid.

Alibil'ity. (L. alibilis, from alo, to nourish; G. nahrhaft.) A term used to express the capacity of a nutritive substance for absorption; assimi-

Al'ible. (Same etymon.) Fit for nourishing.
A. sub'stance. Applied to the nutritive portion of the chyme, as distinct from the exerementitious.

Alibon fier. (Fr.) Storax.

Ali'ca. Italy; in a valley between Palaja and Patrino, on the right bank of the Rigone. Two mineral waters springing from the blue

The Aqua di Sant Andrea a Corsini has a temperature of 16° C. (60.8° F.), and contains magnesium, calcium and alumina sulphate, sodium and magnesium chloride, calcium carbonate, some iron, and carbonic acid gas. It is used in urinary deposits, congestions of the spleen and liver, atony of the stomach, menorrhagia, and leucorrlicea

Acqua di Clemente, the other spring, is of the same temperature and general constitution, but contains more iron. It is used in chronic gout and rheumatism, hysteria, and anæmic condiAl'ica. (L. alo, to nourish. G. Spelt, Dinkel.) A kind of grain much like to wheat; supposed to be what is called—spelt, Triticum spelta.

Also, applied to a kind of pottage made of this

grain

Alican'te. Spain; a seaport on the Mediterranean. Climate mild in winter, snow rarely falling. It is protected by high limestone rocks on the north and north-west; there is no great amount of moisture. By some the atmosphere is spoken of as dry and stimulating.

Al'ices. (L. alica, a kind of grain.) The commencing spots of the eruption of Variola, or

smallpox, from their likeness to grain.

Al'icum. Spain; near Guadix. A mineral water having a temperature of 34°C. (93°2°F.), and depositing stalactites. It contains a little calcium chloride and considerable amounts of calcium and magnesium sulphate. It is used in atonic diseases, in scrofula, and in skin diseases.

Alienated. (L. alieno, to withdraw, to make over to another. F. aliene; G. abgeneigt.)

Estranged; withdrawn to another.

Applied to first leaves, which give way to others

different from them.

Aliena'tio. (Same etymon. G. Entfremdung, Abneuging.) A withdrawing from one's friendship; an aversion. Used formerly as synonymous with anomaly.

A. men'tis. Insanity.

**Aliena'tion.** (L. alirno, to withdraw.) Estrangement; a change of affection.

A., men'tal. (F. aliénation; I. alienazione; S. alienacion; G. Geistesstorung.) A synonym of Insanity; a derangement of the intellect.

Alienist. (Same etymon.) A word derived from the French, and sometimes used to signify a physician who devotes his attention to insane patients.

Alie'num. (Same etymon.) A term applied to things foreign to the body and hurtful.

Also, used as corrupted.

Alie'nus. (Same etymon.) Delirious;

**Aliferous.** (L. ala, a wing; fero, to bear; G. beflugelt.) Wing bearing.

**A liform.** (L. ala, a wing : forma, likeness. Gr. πτερυγώδης; F. aliforme; G. flugelformig.) Wing-like.

Alifor'mes mus'culi. The pterygoid

A. proces'sus. The great wings of the sphenoid.

Alig'erous. (L. ala, a wing; gero, to bear. G. beflugelt.) Bearing or having wings.

Alig'ulus. A synonym of Confectio.

Alima. (Alynos, banishing hunger.) Food.

Alima. (Αλιμος, banishing lunger.) Food.

Alima. ("Αλιμος, belonging to the sea.)

A kind of sand from which lead and other metals are obtained. (Parr.)

Alimel'lae. A synonym of the Parotid

gland.

Aliment. (L. alimentum, from alo, to nourish. Gr. τροφή, στίον; F. aliment; I. and S. alimento; G. Nahrung, Nahrungsmittel.) The term aliment is applied to any substance which is either a normal constituent of, or is capable of being converted by the processes of digestion and assimilation into, the fluids and tissues of the hody. In this sense common salt and albumen are both aliments, the former heing applied directly to the purposes of nutrition, tho latter undergoing certain pre-

liminary changes before it can be so applied. usual division is into inorganic and organic, the former embracing oxygen, water, and the salts of those metals which enter into the chemical composition of the body, the latter being again divided into the non-nitrogenous, including fats and earbobydrates, as sugar, starch, and gum, and the nitrogenous, of which the principal are animal albumen of various kinds, casein, myosine, vitellin, and globulin, and vegetable albumen, fibrin, and casein. Alcohol occupies an intermediate position between the fats and the carbobydrates. The value of any substance depends on its digestibility and assimilability. A due admixture of hydrocarbonaceous with nitrogenous food is economical. The absolute quantity of aliment required varies with age, sex, strength, and weight of body, amount of work done, temperature, and many other conditions. A fair estimate is the following, given by Moleschott for an average working man: - Dry albuminous matter 4.587 oz., or 130 grammes, fatty matter 2.961 oz., or 84 grammes, carbohydrates 14.250 oz., or 404 grammes, salts 1.058 oz., or 30 grammes. Thus about 23 oz. form the quantity of dry solid matter contained in this standard diet, and a fifth of it is composed of nitrogenous matter. An ordinary food contains about 50 per cent. of water, and hence the 23 oz. will correspond to 46 oz. of solid food in the condition in which it is consumed; in addition, from 50 to 80 oz. of water are usually ingested. (Pavy.) The dynamic or force-producing value of this supply is equal to 3960 foot-tens.

Alimental. (Same etymon.) Serving

for nutriment; nutritious.

Aliment'ary. (L. alimentum, food or nourishment. F. alimentaire.) Of or belonging to food or aliment; nourishing.

A. bo'lus. (F. bol alimentaire.) The mass

A. bo'lus. (F. bol alimentaire.) The mass of food after mastication, just as it is prepared to be swallowed.

A. canal. The whole apparatus, with its accessory glands, beginning at the mouth and ending at the anus, destined for the preparation of the food into fit material for absorption, and for the expulsion of such non-nutrient materials as may have been introduced through the mouth, and of those waste products of the body which are exercted by the glands opening into or connected with the alimentary tube.

A. duct. A synonym of the Alimentary canal.

Also, a synonym of the Thoracic duct.

A. sub'stances. A term for food.

A. sys'tem. The entire tract of the digestive system from the mouth to the anus. In the lowest groups of the animal kingdom no separate alimentary canal exists; the body of the unimal, as in the Amœba, folds over the food, and, extracting the nourishment it may contain, discharges the indigestible residue. In the sponges, which are but little elevated above the Amoeba, the body is tunnelled and the sides of the passages are lined by ameeba-like masses of protoplasm, hy which absorption and digestion of matter drawn in and ejected by means of cilia through openings on the surface of the body is effected. In the Infusoria, as in Vorticella, a mouth is usually present, leading into a ciliated tube, which either opens into a general somatic cavity, or after a short course terminates in a rectum opening by an anal orifice. In the great division of the Cœlenterata the organs of circulation and digestion are in intimate relation, or there is a common eavity ministering to both functions, termed the gastro-vascular space, as in the Polype. So amongst the Anthozoa, of which the Anemone is a type, the mouth is surrounded by tentacles, and opens into the stomach, which is again continuous with the hody-cavity; neither

intestine nor anus is present.

In the Echinodermata the month is either unarmed, as in the starfish and Holothuria, or provided with a complicated dentigerous apparatus, as in the Echinida. In the Asteriadae the stomach immediately succeeds the mouth and occupies the greater part of the disc, giving off one process that is regarded as a liver, and others which extend in the form of paired exeal prolongations into the rays, which have also been regarded as hepatic in function. The Echinidae have a pharynx and long narrow esophagus provided with papille, a stomach, convolnted intestine, and saelike rectum, all kept in position by a mesentery. In Holothurioids the mouth is surrounded by tentacles, leading to an œsophagus surrounded by a calcareous ring, which is succeeded by a stomach, slightly looped and ciliated, intestine, and rectum or cloaca, into which the respiratory apparatus opens.

In Vermes the Turbellaria have a mouth opening near the anterior extremity or on the superior snrface of the body; the pharynx is often protrusible or a proboscis is present, as in Nemertina, provided with boring organs and sometimes a poison bag. Gland tubes, which are probably salivary glands, open into the esophagus. The intestine is either simple with a terminal anus, as in the Rhahdoccela, or is ramified and terminates excally, as in the Dendroccela; in the latter it is always, and in the former sometimes, ciliated. In some, the Acœla, the intestine ap-

pears to be absent.

In Mollusea the digestive system is, as a rule, well developed. In Bryozoa or Polyzoa the mouth is surrounded by ciliated tentacles, which spring from the lophophore, and is either partially covered by a valve-like process or epistoma, as in the Phylactolæmata, or is naked, as in the Gymnolæmata. It is liced by a hard structure, arranged in an imbricated manner. A muscular pharynx leads into the stomach, having a gizzard-like muscle on either side, and this again into the intestine, which has a crecal process of considerable length. The intestine is recurrent and opens near the mouth. In the Tunicata the branchial cavity is often regarded as the vestibule of the digestive apparatus; at the commencement of the latter is a ciliated groove, beneath which is an endostyle; a stomach with a glandular lining often raised into folds, and acting as a liver succeeds. In some the intestine is beset with hepatic tubes. The anus usually lies above the month, and is directed towards the expiratory tube. In Brachiopoda the mouth is a small transverse slit between the arms; the œsophagns is short, stomach small, intestine long, rather wide, surrounded in part by a liver, in the form of numerous sacculi, opening inwards by separate orifices, and there is either no anus or the intestine ends with a bulblike swelling between the folds of the mouth. In Lamellibranchiata the mouth is a transverse shit, deeply situated, with two labial palpi on each side. There is no dental apparatus. Sali-vary glands only exist in Teredo. Œsophagus short, stomach spherical or oval, surrounded by the liver, with a excal appendix confaining the crystalline style, which is a cylinder or cone composed of numerous two-pointed needles. The stomach is lined with ciliated epithelium. The intestine is convoluted, and the rectum generally perforates the ventricle of the heart, though it does not do so in Ostræa, Teredo, and Anomia. In Gasteropeda the mouth is provided with hips and one or two upper jaws, or hard cutting sur-faces of conchyolin. In the interior is a rasping organ or radula, and two lobulated salivary glands, secreting acid saliva, in some species. The æsophagus is muscular, and often dilated like a erop, or has a excal process opening into it. Stomach thin walled, single or multiple. Intestine surrounded by the liver, convoluted, opening in front on the right side. In the higher Cephalopoda the mouth, which is in the centre of the arms, is provided with a pair of horny jaws, a tongue and radula, and one or two pairs of salivary glands. The esophagus presents in the Octopoda sac-like dilatations, the crop and proventriculus. The stomach has thick fleshy walls, and is prolonged into a cæcal process, into which the biliary ducts open. Intestine wide, short. and convoluted, opening into the base of the funnel; the liver presents 2—4 lobes, and there is a yellowish mass, regarded as the pancreas. The saliva, bile, and pancreatic juice are all acid.

In Arthropoda the alimentary canal is generally well developed. In the Cirripedia the mouth is deeply situated between the lobes of the mantle, and is provided with an upper lip with feelers and the rudiments of two pairs of sbort-toothed lower jaws, fused with a kind of lower lip; cesophagus short, stomach small, with two lohulated glands, supposed to be salivary, near the anterior extremity, and surrounded by the hepatic tubes at its pyloric part. Intestine straight, opening by an anus between the two last cirrhi. In the higher Crustacea the mouth is inferior and surrounded by a number of tactile and prehensile organs in front of the upper lip, and two strong and serrated upper jaws or mandibulte on each side. Then follow one or several pairs of weaker lower jaws or maxillæ, which are often atrophied. In the mouth is a bifid torgue. The œsophagus is short, and opens into a stomach lined by hristles, teeth, or a chitinous framework, and provided with strong muscles. The intestine is nearly straight, and opens at the end of the body. There are no salivary glands. The liver invests the intestine, or forms a sac. In Arachnida the lower forms present a suctorial, the higher a mandibulate mouth. The upper jaws are absent, and their place is snpplied by the segmented feelers or falces, the terminal claw-like joint of which has the opening of the poison gland. The lower jaws, maxillae, hear feelers with four segments. Between the two lower jaws there is often a lower lip. The first pair of legs are often jaw-feet. Salivary glands are found in all the higher forms. The esophagus is mnscular, and is either continuous with a tubular intestine, or it forms a sac, with 8, or 10, or even 30 caecal processes, which often extend into the legs. A large intestine is sometimes present. The liver is either absent or forms a granular covering to the intestines, or presents the form of a short-branched tube, or lastly of a voluminous lobulated organ. In masticating insects the two upper jaws, mandibulæ, consist of a single segment, and have an upper lip or labium be-tween them. The two lower jaws have their

segments corresponding to the coxa, femur, and tarsus of the insect's foot, and a special lamina internally. The labium or lower lip is between them, and behind this again is the mentum. Connected with the fore part of the mentum is the tongue or ligula and the labial palpi. In snetorial insects the above parts are more or less modified. The mouth is continuous with a pharynx and asophagus, which often dilates into a crop or ingluvies. To this follow a proventriculus, armed with chitinous processes and moved by powerful muscles; a chylific stomach, lined by a glandular membrane representing a liver, and an intestine divisible into an ileum, colon, and rectum. Salivary glands are present in most insects, but there are none in Hydrophili.

In Fishes the usually wide mouth is at the anterior extremity of the body, and has two thick fleshy lips. Teeth are usually present, adherent to, but not implanted into, the bones. Tongue small and hard; no salivary glands; pharynx muscular, stomach tubular, surrounded at its pyloric extremity with caecal processes, appendices pyloricæ, supposed to be the rudi-ment of the pancreus, but their secretion is acid. Intestine straight or convoluted, villi sparse: mucous membrane longitudinally folded, but with a spiral fold in cartilaginous fish. opening in front of the openings for the urinary and sexual organs. Liver large, generally with gall-bladder. Pancreas and spleen usually

In Batrachia the oral cavity is wide, the bones entering into its composition often beset with small teeth, some of which are implanted in alveoli. Tongue usually present. No salivary glands. The œsophagus leads into a stomach with pyloric valve, and this into a small and large intestine, distinguished by their size. intestine is spirally coiled in the larva. gastric tubules are simple, and the intestinal villi comparatively few in number; but the mucous membrane is rugose. The liver, two-lobed in Anoma, has a gall-bladder. Pancreas and spleen always present.

Amongst Reptiles the jaws are usually beset with teeth lodged in sockets, but in Chelonia the jaws have a horny covering. Salivary glands are present. (Esophagus wide and extensible, beset in Chelonia with villons-like processes. Stomach elongated, with pylorie valve; the intestine short in the carnivorous, long in the herbivorous families. Large intestine separated from the small by a circular muscle. Liver and pancreas always present; gall-bladder only absent in Ophidia.

In Birds the jaws are covered with a horny beak; a tongue is present, varying much in form and covering; a caecal process often extends from its floor far down the neck; three pairs of salivary glands usually present. Esophagus long and wide, often with a crop at its extremity; the proventriculus, which secretes the gastric jnice, then follows the muscular gizzard. The intestine is divided into small and large; the rectum opens into the cloaca, which receives the oviduets and ureters. At its posterior extremity is the bursa fabricii.

In Mammals, lips and cheeks are present in all, with the exception of the monotremes and the dolphins; check pouches are sometimes present; the surface of the mouth usually smooth, but often beset with hair or bristles. At the posterior edge of the hard palate is the soft palate; teeth implanted in alveoli, almost universally present. Tongue of various form and size, ministering to taste; three pairs of salivary glands usually present, but none in the flesh-cating Cetacea. Esophagus very muscular; stomach simple or compound, with mucous and peptic glands; intestine divisible into three parts-small intestine with villi, large intestine without villi, and the rectum; liver large, usually with one gall-bladder. Pancreas and spleen constantly present.

A. tube. A synonym of the Alimentary canal.

(Same etymon. Alimenta tion. alimentation; G. Ernahrung.) The act or process of taking or receiving nourishment. Also, the process of conversion of food into material fit for nutriment.

A. iod'ic. A mode of giving iodine in conjunction with farinaceons food.

Aliment'iveness. (Same etymon. F. alimentivité.) The desire for food. A faculty supposed by the phrenologists to exist in the fossa zygomatica, exactly under Acquisitiveness, and before Destructiveness, and to produce the appetite for food, or the nutritive instinct.

**Al'imon.** ("Αλιμον, a shrubby plant growing on the sea shore; from äλs, the sea.) Probably the Atriplex halimus; in use amongst the ancients, both as a food and as a medicine in dysentery and gastrie diseases, as an aphrodisiae and galactogogue. Hab. Crete. (Waring.)

Alimonia. (L. alimonia, nourishment.
G. Ernahrung.) Sustemance, food.

Alimo'nium. The same as Alimonia. Alimos. Common liquorice.

Ali'mum. ('A, neg.; λιμός, hunger.) A plant serviceable in allaying both hunger and thirst.

Also, an old name for the Arum maculatum. Alina'sal. Belonging to the Ala nasi.

A. pro'cess. A cartilaginous outgrowth surrounding each nasal aperture in the frog. Alinde'sis. ('Αλίνδησις, a rolling in the

dust; from αλίνδεω, to roll over.) A kind of exercise among the ancient Greeks; the wrestlers. being anointed with oil, rolled themselves in the dust, according to Hippocrates, l. 2, de Diat. xlii, 15.

Alinthisar. Arabic for an elongation of the Uvula. (Waltherns, Sylv. Med, p. 1611.)

Alinzadir. Arabic for Sal ammoniac.

Aliocab. (Arab.) Term for Sal ammoniac. **Alipæ'na.** ('Aλιπής, without fat.) plaster made without any fatty matter.

Alipæn'os. ('A, neg.; λιπαίνω, to make fat.) A term applied to very lean persons.

Also, to external remedies of a dry or nongreasy nature, as powders, according to Celsus, v, 19.

Alipan'tos. The same as Alipanos. Alipas'ma. ('Αλείφω, to anoint.) powder which, when mixed with oil, is rubbed on the body to prevent sweating.

Alipa'ta. A tree growing in the Philippine Islands, and reputed to he highly poisonous; its milky juice and the smoke of its wood are said to cause blindness.

A'lipes. (L. ala, a wing; pes, a foot.) A winged foot; same as Cheiropterus.

Also, (G. schnellfüssig) swift-footed.

Alip'ta. ('Alei $\pi \tau \eta s$ , an anointer. G. Einsalber.) He that anointed the wrestlers in the ancient games, before they went to exercise, and kept them in strength and good complexion. Also, a term for a chirurgeon, or one who

professed to keep the body in a good condition as

to strength, activity and colour. **Alipte rium.** ('Λλειπτήριου, a place for anointing.) A room in the baths of the Romans and Greeks where persons were auointed after bathing.

Alip'tes. Same as Alipta.

Alip'tic. ('Αλειπτικός, from ἀλείφιο, to anoint. F. aliptique; G. Salbekunst. Term for that department of ancient medicine which treated of inunction as a mode of enre.

Alisan'ders. Same as Alexanders. Alise'da. Spain; near Las Navas de Tolosa, in the Sierra Morena. An astringent chalybeate water of 16° C. (60°8° F.) Its mineralisation is slight. It is used in gastric weakness, chronic diarrhea, in amenorrhea, and in chlorosis.

('Als, the sea. G. Froschloffel.) Alis'ma. A Genus of the Nat. Ord. Alismaceae. Root fibrous; leaves erect or floating; inflorescence umbelled or panicled; branches whorled, bracteate; petals deciduous, involute; stamens six, filaments filiform; carpels many, free; ovules

solitary, campylotropous; achenes ribbed; embryo hooked.

Also, an old name of the Arnica montana, and of a species of Damasonium.

A. graminifo'lia. A synonym of A.

A.lanceola'ta. A variety of A. plantago, with lanceolate leaves, ovate sepals, and styles as

long as the ovary

A. planta'go. (F. fluteau, or plantain d'eau; G. Wasserwegerich.) Leaves erect; flowers panicled, carpels in one whorl, laterally compressed, styles ventral. The juice is acrid. The rhizomes, which smell like orris root, when deprived of acridity by drying, are used as food by the Kalmucks; they have been used in doses of ten grains, gradually increased, in chorea, epilepsy, and hydrophobia; sometimes they produce nausea. The dried leaves will produce vesication; they have been recommended in chronic cystitis.

Alisma cee. (F. alismacées; G. Frosch-löffelgewächse.) A Nat. Order or a Family of the Nat. Order Helobiæ. Swamp or floating plants. Leaves narrow, or with an expanded blade, parallel-veined; flowers perfect, very rarely unisexual; sepals 3, herbaceous; petals 3, petaloid; stamens few or numerous; authers in-trorse; ovaries several, superior, one-celled; ovules solitary, or two superposed; placentas axile or basal; fruit dry; seeds without albumen; embryo undivided, horseshoe shaped.

Alisma'ceous. Similar to the plant

Alisma. Alis'mal alli'ance. One of Lindley's divisions of Exogenous plants. Hypogynous, tri-hexapetaloideous Endogens, with separate carnels and no albumen.

Alis'meæ. A Tribe of the Nat. Ord. Alismacca, having a semi-petaloid calyx, one or two erect or ascending sutural seeds, and a straight or horseshoe-shaped embryo.

Alis'min. A crystallizable substance obtained from the Alisma plantago.

Alis'moid. (Alisma; eldos, form.) Like to the plant Alisma.

Al'ison. The same as Alisson.

Alisphe'noid. (L. ala, a wing; sphenoid bone.) That part of the infero-lateral wall of the endocranium which lies between the second and fifth nerves, and corresponds to the alæ magnæ,

wings, of the posterior sphenoid; the greater wing of the sphenoid of man. It is a separate bone in the osseous fishes, an extension of the prootic in front of the fifth nerve in Batrachia, sometimes free and sometimes anchylosed in reptiles, though absent in Chelonians. In birds it is large, and at first composed of two bones, but subsequently it is fused with the surrounding elements. In Mammals it is developed from one or two centres, but never remains separate from its basal piece, the basisphenoid.

A. canal'. A canal perforating the alisphenoid at the origin of its external pterygoid plate, and giving passage to the external carotid artery. It occurs in the dog.

A. tube. The same as A. canal.

Alisson. ('A, neg.; λύσσα, raging madness.) An old name of a plant which was used to avert hydrophobia, probably the Sherardia arrensis

Also, a name of the plants of the Genus Alys-

Alistetes. (AAs, salt.) Arabic for Sal ammoniae. (Ruland.)

**Al'ites.** (L. alatus, winged.) The winged things. Birds.

Alitura. (L. alitura, a nourishing; from alo, to nourish.) Term for the process of assimilation or nutrition, as anciently employed, but the word simply means food or nourishment. (Blancardus.)

Aliza'rí. The Rubia tinctorum, or madder. Aliz'arin. (G. Krapproth.) C14H8O4. The red colouring matter of the madder root, Rubia tinetorum, a result of the resolution of ruberythrie acid which is present in the fresh root, glucose being the other product. It is now chiefly obtained from anthracene. It consists of reddishyellow delicate prisms, sparingly soluble in hot water, easily in alcohol and ether. It acts as a weak acid. It produces insoluble compounds, lake colours, with alumina and stannic oxide, and purple ones with ferric oxide. A tincture, and papers soaked in it, have been used as a test for acids and alkalies instead of litmus.

Alizarin'ic acid. A product of the action of nitric acid on alizarin. Identical with Phthalic acid.

Arabic for Antimonium, or Al'kafiat. antimony. (Ruland and Johnson.)

A'lkafiet. Same as Alkafiat.

Al'kahest. (Arabic.) In Alchemy, the universal solvent.

The properties of the Alkahest, according to Van Helmont, are the following :- It is a fluid of perfect simplicity and purity, is never found native, but always prepared by art; is capable of dissolving all substances into a liquor, which rises wholly in distillation, leaving no fæces behind; at the same time that the alkahest itself spontaneously separates from the body on which it has produced such a remarkable change.

Alkalam'ides. A synonym of secondary monamides containing an acid radicle and an alcohol radicle.

Al'kale. Ancient name for the fat or oil of the common hen; the Oleum galling. (Ruland.)

Alkales'cence. (F. alcalescence; I. alcalescenza; S. alcalescencia; G. Alkalität.) A state of alkalinity; having the properties of an alkāli.

Alkales'cent. (F. alcalescent; G. alkalischwerdenet.) Of the nature, in some degree, of an alkali; baying slightly alkaline qualities;

becoming alkaline.

Al'Kali. (Arab. Al, the whole, or essence; kali, the name of the plant from which soda was first obtained. F. alcali; I. and S. alcali; G. Alkali.) A term which includes several hydrated oxides of the alkali-metals, potassium, sodium, rubidium, lithium, ecsium, and the hypothetical ammonium. They are all electropositive, possess well-marked basic properties, and form salts with acids, turn red litmus blue, turmeric brown, syrup of violets green; they can saponify fats, are caustic, and are easily soluble in water.

in water.

The term alkali has been applied to two classes of compounds, which have only this in common that they are able to nentralise acids. One of these classes includes the mineral alkalies, and are of comparatively simple chemical constitution; whilst the other includes the complex organic compounds produced by plants, and which are now usually distinguished as alkaloids.

When potash, soda, or lime, are applied to the skin in the canstic state, they withdraw water and form an eschar. They are hence used for the destruction and removal of warts, condylomata, moles, erectile tumours, and hæmorrhoids, and for the opening of abscesses. Also for effecting powerful derivation in cases of disease of bone, or cartilage, or joint. The salts of potash, and the other members of the group, are sometimes applied to the skin in cases of prurigo and scabies, to allay the itching and to kill the parasite. Solutions of the salts are employed to excite inflammation in old fistule, and baths containing them have been given in tetanus, convulsions, paralysis, and epidemic cholera, in ameuorrhea and cerebral congestion, to determine a flow of blood to the skin. In still more feebly acting solutions, or in combination with oil, as in soap, the alkalies are used as detergents, and in the treatment of many cutaneous affections. Lime water is said to be beneficial in aphthæ, and to effect the solution of the false membrane in croup. When taken into the stomach, the alkalies and alkaline carbonates at first neutralise the free acid contained in the gastric juice, but, as Bernard's experiments have shown, almost immediately cause a great increase in the quantity of acid secreted. In a healthy condition, however, they are probably unnecessary. if not absolutely injurious, but in cases of gastric catarrh dependent upon excess of acid they may prove of great service. When absorbed into the blood the alkalies and their salts, as the citrates and tartrates, favour the metabolism and combustion of the hydrocarbonaceous compounds, but taken in excess they diminish its plasticity and render it poor in solid constituents, spanæmia, ultimately inducing a condition similar to or identical with scurvy. Fat and pathological products or deposits disappear, and they have hence been largely administered in scrofula, syphilis, obesity, enlargements of the liver, and other glands. Sodinm sulphate and magnesium sulphate, in Dr. Rutherford's experiments on dogs, greatly ang-mented the sccretion of bile. Their powerful action in neutralising acids has long rendered them important agents in the treatment of calenlous diseases, in which they are given, partly with the view of correcting the condition of the blood which leads to lithiasis, partly to form compounds with uric and oxalic acids that are more soluble than the corresponding lime salts, and therefore less likely to produce gravel, and partly, both internally and in the form of injection into the biadder, to effect the solution of stones already formed. The carbonates, and especially the bicarbonates, in doses of from 8 to 10 or 12 drachms daily, have been extensively employed in the treatment of acute articular rheumatism, and are believed to have a powerful effect in preventing the occurrence of cardiac complications.

A., a'erated. Bergman's name for salts of carbonic acid.

A. ammoni'acum aceta'tum. Liquor ammoniœ acetatis.

A. ammoni'acum caus'ticum. Ammonia.

A. ammonia'cum flu'idum. Liquor ammonise.

A. ammoni'acum spirituo'sum. Spiritus ammonie.

A., an'imal. Ammonia.

A., caus'tic. A term for a pure oxide, nn-hydrated, of an alkali metal, which possesses strong caustic powers. Applied specially to canstic potash, which is employed in making issues.

A., deliques'cent. A name for Potash.
A., efferves'cent. An old name of Alkaline earbonates.

A., fix'ed. Term applied to potash and soda, because they are not, like ammonia, volatile by heat.

A. fix'um tartar'icum. Potassium tartrate.

A., mari'ne. Soda.

A., min'eral. A term given to soda.

A. minera'le. Crude sodium carbonate.

A. minera'le nitra'tum. Sodium nitrate.

A.minera'le phosphora'tum. Sodium phosphate.

A. minera'le sali'num. Sodinm chloride.
A. minera'le sulphu'ricum. Sodinm sulphate.

A. of ni'tre. Potash derived from potassium nitrate.

A. of tar'tar. Potash obtained by the calcination of potassium tartrate with charcoal.

A., phlogis'tic. Potassium chlorate.

A., phlogis'ticated. Term applied to the product of a fixed alkali when mixed with bnlock's blood, or other animal substance, and lixiviated, because it was supposed that iron and the alkali became combined with a body containing phlogiston.

A. pne'um. (Πνεῦμα, air, life.) A salt which Hahnemann described as a new alkali, to which he attributed wonderful properties. It is

borax.

A., Prus'sian. Same as A. phlogisticated.
A. tar'tari ace'to satura'tum. Potassium acetate.

A., u'rinary. Ammonia.

A. vegetab'ile cum ace'to. Potassium acetate.

A.vegetab'ile fix'um caus'ticum. Potassa fusa.

A. vegetab'ile mite depura'tum.
Pure potassium carbonate.
A. vegetab'ile sali'to-dephlogisti-

ca'tum. Potassium chlorate.

A. vegetab'ile tartariza'tum. Potassium tartrate.

A. vegetab'ile vitriola'tum. Potassium snlphate.

A., veg'etable. A name for potash, hecause it is obtained from the incineration of vegetable substances.

A., vol'atile. Name for Ammonia.
A. volatile. A synonym of Ammonia, and also of its sesquicarbonate.

A. volat'ile aceta'tum. Liquer ammoniæ acetatis.

A. volat'ile aera'tum. Ammonia sesquicarbonate.

A. volat'ile ammoniaca'le. Ammonia sesquicarbonate.

A. volatile caus'ticum. Ammonia.
A., vol'atile, con'crete. Sesquicarbonate of ammonia.

A. volat'ile ex sa'le ammoni'aco. Ammonia sesquicarhonate.

A., vol'atile, mild. Sesquicarbonate of ammonia.

A. volat'ile nitra'tum. Ammonium nitrate.

A. volat'ile tartariza'tum. Ammonium tartrate.

A. volat'ile vitriola'tum. Ammonium sulphate.

Arabic for Vas, or vessel. Al'kalia.

Al'kali-albumen. (G. Alkali-albuminate.) Formed as a precipitate when a liquid albuminous substance is treated with dilute caustic alkali, and then neutralised by a dilute acid. It is probable that the deposits thus formed vary in some minute way according to the special albuminous fluid from which they are thrown down, inasmuch as they differ in their action on polarised light. Alkali-albumen is not distinguishable from Casein, which is also termed natural alkali-albumen. It is the same substance as Proteïue of Hoppe-Seyler.

Al'kalid. Arabic for Oxide of copper, or

burnt copper.

Al'kaligene. (Alkali; γεννάω, to beget.) Nitrogen, because it is a chief constituent of ammonia.

Alkalig'enous. (Alkali; γεννάω, to generate or produce.) Capable of yielding or producing alkaline qualities; alkali-producing. **Alkalimeter.** (Alkali; μετρέω, to

measure ) A burette graduated to scale; used in

alkalimetry.

Alkalim'etry. (Same etymon.) process by which the amount of alkali or alkaline carbonate in a substance, such as the soda of commerce, is determined by the amount of an acid of given strength required for neutralisation, as tested by solution of litmus. Sulphuric acid is generally used; its exact capacity for the complete neutralisation of anhydrous sodium carbonate determined, it or the alkali to be tested is coloured by means of litmus, and the operation is conducted in a burette, the alkalimeter, graduated in known proportions.

Al'kaline. (F. alcalin; G. alkalisch,

laugenhuft.) Belonging to, or having the nature

or properties of, an alkali.

A. earth metals. Calcium, strontium, and barium.

A. earths. The oxides of barium, strontium, and calcium.

A. met'als. Potassium, sodium, cæsium, rubidium, lithium, and ammonium.

A. min'eral wa'ters. See Mineral waters, alkaline.

A. phosphates of urine. Sodium, potassium and ammonium phosphates.

Alkalifi'able. (Alkali; fio, to become.)
Having the capacity to become alkaline.
Alkalin'ity. (F. alcalinité.) Having

the properties of au alkali.

Alkalinu'ria. A condition of alkalinity of urine.

Alkalisa'tion. (F. alcalization; G. Alkalisirung.) The act of conferring alkaling qualities on any substance.

Al'kaloid. (Alkali; ɛiòos, likeness.) Re-

sembling an alkali.

A. pro'cess. The following account of the processes for the detection of alkaloids, by Prof. Dragendorff, is taken from the 'Year Book of Pharmaey':- 1. The substance to be analysed should be first cut into small pieces and treated with water containing snlphuric acid, at a temperature between 40° C. and 50° C., two or three times, and the filtrates are put together after all the liquid has been pressed ont of the solid matter. Most of the alkaloids are not injured by this treatment, even when too much acid has been used. Solanine, colchiciue, aud digitalin are the only ones that might be injured by a large excess of acid. If there is abundance of time, the macerations may be made at common temperatures.

Berberine is less soluble in acidulated water than in pure water, but it is completely dissolved by the large quantity of liquid used. Piperine also dis-olves with difficulty in acidulated water, and part of this alkaloid may remain in the undissolved residuum, where it should be sought for

afterwards.

2. Evaporate the filtrates, after the free acid has been partially neutralized with magnesia, until the liquid reaches the consistency of syrup; mix this with three or four times its volume of alcohol and a little dilute sulphuric acid, allow it to digest for about twenty-four hours at about 30°, let it become quite cold, and filter from the solid matters that have been separated by the alcohol. Wash the solid residue with spirits of wine of about seventy per cent. The remarks made at 1 concerning solanine, colchicine, and digitalin, apply equally to this digestion.

3. The alcohol must be separated from the filtrate by distillation (evaporation), and the watery residue, after the addition of a little more water, if necessary, is filtered into a flask, and in its acid condition is treated with freshly rectified petroleum naphtha (see note at the end of this translation) by continued and repeated shaking together at a temperature of about 40° C. After the liquids have separated, the naphtha, sometimes containing colouring matter and such impurities as may be removed by this treatment, is drawn off from the aqueous solution. The naph-tha may also take up piperine, and if a considerable quantity has been used, and there is not much impurity present, the alkaloid will be left upon evaporating the naphtha in well-defined crystals belonging to the rhombic system. Concentrated sulphuric acid dissolves it gradually, with the production of a handsome brown colour.

4. Shake the aqueous solution with benzol, in the same way, at from 40° C, to 50° C, and evaporate the benzol after removing it. If there are traces of any alkaloid in the residue from this evaporation, it indicates caffeine. In this case, neutralise the greater part of the acid in the aqueous solution with magnesia or ammonia, but still leave it decidedly acid, and treat it again with fresh portions of benzol, until the latter leaves no residue upon evaporation. Wash the benzol solution by shaking it with distilled water; separate from the water, and filter it. Distil off the greater part of the benzol from this filtrate, and evaporate the remainder upon several watch glasses. Care must be exercised that in case a drop of the aqueons fluid passed through the filter

it is not evaporated with the benzol.

The residue from this evaporation may contain caffeine, delphine, colchicine, cubebine, digitalin, and traces of veratrine, physostigmine, and ber-Caffeine forms definite crystals, as colourless, glossy needles; it is known by its reaction with chlorine water and ammonia. Sulphurie acid does not colour it. Cubebine also forms small crystals, which may be known by their behaviour with sulphuric acid, and the same may be said of colocynthine, claterine, and syringine. A vellow coloured residue indicates colchicine and berberine. Sulphuric acid dissolves and colours colchicine an intense and durable dark vellow; berberine olive green, becoming clear afterwards. Berberine may be distinguished from colchicine by the behaviour of its alcoholic solution with tineture of iodine. Delphine, digitalia, veratrine, and physostigmine are left as amorphous nearly colourless residues. Delphine is coloured light brown by sulphuric acid; digitalin yields with it, in less than fifteen hours, a number of colours, changing from amber, through red and brown, to dark cherry red, and its presence may be confirmed by the sulphuric acid and bromine reaction. Veratrine, with pure sulphuric acid, becomes yellow orange, and in less than half an hour beautiful orange red, and this test may be confirmed by boiling with fuming hydrochloric acid. Physostigmine is not coloured by sulphuric acid. It may be known by its action on the eyes of cats.

5. The acid watery liquid is shaken with amylic alcohol in the same way as in 3 and 4, if the

presence of theobromine is suspected.

There are also taken up by the amylic acid some of the above-named alkaloids remaining from 3 and 4; namely, veratrine and herberiue, and traces of narcotine, aconitine, and atropine, and they are left in crystals after the evaporation of the solution.

Theobromine is recognised by its reaction with chlorine water and ammonia, and also as it dissolves without colour in concentrated sulphuric

acid.

Narcotine is not readily soluble in acetic acid, and may be recognised by its reaction when warmed with concentrated sulphuric acid.

6. The acid watery liquid is shaken with chloroform only when the presence of the alkaloids of

opium is suspected.

Chloroform takes up papaverine, thebaine (slowly), together with small quantities of narceine, brucine, physostigmine, berberine, and, when the treatment given at 5 is omitted, vera-

trine and narcotine.

Crystals of paparerine and brucine are left after the evaporation of the chloroform solution. Paparerine may be readily distinguished by testing with sulphuric acid (beautiful blue violet colour), and brucine by the red colour imparted to it by Erdmann's reagent. Most of the narcotine, thebaine, narceine, veratrine, physostigmine, and berberiue, are left as amorphous substances.

Narcotine may be separated from the other alkaloids by dilute acetic acid, in which it is not readily soluble, and it may be proved as in 5. Thebaine is characterised by its behaviour with

cold sulphuric acid. Veratrine and physostig-

mine as above.

7. The watery liquid at about 43° C. is then covered with a layer of petroleum naphtha, made distinctly alkaline with ammonia, and immediately well shaken. After the first naphtha solution has been drawn off, other extractions should be made at the same temperature with fresh portions of petroleum naphtha. The warm naphtha solutions should be washed with distilled water and afterwards filtered and evaporated. If the solution is too highly coloured by foreign matter, it may be purified by taking up the alkaloids in acidulated water, adding ammonia and shaking with pure naphtha again.

The petroleum naphtha takes up strychnine, brucine, quinine, emetine, veratrine, conine, ni-

cotine, and papaverine.

(a) Of these, conine and nicotine are fluids, and have characteristic odours. They may be brought into solution in distilled water, and nicotine is precipitated in minute crystals by potashea/minum-iodide from the diluted solution after neutralising with sulphuric acid, while conine is precipitated in amorphous form.

(b) Upon cooling the warm naphtha solution, quinine separates, and traces of strychnine and

papaverine also crystallise out.

(c) After evaporation, the remainder of the quinine, strychnine, and papaverine are left in crystals, and brucine, emetine, and veratrine in amorphous form.

The dry alkaloids are treated with anhydrous ether, which dissolves quinine, emetine, papaverine, and veratrine; and also conine and nicotine, if they have not been removed by

water.

Strychnine and brucine may be separated by absolute alcohol, in which strychnine is nearly insoluble. Brucine is recognised after the evaporation of its solution by its behaviour with Erdmann's reagent. Strychnine may be determined by means of sulphuric acid and bichromate of potash.

After evaporating the ether solution, quinine, emetine, veratrine, and papaverine are dissolved in the smallest possible quantity of very dilute sulphuric acid; and the cold solution, which should not contain less than one per ceut. of the alkaloids, is treated with carbonate of soda, when quinine, emetine, and papaverne are precipi-

tated.

Quinine may be determined by its behaviour with chlorine water and ammonia. Emetine by producing an emetic effect, and by the absence of the veratrine reaction with hydrochloric acid. Papaverine by its behaviour with sulphuric acid. Veratrine, after its watery filtrate has been treated with chloroform, and the latter evaporated by boiling, with hydrochloric acid.

8. The alkaline watery liquid is shaken with benzol at 40°C, or 50°C, purifying as in 7. This removes quinidine, einchonine, atropine, hyoscyamine, accontine, physostigmine, and codeine.

Crystals of cinchonine, sometimes accompanied by a little atropine and quinidine, separate from the solution on cooling.

After evaporating the solution there remain with those just named, erystallized codeine (very distinct), acontine, hyoscyamine, and physostigmine (mostly amorphous).

(a) The residue left by evaporation is treated

(a) The residue left by evaporation is treated with ether, which dissolves all the above-named

alkaloids except cinchonine.

(b) The residue from the evaporation of this ether solution must be dissolved in the smallest possible quantity of water containing sulphuric acid, and treated with ammonia slightly in excess, which separates quinidine and aconitine, leaving atropine, hyoscyamine, and codeine in solution.

The precipitate, which may contain quinidine and aconitine, is collected on a very small filter and dissolved in the least quantity of hydro-chloric acid. Upon the addition of chloride of platinum the whole of the quinidine is precipi-

The solution of aconitine is freed from platinum by a current of sulphuretted hydrogen; then it is made alkaline and shaken with chloroform. In the residue left by evaporating this chloroform solution, the aconitine may be recognised by means of sulphuric or phosphoric acid.

(c) Atropine dissolves with difficulty in cold benzol, and codeine dissolves readily. The former is not coloured by concentrated sulphurie acid; the latter is gradually coloured blue. Atropine, when warmed with concentrated sulphuric acid, gives the characteristic odour previously described; codeine does not. Atropine (hyoscyamine) distends the pupil of the eye; codeine does

not. For physostigmine, see 4.

9. The watery liquid is now acidulated with sulphuric acid and heated to 50° C. or 60° C., covered with amylic alcohol, purifying as in 7 and 8. By shaking with amylic alcohol at the temperature just given, the morphine, solanine, and part of the narceine are obtained. The latter should be dissolved in lukewarm water, and put with the

watery liquid at 10.

The solution of solunine in amylic alcohol gelatinises upon cooling, that of morphine forms the best of alkaloid crystals. Morphine is proved by Fröhde's reaction (with molybdate of soda) and by Hersemann's test (concentrated sulphuric acid solution and nitric acid).

Solanine is characterised by its decomposition in hydrochloric acid, and the retention of the products of this decomposition by ether; and also by its behaviour with iodine water and sulphuric

acid.

10. The watery liquid may still contain curarine and traces of berberine, narceine (and digi-

Evaporate it to dryness with powdered glass; digest the pulverised residue for a day in alcohol; filter, and evaporate the filtrate. If the residue is very impure, it may be repeatedly recrystallised from water and alcohol.

Berberine remains as a yellow coloured residue, and is known by the behaviour of its alcoholic

solution with iodine water.

Narceine is left in colourless crystals. It is recognised by its reaction with sulphuric acid, or by the behaviour of its aqueous solution with iodine water.

Curarine is left mostly amorphous, and is distinguished by its reaction with sulphuric acid alone, and with sulphuric acid and chromate of

Note.—Petroleum naphtha has a boiling point between 30° C. and 80° C. It should be purified by shaking with an ammoniacal solution of acetate of lead, and distilling. That which is sold in Russia as an illuminating fluid, under the name of "chandorine," may be rectified for use in this way. Petroleum naphtha does not dissolve asphalt, which is soluble in benzol. Benzol boils at 80° C. or 81° C. Petroleum naphtha begins to

boil at a much lower temperature.

Alkaloidal. (Alkali; εἶδος, form.) Having the properties or composition of an alkaloid.

(Alkali; siõos, likeness. Al'kaloids. F. alcaloide; G. Alkaloid, Pflanzenbasen, organische Salzbase.) Certain nitrogenous basic substances of highly complex chemical constitutions tution, found in many plants, either alone or in combination with acids, or produced by the destructive distillation of organic matters, having usually an alkaline reaction; they are slightly soluble in water, easily in alcohol; they turn reddened litmus paper blue, and have a bitter taste. Most of them contain oxygen, and are non-volatile and erystallizable; those which contain no oxygen are generally liquid and distillable. They are all precipitated from solution by tannic acid, and the double iodides of potassium and mercury or bismuth. Almost all the alkaloids have a very marked, and many have a poisonous, action on the living animal body, an action which in most is chiefly concentrated on the nervous system. The mode of action is unknown, but recent experiments tend to the view that arrest of oxidation processes and combination with some of the protoplasmic materials of the body is not an infrequent condition. Alkaloids are in many instances destructive to the lowest forms of life, bacteria, vibriones, and such like.

In the treatment of poisoning by alkaloids, after the administration of an emetic, a solution of tannin or an intusion of galls may be given with

advantage.

A., sublima'tion of. The recrystallization of alkaloids on a cool surface after being converted into vapour, or sublimed, by the application of heat. This process has been suggested as a means of detection in eases of poisoning; there is considerable uncertainty in the form of the resulting crystals, unless the surrounding physical conditions are exactly similar; but many alkaloids under favorable circumstances sublime in distinctive forms.

Al'kanet. ( $\Lambda r$ , alkanah, a reed. orcanette; I. arganetta, ancusa; S. orcaneta; G. Ochsenzunge, Alkannawurzel.) The root of the Anchusa tinctoria. Twisted, dark red pieces, 3"—4" long. The colouring principle, anchusic acid, chiefly residing in the bark, is yielded to alcohol, ether, and oils, but not to water. Al-kanet was formerly used as an astringent, but now only as a colouring material,

A., bas'tard. The Lithospermum officinale.

A., dy'er's. The Anchusa tinctoria.

A., gar'den. The Anchusa officinalis.

A., offic'inal. The Anchusa officinalis.

Alkan'na. (Arab.) See Alcanna. Also a term for Isinglass.

A. ma'jor latifo'lia denta'ta. Prinos verticillatus.

A. orienta'lis. The Lawsonia inermis.

A. spu'ria. The Anchusa tinctoria.

A. tincto'ria. The Anchusa tinctoria.

A. ve'ra. The Lawsonia inermis.

Alkan'næ ra'dix. The root of the Anchusa tinctoria. See Alkanct.

Al'kant. Old name for either Hydrargyrum

or mercury, or for a kind of ink. (Ruland.)

Alkan'tum. Arabic for Oxide of copper; also applied to arsenie. (Ruland.)

Al'kar. An Arabic term for a remedy.
Alkara. Arabic for a cucurbit. (Ruland.) Alkargen. A synonym of Cacodylic

Alkar'sin. Cadet's fuming liquid. Prepared by distilling equal parts of potassium acetate and arsenious oxide in a glass retort. It consists of eacodyl and its exidation products; it is very poisonous.

Alkasa. Arabic for a crucible. (Ruland.)

Alkasa.

Alkeken'gi. (Arabic. F. coqueret, cerises d'hiver, eerises de juif; G. Judenkirsche, Schlafkirsche.) The wintercerises d'hiver, ecrisco august.
Teufelskirsche, Schlafkirsche.) The winterberries are acidulous and slightly diuretic, and enter into the formation of the French Sirop de Chicorée composé. They contain a bitter principle, Physalin. They have been used in suppression of urine, gravel, and nrinary disorders generally; in gout as a substitute for colchicum, and as a febrifuge. The dried and powdered hull of the fruit has been used in intermittent fever.

Alkemelych. The Arabic name of the

Alchemilla.

**Alkerm'es.** (Al, eminence; kermes, the reddish galls found on the branches of the searlet oak, Quercus coccifera, in Italy, Spain, and South of France.) Term for an old remedy, of the consistence of a confection, of which the kermes formed the basis.

Christophorus Ayrerus prefers bezoar stone and the confection of Alkermes before other cordials, and amber in some cases; alkermes comforts the inner parts, and bezoar stone hath an especial virtue against all melancholy affections. Burton,

Anatomy of Melaneholy.

A. aurif icum minera'le. A synonym of Intimony oxysulphuret.

A. liq'uid. A synonym of Elixir of alkermis.

Alker'va. Arabic for the Oleum ricini, easter oil.

Al'kes. Arabic for burnt brass. (Quincy.) Al'ketran. Arabic for the Oil of cedar.

Alkib'ric. Arabic for Sulphur vivum. (Ruland and Johnson.)

Alkin. Arabic for Potash; also for the smoke of coals. (Ruland and Johnson.)

Alkitram. Arabic for Pix liquida, or (Ruland and Johnson.)

Alkit'ran. Arabic for a resin obtained

from the cedar tree.

Al'koel. Arabic for the Sulphuret of lead; also for the Lapis lazuli, and for Antimonium, or antimony. (Hooper.)

Al'kofol. A synonym of Alcohol. Same as Alcohol.

Al'kol. Alcohol.

Also, a term for burnt brass.

Al'kool. Alcohol.

Al'kosor. Arabic for Camphire, or camphor. (Ruland and Johnson.)

Al'ky. Arabic for the Sugar of lead. (Rn-land and Johnson.) Al'kymia. Arabic for the Powder of

basilicon. (Ruland and Johnson.)

Alkymis'tre. An alchemist. Al'la. Latin for Ale.

Al'labor. Arabic for Plumbum, or lead. (Hooper.)

Allage. The same as Allaxis.

Allagoste mones. ('Αλλαγή, change; στήμων, a thread, from  $l\sigma \tau \eta \mu$ , to stand.) A term applied by Gleditsch and Mönch to plants in which the pctals and stamens are arranged alternately on the receptacle.

Al'lamand, Jean Nicholas Sebastian. Swiss naturalist, born at Lansanne,

1713; died at Leyden, 1787.

Allaman'da. A Genns of the Nat. Ord. Apocynaceæ. Calyx five-partite, without glands; flowers funnel-shaped, with a campannlate limb; fruit a prickly capsule.

A. cathar'tica. (F. orelic.) Leaves whorled or opposite, oblong, acuminate, mem-Leaves branous; lobes of the calyx acuminate, smooth. A shrub growing in Guiana, an infusion of the leaves of which is said to be valuable as a cathartic in painter's colic. In large doses it is emetic.

A. grandiflo'ra. A synonym of A. cathar-

Allaman'deæ. A Tribe of the Nat. Ord. Apocynaceæ, having a unilocular capsule.

Al'lan, Bridge of. Scotland; near Stirling. The residential place for persons who drink the mineral waters of Airthrey.

Allandoa. The native name in Ceylon of

the Allwanthus zeylanieus.

Al'lanite. A silico-aluminate of cerium, containing varying proportions of iron, lime,

magnesia, and other matters.

Allanti'asis. ('Aλλαs, forced meat.) Sausage poisoning. The affection probably arises from putrefactive changes occurring in the sausage owing to imperfect curing or storage, or the use of improper materials in the manufacture. The presence of a poison is only suspected from the symptoms. No organic poisonous base has been isolated by any chemist. The Wnrtemburg been isolated by any chemist. The Wnrtemburg Black Forest and the neighbourhood of the Welzheimerwald are said to be the districts where cases have most frequently occurred. The whole number that have been reported does not much exceed 500. The poisonous sausages when cut across have a dirty greyish-green colour, soft cheesy consistence, disagreeable smell and taste, sometimes causing smarting or soreness in the throat. The symptoms are usually seen in families, not in individuals, and run a subacute The first symptoms usually occur in from eighteen to twenty-four hours after ingestion, the sufferers often complaining of nausea, followed by diarrhea and vomiting, with intermittent colicky pains and vertigo. The gastrointestinal symptoms may, however, be absent, and difficulty in swallowing, disordered vision, muscular weakness, and general prostration, constitute the disease. Dyspnæa and præcordial anxiety are common symptoms. Death, when the disease is fatal, occurred in twenty-four out of forty-eight cases between the seventh and tenth days, but it may occur in the course of twenty-four hours, or be protracted to three weeks or more. The post-mortem appearances are not very well marked, but there is usually hyperemia of the alimentary tract and of the lungs and bronchial mucous membrane. The treatment should probably consist in the administration of emetics and of purgatives or of purgative enemata.

A variety in spelling of Allan'tis. Allantois.

Allanto'des. A synonym of the Allan-

Allan'toic. (Allantoïs. F. allantoïque.) Belonging to the allantoïs.

A. ac'id. (F. acide allanto que; G. Allantoinsaure.) A little-known acid, resulting together with urea from the oxidation of allantoin.

Probably only Allantoin.

A. flu'id. (F. liquide allantoidien; G. allantoische Flussigkeit.) The fluid of the Allantois. It contains, besides allantoin, albumen. alkaline lactates, sodium chlorice, calcium and maguesium phosphate, glucose, except in man, and some urea. The solid constituents amount to about 0.15 per cent.

In the allantoic fluid of the mare peculiar hodies called Hippophane are found, either floating free or fixed to the walls of the allantois.

Allan'toid. (Allantois; είδος, form; G. wirsiformig.) Resembling the allantois,

A. an'imals. The Mammalia, Aves, and Reptilia, which all have an allantois.

A. liq'uid. The same as Allantoic fluid.

A. mem'brane. The Allantois.

A. ve'sicle. The Allantois.
A. ves'sels. The blood-vessels of the allantois, which ultimately become the umbilical

**Allantoi'dea.** ("A $\lambda\lambda\tilde{a}s$ , a sausage.) A Group of Vertebrata in which the feetus is furnished with an allantois, comprising the reptiles, birds, and mammals.

Allantoi'des membra'na. The Al-

lantois.

**Allan'toin.** (Etym. same as *Allantoïs*.)  $C_4\Pi_6N_4O_3$ . The nitrogenous constituent of the allantoic and amniotic fluids; it occurs also in the urine of new-born animals, and has been found in normal urine, and generally in that of well-fed dogs and in that of preguant females. It forms small, but hrilliant, four-sided prismatic crystals, having usually dihedral unequal summits, transparent, colourless, and tasteless. It is soluble in hot alcohol, in 160 parts of cold water, more soluble in hot water, insoluble in cold alcohol and ether. It is one of the products of the decomposition of urea; strong sulphuric acid decomposes it into ammonia, carbonic acid, and carbonic oxide; nitric acid produces urea and allanturic acid; with strong alkalies ammonia and oxalic acid are formed. It forms salts with metals, but not with acids.

Allan'tois. ("Αλλάs, a sausage; εἶδοs, likeness, so called because of its shape in some animals. F. allantoide; I. allantoide; G. Wurst-häutehen.) The urinary vesicle—a feetal structure not found in fishes or amphibia, but present in reptiles, birds, and mammals. One of the feetal appendages which, about the eleventh to the sixteenth day of incubation, during the period of embryonic life in the fowl, serves as the chief organ of respiration. The allantois originates as a vesicular bud from the mesoblastic and hypoblastic elements of the splanchnopleure close to its junction with the somatopleure at the binder end of the embryo, in intimate connection with the part which afterwards becomes the cloaca; it is consequently an appendage of the alimentary canal. After the eighth day to the end of feetal life it is contractile, the movements being due to the presence of smooth muscular fibre cells. At an early period it developes a long stalk, pushes its way between the true and the false amnion, and curves over the embryo, so that, in the fowl, during the later stages of incubation it is separated from the shell only by the thin chorion.

At its earliest stage blood-vessels make their appearance in the outer layer. The arteries are branches or outgrowths of the iliac arteries, and subsequently become the umbilical arteries; the blood is returned by two veins, which very soon after their appearance unite close to the allantois into one trunk, which joins the omphalomesenteric vein. Thus by its proximity to the shell the allantois is an important respiratory organ.

In birds it begins on the third day, in man not until the twelfth or thirteeuth. In the Pachydermata and the Cetacea it is very large; in the Carnivora it is, like the placenta, zonular; in the Rodentia and man it is small. In mammals it serves to convey by its growth the blood-vessels to the interior of the chorion. and in man, when it has accomplished this purpose, at the end of the fourth week, it ceases to grow as a vesicle, and seems to disappear at the end of the second month, though the vessels remain, and the lower part forms the urinary bladder, the connection between the extra- and intra-somatic parts remaining as the urachus, which, though usually obliterated about the fifth month, is occasionally pervious. It is lined by epithelium with large nuclei. It receives the secretion of the Wolffian bodies and later that of the kidneys.

In mammals the allantois thus performs a double function: on the one hand establishing a communication between the fœtal and maternal blood, hy which the aeration of the former is provided for, though the two bloods do not actually mingle; and on the other, aiding in forming part of the adult urinary bladder. The arteries, which convey the blood to be aerated by coming into near relation with the maternal blood, spring from the primitive aortæ, and their brauches, after penetrating and ramifying in the villi of the chorion, reunite to form the umbilical veins. With the closing up of the navel and the fuller development of the placenta, these vessels become greatly elongated and form the umbilical arteries and vein.

A., vas'cular lay'er of. The outer mesoblastic layer of the allantois which, separating from the deeper hypoblastic layer, is also called the Endochorion.

Allantotox'icum. ('A\\alphas, forcedmeat, a sausage; τοξικόν, a poison. G. Warstgift.) Term for a poison developed in putrid sausages made of blood and liver, and often proving speedily fatal. See Allantiasis.

Allanturic acid. C<sub>10</sub>H<sub>14</sub>N<sub>8</sub>O<sub>9</sub>. An acid obtained by Pelouze by treating allantoin with nitric acid, or boiling uric acid or allantoin with peroxide of lead. It is volatile and uncrystallisable.

Allarinoch. Old name for Plumbum, or

lead. (Quincy.)
Al'larton. An English surgeon of the nineteenth century.

A.'s opera'tion. A modification of median lithotomy in which little or no incision is made into the prostate; an ordinary staff is used. The left finger in the rectum touches the prostate, a straight bistoury is carried from half an inch in front of the anus into the membranous urethra in front of the prostate, and a few lines of incision towards the bladder is made; the external opening is enlarged to an inch or more as the bistoury is withdrawn. A long ball-pointed probe is run along the staff into the bladder, the staff is withdrawn, the finger is introduced under the guioance of the probe, the prostate and neck of the bladder are dilated so as to receive the forceps, when the stone is extracted.

Alla'sia. Name of a tree that grows on the coast of Mozambique; its leaves, applied in form of a cataplasm to the loins, being supposed to facilitate parturition.

Allax'is. ('Αλλάσσω, to change. G. Umwichseling.) Change, conversion, metamorphosis. Allay'ing. See Alligation, Alloy.

Allecrim braho. A Brazilian plant, the Hypericum laxiusculum, reputed to be a specific against the bites of serpents.

Allec'tuary. A varied spelling of Elec-

Alleghany Mountain springs. United States of America; Pennsylvania State, Cambria county Altitude 2000 feet, on the summit of the Alleghany. The waters are indifferent. with one exception, the Ignatins spring, which is a chalybeate.

Allegrez'za. Italy; Tuseany; Commun del Montagno, Mineral waters having a temp. 15 C. (59° F.), and containing sodium carbonate, and chloride and calcium carbonate; also probably sulphur. Used in urinary concretions, vesical catarrh, rheumatic affections, and skin diseases.

Alle'lo. The common name in Egypt of

the Solanum nigrum.

Allelu'ia. (Heb.) A name for the plant Oxalis acctoscila, because it was pleutiful in Rogation week, when the priests sung their halle lujahs.

Allen'ce. Ancient name for Stamum, or tin.

Allenimen'tum. (L. ad, to; lenis, soft.

G. Linderingsmittel.) A soothing remedy.

Allen'thesis. (Άλλος, another; ευθεσις, an insertion. F. allenthèse.) The introduction into, or actual losing of, a foreign body within the organism.

(Same etymon.) That Allen'theton. which is introduced or inserted into the organism. Allen'thetum. Same as Allentheton.

Alleo'tic. An erroneous spelling of Alleotie or Alloiotic.

Allerheil'igen. Switzerland; Canton of Soleure, between Lengnau and Grenchen. Altitude 1360 ft. Mineral waters containing caleium and magnesium earbonate and sulphate; they are of a temp. 13° C. (55°4 F.), and are well adapted for neuropathic diseases; they are very ancient, and much frequented. There is a whey-cure establishment.

Allerimbra'bo. A Brazilian name for the

Hypericum laxiusculum. (D.)

Allevamen'tum. (L., from allevo, to make smooth. G. Erleichterungsmittel.) A

means of alleviating.

Allevard'. France; Dep. de l'Isère, Arroud. de Grenoble; about ten miles from the town of Grenoble. The spring, which is situated in a narrow and very picturesque valley, contains a large proportion of free hydrogen sulphide, with various sulphates, chlorides, and carbonates. Temp. 24·3° C. (75° F.) Altitude 1544 feet. Recommended in cutaneous diseases and pul-monary catarrh. The waters are used for inhalation, chiefly for an hour or more; under their influence the respiration becomes slower and fuller, the heart quieter. Chronic laryngeal and bronchial affections are treated thus, with the effect of diminishing the cough and improving the expectoration. Asthma is said to be greatly benefited.

Whey boths are used here for diseases of the nervous system and of the heart.

Alleva'tion. (L. allevatio, from allevo, to lift up. G. Erleichterung.) A raising up; and so an alleviating, an assuaging, as of pain.

Alleva'tor. (L.) One who raises np; an apparatos for raising sick persons.

Allex. The thumb or great toe.

Alleza'ni. France; Corsica, Arrond. de Corse. Bicarbonated chalybeate springs. Temp. 55 4° C. (131.7° F.).

All-flow'er wa'ter. A name for the urine of the eow, which was used as a remedy. (1).)

All-good. The Chenopodium bonus Henricus. The syllable All is a corruption of Hal=

Harry = Henricus.

All heal. The Heracleum spondylium; the stackys palustris; and also the Hypericum androsæmum, or St. Peter's wort.

A. heal, clown's. The Stachys palustris. A. heal, Her'cules. The Opoponax chi-

Allia ceous. (L. allium, garlie. F. alliace; G. knoblauchartig, lauchartig.) Belonging to, or of the nature of, garlie.

Alliaræ'ris. Ancient term for the copper used in preparing the philosopher's stone.

Allia'ria. Nat. Ord. Crucifera. plant Jack-by-the-hedge, or Sauce-alone, having a taste like garlie; now called Sisymbrium officinate. The herb and seeds are regarded as diuretic, diaphoretic, and expectorant, and have been given in asthma and catarrh. Also used in gangrenous affections and to promoto suppuration.

Allia'rious. The same as Alliaccous.
Allia'rium. Same as Alliaria.

Allicar. Arabic for Acetum or vinegar. Allicola. Name for Petroleum. (Hooper.) Alliga'men. (L., from alligo, to bind. Gr. ἀπόδεσμος; G. Binde, Schnur.) A band, a bandage, a cord.

Alligans. (L., from alligo, to bind to. G. anklammernd.) Attaching to; binding to. (G. Klammerwurzel, Haft-

A. ra'dlx. (G. Klammerwur wurzel.) An aerial or accessory root.

Alligation. (L. ulligatio, from alligo, to bind to. F. alliage; G. Verbindung, Legirung.) A combination of two or more metals; applied by Berzelius to combinations of electro-positive bodies, as sulphur, hydrogen, and boron, with certain electro-negative bodies, as silicon, arsenic, and electro-negative metals.

Alligator'idæ. A Family of the Order Crocodilia, Subclass Hydrosauria, Class Reptilia. Muzzle long, without fosse for the inferior canine teeth; ventral plates usually separate;

web of feet rudimentary. Hab. America.

Alligatura. (L. alligo, to bind to. G. Verband.) Term for the act or process of bandaging; or for a ligature, or bandage, according to Scribonius, n. 200.

Al'lii bul'bus, Belg. Ph. The bulb of the Allium sativum.

Italian naturalist Allioni, Charles. Born at Turin, 1725; died in and physician. same city, 1803.

Allioporum. The ancient name of the Allium scorodoprasum.

Allio'tic. The same as Allwotic.

Allitu'ric acid. C<sub>6</sub>H<sub>6</sub>N<sub>2</sub>O<sub>4</sub> A product of the disintegration of alloxantine when its watery solution is heated with hydrochloric acid. **Allium.** (Perhaps from άλέω, to avoid; because of its offensive smell. F. Ail; G. Lauch.) The pharmacopæial name of the Allium sativum,

or Bulbus allii sativi.

A Genus of the Tribe Lilica, Nat. Ord. Liliacea. Bulbous fœtid plants; flowers umbellate, euclosed within a spathe; sepals and petals spreading; the stamens inserted into their base; fruit a capsule; seeds angular.

A. ampelop'rasum. The A. porrum.

A. arena'rium. The A. scorodoprasum.
A. ascalon'icum. (F. échalote; G. Schalotte.) The shallot. Hab. Syria. Umbels not bulbiferous, globose; stem leafy at the base only; leaves awl-shaped; spathe two-valved; stameus tricuspidate; lobes of the flowers ovatelaneeolate; bulbs elustered. It is stimulant and diuretic. Used in cookery.

A. canaden'se. Meadow garlie. II ab. North America. Has the same properties as garlic.

A. ce'pa. (Κρόμυου; L. capa, or cepa; F. oignon; I. cipolla; S. cebolla; G. Zwiebel.)
The onion. Hab. Egypt. Umbel not bulbiferous, globose; stem ventricose, leafy at the base; leaves terete; spathe reflexed; lobes of the flower obtuse, hooded, half as long as stamens; bulb solitary, compressed. The expressed juice has been used as an expectorant, diuretic, and antiscorbutic, in doses of two or three tablespoonfuls daily. Onion poultice is used for boils and buboes.

A. contor tum. The A. scorodoprasum.
A. fistulo'sum. (F. ciboule.) Welsh onion. Hab. Siberia. Umbel not bulbiferous, globose; scape and leaves terete, fistular; lobes of the flower half as long as the stamens; evary three-cornered. Perennial. Used as a condiment, and as a stimulant and expectorant.

A. gal'licum. The Portulacea obracea.
A. hirsu'tum. Perhaps the Moly.

A. leptophyl'lum. An Indian species, the bulbs of which are eaten, and the leaves dried and used as a condiment.

A. mag'icum. The A. victoriale.

A. mo'ly. A species of garlie. (Linnæus). A. ni'grum. Perhaps the Moly.

A. olera'ceum. Field garlie. Bulb diuretie. A. ophioscor'odon. A synonym of the A. scorodoprasum.

A. plantagin'eum. The A. victoriale. A. por'rum. (Πράσον; F. poireau; I. porro; S. puerro; G. Lauch, Porrey.) The leek or porret. Hab. S. Europe. Umbel not bulbiferous; stem leafy; spathe one-valved, deciduous; lobes of the flower oblong, obtuse; bulb simple, soft. Used as a food and condiment. The infusion has been employed as an injection.

A. red'olens. The Teucrium scordium.
A. sati'vum. (Σκόροδον; L. allium; F. ail; G. Knoblauch; I. aglio; S. ajo.) The gallic plant. Hab. Sicily. Umbel hulbiferous; leaves slightly carinate; spathe one-valved, deciduous; bulbs compound, covered with a white skin. A local irritant, tonic, stimulant, diuretic, anthelmintic, and emmenagogue. Infused in water or milk it has been used as an injection in ascarides. The essential oil is given in the later stages of acute bronchitis of infants as a stimulating expectorant, and in diphtheria. Externally it has been used as a vesicant and rubefacient poultiee to the ehest in the capillary bronchitis of children, and to the extremities in convulsions. Garlie poulties have been used in burns and snake bites. When absorbed either by the alimentary canal or the skin it gives the pecuhiar odour to the breath of its essential oil, allyl-

sulphide, of which 112 lbs. of garlic contains about 3 oz. The expressed juice has been used in enfeebled digestion and dyspepsia, chronic catarrh, atonic dropsies. Dose 388-3ij. Formerly the infusion was given in milk. The U.S. I'h. has a Syrupus allii. Water, alcohol, and vinegar, extract the properties of garlie.

A. schoenop'rasum. (F. civette; 1. cipoletta; S. cebolleta; G. Schnittlauch.) Chives. Hab. Europe, Asia, N. America. A pot herb. Leaves fistular; head dense flowered, without bulbils; spathes two, stamens included.

A. scorodop'rasum. (F. rocambole; G. spanische Schalotte.) The rockambole or sand leek. Hab. Europe. Leaves flat, keeled, edges scabrid; sheaths two-edged; spathes two; head with bulbils; stamens not exserted. Used as a food and condiment,

A. ursinum. Ramsons. Bulb diuretie. A. victo'riale. (F. victoriale longue; G. Siegwurz, langer Allermannsharnisch.) A plant, the root of which, when dried, loses its alliaceous taste and smell, and is said to allay the abdominal spasms of gravid females.

A. vinea'le. (F. ail des vignes; G. Wilderlauch, Weinbergslauch.) Filaments three-pointed; leaves tubular. A species the bulbils of which are occasionally found in wheat grown in places not earefully farmed. They give a disagreeable garlicky flavour to bread made of it.

Allman, William. Professor of Botany at Dublin. Born 1771; died 1846.

Allochet'ia. ("Αλλος, another; χίζω, to see one's self.) The discharge of extraueous ease one's self.) matters from the bowels.

Also, the discharge of fæces through an unnatural opening. (D.)

**Allochez'ia.** ("Allos, other;  $\chi \in \zeta \in l\omega$ , from  $\chi \in \zeta \omega$ , to go to stool. F. allochezie.) A de-Allochez'ia. jection of abnormal substance.

Also, a dejection through an artificial anus; an abnormal opening.

Alloch'roic. **Alloch'roic.** ('Αλλόχροος, changed in colour; G. schillernd.) Changeable in colour shot-colour.

Alloch'roite. ("Aλλος, other; χρόα colour.) A variety of iron garnet, which exhibits varied colours when heated with sodium phosphate in the blowpipe flame; hence its name.

Allochroma'sia. (Αλλος; χρωμα, colour. F. allochromasie; G. Farbenrerunderung, Farbenwechsel.) A changing of colour.
Also, a synonym of Achromatopsy.

Allochromatic. (Same etymon.) Changing colour, causing or depending on a change of colour.

**Alloch'roous.** (L. discolor; G. verschie-nfarbig.) Frequently changing colour; a denfarbig.) symptom in disease regarded by Hippocrates as of bad omen.

Allod'apa typ'ica. A sexually mature Nematoid Entozoon found in the execum of Dicholophus cristatus.

Alloean'thus. A Genus of Moraccae. The only species knowa, A. zeylanicus, is a tree with milky sap and alternate leaves. The liber is employed to make paper and coarse textile fabrie:

('Aλλοῖοs, different; Allœop'athy. πάθος, disease.) A synonym of Allopathy. **Alloeo'sis.** ('Αλλοίωσις, from ἀλλοιόω, to

render different, or to change. G. Umunderung.) Term for a change in the constitution.

Allœo'tic. (Allwosis, a change in the

constitution. F. allwotique; G. Umundernd.) Relonging or pertaining to Allwosis; applied to medicines capable of bringing about a change in

the constituti n; alterative.

Allog amy. (Allos, another; γαμός, marriage.) The fecundation of a flower by pollen either from the androccium of the same flower, or from the androccia of flowers on the same plant.

Alloio'sis. Similar to Allwosis. Alloio'tic. Similar to Allastic.

Allola'lia. ('Aλλos. other; λαλιά, talk. F. allolalie.) An unusual state of speech or utterance.

**Allom'erism.** (Allows;  $\mu i \rho o s$ , a part.) A term given by Cooke to that condition in which the crystalline form continues the same, although the proportions of the isomorphous constituents vary

Allomor'phia. Same as Allomorphosis. Allomorpho'sis. ('Αλλος, other; μορφή. form. F. allomorphie; G. Gestalteerunderung.) The same as Metamorphosis.

Allopath. ('Aλλος, other; πάθος, affec-

tion.) A practitioner of Allopathy.

Allopath'ic. (Same etymon.) Of or helonging to allopathy.

Allop'athist. (Same etymon.) A prac-

titioner of allopathy.

Allop athy. (The same etymon.) term for the curing of a diseased action, by inducing another of a different kind, yet not necessarily diseased: but it has been put forth by homeopaths to signify a doctrine of applying remedies according to the material condition of the organs affected by disease, and by such application, as it were, exciting another and different kind of disease, in which, they assert, the entire legitimate system or science of medicine, as opposed to homeopathy, consists. It need scarcely be stated that such a definition so applied is not a correct statement of the theory or theories underlying modern medicine. According to the homoopathists there are only three possible relations between the symptoms of diseases and the specific effects of medicines; namely, opposition, resemblance, and homogeneity. It follows, therefore, that there are only three imaginable methods of employing medicines against disease, and these are denominated anti-

pathic, homoopathic, and allopathic. **Allophane.** ("Αλλος, other; φαίνο, to appear.) A substance of the clay family, consisting chiefly of silica, alumina, and water of crystallization; it is brittle, translucent, of a resinous lustre, and green, blue, brown, or white in colour.

Allophan'ic ac'id. C<sub>2</sub>H<sub>4</sub>N<sub>2</sub>O<sub>2</sub>. (G. Urencarbaminsaure, Berz. Harnstoffkohlen säure, Gmelin.) This acid is only known in combination in the form of salts or ethers. Allophanie ether was first obtained by Liebig and Wöhler by the transmission of hydrocyanic acid vapour through alcohol.

Allopha'sis. ('Aλλος, other; φάσις, a saying from φημί, to say.) Delirium, or incoherent talk

Allophyle. ("Αλλος, another; φυλή, tribe.

G. fremd, auslandisch.) Foreign.

A. race. A term applied by Quatrefages to the Esthonians, Caucasians, and Ainos, which he regards as making up, with the Aryan and Semitic

nations, the white group of the human race. **Allop tera.** (Αλλος, other; πτέρον, a wing. F. Alloptere.) Applied by luméril to the pectoral fins, the situation of which varies much.

Allosteato'des. (Αλλος; στέαρ, suet.) An alteration of the secretion of the sebaceous glands of the skin.

Allotre'ta. ("Allos, one for another; τοητός, having a hole.) Applied by C. G. Ebrenberg to two Families of the Polygastrica having the mouth or the anus terminal.

Allot'ria. ('Αλλότριος, strange.) Foreign hodies or substances in unnatural positions.

Allot'ria. A Genus of the Hymenoptera entomophaga, Class Insecta.

A. vic'trix. A parasitie eynips which deposits its ova in the rose aphis, where they develop.

('Αλλότριος, of Allotriaposte ma. auother; ἀπόστημα, a large absess. L abscessus atienus; F. allotriapostème; G. Fremdgeschwulst.) A term by Senftleben for an abscess containing another.

Allotrice crisis. ('Αλλότριος; ἔκκρισις, secretion.) An abnormal quality of the secretions from the hody.

Allotriochet'ia. ('Αλλότριος, of another, foreign;  $\chi \in \zeta \omega$ , to ease one's self.) The same as Allochetia.

Allotriochezia. ('Αλλότριος; χέζω, to ease one's self. F. and G. allotriochizie.) An abnormal evacuation from the bowels.

**Allotrioec'crisis.** ('Αλλότριος, strange; εκκρισις, secretion.) The separation or excretion of extraneous matters in disease.

Allotriodon'tia. ('Αλλότριος; όδούς, a tooth.) The fixing in of artificial or prepared natural teeth.

Allotriogeu'sia. ('Αλλότριος; γεῦσις, ste. F. allotriogeusie; G. Geschmachstäutaste. schung.) Perversion of taste, either from affeetion of the nervous system or from disease of the mouth.

Allotriogeus'tia. ('Αλλότριος; γεύσις,

taste.) Same as Allotriogensia
Allot'riolith. ('Αλλότριος; λίθος, a stone.) A calculus of unusual material.

Allotriolithiasis. ('Αλλότριος; lithiasis.) The formation of calculi of unusual substances, as the calculous bezoar.

**Allotriopha** gia. ('Αλλότριος; φαγεῖν, to eat; G. Dreckessen.) Morbid desire to eat unwholesome substances. Same as Allotriophaqu.

Allotrioph agy. ( Αλλότριος; φαγείν, to eat.) The eating of unnatural things, such as occurs in certain forms of insanity and hysteria. Vogel has given this term to the disease called

Allotriotek'nia. ('Αλλότριος; τέκνον, that which is born, a child) The birth of a mole or other unnatural fætal product.

Allotriotex'is. ('Αλλότριος; τέξις, child-bearing.) An unnatural delivery; also the product of such, as a mole.

Allotriu'ria. ('Αλλότρος; οὖρον, urine.) The presence of foreign matters in the urine.

Allotrophic. ( Αλλος, other, τροφή, Term applied to substances which, whilst food.) preserving their ordinary chemical and physical characters, lose their normal physiological nutritive properties, and may even become injurious.

Allotropic. (G. allotropisch.) Having

the properties belonging to Allotropy.

A. ox'ygen. A synonym of Ozone.

Allot ropism. (Allos, other;  $\tau \rho \delta \pi \sigma s$ , way, manner, or custom.) The condition of a way, manner, or custom.) Allotropy.

Allotropy. ('Alλos; τρύπος.) A term

employed to express the fact that certain elements are capable of existing in two or more conditions, in which they possess different physical and chemical properties; as sulphur melted at a high temperature, which before bright yellow, and brittle, becomes dark, teuacious, and may be drawn out into threads like caonteboue. Carbon presents allotropic forms in charcoal, plumbago, and the diamond.

Allouche. (Fr.) The fruit of the Al-

louchier or Cratagus aria.

Allox'an. C<sub>4</sub>H<sub>2</sub>N<sub>2</sub>O<sub>4</sub>. Obtained by adding cold concentrated nitric acid to uric acid. It forms large, efflorescent, rectangular prisms, containing four equiv. of water of crystallisation; it dissolves in water; has an acid reaction, an astringent taste, and stains the skin red or purple. Its solutions are recognised by giving a white precipitate of oxaluramide with hydrocyanic acid and ammonia. It is said to have been found in the urine in a case of heart disease.

Alloxanate. A salt of alloxanic acid. Alloxan'ic ac'id. C<sub>4</sub>N<sub>2</sub>H<sub>4</sub>O<sub>5</sub>. Formed when haryta water is added to a solution of alloxan heated to 60° C. (140° F.), until the precipitate ceases to be redissolved; barium alloxanate is formed, and on the addition of dilute sulphuric acid the harinm is removed as insoluble sulphate. and the alloxanic acid crystallised from the solu-tion in fine needles. It is a hibasic acid. The alloxanates are decomposed on boiling with water into urea and mesoxalic acid.

C8H4N4O7. Alloxan'tin. Obtained by the action of hot dilute nitric acid upon uric acid. It forms small, four-sided, oblique, rhombic prisms, colourless and transparent, which become red on exposure to ammoniacal vapours.

Alloy. (F. aloyer; to mix metals. F. alliage; I. lega; G. Legirung.) The combination or mixture which takes place when two or more metals, with the exception of mercury, are melted together. This may be a solution of one metal in another, a chemical combination, or a mechanical mixture, or a combination of these. Alloys of which mercury forms a part are called amalgams. The least valuable of the two metals is called the alloy. Alloys of most metals offer a greater resistance to the current of electricity than the mean resistance of their component

A., fu'sible. An alloy used for filling hollow teeth; it melts at a sufficiently low temperature to enable it to be applied by instruments, which are not heated to such an extent as to damage the structures of the mouth.

All'spice. The common name for the fruit of the Eugenia pimenta, or Jamaica pepper. See

Pimenta.

A. bush. The Benzoin odoriferum.

A., Carolina. The Calycanthus floridus.
A., wild. The Benzoin odoriferum.
Allucina'tion. A variety of the more

common form of spelling Hallucination.

Allu'me. Italy; in the Island Giglio, Chalybeate waters of 15° C. (59° F.) They contain a large quantity of iron sulphate and some sodium chloride. Used in abdomiual diseases and in chronic psoriasis.

Al'lus. The thumb; the great toe.

Allu'vial. (L. alluo, to wash.) Of or belonging to Alluvium. Applied to deposits on the land which have been produced by the action of

A. soils. Soils which have resulted from

recent deposit from water, consisting largely of sand, clay, and much vegetable matter; they are frequent in the deltas of rivers and in low-lying districts; from their origin they are wet and often marsby, whilst drainage is difficult. As a rule they are unhealthy, unless the drainage is well carried out.

A. wa'ters. Well water from alluvial soils is generally impure, often containing much organic matter, which occasionally gives rise to abundance of nitrites; in addition, they generally contain calcium carbonate and sulphate, magnesium sulphate, sodium carbonate and chloride, silica, and iron. From 20 to 120 grains of solids per gallon is no unusual amount.

Alluvium. (L. ad, to; luo, to wash. F. alluvion; 1. alluvione; G. Alluvium, angeschwemmte Land.) The stratum immediately below the superficial mould, which has been washed down by the ordinary operations of water, and consisting of coarse gravel, sand, or mud. The product of the extraordinary operations of water,

as in a deluge, is called Diluvium.

Al'lux. Same as Hallns.
Al'lyl. C<sub>3</sub>H<sub>5</sub>. A non-saturated univalent alcohol-radicle. Allyl can be obtained in the free state by decomposing the iodide with sodium at a gentle heat, and afterwards distilling the it is a very volatile iquid product. It is a very volatile iquid, with a pungent odour, resembling horseradish; sp. gr. 0.684 at 14° C. (57° F.) It boils at 50° C. (138° F.) It is but little attacked by strong sulphnric acid.

A. al'cohol. C<sub>3</sub>H<sub>5</sub>.HO. A colourless liquid, boiling at 97° C. (207° F.), and having a pungent odour. It mixes in all proportions with water, alcohol, and ether. It burns with a brighter flame thau alcohol.

A. al'dehyde. C<sub>3</sub>H<sub>4</sub>O. A synonym of Acrolein.

**A. sul'phide.**  $(C_3H_5)_2S$ . A natural product, being the essential oil of garlic. It occurs also in the herb and seeds of *Thiaspi arrense*, which, when distilled, yield a mixture of 90 per cent. of oil of gariic and IO per cent, of oil of mustard (sulphocyanide of allyl).

A. sulphocar bimide. C3 II5.CS.N. The essential oil of black mustard seed. It does not exist ready formed in the seeds, but is produced by the decomposition of myronic acid by myrosine.

A. sulphocy anide. (G. Schwefelvyan-allyl.) C<sub>4</sub>II<sub>5</sub>NS. See Mustard, essential oil of. A. thiocar bimide. A synonym of A. sulphocarbimide.

Allylene. C3H4. An allyl compound of the acetylene series.

Al'ma. Arabic for Aqua, or water. (R. and J.)

Also, the first motion of a feetus to free itself from its confinement. (Parr.)

Also, (Gr. άλμα, a spring), a pulsation; palpitation of the heart.

Al'mabri. Arabic for a stone like to amber. (Ruland.)

Arabic for the operation of Alma gra. washing, or the substance washed. Term for red earth or bole; used as an

astringent. Also, a name for the white sulphur of the alchemists.

Old term for a lotion. (Ruland.)

Alma'gro. Spain. A carbonic acid spring of a temperature of 8° C (46'4° F.); the gas is so plentiful that animals are soon suffocated.

Almakan'da. Arabic for litharge. (R. and J.)

Al'makist. Arabic for litharge.

Almame'zo. Austria-Hungary; in the Bereg-Ugoesa County. Many mineral waters are found in this district, the composition of which is little known.

Al'mandine. A name for the violet or violet-red varieties of the garnet and its congeners.

Almarago. See Almargen.

Almar'cab. Arabic for litharge. (Turton.) Almarcarida. Arabic for litharge of silver (Ruland); also called Almarcab (Turton); and Almariab, according to Castellus.

Almar'cat. Arabic for the Scoria auri.

(R. and J.)

Almar'gen. Arabic for the substance coral; also called Almarago and Armalgor. (R. and J.)

Almariab. The litharge of silver, which is litharge having a pale colour.

Almarkasita. Arabic for Hydrargyrum, or mercury. (R. and J.)

Al'martak. Arabic for powder of litharge.

(R. and J.) Al'mas. Hungary; a village about ten miles from Komorn, on the right bank of the Danube. Tepid mineral waters strongly impregnated with

hydrogen-sulphide. Almatatica. (Arab.) Term anciently used for the metal Cuprum, or copper. (R. and

Al'me. ('Αλμη.) Brine; also called Muria by Pliny and Celsus. It was used for ulcers of the mouth and rectum in dysentery, and as a local application in diseases of the joints of the hands and feet. (Waring.)

Almecasite. Same as Almatatica.

Almechasite. Same as Almatatica. Alme'ida. Spain; Province of Leon, near Bonar. A hot spring containing sulphur and alkaline salts, which has a local reputation for almost all diseases.

Almeliletu. Used by Avicenna to signify a preternatural heat, less than that of fever, and which may continue after a fever. (Castellus.)

Almene. Arabic for Rock-salt. (R. and

J.) Almeri'a. Spain. Mineral waters springing from the foot of a quartz rock. They contain ealcium, magnesium and sodium chloride, magnesium and ealcium sulphate, and magnesium carbonate, and much free carbonic acid. They are used in nervous diseases, paralysis, rheumatism, chronic mucous discharges, and skin discases

Al'metat. Arabic for the Scoria auri. Almeze'rion. The Cucorum tricoccum. Almi'sa. Arabic for Moschus, or musk. (Johnson.)

Almis'adir. Arabic for Sal ammouiacum.

**Al'misdach.** Arabic term used by Albueass for the larger of two kinds of forceps, furnished with teeth on the inside, for erushing the head of the feetus when of extraordinary size; the smaller was called Misdach.

Almizadir. Arabic for Verdigris. (Dornæus, R. and J.)

Al'mond. ('Aμυγδάλη; L. amygdalus; F. amande; I. mandola; S. almendra; G. Mandel.) The seed of the Amygdalus communis. See Amygdala.

A. bis'cuits. Prepared in a similar way to almond bread, and used for the same purpose.

A., bit'ter. See Amygdala amara.
A. bread. A food for the diabetic, made of blanched sweet almonds and white of egg. Useful because almonds contain no starch and only a very small amount indeed of sugar.

A. cake. The compressed mass left after the expression of the oil from almonds. Used as

a cosmetic.

A., coun'try. The same as A., Indian. A., earth. The Arachis hypogaa.

A. fla'vour. A liquid prepared from the bitter almond, and containing variable quantities of its essential oil. Poisoning by this substance has been recorded.

A., Guia'na. Brazil nuts; the fruit of the

Bertholletia excelsa.

A., In'dian. The fruit of the Terminalia catappa; it is oleaginous and nutritious.

A., Ja'va. The fruit of the Canarium com-ne. They are made into a kind of bread, and an oil, like almond oil, is obtained from them.

A. Jor'dan. The best variety of the Amygdala dulcis, imported from Malaga.

A. of the ear. (F. amyydale des oreilles; Ohrenmandel.) Variously applied to the G. Ohrenmandel.) tonsils and to a small lymphatic gland over the mastoid process or below the external ear.

A. of the throat. (F. amygdale; G. Halsmandel.) A popular name of the tonsils.

A. oil. See Oleum amygdalæ.

A. paste. Four ounces of blanched bitter almonds, the white of one egg, rose water and spirit of wine equal parts, as much as is sufficient; bcaten up into a paste, and used for preventing chapped hands.

A. pow'der. Almond cake powdered and used, instead of soap, for washing the hands when

chapped.

A., sweet. See Amygdala dulcis.

A. tree. The Amygdalus communis.
Almuri. Arabic for a eathartic preparation used by the ancients; mentioned by Rhazes.

Used by Avicenna for the Alnaba'ti. Carob fruit.

Al'nec. Arabic for Stannum, or tin. (Ruland and Johnson.) Alneric. Arabic for Sulphur vivum.

Alnic'olus. (L. alnus, the alder tree; lo, to inhabit.) Living on the alder tree. colo, to inhabit.)

Alnites. A Genus of Fossil Betulacea,

found only in the Tertiary system.

Al'nus. (F. aulne; G. Erle.) A Genus of the Nat. Ord. Betulaceæ. Stamens four; nuts angular, wingless, one-or two-seeded.

A. commu'nis. The A. glutinosa. A. glutino'sa. (F. aulne commun; I. ontano; G. Schwarzerle.) The alder. Hab. Europe, Asia. Leaves roundish, blunt, wedge-shaped at the base, bearded at the angles of the veins beneath. The bark and leaves are astringent and bitter; the nuts are astringent. The leaves when bruised are used as an antilactic poultice and as an application to wounds and ulcers. The infusion of the nuts is used as an astringent gargle. The bark has been recommended as an antiperiodic in ague.

A. inca'na. The tag alder. Hab. North America. The hark is used internally and ex-ternally as a hæmostatic. The tree is believed to possess the same properties as the A. glutinosa. In Kamtschatka the bark is used for making a

kind of bread.

A. ni'gra. The Rhamnus frangula.

A. rotundifo'lia. The A. glutinosa. A. serratula'ta. The A. serrulata.

The American alder. **A. serrula'ta.** The American alder. Used as *A. glutinosa*. It is credited with antisyphilitic and antiscrofulous properties.

Aloca'sia. A Genus of the Nat. Ord.

Aroidea.

A. monta'na. Hab. Iudia. The fresh juice is acrid, and is used by the natives as a stimulant and rubefacient.

Alo'chia. (A, neg.; and lochia.) Absence

of the lochial discharge.

**Al'oe**. ('Alon, F. alos; I. and S. alos; G. alosaft; Ar. cebar, musebber.) Aloes. The inspissated jnice of the leaves of many species of aloe. The leaves are cut off and allowed to drain naturally, without pressure, into a receptacle, and the juice is evaporated either in the sun or by boiling. It varies in appearance and in consistence, according to age, the kind of aloe used, the mode of preparation, and other circumstances. Aloes is somewhat sweetish and also very bitter, of a strong and disagreeable odour, of a brownish colour, and a more or less resinous fracture. It contains crystalline and amorphous aloin, resin, volatile oil, gallic acid, albumen, and calcium and potassium salts. Aloes has been used as a stimulating application to slowly healing wounds and ulcers. Aloes in sufficient dose is a cathartic. It increases the secretion of bile, and in some degree that of the glands of the large intestine. Some late observations tend to show that a necessary condition of its purgative action is the presence of bile in the intestines. In large doses it produces active purgation, sometimes with much griping, and occasionally with rectal congestion and hamorrhoids. As a result of this action, it is considered to be an emmenagogue and an abortifacient. In small doses it is a stomachic and cholagogue. It is used in constipation, in indolence of the liver and intestines, in thread worms, and in amenorrhea, and is counter-indicated, at least in large doses, in rectal hæmorrhage, piles, menorrhagia, threatened abortion, and pregnancy; in habitual constipation it is used in small doses, combined with nux vomica, or other bitter. Contrary to general practice, it was recommended by Oppolzer in piles, with quinine or iron. Dose, -6 grains.

Death is said to have been caused by large doses of alees; in one case two drachms were taken hy an adult; diarrhea came on, which

proved fatal in twelve hours.

A. aromat'ica. A synonym of Alocs-

A. Barbaden'sis, Ph. B. (F. alois des Barbades.) Barbadoes aloes. Derived chiefly from Aloe vulgaris, but also in some degree from A. arborescens, A. purpurescens, and A. Socotrina. It varies in colour from dark-brown to reddishbrown or liver colour, when powdered dull olive yellow, breaks with a clean, dull, waxy fracture, with opaque edges, has a strong disagreeable smell; dissolves almost entirely in proof spirit, and during solution exhibits under the microscope numerous crystals. One part dissolved in 100,000 of distilled water gives a fine rose-colour on the addition of chloride of gold or tincture of iedine; other varieties show this reaction feebly or not at all. Dose, 2-6 grains, or less.

A. caballina. (F. aloès caballin; G. Rossaloë.) Caballine, horse, or fetid aloes An inferior variety derived from the dregs of more valuable kinds, and at one time used in veterinary medicine on account of its cheapness. It is black, opaque, dull in fracture, and very nauseous.

A. Capen'sis, U.S. Ph. (F. aloès du Cap.) Cape aloes. The inspissated inice of Aloe spicata and other species, as A. ferox, A. africana, A. perfoliata. It has a dark olive or greenish-black colonr, when powdered bright yellow, slightly tinged with green, a brilliant conchoidal fracture. transparent at the edges, and without crystals when dissolved in spirit. It contains, in 100 parts, 59 45 of soluble aloes, 32 433 of insoluble aloes, and 8.117 of salts.

A. depura'ta. Purified aloes; a synonym

of Extractum aloes alcoholicum.

A. epat'ica. The same as A. hepatica.
A. gum'mi. Gnm aloes; a synonym of Alves.

A. hepat'ica. (F. aloés hépatique; S. Leberaloë.) Hepatic aloes. A variety of uncertain origin, probably obtained from the same species as Socotrine aloes, but prepared with less care. It is reddish-brown in colour, of nauseons taste, darker and less aromatic than Socotrine aloes, and with a less smooth fracture and a more opaque appearance.

A. insucca'ta. Alees dissolved in the juice of roses, violets, borage and bugloss, and then evaporated to a proper consistence.

A. insucca'ta tarta'rea. The Alor insuccata, to which one third of its weight of cream of tartar has been added.

A. lu'cida. A synonym of A. socotrina and of A. capensis.

A. Natalen'sis. Natal aloes. A variety imported from Natal. It is opaque and of greyishbrown colour. The aloin which it contains is called Nataloin.

A. pur'gans. A term for the drug Aloes.

A. purifica'ta, U.S. Ph. Purified aloes. Socotrine aloes 24 troy ounces, strong alcohol 4 fluid ounces. The aloes, first multed in a water bath, is mixed with the alcohol, then strained and evaporated. Ordered for the purpose of removing sticks and other impurities.

A. rosa'ta. Aloes repeatedly dissolved in the juice of roses, and as often evaporated to a proper consistence.

A. Socotri'na, B. Ph. (F. alois soccotrin; G. Socotrinischealoe.) Socotrine aloes. The inspissated juice of A. socotrina, and probably of A. abyssinica, A. officinalis, and A. rubescens. It is dirk reddish or yellowish brown, when powdered golden yellow, breaks with an irregular or a smooth and resinens fracture, having translucent edges, is more aromatic in smell than the other varieties, and contains an abundance of erystals when dissolved in spirit. It is supposed to be gentler in action. Dose, 2-6 grains or

A. succotori'na. Otherwise Aloe 8000trina.

A. viola'ta. Aloes repeatedly dissolved in the juice of violets, and as often evaporated to a proper consistence.

A. viola'ta tarta'rea. The A. violata, to which one third of its weight of cream of tartar has been added.

A. zoctorin'ia. A synonym of Aloe soco-

tring. Al'oe. (G. alor pflanze; Ar. sibbur; Syr. olar.)

A Genus of the Nat. Ord. Liliacea. Caulescent; leaves permanent, succulent; flowers cylindrical; corolla erect, mouth spreading, bottom nectariferous; stamens hypogynous; eapsule membranous, 3-celled; ovules numerous. The leaves have a strong enticle and a thick walled epiderunis enelosing a transparent, large-celled, mucilaginous pulp tissue, and a subepidermic layer of small celled green parenchyma, in which run many parallel bundles of vessels having on their inner surface a layer of smaller prismatic truncated cells placed end to end, which in summer are filled with a transparent viscid juice; sometimes the divisions disappear and the eells become tubes. This juice when inspissated forms aloes; when fresh it is used as an external refrigerant application in inflammations. The pulp washed in cold water and mixed with a little burnt alum is a native remedy for ophthalmia, and is applied in a muslin bag.

A. Abyssin'ica. Subcaulescent; leaves lanceolate, rather erect, margin with reddish sinuations; flowers greenish yellow. A species which probably affords some of the aloes shipped from the Red Sea as Socotrine or Moka aloes.

A. Africa'na (Miller). A Cape species; vields a less powerful aloes.

A. America'na. The Agave americana. A. arab'ica. A species said to supply Hepatic aloes.

A. arbores'cens (Miller). One of the species producing Cape aloes

A. Barbaden'sis (Miller). A synonym of A. vulgaris.

A. commeli'na (Willd). One of the species producing Cape aloes.

A. dichot'oma. The arrow tree; so called because of its use by the Ilottentots for arrows. It yields a kind of aloes. (W.)

A. fe'rox, L. A species supplying the best kind of Cape aloes.

A. gal'lica. An old term for a bitter drug,

probably Gentian. A. Guineen'sis. A synonym of the A.

A. In'dica (Royle). Hab. North-West provinces of India. A variety of A. vulgaris, having spikes of red flowers.

A. ispica'ta. A synonym of A. spicata. A. lin'gua. A synonym of A. lingua-

formis. A. linguæfor'mis. One of the species

producing the best Cape aloes. A. litora lis (König). Hab. Cape Comorin.

Probably a variety of A. vulgaris stunted by a poer saline soil. A. multifor'mis. A source of Cape aloes.

A. officina'lis. A variety of the A. Socotring.

A. perfolia'ta. (Var. Vera, Linnaus.) A synonym of A. vulgaris. A. plicati'lis. A species producing a less

powerful kind of Cape aloes.

A. purpures'cens. A species producing part of the Cape aloes.

A. rubes'cens. A variety of the A. Socotrina, having a suffruticose stem; spreading leaves with thorny margins, and a compressed branched peduncle.

A. sinuata. A synonym of A. vulgaris.
A. Socotrina. Hab. Island of Socotra, southern shores of the Red Sca and Indian Ocean. Stem arbore seent, 18" in height; Icaves ensiform, green, with small white serratures; flowers yellow or red and yellow; stamens unequal. The chief source of Socotrine aloes.

A. spica'ta. Hah. Cape of Good Hope. Stem arborescent, round. 3'-4' high; leaves ensiform, flat, dentate, spotted with white; flowers spiked, campanulate, horizontal, whitish, hencath each is a broad ovate, acute bract. Yields Cape

A. ve'ra (Miller). A synonym of A. Socotrina.

A. vulga'ris (Lam.). The Barbadoes aloe. Hab. India, North Africa, South Europe, West Indies. Stem arborescent, short, and woody, throwing up many suckers from the base; leaves ensiform, sinuate-serrate, glaucous, white-spotted; flowers yellow, not exceeding the stamens in The source of Barbadoes and Curaçoa length. aloes

Aloeda'rium. ('Αλοηδάριον.) Old name for a cathartic medicine, having aloes as a chief ingredient, many of which are described by Actiue, iii, 101. (Gorræus.)

Alcepaticus. Composed of, or compounded with, aloes.

Aloephan'ginæ pil'ulæ. A term for pills composed of aloes and aromatics; the adjective being of Arabic origin, and signifying odorous er aromatic.

Aloeresin'ic ac'id.  $C_{15}H_{16}O_7$ . brownish-yellow resin, consisting of microscopic crystalline granules, soluble in alcohol and ether.

Aloeresinin'ic ac'id.  $C_{15}H_{16}O_6$ . yellow crystalline substance, resulting with alocretininic acid, from the action of ether on a resinous product obtained by the action of hoiling dilute sulphuric acid on the insoluble portion of Cape aloes in water. It is easily soluble in alcohol and ether.

Aloere'tin. 2(C<sub>15</sub>H<sub>21</sub>O<sub>20</sub>)+H<sub>2</sub>O. A product of the oxidation and hydration of aloeresinic and aloeretinie acids. Insoluble in ether, which distinguishes it from aloeresinic acid.

Aloeretin ic ac'id.  $C_{30}H_{34}O_{15}$ . A substance which, under the microscope, appears under the form of brown, resinous, shining plates. With difficulty soluble in alcohol, insoluble in. water and ether, of acid reaction and bitter taste.

Aloeretinin'ic ac'id. C<sub>15</sub>H<sub>18</sub>O<sub>8</sub>. brown amorphous substance, obtained along with aloeresininie acid from Cape aloes. It is insoluble in ether.

Al'oes. The English name for the juice of the several species of Aloë, when prepared into an extract.

A., Barba'does. See Aloë Barbadensis. A., Beth'elsdorp. A fine kind of Cape aloes prepared at the Missionary Institution at Bethelsdorp, at the Cape of Good Hope.

A., blue. (F. alocs bleu.) A synonym of the Agave americana. A synonym of Hepatic A., Bom'bay.

alors.

A., cab'alline. See Aloë caballina.

A., Cape. See Aloë capensis.

A., Curaco'a. A variety made in the Island of Curaçoa in the Dutch West Indies. A., Cy'prus. An excellent variety made in

the Island of Cyprus. A., East In'dia. A synonym of Aloë socotrina.

A., false. The Agave virginica.
A., fe'tid. (F. A. noiratre et fetide.) A synonym of Alve cuballina.

A., green. (F. aloès vert.) A synonym of Fourcroya grgantea.

A., hepat'ic. See Aloë hepatici.

A., horse. A synonym of Aloe caballina. A., In'dia. (G. ostindische Aloe.) ferior variety made in various parts of India, but seldom found in an European market.

A., insol'uble. C<sub>102</sub>H<sub>130</sub>O<sub>59</sub>. A term applied by Kossmanu to the resmous residue of a watery solution of Cape aloes soluble in alcohol.

A., Jamai'ca. The same as Aloë barbadensis.

A., liq'uid soc'otrine. Obtained from the Red Sea. It yields a crystalline deposit, and when dried is like Socotrine aloes.

A., min'eral. Asphalt or Bitumen Judai-

A., Mo'cha. Same as Aloes, Moka. A., Mo'ka. An inferior kind of hepatic aloes, of dark colour and nauscous smell, brought to Aden from the interior.

A., Natal'. See Aloë natalensis.

A., res'in of. A transpareut brown substance deposited from a hot watery deeoction of aloes, soluble in alcohol, ether, and alkaline solutions. It is a purgative of variable action.

A. root. The Aletris farinosa.
A., shi'ning. A synonym of Aloë capensis. A., soc'cotrine. The same as Aloe socotrina.

A., soc'otrine. See Aloë socotrina. A., sol'uble. C<sub>51</sub>H<sub>66</sub>O<sub>20</sub>. A term applied by Kossmann to the part of Cape aloes soluble in water, which he believes to be different from alou. It is decomposed by dilute sulphuric acid into aloe-resinic acid and aloeretin, which are insoluble, and into glucose and alceretinic acid, which last, though insoluble in water, remains dissolved in the saccharine fluid.

A. spica'tæ extrac'tum. A synonym

of Aloë socotrina.

A., translu'cent. A synonym of Aloë socotrina.

A., Tur'kestan, A synonym of Indian

A., Tur'key. A syoonym of Aloë socotrina. A., vol'atile oll of. (G. Alorsol.) C8H12O3. A pale yellow mobile liquid existing in small quantity in aloes; of sp. gr. 0.863, boiling between 266.6° C. and 271.1° C. (510° F. and 520° F.), and having a taste and smell of mint, or of a mixture of fusel oil and prussic acid.

A. vulga'ris extrac'tum. A synonym of

Aloë hepatica.

Aloes'ic ac'id. An impure mixture of chrysammie and aloetinie acids.

Al'oesin. A bitter principle found by Pfaff

in aloes, probably aloin.

Aloesin'ic ac'id. A red-brown fluid of musky odour, obtained by the action of weak chlorine water on aloisol. It boils and is decomposed at 250° C. (482° F.) Insoluble in water, soluble in alcohol and ether; it becomes resinous on exposure to the air.

(F. bois d'aloes, calam-Al'oes-wood. bac; G. Aloeholz.) Considerable doubt has existed as to the tree from which this sub-stance is obtained. It would appear that the true aloes-wood is a product of the Aloexylum agallochum. It is of ashy brown colour, veined, soft when recent, becoming hard when kept; of agreeable odour, and bitter, aromatic taste and gives a pleasant perfume when burnt. It is supposed to consist largely of resinous concretion. It is used as an analeptic and as a stimulant perfume, when burnt, in vertigo and paralysis. It is also called Agila wood.

An aloes-wood is obtained from a species of Aquilaria; also a cordiat, and used in gout and

rheumatism.

A., false. A product of Exceptaria agallocha, au Euphorbiaceous plant, which has been erroneously supposed to yield aloes-wood.

Aloetic. (L. aloeticus, from aloë, the aloe plant. F. aloetique; G. aloehaltig.) Of or bo-

longing to aloes.

A. ac'id. A synonym of Chrysammic acid. According to some, an orange powder obtained by the action of nitric acid on aloes with heat, and distinct from chrysammic acid.

Aloet'ica. Aloetic remedies; medicines

containing aloes.

Al'oetine. The purified juice of aloes. It crystallises in prismatic needles of a beautiful sulphur-yellow colour. Its taste, at first imper-ceptible on account of its insolubility in water, soou becomes intensely and persistently bitter. It is probably an impure substance containing Aloin.

Aloex'ylon. A synonym of Aloes-wood. Aloex'ylum. ('Αλόη, aloe; ξύλον, wood.) A doubtful Genus of the Suborder Cæsalpiniæ, Nat. Ord. Leguminosæ. Sepals four, caducous, one larger than the others, and falciform; petals five, unequal; stameus ten; ovary compressed; fruit woody, smooth, falciform, monospermous; seed arillate.

A. agal'lochum. Hab. Cochin China. Yields Aloes-wood. A lofty tree, with alternate, simple, lanceolate, petiolated leaves, and terminal many-flowered peduncles.

A. ova'ta. Also yields Aloes-wood.
Alofel. Arabic term for Pannus, or a

pledget of lint or rag, wherewith to press upon a vessel after venesection. (R. and J.)

Alogandromel'ia. ('Αλογος, without reason, and so a brute; ἀνήο, a man; μέλος, a limb.) Term by Malacarne for a class of monsters having the hody of a brute with the limbs of a man.

Aloghermaphrodit'ia. ερμαφρόδιτος, hermaphrodite.) Term by Malacarne for a class of monster-brutes having the two sexes united in the same individual, which

normally ought to be distinct. **Alo**'gia. ('A, neg.; λόγος, a discourse.)
Defect of speech from intellectual deficiency.

**Alogotroph** ia. ( Δλογος, void of reason; τρέφω, to nourish.) A term which has been applied to the morbid or excessive nutrition of any part.

('Aloyos, without speech. G. Irrational, unreasonable. unvernunftig.)

Al'ohar. Arabie for Hydrargyrum, or mereury. (R. and J.)

Al'ohoc. Same as Alohar.

The same as Aloëtic. Aloicus.

Al'oid. ('Αλόη, aloe; εἰδος, form.) Having the appearance or characters of an aloe or of aloes.

Al'oin. The active principle of aloes. Its composition varies according to its source; that from Barbadoes aloes, barbaloin, is C17 H18O7; that from Natal aloes, nataloin, is  $C_{34}H_{36}O_{15}$ ; that from Socrotine aloes, socaloin, is similar to barbaloin. Aloin is a glucoside, and is obtained by crystallization from a concentrated aqueous solution of aloes and recrystallization. It consists of minute needle-shaped radiating crystals, pale yellow, and, after a first sweetness, intensely bitter, slightly soluble in cold, readily in hot water and in alcohol. It exidises at 100° C. (212° F.) Nitricacid forms a deep red solution, converting it into chrysammie acid; sulphurie acid gives a dirty-green colour; paper soaked in a solution of aloin is turned pink by nitric peroxide. It is an active esthartic, although this has been doubted. Dose, 0.5—

A., amor'phous. Probably aloin, along with impurities obtained during the process of inspissation of the aloes juice. It is soluble in water, and forms 25 to 30 per cent. of aloes. It is

purgative.

A Tribe of the Nat. Order Aloin'eæ. Liliacca. Perianth usually tubular; episperm membranous, palish; leaves fleshy or coriaceous; fruit sometimes fleshy.

Aloin'eus. Having the characters of the alne

Al'oisol. A synonym of the volatile oil of aloes.

Aloi'tes. A synonym in Apuleius of Aloë gallica, which was probably a Gentian.

Also, a Genus of Fossil Liliaceae found only in

the Tertiary deposits.

Aloitin'ic ac'id.  $C_7H_2N_2O_5$  or  $C_7H_2$ (NO2)2O. A yellow, almost insoluble substance, obtained by the action of strong nitric acid on aloes. Slightly soluble in water, dissolving with a purple-red colour in hot alcohol, changing to rollow with acids and restored by alkalies. On yellow with acids and restored by alkalies. further boiling with concentrated nitric acid it forms ehrysammic and then pieric acids.

Alom'ba. Arabic for Plumbum, or lead.

(Quincy.)

Alomie'æ. Applied by Lessing to a Subtribe of the Nat. Order Eupatoriaceæ, having the Alomia for their type.

Al'ooc. Same as Alomba.

**Alooc.** Cannot as Income. **Aloopees.** ('Αλώπεκες, from ἀλώπηξ, à in which these muscles are strong.) The fox, in which these muscles are strong.) The psoæ muscles, according to Vesalins, de H. C. F. ii, 38; and Fallopius in Observ. Anat. i, p. 390.

**Alope'cia.** ('Αλωπεκία, from ἀλώπηξ, a fox, because partial loss of hair is common in that animal. F. alopècie; 1. and S. alopecia; G. Alopekie, Fuchsraude, Fuchsgrind, Kahlkopfigkeit.) The partial or complete falling off of hair from a part, the beard and eyebrows, as well as from the scalp; baldness.

A. accidenta'lis. Baldness arising from definite local disease, or affections, as Tinca decalvans, or conditions of the general system which impair nutrition, as fevers, syphilis, gout, mental

over-work or distress, pregnancy.

A. acquis'ita. Acquired, as contradis-

tinguished from congenital alopecia.

A. adna'ta. Congenital alopecia; it does not generally last through life, but the hair hegins to grow in a few years after birth more or less completely. When it is permanent, the other enticular structures, the teeth, and nails, are often deficient. It is seldom complete; the hair bulbs are present in greater or less number, but the growth is downy.

A. area'ta. A form of premature idiopathie baldness, due to the falling out of the hairs from their follicles in an apparently healthy skin, beginning as a rule on the hairy scalp in a single, white, smooth, shining patch of baldness, surround d abruptly by healthy hair. It is believed by some to be due to a lesion of nerve function; the hair bulbs atrophy, and the hairs often become broken up or nodulated at the lower part. It is very much more common in childhood than in advanced age, but constitution and sex appear to have no influence upon it. It is probably non-contagious, and is not caused by an epiphyte. It would seem that the discrepancy amongst observers as to the presence or absence of fungous elements depends upon a confusion of this disease with a very similar one, Tinea decalvans, which is carried by the growth of the Microsporon Audouinii. The treatment consists in applying frictions with ethereal oils in alcoholic solution, or stimulating alkaloids, veratria, aconite, dissolved in alcohol, or blistering with iodine, cantharides, or capsicum.

A. circumscrip'ta. A synonym of A. arista.

A. congenita'lis. The same as A. adnata. A. furfura'cea. In this affection the discased portion of the scalp is covered with thin, white, asbestos-like, glistening scales, which if removed by potash soap rapidly re-form. The condition may persist for months or years, and is a frequent condition in chlorosis. After a time the bair begins to fall off, and bald patches of greater or less extent occur. The patch of skin is smooth, shiny, pinkish, and thinned. The causes may be arranged under the three heads of chlorosis, anæmia, and cachexia.

A. neurot'ica. Baldness depending upon conditions of local nerve disturbance, or of central nervous disorders, or upon mental distress.

A. norma'lis. A term which includes both the falling of the lange of the infaut, and the baldness of old age.

A. partia'lis. A synonym of A. arcata. A. præmatu'ra. Premature baldness, which may be either idiopathic or symptomatic.

A. præmatu'ra idiopath'ica. Baldness taking place in early life without other concomitant skin disease, and probably depending on a disturbance of local nutrition of neurotic origin.

A. præmatu'ra symptomat'ica. form which results from disease of the hair follicles and sebaceous glands, and is a symptom rather than a disease; it is seen in acne, sycosis, variola, lichen, herpes, tinea tonsurans, lupus erythematodes, favus, in which case the treatment coin-eides with that of the morbid process itself; or from certain exhausting affections, as typhus, the puerperal state, anæmia, eareinoma, tubercnlosis, cirrhosis of the liver, when it is due to seborrhæa of the scalp, and is either incurable, or as the anamic conditions of the system disappear, a new growth of hair occurs.

A. senilis. (F. calvitie; 1. calvezza; G. Kahlheit.) Baldness of old age; calvities. Senile baldness generally begins on the crown of the head, and is preceded by greyness of the hairs; it depends on atrophy or a physiological involution of the hair bulbs and surrounding

A. syphilitica. Loss of hair in syphilitie patients, due, according to Kaposi, to circumscribed and discrete specific cell infiltrations, papules near schaceous and bair follicles, and gummata. The treatment consists in softening the scales with oil and their removal by washing the part with a solution of soft soap in half the quantity of highly rectified spirit of wine, the use of astringents such as tannin, quinine, tincture of cantharides, veratria, in such quantity and combination that they will not irritate the scalp or set up eczema or inflammation; the general treatment, which is very important, should be that necessary for the constitutional disease itself.

A. un'guis. A periodical falling off of one or more of the nails.

A. universa'lis. Baldness affecting the whole of the body; an entire absence of hair.

Alope'ciæ. (Same etymon. G. kahle Stellen, Glatze.) Bald patches.

**Alopecurioid.** ('Αλωπέκουρος, the foxtail grass.) Like a fox's tail; or like the Alopecurus.

Alopecurus. ('Αλωπέκουρος, a kind of grass, from ἀλώπηξ, a fox; οὐρά, the tail. G. Fuchsschwanzgras.) The foxtail grass. A Genus of the Nat. Ord. Graminacea.

Aloreov. Alopecia. Alorein'ie ac'id.  $C_9H_{10}O_3+H_2O$ . product of the action of potash on aloes; consisting of fine needles, slightly soluble in cold water, and fusible at 115° C. (239° F.)

Alos ach'ne. ('Aλός ἄχνη. L. spuma maris.) The saline deposit on rocks resulting from the evaporation of sea water; used in toothache.

(Waring.)

Alo'sa. (Θρίσσα, from θρίξ, a hair, so called because it was full of small hair-like bones; F. alose; G. Mutterharing, Alse, Schade.) A species of the Clupea, or shad, also spelt Alausa. See Cluvea alosa.

("Aλs, salt; ἄνθος, a flower. Alosan'thi. L. flos salis.) An old term signifying the flower of salt; probably a native impure sodium carbonate. (Ruland.)

Alosat. Arabic for Hydrargyrum, or mercur

Alosohoc. Same as Alosat.

Aloto. The native name in the Sandwich Islands of a species of Euphorbia, the viscid milky juice of which is used as an application to ulcers

Alou'chi. A resin procured from the Icica

Alouette. A French surgeon.

A.'s meth'od of amputa tion. The plan of amputation at the hip joint recommended by Alouette consisted in making a semicircular flap extending from the upper and outer part of the great trochanter to the ischial tuberosity, cutting through all the soft parts to the joint. The capsular ligament is opened, the thigh rotated inwards, the round ligament divided with a probepointed bistoury, and the bone dislocated by strongly flexing it; the capsular ligament is then completely divided, and a flap four or five fingers broad made by bringing the knife down on the inside of the hone.

Alout'cha. A tobacco grown Crimea, probably the Nicotiana rustica. tobacco grown in the

Aloxan'thin.  $C_{15}H_{10}O_6$ . A yellow substance obtained by the action of potassium bichromate on barbaloin and socaloin. It is related to chrysophanic acid and emodin. When heated with zine dust it yields methyl-anthracene.

Aloy'sia. A Genus of the Nat. Ord. Ver-

A. citriodo'ra. (F. verreine odorante: I. erba cedrata, cedronella; S. yerba luisa.) The lemon-scented verbena. The mint-like leaves have a pleasant smell of lemon. An infusion of 5 parts to 1000 of water is used as a stimulant, stomachie, and antispasmodic.

Alpac'a. The Auchenia pacos. A South American ruminant without horns, the long woolly hair of which is used extensively for the manufacture of material for clothing.

Al'pam. A Malabar shrub, from which is prepared an eintment for scabies; it also enjoys a high reputation as an antidote to poisons. has been identified with the Bragantia Wallichii.

**Alpama'to.** The *Psidium thea*, the leaves of which are used by the natives of the Argentine

Republic for tea.

Alpes'tris. (Alpes, the Alps.) Applied to plants that grow on mountains somewhat elevated, or on the middle portion of high moun-

A. plan'ta. (G. Voralpenpflanze.) Alpine plants; plants growing on high elevations.

Alphabeta'rius. Applied by Linneus hotanists who in their works employ only alphabetical order to arrange the plants of which they treat.

Alpheinæ. A Subfamily of the Family Caridide, of the Tribe Macriera, Suborder De-A Subfamily of the Family capoda, Order Podophthalmata or Thoracostraca, Class Crustacea. Body generally compressed; mandibles deeply two-cleft; usually bearing palpi; second pair of maxillæ with rudimentary palpi; first two pairs of legs with claws.

Alphenic. A name of Sngar-candy.
Alphenik. (Arab.) Term for Succharum
penduum or S. hordcatum; barley sugar.

Alphe'nols. A name given by Grimaux to certain chemical compounds which are in structure partly an alcohol and partly phenol.

Alphite'don. ('Αλφιτηδον from άλφιτον, barley meal.) A term applied to a minutely comminuted fracture.

Alphit'idum. Same as Alphitedon.

**Alphitomor'phous.** (᾿Αλφετον, barley meal; μορφή, form.) Applied to pulverulent

microscopie fungi, parasitical on plants. **Al'phiton**. ('Αλφισον, pearl-barley, barley meal, as distinguished from ἄλευρον, wheat meal. Name for meal, particularly barley meal; and also of a kind of porridge made of harley meal.

Al'phitum. Same as Alphiton. (Alphodes; Alphodeopsori'asis. psoriasis.) Term for psoriasis of the form called alphous.

(F. alpheux.) Having or Alpho'des.

pertaining to alphus; alphous. **Alphoi des.** ('Aλφόs, a dull-whiteleprosy; eloos, likeness.) Applied to diseases having a white appearance, as Lepra alphoides.

Alphon'sin. (Alphonso Ferr of Naples, its inventor in 1552.) Name of an instrument having three elastic hranches for laying hold of and extracting halls from wounds.

**Al'phos.** ('A $\lambda \phi \sigma s$ , a dull-white leprosy.) Term for the species of leprosy formerly called Lepra alphos.

Also, a synonym of Lepra, or a variety of it, L. alphoides, or Psoriasis, from the whiteness of the

**Alpho'sis.** ('Αλφός, white.) A synonym of Albinism.

A. aethiop'ica. A synonym of Albinism. Al'phous. Relating to or resembling Lepra alphoides.

Al'phus. Same as Alphos.

Alpicolus. (L. Alpes, the Alps; colo, to inhabit.) Living or growing upon the Alps, as the Grimmia alpicola.

Alpicus. (L. Alpes. G. alpisch.) Growing on, or related to, the Alps.

Alpig'enus. (L. Alpcs, the Alps; geno, the

Altercan genon. Ancient name for Hyoscyamus, or henoane. (Hooper.)

Alter'cum. Same as Altercangenon.
Al'tered. (L. alter, another.) A synonym of Castrated.

**Alternan'thera.** A Genus of Amaranthaceae. Plants chiefly inhabiting tropical or subtropical regions.

A. ses'silis. Hab. Sonthern Asia. Used as a stomachic and for the cure of colic. In the

Moluceas it is used as a pot herb.

Alternate. (L. alterno, to change by turns. F. alterne; G. abweehselnd, weekselnd, weekselnd, belowing by turns, or in succession.

A. æstiva'tion. Term applied to flowers in which the inner whorl alternates with the outer.

A. hemiple'gia. That form of paralysis in which the loss of power in the facial muscles is on the opposite side to that of the limbs.

A. leaves. Applied to leaves which arise singly from a node, and are placed alternately on opposite sides of the stem.

A. rub'bing. A term applied to a pericardial friction sound when it is heard in both systole and directole

systole and disatole.

A. squint. That form of strabismus or squint in which either eye can be fixed on a definite object, so that each eye may alternately be made to deviate from its right position.

Alter nately pin nate. The same as Alternatipinnate.

**Al'ternating.** (L. alterno, to do anything by turns.) Following by turns.

A. cal'culus. A prinary calculus which is made of strata of differing substances. See Calculus, alternating.

Alterna'tion. (L. alternatio, from alterno, to do anything by turns. F. alternation; I. alternazione; G. abwechselung.) The act of

alternating; reciprocal succession.

A. of generaltions. (F. génération alternante; G. Generationswechsel.) A term used to express a form of reproduction in which the original embryo develops, by budding or fission, a series of independent asexual organisms, the last term of which only possesses sexual organs and grows to the likeness of the original parent. The phenomena iceladed under this title ocear both in the animal and vegetable kingdoms. At a certain period in a plant's life single cells become detached from the organic connection, and either immediately, or after further preparation, enter upon an independent course of development; these cells are the reproductive cells, and the plant structures which result from similar reproductive cells, and are also like one another, form a generation. Now the alternation of generations occurs in the fact that the generations which proceed from one another are unlike, that is to say, in those organisms which multiply asexnally and sexually; the offspring of the impregnated germ reproduces only by agamogenesis, so that from an ovum or ovule (A) is produced in the ordinary way an animal or plant, which grows up and nitimately divides or gives rise to a new individual (B) by budding, the organism so produced growing into a sexually mature individual, forming ova and spermatozoa, from the union of which arises anew the impregnated ovum.

In the vegetable kingdom the ferns afford an instance of alternation of generations; the spore on germination first produces a parenchymatous expansion, the prothallium, and not a plant like

the parent, but from its under surface arise the sexual organs, the antheridium and the archegonium, from the conjunction of the products of which arises the new plant. A similar mode of development ocenrs in the Equisetaceae.

The best known instances of the alternation of generations occur in the animal kingdom. Amongst the Coelenterata it is observed in those cases in which the Medusoid form of Hydroid polypi alternates with the Hydroid. Amongst the Vermes it may be seen in the Trematoda and Cestoidea, and it has been followed in some of the Tunicated mollusca. In the two latter cases the alternation of generations is somewhat complicated: for instead of the impregnated ovum (A) producing a sexless organism (v) which develops the ova and spermatozoa from the union of which arises the ovum (A) again, B produces a sexless organism, which may either resemble itself (B2) or may be of a different nature (c); in either ease the organism may reproduce its like (B3 or C2) or may develop again a different form (D) which in turn may either produce its like (D2) or may produce ova and spermatozoa from which an impregnated ovnm (A) again arises. As for instance, the egg (A) of the common Distoma undergoes eleavage to form the morula, and afterwards the gastrula, the orifice of invagination closes up, and an elongated, ciliated larva is formed. This larva then escapes from its host, in the ease of endoparasitie forms, and is swallowed by some aquatic animal, into whose blood-spaces and connective-tissue it passes; in this situation it grows to a large size and assumes a sac-like form, retaining its ciliated investment. This is the sporocyst (B). The interior of the sporocyst now breaks up into groups of cells, which grow till they consist of sacs devoid of cilia; these sacs form for themselves a head, a month, and a gullet; each zooid thus produced forms a Redia (c), or King's yellow worm. After a time vesieles appear in the body cavity of the Redia, and rapidly develop into tadpole-like zooids, the Cercuriæ (D). By the atrophy of the Redia the Cercuriæ escape, swim about freely for a time, and finally fix themselves on to a snail, a Paludina; they then lose their tails, and become enveloped in a structureless cyst. The encysted embryo (E) developes rudiments of coronal hooklets. If now the Paludina which is thus infested is swallowed by a water bird in which the adult Distoma is parasitic, the embryo gradually developes till it assumes the form of the parent Distoma, and acquires complete sexual organs. In this cycle of changes it is noticeable that the Redia may develop secondary Redia instead of Cerearia, whilst the Cercariæ may develop secondary Cercariæ, and the sporocysts second sporocysts; or the Cercarian stage may be entirely omitted, whilst occasionally the Redia is developed directly from the ciliated larva. Amongst the Mollusca the Salpæ exhibit the alternation of generations in its simplest form-viz. that in which the organism (B) arising from the impregnated germ (A) produces offspring only agamogenetically, and so gives rise to a series of independent organisms, which are more or less different from the original one, and which sooner or later acquire generative organs, from which are formed impregnated germs, giving rise to the original form. Amongst the Arthropoda, the hexapod Insecta nfford an example of alternation of generations, as in the Aphides, in which the independent organisms which correspond with B give rise agamogenetically to others (B2), and these again to others (B3), and so on, though ultimately a sexual indi-

vidual (A) is produced.

Alternatipin nate. (L. alternatim, by turns; pinnatus, feathered. F. alternatipenné; G. wechselngefiedert.) Applied to a pinnate leaf, the leaflets of which are alternate upon the common petiole.

Alter'native. (G. abwechselnd.) Same

as Alternate.

A. æstiva'tion. The same as Alternate æstivation.

A. douche. See Douche, alternative.

Alter natives, Vol'ta's. A term applied by Volta to the phenomena observed when an electrical current is made to pass through the leg of a galvanoscopic frog, and which he summed up in the two following laws:-(I) the current traversing a nerve diminishes it's excitability differently according to its direction; and (2) the direct current renders the nerve less excitable than the inverse

Alternifo'liate. (L. alternus, one after another; folum, a leaf.) Having alternate leaves, as the Valeriana alternifolia.

Alternipet alous. (L. alternipetalus.) A term applied in Botany to the stamens, carpels, or styles, when these organs are inserted on the receptacle opposite the interspaces of the petals.

Alternipin'nate. The same as Alter-

natininnate.

Alternisep'alous. (L. alternisepalus.) A term applied in Botany to the petals, stamens, carpels, ovarial loculi, or styles, when they are inserted opposite the interspaces of the sepals.

Al'tey plum'bi. Old term for the Sugar

of lead.

Althæ'a. ('Αλθαία, wild mallow.) A Genus of the Nat. Ord. Malvaccæ. Calyx 5-cleft; involuere 6-9-eleft; styles numerous; fruit orbicular, many-celled, with a convex centre.

Also, U.S. Ph., the officinal name of the root of the Althan officinalis.

A. hirsu'ta. Hirsute; peduncles oneflowered, longer than the leaves. Emollient; seeds aperient and diuretic.

A. laurinen'sis. Used in Italy as a sub-

stitute for A officinalis.

A. narbonen'sis. A species occasionally

used instead of A. officinalis.

A. officina'lis. (F. guimauve; I. altea; S. malvarisco; G. Eibisch.) The marshmallow. Stems 2'—4' high, woolly; leaves alternate, hoary on both sides, the lower 5-lobed, the upper 3-lobed; flowers terminal, axillary. The whole plant is mucilaginous, and supplies Althew folia and Althew radix.

A. ro'sea. (F. rose trémière, passe-rose; I. alcea, bismalra; G. Stockrose, Malvenrose.) Stem tall, straight, hairy; leaves cordate, 5—7angled, crenate, rugose; tlowers axillary, sessile, or in terminal spikes; petals hairy at base. The flowers, officinal in the Fr. Codex, are mucilaginous and demulcent, and supply a colouring matter which is used to adulterate wine, and as a test for acid and alkalies, like litmus.

Althæ'æ flo'res. (F. fleurs de guimauve; G. Altheeblumen, Eibischblüthen.) The flowers of

the Althaa officinalis, Mucilaginous. Seldom used. A. fo'lia. (F. feuilles de guimaure; G. Eibischblätter.) The leaves of the Althæa officinalis; they are used to make an emollient decoction.

A. ra'dix. (F. racine de guimauve; G.

Eibischwurzel.) Marshmallow root, from the Althora officinalis, collected in autumn from plants at least two years old. As seen in commerce it is deprived of its epidermis, is whitish, deshy, more or less fibrous, having a feeble smell, and a sweetish mucilaginous taste. It contains bassorin, a small quantity of asparagine, sugar, starch, and a fixed oil, and tannin in the epidermis. It is demulcent, and is used in decoction, syrup, pill, and lozenge, in inflammation and irritation of the bronchial and other mucous membranes; and boiled and bruised as a poultice.

Althana'ca. (Arabic.) Old name for Or-

piment. (R. and J.)

Althana'cha. Same as Althanaca. Althebe'gium. Arabic for a swelling which occurs in cachectic and leucophlegmatic habits, as that under the eyes. (James.)

Altheben. (Arab.) Pterygium, or Pannus. Althe'in. An alkaloid found in the marshmallow, Althwa officinalis; once supposed to be distinct, but now known to be asparagin.

**Altheste'ria.** ('Αλθηστήριον, a remedy.) Remedies, especially those applied externally, or

to wounds.

Altheus. ('Αλθεύς, from ἀλθαίνω, to heal.) A healer, a physician.

Althexis. ('Αλθεξες, from ἀλθαίνω, to ('Aλθεύς, from άλθαίνω, to

An old term for the cure of a disease.

Althion'ic. Same as Alcouthionic. Althos. (Albos, a healing.) A medicine.
Alticomous. (L. altus, high; coma,
the hair of the head, the leaves of trees. G. hochbelaubt.) Clothed with leaves high up only.

Altij'ugus. (L. altus; jugum, a yoke, the summit. G. hochgipfelig.) Having a lofty summit or top.

Altilibat. A synonym of Turpentine.
Al'timar. Arabic for the Oxide of copper, or burnt copper. (R. and J.)

Altim etry. (L. altus, high; metrum, a measure.) Term for the art of measuring heights or altitudes.

Altimio. Arabic for the Scoria of lead. Altin car. Arabic for a kind of factitious salt used in the separation of metals, according to Libavius, S. Ch. Arc. viii, 38.

Altin'gat. Arabic for the Flos æris, rust of copper, or verdigris. (Ruland and Johnson.) A synonym of

Altin'gia excel'sa.
Liquidamber altingia.

Altingia'ceæ. Liquidambers. samiferous trees. Leaves simple or lobed, alternate, with deciduous stipules; tlowers unisexual, involucrate, amentaceous; male flowers naked, with many nearly sessile anthers; female dowers in a globular head; ovary two-celled; ovules numerous; fruit cone-shaped and scaly; seeds winged, peltate, albuminous; embryo inverted; radicle superior.

Also, called Liquidamberacea. Altinur'aum. Arabic for the Sulphas ferri, or vitriol. (Ruland and Johnson.)

Altiros'træ. (L. altus, high; rostrum, a beak.) Applied by Blainville to a Section of his Heterodactylous scausores, having the heak higher than it is broad.

Al'tith. Arabic term for Asafætida. Al'titude. (L. altitudo, from altus, lofty. F. altitude; I. altezza; G. Hohe.) Term applied to the height of any place above the level of the The greatest altitude attained by Glaisher in his balloon ascents was more than 29,000 feet, when he became insensible. One of the highest, if not the highest, known habitation of man is the village of Thok-djalauk in Thibet, which is upwards of 15,000 feet above the level of the sea.

The most elevated baths in Europe are those of St Moritz, 5464 feet, and Leukerbad, 4670 feet, in Switzerland; Baréges, 4000 feet, Mout Dore, 3300 feet, Cauterets, 3200 feet, and Bourbonle, 2600 feet, in France.

Altiv'olus. (L. altus; volo, to fly. G. hochfliegend.) Applied to the Rhodolæna altivola, a climbing shrub which attains even to the top of

the largest trees.

Alt-oet'ting. See New-octting.
Altrices. (L. altrix, a nourisher.) One of the two divisions of the Class Aves proposed by Owen, in which the young are excluded from the egg, feeble, naked, and blind, and dependent

on their parents for support.

Al'truism. (L. alter, another.) Term employed by Auguste Comte to designate the mental state opposed to that which has received the name of egoism. In Physiology, it has been used to express the desires or instincts, which have also received the name of sympathetic instincts, as directing the conduct rather in the interest of others than of the individual. It is exemplified in the sentiments of friendship, veneration, and goodness. It is the source also of domesticity and sociability; sentiments that are recognisable in animals as well as in man.

Alt-Sohl. Hungary; County of Sohl. Mineral waters containing sodium sulphate, sodium, magnesium, calcium and iron carbonates, with free carbonic acid. Temp. 11° C. (52° F.) The most important is the Czerwena Woda, or Eau rouge, which contains and deposits a considerable quantity of iron.

Alt-Tura. Austria-Hungary; County of Oberneutra. Cold mineral waters, containing Austria-Hungary; County of sodium, ealeium, magnesium, and iron sulphate, sodium and calcium chlorides and carbonates.

Used in anamia and scrofula.

Al'tus. (L. altus, participle of alo, to fly.) High; profound; deep. Applied to words to signify intensity, as Altus sommus, Altus sopor,

sound or deep sleep, as in a lethargy.

Altwasser. Germany; Silesia; a village near Salzbrun. Stuated in a pleasant valley, 1255 feet high, having a mild climate and good accommodation. There are several springs, of a temperature varying from 21.5° C. (70.7° F.) to 35 C. (95° F.), containing iron with some alkaline and earthy earbonates and free carbonic There are also ehalybeate peat baths. Used in anamie cases.

Al'uach. Arabic for Stannum, or tin. Alucina'tio. (G. Traumerei.) The better

form of Hallucinatio.

Alucita. A Genus of the Family Pterophorida, Group Microlepidoptera, Order Lepidoptera, Class Insecta. Wings divided to the

base into six linear rays.

A. cerealel'la. (F. alucite des céréales.) The larvæ are very destructive to wheat. When the seales of the moth abound in the dust of wheat, they cause great cutaneous discomfort, conjunctivitis, and painful sensations in the throat.

A'lud. Arabic for Agallochum, Agillo-

chum, or aloes wood.

Al'udel'. An old term for each vessel in an arrangement of a number of globe-shaped pots or glass vessels, one placed above the other, and communicating with each other from bottom to top,

for subliming any matter; the lowest was a pot containing the substance to be sublimed, and the highest a receiver for the flowers, or sublimate.

Aludit. Arabic for Hydrargyrum, or mercurv

Al'uech. Arabic for pure Tin.

Alufir. (Arab) Term for a diffused redness of the skin called Rubedo. (Ruland and Johnson.)

Alui'ne. (Fr.) A synonym of the Artemisia absinthium.

A'lula. (Dim. of ala, a wing. F. alule, aillerette, ailette balancier, cuilleron.) A little wing. Applied to the minute membranous scales situated above the halteres in certain of the Diptera, and under the elytra of some aquatic Coleoptera.

Also, the bastard wing, composed of feathers situated on the rudimentary thumb of the bird.

Alulif'era. (L. alula, a little wing; fero, to carry. F. porte-aiguillons.) A Group of the Order Hymenoptera. Antenuæ generally with thirteen segments in the male, twelve in the female; abdomen always pediculated; female possessing a perforated retractile sting and poison glands. Larvæ without feet and anus.

Al'um. A plant in use by the ancient Romans for affections of the kidneys, lungs, and fauces; probably Symphytum officinale.

Also, a kind of garlie.

A. bat'tery. A galvanie battery consisting of earbon and unamalgamated zine plunged into sand, which is kept moist by an aqueous solution of alum.

A. gal'licum. A synonym of the Symphytum officinale.

Al'um. See Alumen.

A., ammo'nia. A synonym of Common alum

A., ammo'niofer'ric. A synonym of Ferri et ammoniæ sulphas.

A., burnt. The Alumen exsicoatum.
A. cake. The solid mixture of silica and aluminium sulphate, obtained in the preparation

of the latter for dyeing purposes, by decomposing clay with sulphuric acid. A. cat'aplasm. A synonym of Coagulum

A., com'mon. See Alumen.

A. curd. The Coagulum aluminis.
A., dried. See Alumen exsiceatum.

A. earth of Nepa'l. An article of the native Iudian Materia Medica, which is probably a more or less pure iron alum.

A., Egyptian. The Λίγύπτια στυπτήρια

of Hippocrates; an astringent salt.

A., En'glish. A synonym of common alum. A., feath'er. A synonym of native ironalum; and also of Alunogene. A. gar'gle. See Gargarisma aluminis.

A., i'ron. A double salt in which iron is tituted for aluminium. See Ferri et amsubstituted for aluminium. moniæ sulphas, and Ferri et potassii sulphas.

A., pot'ash. The sulphate of alumina and potash.

A. poult'ice. A synonym of Coagulum aluminis.

A., Roche. A variety of common alum, so called because originally it came from Rocca, in Syria. It is in small pieces of a pale rose colour,

obtained from bole or rose-pink.

A., Roche, com'mon. Small pieces of common alum moistened and then stained with

bole.

alummis.

A., rock. A synonym of common alum. A., Ro'man. The purest variety found in

commerce. It occurs in small fragments covered with a reddish-brown adventitious powder. It is crystallised in cubes; and is obtained by the repeated reasting and lixiviation of Alumite.

A. root. Common name of the Heuchera americana and H. cortusa. Also of the Geranium

maculatum.

A. root, North Amer'ican. The root of Heuchera americana.

A. slate. An alum ore consisting of a mixture of iron pyrites with alumina, silica, and bituminous matter.

A. spring. See Virginia mineral waters.
A. stone. A felspathic rock, being a native mixture of aluminium sulphate and potassium sulphate, found at Tolfa and Piombine, in Italy,

A. whey. (G. Alaumolke.) Two drachms of alum is boiled in a pint of milk, and the curd strained off. Used as an astringent in diarrhea, menorrhagia, hæmatemesis, and internal hæmorrhages generally. Dose, a wineglassful, containing about 15 grains of alum.

Alumbo'ti. Arabic for Oxide of lead. (R.

and J.)

Al'umen. The Alumen liquidum; also the Mercurius and Gemmæ optimum of the Arabian philosophers.

philosophers.

Also, applied to the metal Antimony.

Alumen, Ph. Brit. and U.S. (F. alun; I. allume; S. allumbre; G. Alaun.) Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> + (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>+24H<sub>2</sub>O. Alum, or aluminium and ammonium sulphate. The only form of alum recognised by the Brit. Pharmacopoia. It is made by adding ammonium sulphate to solution of aluminium sulphate, and purifying by recrystallization from its solution in water. It is a white, somewhat efflorescent, crystalline mass, having the faces of regular octohedra, and possessing an acid sweetish astringent taste. It is insoluble in spirit, soluble in fifteen times its weight of cold, and three fourths its weight of boiling water. Alum precipitates albumen, and contracts the mucous and other soft tissues. It is absorbed from the stomach and intestines, as an albuminate probably, and has been found in the urine. It hinders decomposition. Its action on, and course through, the organs is not known. Alum is astringent and antispasmodic in small, purgative and emetic in large, doses. It is used as a styptic, in powder or solution, in hæmorrhage from leech bites, from the nose, or after tooth-drawing; as an astringent lotion or injection in too free discharge from ulcers, in eczema, leucorrhea, gonorrhea, and similar mucous discharges; as a gargle in relaxed throat and in aphthous ulceration of the mouth; and as a spray in chronic laryngeal congestion and inflammation. Alum is used in pyrosis, in hæmatemesis, in mucous diarrhæa, and in internal bleedings generally. It is of use in the later stages of hooping-cough; and has been given in bronchorrhoea, in profuse perspiration, and in painters' colic. Dose, as an astringent, 5—15 grains or more; as an emetic, 1-3 drachms.

Death has occurred in eight hours from swallowing an ounce and a half of alum; there was nausea, vomiting of sanguinolent fluid, small quick pulse, hurried breathing, and intense agony; and after death the whole digestive tract was found inflamed, the esophagus softened, the stomach congested, its mucous coat grey, softened, and disorganised; the duodenum thickened and

grey; and the peritoneum inflamed. White of egg in water, or magnesia suspended in milk, should be freely given, and vomiting immediately induced by irritation of the fauces, or the administration of an emetic.

Alum has been recommended for the purpose of purifying water from organic matter. It would appear that its action'is confined to the suspended matters, and that organic substances in solution

are little, if at all, affected by it.

Alum has been found in inferior bread; it is said to be used for the purpose of improving damaged flour and rendering its use possible. It is believed to prevent bread from becoming sour or mouldy, to increase its whiteness and lightness, and to cause it to retain more water. It is added, as an adulteration, along with salt and iron sulphate, to give a head to beer.

In the Ph. Germ., Ph. Helvet., Ph. Ital., and the Fr Codex, the salt used is the aluminium and

potassium sulphate.

A. al'bum. (L. albus, white.) Common alum.

A. al'kali. (Arab.) Nitre.
A. alko'ri. (Arab.) Nitre.
A. ammoniaca'le. Sulphate of alumina and ammonia. See Alum.

A. bulga'num. A red and transparent species of varnish resembling mastich.

A. calcina'tum. (L. calcinatus, calcined.) A synonym of A. exsiccatum.

A. cati'num. (L. catinus, a crucible.)

The potash of commerce.

A. chroma'tum. Chrome alum, sulphate of chromium and potash.

Common alum. A. commu'ne. A lumen.

A. cre'pum. The tartar of good wine.
A. cru'dum, Belg. Ph. (L. crudus, raw, crude.) The potassium alum of commerce.

A. crystal'linum. (Κρυστάλλινος, of crystal.) A synonym of common alum.

A. cu'pricum. (L. cuprum, copper.)

Sulphate of copper and potash.

A.depura'tum. Ph. Helv. (L. depuratus,

purified.) A synonym of Alumen.

A. de Roch'i. The Alum, Roche.

A. de Roch'igal'is. The Alum, Roche.

A. draconisa'tum. Belg. Ph. (L. draconisatus, mixed with dragon's blood.) Two parts of crude alum are melted in an iron vessel, and then one part of powdered dragon's blood added.

A. exsicca'tum. Ph. Br. and U.S. (L. exsiceatus, dried up.) Burnt alum. Four oz. of alum are heated in a porcelain dish at a temperature not exceeding 205° C. (401° F.) until aqueons vapour ceases to be given off, and the salt has lost 47 per cent. of its weight, when it is powdered. It differs from alum only in the absence of water. It is used as an escharotic; and has been given in constipation. Dose, 5-10

A. factit'ium. (L. factitius, made by art, artificial.) Manufactured, or common alum.

A. fæ'cum. (L. fæx, lees, dregs.) Potash

made from the ashes of vine branches and wine lees.

A. fer'ricum. (L. ferrum, iron.) Sulphate of iron and potash.

A. glacia'le. (L. glacialis, frozen.) Common alum.

A. ital'icum. (L. italicus, Italian.) Roman or red alum.

A. kinosa'tum. Belg. Ph. (L. kinosatus, mixed with kino.) Two parts of crude alum is nuelted in an iron vessel, and then one part of powdered kino is added.

Also, a synonym of the Pulvis aluminis com-

positus.

A. liq'uidum. (L. liquidus, fluid.) Au old term for a substance which appears to be the rock butter of modern mineralogists, consisting of alnm with alumina and oxide of iron.

A. martia'lum. (L. martialis, relating to Mars, an old term for iron.) Sulphate of iron

and potash.

A. natrona'tum. (L. natronatus, belonging to natron or soda.) The Aluminii et sodii sulphas.

A. odig. (Arab.) Sal ammoniae.

A. philosopho'rum. (L. philosophus, a philosopher.) The line of egg-shells.

A. plumeum. (L. plumeus, downy.)

A. plume'sum. (L. plumosus, full of down or feathers.) A term applied to the fibrons variety of native alum; also to fibrous gypsum: feathery alum; asbestos.

A. plumo'sum Basil'ii Valent'ini. Basil Valentine's feathery alum. A synonym of

Boracic acid.

A. prus'sicum. Common alum.

A. ro'chum. Roche alnm.

A. Roma'num. Roman alum.

A. ro'sa. Boiled alum.

A. ru'brum. (L. ruber, red.) Red alum. The Roman alum, which has a readish colonr.

A. ru'peum. (L. rupes, a cliff.) synonym of common alum.

A. ru'tilum. (L. rutilus, red.) A synonym

of Roman alum.

A. sacchari'num. (L. saccharinus, sugary.) Term for a cosmetic preparation in former repute, made of rose water, alum, and

A. scari'ola. Gypsum. A. scis'sile. (L. scissilis, easily split or

eleft.) A term for gypsum.

A. scis'sum. (L. scissus, split.) term for stone-alum. (Quincy.)

A. sco jalæ. Same as A. scojolæ.

A. sco'jolæ. Selenite.

A. sicca'tum. (L. siccatus, dried.) A synonym of A. exsiceatum.

A. spongio'sum. (L. spongiosus, spongy, porons.) Burnt alum.

A. stir'iacum. (L. stiriacus, shaped like an icicle.) Common aluiu.

A. sy'rach. (Arab.) Burnt alum. A. trichi'tis. ( $\Theta \rho i \xi$ , a hair.) Asb A. trichi'tis. (θρίξ, a hair.) Asbestos. A. uri'næ. (L. urına, urine.) Common

A. us'teum. Otherwise A. ustum. A. us'tum. Ph. Germ. and Ph. Helv. (L. ustus, burnt; G. gebrannter Alaun.) A similar preparation to the A. exsiceatum, Ph. Br.

A. vena'le. Belg. Ph. (L. venalis, of, or belonging to selling.) The same as A. erudum.

Common alnm. Alumeni'zed. (L. alumen.) Charged or

mixed with alum. Arabic name for Butyrum, Al'umhair.

or butter. (Quincy.)

Alumina. (L. alumen, alum. F. alumine; G. Aluminumoxyd, Alaumerde, Thonerde.) A evoonym of Aluminium oxide.

A. and ammo'nia, sul'phate of. The Alumen of the British Pharmacopæia

A. and i'ron, sul'phate of. The Alumi-

nium and iron sulphate.

A., ben'zinated solu'tion of. A substitute for Pagliari's styptic. Eight ounces of aluminium sulphate dissolved in water is saturated with gelatinous alumina, and six draehms of bruised amygdaloid benzoin added; it is kept at 66° C. (150°8° F.) for six hours, and after filtration should be of sp. gr. 1.26. In a few days crystals of alum are deposited, when the liquid is fit for use. It has a pleasant odonr, and an astringent balsamie taste. Diluted with 4-10 parts of water it has been used as an injection in leucorrhoea.

A., sul'phate of. See Aluminii sul-

phas. A., tan'nate of. A substance described as yehowish, crystalline, and soluble in hot water, and recommended in solution as an injection in gonorrhœa. Aluminium tannate is almost insoluble in water, and so it is supposed that this is probably a mixture only of tannic acid and

Alu'mina ace'tica. A synonym of

Aluminium acetate.

A. ace'tica liq'uida. A synonym of the Liquor aluminii acetici, Helv. Ph. A. acid'ulo-sulphu'rica cum ka'li.

Common potassium-alum. A. ammonia to-sulphu rica. The Alu-

men of the British Pharmacopœia. A. depura'ta. A synonym of Alumina, obtained by heating aluminium sulphate to red-

A. hydra'ta, Germ. Ph. and Helv. Ph. (G. Thonerdehydrat.) Alum, 10 parts, is dissolved in 80 parts of hot distilled water, filtered, and then mixed with 9 parts of pure sodium earbonate dissolved in 80 parts of distilled water. The precipitate having been washed with distilled water till this does not cloud a solution of barium nitrate, is dried and powdered. It is a light white astringent powder, iusoluble in water. Dose, 0·1-0·6 grammes.

A. hydrochlo'rica. A synonym of Alu-

minium chloride.

hypochloro'sa. (G. unterchlorigsaure Thonerde.) A solntion of alum and of ealcium ehloride are mixed, and the solntion filtered. It is only used externally as a disinfectant.

A. kali'na sulphu'rica. Common potash alum.

A. muriat'ica. A synonym of Aluminium

chloride. A. na'tri-sulphu'rica. A synonym of Aluminii et sodii sulphas.

A. ni'trica. A synonym of Aluminium nitrate.

A. pu'ra. The same as A. depurata.
A. sulfu'rica. A synonym of Aluminii sulphas, U. S. Pha

A. sulphu'rica. Common alum.
A. vitriol'ica. (L. vitriolicus, containing vitriol, or sulphuric acid.) Common alum.

Alu'minæ ac'etas. A synonym of Aluminium acctate.

A. et ammo'niæ sul'phas. The Alumon of the British Pharmacopæia.

A. et potas'sæ hypersul'phas. synonym of Aluminii et potassii sulphas, U.S. Ph. A. et potas'sæ sul'phas. A synonym of

Aluminii et potassii sulphas, U.S. Ph.

A. et potas'sæ supersul'phas. A synonym of the Aluminii et potassii sulphas, U.S. Ph.

A. hydrochlo'ras. A synonym of Aluminium chloride.

A. sul'phas. A synonym of Aluminii sulphas, U. S. Ph.

A. sul'phas acid'ulus cum potas'sa. A synonym of Alaminii et potassii sulphas, U.S. Ph.

A. sul'phas fu'sus. (L. fusus, spread out, melted.) A synonym of Alumen exsiceatum.

Alu'minate. A compound in which alumina acts towards the stronger bases as an acid-forming oxide, or in which the hydrogen of gelatinous alumina, aluminium trihydrate, is replaced by a metal. Aluminates occur native.

Alu'minated. (L. aluminatus; F. alumine; G. aluminirt, thonerdehaltig.) Containing alum.

Alumin'iate. Same as Aluminate.

Alumin'ic. (F. aluminique.) A term formerly used to express the presence of alumina.

Alumin'ico. A prefix in several compound epithets, applied by Berzelius to double salts produced by combination of an aluminie salt with another indicated by the succeeding part of the epithet, as Aluminieo-ammonicus, -baryticus.

**Aluminif'erous.** (L. Alumen; fero, to bear. F. aluminifere; G. alauntragend.) Containing alum.

Alumin'ii ac'etas. See Aluminium acctate.

A. et ammo'nii sul'phas. The Alumen of the British Pharmacopæia.

A. et fer'ri sul'phas. Prepared by dissolving alumina and iron carbonate in sulphuric acid. It has been used as an astringent and vermifuge. Dose, 5—10 grains.

A.et potas'sii sul'phas, U.S. Ph. (F. alun, sulfate double d'aluminium et de potassium; I. allume; S. allumbre; G. Aluum.) Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>+K<sub>2</sub>SO<sub>4</sub>+24H<sub>2</sub>O. Potash alum. A double sait of aluminium and potash. It is made from alum slate containing iron bisulphide. The ore is roasted, then moistened and exposed to the air, so that the sulphur absorbs oxygen, becomes sulphuric acid, and forms aluminium sulphate and ferrous sulphate, which are separated by lixiviation with water. The solution being concentrated is mixed with potassium chloride, which forms soluble iron chloride and potassium sulphate, the latter unites with the ammonium sulphate, and is purified by crystallization. It crystallizes in transparent regular octohedra, which on exposure to the air become opaque and white; it is insoluble in alcohol, of an acid reaction, and a sweetish astringent taste. Its action is that of the ammonia alum. See Alumen.

A. et so'dii sul'phas.  $Al_2(SO_4)_3+Na_2SO_4+24H_2O$ . A similar salt to the potash alum, but more soluble and difficult to crystallise.

A. subac'etas. A salt called by this name has been used as an astringent to exuberant granulations.

A. sul'phas, U.S. Ph. (G. Aluminium schwefelsaures.) Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>.18H<sub>2</sub>O, or Al<sub>2</sub>O<sub>3</sub>. 3SO<sub>3</sub>.18H<sub>2</sub>O. Prepared by adding solution of sodium carbonate to a solution of alum, dissolving the precipitated alumina in sulphuric acid and water and evaporating to dryness. It is a white powder, soluble in twice its weight of water, from which it crystallises in thin pearly

six-sided monoclinic plates. It is used externally as an astringent and antiseptic in foul ulcers and fetid discharges; as a mild caustic in enlarged tonsils, polypi, and cancerous nleers. A solution of a pound or more in a quart of water is an efficient preservative for some time of dead bodies when injected into the veins.

when injected into the veins.

A. tan'nas. Seo Alumina, tannate of.

Alumin'io-sil'icate. Applied by
Bonnsdorf to a group of salts in which alumina
and silica are regarded as together playing the
part of an acid.

Aluminite. Native hydrated aluminium sulphate, occurring in whitish, somewhat rounded masses.

Alumin'ium. Symbol Al. Atomic weight, 27-3. An earth metal, existing abundantly in nature as a silicate in felspar and clay; it is contained in the solar atmosphere. It is prepared directly from eryolite and from the double chloride of aluminium and sodium. It is white, susceptible of a high polish, and light, its sp. gr. being 2-6. It forms alloys, and is trivalent in its combinations. It is soluble in hydrochloric and sulphurie acids, but not in intric acid; organic acids have little action on it except in the presence of sodium chloride. Its salts, when mixed with cobalt nitrate, become blue in the blowpipe flame.

A. ac'etate. (F. acétate d'alumine.) Al<sub>2</sub>(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>6</sub>. Obtained by the direct combination of hydrated alumina with acetic acid, or by the double decomposition of plumbic acetate and aluminium sulphate. It is colourless, acid to litmus, deliquescent, and astringent in taste. When exposed in a dilute solution to a temperature of 100° C. (212° F.), the whole of the acetic acid is expelled and aluminium dihydrate is left in solution. It has been used as an astringent in cebronic gonorrhœa and hæmoptysis, and as a disinfectant.

A. chlora'tum, Germ. Ph. A synonym of Aluminium chloride.

A.chlo'ride. Al<sub>2</sub>Cl<sub>6</sub>. (F. chlorwre d'aluminium.) Prepared by heating a mixture of alumina and ficely divided carbon in chlorine gas. It is a colourless, transparent, waxy, crystalline substance, boiling at 180° C. (356° F.) Very deliquescent.

The hydrated chloride (Al<sub>2</sub>Cl<sub>6</sub>.12H<sub>2</sub>O) is obtained in hexagonal prisms from the solution of the chloride in water, or from the double decomposition of aluminium sulphate and calcium chloride. It has been used as a disinfectant under the name of chloralum.

A. dihy'drate. Al<sub>2</sub>O<sub>3</sub>.5H<sub>2</sub>O. Formed when a dilnte solution of aluminium diacetate is exposed for several days to a temperature of 100° C. (212° F.) in a closed vessel, and then evaporated to dryness. It is not a mordant.

A. group, met'als of. Aluminium, indium, and gallium.

A. hy'drate. See A. monohydrate, A. dihydrate, A. trihydrate.

A. hy'dricum. A synonym of A. tri-hydrate.

A. hydrox'ide. A synonym of A. hydrate.

**A.** monohy drate.  $Al_2O_2$ ·(OH)<sub>2</sub>. This compound is found native in translucent masses known as diaspore; when heated it falls to powder, and loses the whole of its water at  $360^\circ$  C.  $(680^\circ$  F.)

A. ni'trate. Al<sub>2</sub>(NO<sub>3</sub>)<sub>6</sub>. This salt is ob-

tained by dissolving aluminium hydrate in nitric acid, and evaporating; on cooling, deliquescent prismatic needles are deposited. It has been successfully used, in the proportion of 4 to 6 grains to the ounce of water, as a lotion or vaginal

injection in vulvar praritus.

A. ox'ide. (F. aluminium oxyde, alumine; I. allumina; S. alumina; G. Thonerde, Alaunerde, Aluminiumoxyd.) Al<sub>2</sub>O<sub>3</sub>. Alumina; the only oxide of aluminium. It occurs native, in a nearly pure state, as corundum, a grey, intransparent substance, which, when less pure, is called enery; and in an equally pure condition, but coloured with cobalt, as the ruby; or chromium salts, as the sapphire. It is prepared by adding ammonia to a solution of alum, when the hydrated oxide is precipitated, which, on being heated, yields alumina as a white amorphous powder of sp. gr. 3.9, tasteless, and very little acted on by acids. It is a very weak base, and its salts, the alums, have often an acid reaction. It is used in dyeing as a mordant.

Alumina in solution yields the white gelatinous hydrate to caustic potash, soda and amoionia, which is soluble in excess of the two former agents only; potassium, sodium, and ammonium earbonate deposit the hydrate with an escape of carbonic acid, insoluble in excess. Ammonium

sulphide also precipitates the hydrate.

Alumina is not absorbed by any plants except some of the cryptogams.

A. oxyda'tum. A synonym of Alumina hydrata, Germ. Ph.

A. salts, tests for. The salts are colourless, have a sweet astringent taste, and an acid reaction. They become blue when moistened with cobalt nitrate and heated before the blowpipe, but do not colour the non-luminous gas flame. in solution they are not precipitated by hydrogen sulphide; a white precipitate of aluminium hydrate is produced by ammonium sulphide; caustic potash and soda deposit white, gelatinous aluminium hydrate, soluble in excess; ammonia produces a similar precipitate, insoluble in excess; ammonium carbonate and the alkaline carbonates act in a similar manner.

A. sil'icates. (G. Aluminiumkieselsaures.) These salts, along with other silicates, are found in a large number of crystallised minerals; and in the form of felspar enter into the composition of granitic and other unstratified rocks, which on decomposition by natural causes form clays. The topaz, beryl, and garnet, are silicates of aluminium

and other metals.

A. sulfu'ricum. A synonym of Aluminii sulphas.

A. sul'phate. See Aluminii sulphas.

A. trihy'drate, (G. Thoncrdehydrat.) Al<sub>2</sub>O<sub>3</sub>.2H<sub>2</sub>O. The bulky, white, gelatinous precipitate formed on the addition of ammonia or alkaline earbonates to a solution of alum; when dried it forms a soft friable mass, insoluble in water, but forming a paste with it. The trihydrate appears as white crystals when a solution of aluminium oxide in caustic potash is exposed to the air. It unites firmly with vegetable pigments; and is thus used as a mordaut.

Alu'minized. (L. alumen, alum.) Mixed or charged with alum.

A. char'coal. Finely powdered charcoal is digested with sufficient of a solution of aluminium sulphate to give an impregnation of 7.5 per cent. of alumina; it is evaporated to dryness and then ignited in a covered Hessian crucible. It is recommended as a cheap and efficient substitute for animal charcoal as a decoloriser.

Alu'mino ka'li sulphu'ricum. A synonym of common potassium-alum.

Alu'mino-na'trum sulphu'ricum. The Aluminii et sodii sulphas.

Alumino'sæ. An order of rocks comprising aluminated stones, in the geognostic method of Maraschine.

Also, a term formerly used to describe certain mineral waters which were said to contain an acid aluminous mineral salt dissolving a slight mixture of iron. (Parr.)

Alu'minose. (L. aluminosus; G. alaunhaltig.) Containing, or having relation to,

alum.

Alumino'sis pulmo'num. A name given to the form of lung disease occurring in the workers in gypsum and lime. It commences first as a bronchitis, and in the end results in cirrletic changes of the lung.

Alu'minous. (L. alumen, alum. F. alumineux; G. alaumhaltig, alaumicht.) Of or belonging to, er of the nature of, alum; full of alum.

A. schist. A synonym of Alum slate.

Alu'minum. Same as Aluminium. Alu'mium. A synonym of Aluminium.

A. oxyda'tum. A synonym of Alumina. Alumon'odig. A synonym of Ammonii

chloridum.

Al'ums. Generic name for a group of salts, in which aluminium sulphate forms a double salt with the sulphates of potassium, sodium, ammonium, cæsium, or other substitute.

Alunif'erous. (F. alun, alum; L. fero, to bear.) The same as Aluminiferous.

Al'unite. (F. pierre d'alun.) Alum stone. A mineral found in trachytic formations and in some solfataras, as that of Tolfa, near Civita Vecchia. It occurs in minute rhombohedral crystals or in fine granular masses, intimately mixed with quartz or felspar. It is the source of Roman alum.

Alu'nogene. (F. alun, alum; Gr. γεννάω, to beget.) Hair salt; feather alum. Aluminium sulphate, occurring as a feathery efflorescence in rocks and clays, or in solfataras, as a product of decomposition from atmospheric or other action. It is acicular or fibrous or lamellar, whitish and silky in colour, and astringent to the taste. It also occurs as yellowish or greenish butyraceous efflorescences, known as mountain butter.

Alun's el.  $\Lambda$  drop. Alunes. (' $\Lambda\lambda\dot{\omega}\pi\eta\xi$ , the fox.) Its fat or oil, in the form of bath, was in use in gouty and rheumatic patients. Paulus Ægineta, Lib. vii,

s. iii. (Waring.)

Al'us. The Symphytum officinale.
A. gal'lica. The Symphytum officinale.
Alu'sar. Arabic for Manna. (D., R. and J.)
Alu'sia. (Δύω, to become insane.) Hallucination; illusion; mental deception, error or misconception.

A. ela'tio. Sentimentalism, or mental

extravagance.

A. hypochondri'asis. Low spirits, or hypochondriacism.

Alu'ta. Soft thin leather, used to spread plasters on. A term employed by Apulcius to

designate the Isatis tinctoria.

Aluta'ceous. (L. aluta, dressed leather softened by means of alum. F. alutace; G. ledergelb, lederfarbig.) Having the colour of soft tanned leather.

Alu'tel. Same as Aludel.

Aluy'ne. The common name in France for the Artemisia absinthium.

Aluzar. (Arab.) Old term for snlphur. Alva mari'na. A name given to the dried sea wrack, Zostera marina, which is used for stuffing chairs and mattresses.

Alvaquilla. The Boralea glandulosa, a Chilian shrub, used as a vulnerary. The leaves are used as a substitute for Paraguay tea.

Al'varas ni'gra. A syuonym of Ichthyosis.

Alvea'rium. (L. alveare or alveus, a hollow vessel swelling out in the middle, hence a bee-hive.) The external meatus of the ear, so-called because the cerumen or wax is found there.

Al'veneu. Switzerland; Canton Graubünden. Sitnate in a beautiful district on the right bank of the Albula, 3000 feet above sea level. Cold sulphur waters of 8° C. (46.4° F.) Used in rheumatism and skin diseases. There is a wheycure establishment.

Alve'olar. (L. alreolus, a small hollow; dim. of alveus, a hollow. F. alveole; 1. alveolare; G. zahnfächerig.) Of or belonging to the alveoli, or sockets of the teeth. Having little hollows or cavities.

A. ab'scess. A synonym of Gum-boil.
A. arch. (F. arcade alveolaire; G. Zahn-köhlenfortsatz.) The alveolar surface of either jaw. The superior alveolar arch in man is usually in the form of an hyperbola, with shortish branches; in the chief anthropoid ages it is Ushaped, with long parallel branches; in macacus it is eluptical.

A. ar'tery, infe'rior. (G. Unterkiefer-A synonym of the Inferior dental arterie.)

artery.

A. ar'tery, supe'rior. (G. Oberkieferarteric.) A branch of the internal maxiflary given off as the trunk of the vessel passes into the spheno-maxillary fossa. It descends on the tuberosity of the superior maxillary bone, and supplies the molar and bienspid teeth, and the mucous membrane of the antrum.

A. bor'der. The free border of the upper or lower jaw in which the teeth are lodged.

A. can'cer. See Cancer, alveolar.

A. mem'brane. The dental periosteum. A. nerves. A synonym of the dental branches of the maxillary nerves.

A. pas'sages. (G. alveolengänge.) The ultimate terminations of the bronchial tubes in the lung into which the air-cells or alveoli open.

A. plate. A bony plate, found in certain lizards, which may be single or double, developed on one or both sides of either jaw, to which teeth are attached. When double, there are occasionally transverse partitions forming alveoli.

A. point. Applied in craniometry to a point of the anterior extremity of the articulation of the alveolar borders of the two superior

maxillary bones.

A. pro'cess. The border of the superior maxilla in which the alveoli are placed.

A. sarco'ma. See Sarcoma, alveolar. A. vein. A vessel accompanying the alveolar artery.

Alveola riform. (L. alreolaris, pertaining to alveoli; forma, shape. F. alviotari-

forme; G. zahnhohlformig) Resembling the cellules of honeycomb.

Alve olate. (L. Alveolus, a little trough or eavity. F. alvéole; G. zahnfacherig, zellig.) Having little troughs, hollow places, or eavities.

Alve'oli. (Same etymon.) Small hollows, sockets, or cells.

A. den'tis. (F. alveoles des dents; G. Zahnhohlen, Zahnfacher.) The sockets of the teeth. See Alveolus.

A. laryn'gis. The ventricles of the larynx.

A. of glands. The ultimate sacs of a racemose gland.

A. of lungs. (G. Lungenalveolen.) The air-cells of the lungs.

A. of lymphat'ic glands. The ultimate meshes of a lymphatic gland formed by the trabeculæ of the cortex, and which contain the adenoid or proper gland substance.

A. of mu'cous mem'brane. The depressions on the surface of certain mucous membranes, especially those of the stomach, gall-bladder, and

vesiculæ seminales.

A. of stom'ach. The depressions on the surface of the mucous membrane of the stomach, specially notable near the pylorus. They are polygonal, 200 -100 in diameter, with fringed or villous borders, especially at the pyloric end.

A., sal'ivary. The ultimate saccules of the salivary glands opening into the fine terminal branches of the ducts.

Alve'oliform. Same as Alveolariform. Alve'olo-condyle'an plane. In Anthropology, an important plane determined by three readily accessible points—viz. the alveolar or middle point of the superior alveolar arch, and the most sloping points of the inferior surface of the occipital condyles. It is sometimes called

the natural plane of the base of the skull. Alve'olo-den'tal perios'teum.
The periosteal membrane lining the alveoli, and covering the fangs of the teeth; the dental periosteum.

A. mem'brane. The same as Alveolodental periosteum.

Alve'olo-den'tary. That which relates to the cavities for the teeth and the teeth themselves, as the alveolo-dentary membrane.

Alve'olo-la'bial. (L. alreolus, the socket of a tooth; labia, a lip.) Chaussier's name for

the buccinator muscle.

Alve olus. (L. alveolus, from alreus, a trongh. F. alveolé; I. and S. alveolo; G. zahn-höhle.) The bony socket of a tooth. The alveoli vary in form and size according to that of the teeth they enclose. They are lined with periosteum and pierced at their base for the alveolar vessels and nerve; they are part of the external skeleton, being epidermic or ecderonic structures.

Also, the conical cavity in the guard of a Belemnite which contains the phragmacone.

Also, the individual pieces of the oral skeleton of the Echinidia.

Also, the ultimate vesicles of a racemose gland. Alver'gnat's pump. An apparatus used in the determination of the gases of the blood; it consists of an upright barometertube connected at the bottom hy means of an india-rubber tube with a receptacle containing mercury. At the upper end is a dilatation communicating above with a funnel, and laterally with a bulbous-ended tube, into which the blood is introduced. By means of a perforated stopcock a communication can be made at will between any two of these parts. In using the instrument, the barometer-tube is filled with mercury by raising the receptacle connected with its lower end. The stop-cock is now so turned as to close the upper orifice. On depressing the receptacle the mercury runs out of the tube, and an almost perfect vacuum is formed; and now, by a turn of the stop-cock, the lateral tube and bulb, already filled with blood, are brought into connection with the barometer-tube, and the gases are more or less rapidly given off, and may be collected from the upper extremity of the tube, when the mercury is again made to fill it.

Al'veus. (L. alveus, a trough. G. Mulde.)
A term applied to many tubes, or canals, especially the enlarged portions of them, through which some fluid flows, and particularly to ducts conveying the chyle from the receptacle to the

subclavian vein.

A. ampulles'cens. (L. ampulla, a flask.) The swollen vessel. The dilated portion of the thoracic duet at its commencement from the receptaculum chyli.

A. ampullo'sus. (Same etymon.) The

receptaculum chyli.

A. commu'nis. (L. communis, common, general.) The utricle of the membranous vestihule of the ear.

Also, a term given to the conjoined sacculus and utricle of the membranous vestibule of the ear

as it exists in birds.

(Ἱππόκαμπος, from A. hippocam'pi.  $l\pi\pi\sigma s$ , a horse; and  $\kappa\alpha\mu\pi\dot{\eta}$ , a bending; a monster with a horse's hody and fish's tail, on which the sea gods rode; applied to certain structures in the cerebral ventricles.) A process of the medullary substance of the hemispheres investing the convex surface of each gyrus hippocampi; it is homologous to the white medulla in the axis of cerebral convolutions, and as it protrudes into the lateral ventricle is invested by the epithelium lining this eavity.

A. urogenita'lis. (L. urogenitalis, relating to the urinary and genital organs.) The

Sinus pocularis of the male urethra.

A. utriculo'sus. (L. utriculus, a small leathern bottle.) The utricle of the membranous vestibule of the ear.

Al'vi astric'tio. (L. astrictio, astringeney.) Constipation.

A. excre'tio. (L. excerno, to cleanse by sifting.) Defecation.

A. flux'us. (L. fluxus, a flow.) Diarrhoa. A. flux'us aquo'sus. (L. fluxus; aquosus, watery.) Watery diarrhœa.

A. lax'itas. (L. laxitas, looseness.) Diarrhœa.

A. proflu'vium. (L. profluo, to flow forth.) Diarrhea.

Alviduca. (L. alvus, the belly; duco, to lead, or draw.) A term for purgative medicines.

Alvidu'cous. (Same etymon.) Having power to lead from the helly, that is, to purgo; applied to purgative medicines.

Alviduc tio. (Same etymon.) An old term for an enema.

Al'vine. (L. alvinus, from alvus, the belly. F. alvin.) Of, or belonging to, the belly, stomach, or intestines.

A. concre'tion. A calculus generated in the stomach or bowels.

(L. dejicio, to throw A. dejec'tions. down.) The faces.

A. flux. A synonym of Diarrhea.

Alvi'to. Italy; Naples; in the Province of Campania. A carbonated mineral water which is little known.

Alvolon. An old name of the Mentha puligium.

Al'vum evac'uans. (L. alvus, the fæces, evacuo, to empty out.) A pargative.
Al'vus. (Lat.) The abdomen; the stomach (L. alvus, the

and intestines; the faces; and also the womb. A. adstric'ta.

(L. adstrictus, drawn together.) Constipation.

A. astric'ta. (L. astrictus, drawn together.) Constipation. A. ci'ta. (L. citus, quiek.) Diarrhœa.

A. coac'ta. (L. coactus, of close texture.) The condition of constipution.

A. du'ra. (L. durus, hard.) Constipation.

A. flu'ida. (L. fluidus, fluid.) Relaxed bowels.

A. mol'lis. (L. mollis, soft.) Relaxed bowels.

A. re'num. (L. renes, the kidneys.) The pelvis of the kidney.

A. seg'nis. (L. segnis, slow.) Constipation.

A. solu'ta. (L. solutus, loose.) The condition of diarrhea or purgation.

A. tar'da. (L. tardus, slow.) Constipa-

'A. vir'ldis. (L. viridis, green.) A frecal evacuation.

(Said to be from άλύω, to wander Al'yce. in mind.) A term formerly used for that anxiety and restlessness which is attendant on fevers.

**Alym'phia.** (L. a, neg.; lympha, water, lymph. F. alymphie; G. Lymphmangel.) Term for the morbid absence or deficiency of lymph.

Al'yon. French physician; born 1760, died 1816.

A. oint'ment. An eintment prepared with 500 parts of lard and 64 of nitric acid, used in eases where the citrine ointment is now employed.

Alyp'ia. The same in derivation and

meaning as Alypon.

Alypias. Same as Alupia.

Al'ypon. ("Αλυπος, free from pain and sadness, from  $\dot{a}$ , priv.;  $\lambda \dot{v} \pi \eta$ , sadness.) A plant described by the Greek physicians as a drastic purgative, producing a discharge of black bile, and hence called Frutex terribilis; it is supposed to be the Globularia alypum, which belongs to the Nat. Ord. Selaginaevæ; but Lindley thinks it was a Euphorbiaevons plant. A plant, according to Dioscorides, possessing the power of relieving pain.

Alyp'tæ. (L. unctuarii reunctores.) Slaves employed by the Romans to anoint those who attended the public baths.

Al'ypum. Same as Alypon.

Alysis. ( Λλυσιε.) Anxiety.

Alys'mus. ('Αλυσμός, from αλύω, to wander in mind, to be anxious. F. alysme; G. Unruhe.) A term for the mental auxiety and mournfulness of spirits generally accompanying disease.

Alyssin'eæ. A Tribe of the Nat. Ord. Cruciferæ; fruit a small pod with a broad septum; seeds two-seriate; cotyledons accombent.

Alyssoi'deæ. A term applied by Tourne-

fort to the Cruciferæ comprised by Linnæus in his Genus of Alyssum. By Ventenat it was employed to denote all Cruciferous plants having a siliquose fruit. De Candolle used it to designate a Sub-genus of his Vesicaria, which is an Alvssnm.

Alys'son. ('Aλυσσος, curing madness.) The plant thus designated by the ancients has been variously referred to Rubia sylvestris, Veronica arvensis, Marrubium alyssum, Asperula arvensis, and Farselea clypeata. Fee doubtfully regards it as a species of cultivated madder. The Alysson of Galen is supposed to be distinct from that of Dioscorides, which was used to cure hiccup, and has been referred to Stachys annua. (Waring.)

Also, a synonym of Alisma plantago, the water

Also, in Pliny, the supposed worm existing beneath the tongue of dogs affected with rabies.

Alys'sum. ('A, neg.; λύζω, to have the hiccough.) A plant recommended by the ancients for the relief of hiccough. (Krause.) Also, the same as Alysson.

Probably the Marrubium A. Gale'ni.

alyssum.

A. monta'num. (L. montanus, belonging to a monntain.) Lemery identifies this plant with that which was formerly used as a remedy in rahies.

A. Plin'ii. The Galium mollugo.

A. sati'vum. (L. sativus, that which is sown or planted.) A synonym of Camelina sativa.

A. verticilla tum. (L. verticillus, the whirl of a spindle.) A synonym of Marrubiam verticillatum.

Alysisus. ('Αλυσσος, curing eanine madness.) Having antihydrophobic qualities.

Alyx'ia. A Genus of the Tribe Plumierea, Nat. Ord. Apocynacea. Calyx 5-partite; corolla salver-shaped with naked throat; fruit in pairs.

A. aromat'ica. A synonym of A. stellata.

A. Reinward'tii. A synonym of A. stellata.

A. stella'ta. (L. stellatus, set with stars.)
Hab. Malay, Java. Leaves in sets of three or
four, lancet-shaped, blnnt; flowers in short pednnculated spikes. The bark is known as Pulassari; it is bitter and aromatic, and is used in the pernicious fevers of Batavia, and as a vermifuge.

Alze'gi. Arabic for vitriol, or sulphate of iron; also, for ink. (R. and J.)

Alzemafor. (Arab.) Cinnabar.

Alzilat. (Arab.) The weight of three grains. Al'zir. Arabic name for all plants possessing bulbs.

Alzofar. (Arab.) Copper oxide. Alzola. Spain; Province of Guipusçoa. Situated in a picturesque valley. The waters have a temperature of 31° C. (87.8° F.) and contain a small quantity of sodinm chloride and calcium carbonate. The season lasts from the beginning of June to the end of November. Used in loss of nervous power generally and in urinary disorders.

Al'zum. An old term for the tree yielding bdellium.

Am. (Hind.) The Mango, Mangifera indica.

A'ma. A synonym of Ames. Amab'ile. (L' amabilis, lovable.) T depression in the middle line of the upper lip.

Amacrat'ic. ("Aμα, at once; κράτος, strength.) Applied to a lens in which the rays of light are all collected into one focus, on whichever part they may fall.

Amadam. (Tel.) The castor-oil plant, Ricinus communis.

**Amadel'phous.** ('Aμα, together; ἀδελφός, a brother.) Living in society or in flocks.

Amadinae. (G. Prachtfinken.) Family Ploceda, Class Aves. A group of small Pass-rine hirds inhabiting Africa, South Asia, and New Holland; plumage bright and varied.

Am'adou. (F. ayurio de chine; I. esca-focaja, esca; S. yesca; G. Zundschwamm. Zunderfeuerschwamm.) German tinder, prepared in Northern Europe from Polyporus officinalis, Fr., and Polyporus fomentarius. Fr., common on the trunks of old oaks and beeches. The outer layer having been cut away, the inner spongy part of the fungus is ent into slices, dried and beaten till it is soft. This substance, besides being used as tinder, is made into warm caps, chest protectors, compresses for the support of varicose veins, and other articles. It is used as means of stopping local bleeding, and when saturated with nitre it makes a good moxa.

A. de Panama. (Fr.) A material made of the downy hairs on the inferior surface of the leaves of Melastoma hirta, and used as an hæ-

mostatic.

A., false. (F. amadou faux.) A kind of tinder made from the Boletus tuberosus.

A., nitra'ted. (F. amadou nitré.) Amadou soaked in a solution of potassium nitrate and dried. Burned as nitre-paper to relieve asthma. A., red. (F. amadou roux.) Amadou made

from the Polyporus officinalis.

A., white. (F. amadou blanc.) Paulet has given this name to the thick felt-like mycelium of grevish colour of a fungus growing in the clefts of trees, and used for the same purpose as ordinary amadon.

(Fr.) The Polyporus Amadouvier. officinalis and the P. fomentarius are occasionally

confounded under this name.

Amadum. (Tel.) The Ricinus communis Amaerythrine. A product of the action of air and ammonia on Erythrine, the colouring matter of orchella weed, Roccella

Amaigrisse'ment. (Fr.) Wasting of the body; loss of fat.

A Tribe of Kaffirs on the Amakosah. east coast of Africa.

Amal'fi. Italy. A sea bathing place near Salerno, and about twenty miles from Naples.

Amalgam. ("Λμα, together: γαμέω, to espouse; or more probably from μάλαγμα, from μαλάσσω, to soften. F. amalgume; I and S. amalgama; G. Silberamalgam, Mercursilber, Verquickung, Quickbrei.) Term for a combination or alloy of mercury with any other metal; a calcination or impastation of metals by mercury, according to Ruland and Johnson. It was expressed by the alchemical writers by the character

A natural amalgam, containing indefinite proportions of mercury and silver, forming more or less modified cubic crystals, is found in Moschellandsberg, in Rheinbaiern, and at Rosilla. in the Province of Atakama, in Chili. obtained from Arqueros, in Coquimbo (Chili), contains 86.5 of silver, and 13.5 of mercurv.

A.for elec trical machines. This may be made by melting 2 parts of zinc with 1 part of tin, and adding 5 parts of mercury previously heated to redness. Used when mixed with a little tallow, or simply softened in the hand, to apply to the enshions of electrical machines.

A. for fil'ling teeth. Amalgams of mercury, with one or more other metals, are used for tilling those cavities of earious teeth in which the use of gold is impossible. They sometimes stain the tooth, most certainly, it is said, when the amalgam contains copper or silver. An objection has been made that salivation from the production and absorption of a soluble salt of mercury may ensue, but the objection does not seem to be based on well-authenticated cases. An amalgam of silver becomes black and stains the tooth dark grey; an amalgam known as Sullivan's cement contains copper, which also produces discoloration of the tooth; an amalgam of precipitated palladium is somewhat difficult to make, but it is very plastic and does not stain; an amalgam of cadmium and tin was at one time used, but the cadmium rapidly undergoes oxidation; an amalgam of gold and silver bas been used, but it is somewhat wanting in uniformity of hardness and of time required for hardening; the most approved amalgam is one of silver, tin, and a small proportion of gold. In any ease it is desirable to reduce the quantity of mercury to the lowest possible proportion.

A., natural. An ore composed of mercury

and silver.

A. of copper. (F. mastic métallique.) A mixture of 30 parts of copper and 70 of mercury; employed as a stopping by dentists. It is of grey colour, and is plastic.

A. of tin. (F. amalgame l'étain.) This is composed of 3 parts of tin and 1 of mercury. It has been employed as a vermifuge as well as a filling for carious teeth.

A. of tin and cad'mium. This amalgam

has been used to stop carious teeth.

Amal'gama. (Lat.) An amalgam.

A.stan'no-mercuria'le. (G. Zinnamalgam.) Powdered tin and mercury in equal parts are mixed together into an amalgam, which is added to honey to form the Electuarium stannomercuriale.

Amalgama'ted. (l. amalgamatus; F. amalgamé.) Formed into an amalgam with

mercury.

A. zinc. Zine in plate or cylinder, the surface of which has been covered or amalgamated with mercury to serve in a galvanic battery. It is thus rendered homogeneous and more strongly positive than before. Dr. Althaus recommends the zinc to be immersed in diluted sulphuric acid, after which it is painted by means of a camel's hair brush with a solution of mercury, made by gently heating 4 parts of mercury in 5 parts of nitric and 15 parts of hydrochloric acid. and then adding a further 20 parts of hydrochloric

Amalgama'tion. (Same etymon.) Term for the act or process of combining mercury with

a metal, or forming an amalgam.

Also, applied to a mode of obtaining silver from the ore; this is reasted, powdered, then mixed with mercury, water, and some iron; the resulting amalgam of mercury and silver is dried, pressed to get rid of superfluous mercury, and then distilled, when the silver is left as a porous mass.

Gold is also purified by amalgamation. Ama'lic acid. A synonym of Amalinic

Amalin'ic acid. C12 H12N4O7. A product

of the decomposition of eaffein. In contact with air and ammonia it becomes first red and then violet; with baryta, or other fixed alkali, violet blue. This reaction serves as a test for caffein. The fluid to be tested should be treated with chlorine water, slowly evaporated, and the residue exposed to the contact of ammonia, or concentrated nitric acid. A beautiful purple red coloration occurs, which disappears with excess of ammonia.

Am'alops. An erroneous spelling of Hamalovs.

Amal'tas. (Hind.) The Cathartocarpus fistula.

Amal'thea. (F. amalthée.) Applied by Desvaux to a union of many fruits, dry and horny, in a calyx which remains without becoming fleshy, as in the Agrimonia eupatorium.

Amalthei. Applied by Debuch to a Tribe of the Ammoneæ having the A. amaltheus for

their type.

Amam'bay-guaru. (S. helecho.) The name given in Paraguay to certain ferns of the Genus Polypodium, used in that country, in the form of decoction, as astringents. (Waring.)

Amam'bay-mini. (S. culantrillo.) The

name given in Paraguay to a species of Adiantum.

employed chiefly as an emmenagogue. **Amamelis** ("Αμα, at once; μῆλον, an apple, or any tree fruit.) Ancient name given to a fruit like a pear, particularly to that of a species of Mespilus, or medlar.

Aman'de. (Fr.) The almond.
A. de terre. (G. Erdmandel.) Round

cynerus root. (Crabb.)

Aman'din. An albuminous substance contained in sweet almonds.

Amandinus la'pis. Old term for a gem, or stone, of various colours, which was supposed to destroy and dispel all poisons; wherefore it is not a stone to be despised, it was

Amani'ta. ('Aμανῖται, a sort of fungus. G. Fliegenpilz.) A Sub-genus of the white-spored Series Leucospori, of the Genus Agaricus. entirely enveloping the young plant; pileus convex, then expanded; stem distinct from the hymenophore, with a volva, free and lax, counate with the base or friable, and nearly obsolete; gills free from the stem. Some species are edible, others highly poisonous. The term amanita was anciently restricted to edible mush-

The different species are described under the head Agarieus.

A. cæsa'rea. A synonym of Agaricus cæsareus.

Amani'tæ. (Same etymon.) An old term for edible fungi.

Amani'tin. The active narcotic principle of the Agaricus (or Amunita) muscarius and Agaricus bulbosus. It is brown, non crystallizable, without taste or odgur, and is insoluble in water, but soluble in alcohol and ether.

Aman'siæ. A Tribe of Kützing's Hetero-

carpous algæ.

Amapalatangh vari. A large tree of Madagascar, the leaves of which are used as an astringent. (Flacourt.)

Ama'ra. ('Αμάμα, a channel for water. G. Wassergang) A clouce or sewer. Also (L. amarus, bitter; G. bittere Mittel).

A term given to bitter medicines; bitters. Also, the native name in Socotra of a tree

which yields a light coloured guid, which is

slightly odoriferous, but much inferior to the Olibanum obtained on the Arabian coast.

A. dul'cis. (L. amarus, bitter; dulcis, sweet.) The Solanum dulcamara, or bitter sweet. A. in'dica. An old term for the Momor-

Amarac'ina unguen'ta. Amaracine ointments. A term applied anciently to all fragrant ointments, from the fabled circumstance of Amaracus, a youth employed as perfumer to Cinyras, king of Cyprus, having fallen and broken a box of cintment he was carrying, by which means its odour became more diffused and agree-

Amarac'inum. (Gr. ἀμαράκινον.) An oil, flavoured with marjoram, extracted from the Amaracus, which was employed by the ancients as a stimulant of the muscular system, and of the nterns. (Waring.)

Amar'acus. (Gr. άμάρακος, a plant named after Amaracus, perfumer to Cinyras, King of Cyprus; or from α, neg., μαραίνω, to die away, as long retaining its virtues.) A plant with a bulbous root; in use amongst the ancients as a remedy for the stings of scorpions, affections of the eyes, stomach complaints, dropsy, and dysuria It was likewise used in the form of pessary or ointment as an emmenagogue. The foreign species, called Persian or Egyptian, is generally regarded as the Origanum marjorana-the sweet marjoram; but Fée identifies it with Origanum marjoranoides, the wild or false marjoram; others with the Syrian herb mastich, Tencrium marum.

Amaracus. (Same etymon.) A Genus of the Tribe Saturea, Nat. Ord. Labiuta. The plants closely resemble Origanum, from which they differ in their calyx, the tube of which has three nervures and is hilabiate; in having orbicular, membranous, coloured floral bracts equalling in

length the tube of the corolla.

A. dictam'nus. (Δίκταμνον, from Δικτή, a mountain in Crete, where it grows abundantly.) Dittany of Crete, a subfrutescent plant with entire leaves, and flowers solitary in the axils of the bracts. A celebrated aromatic plant, which formerly enjoyed a great reputation for its stimulant, nervine, emmenagogue, alexipharmic, and vnlnerary properties, though its medicinal virtue seems to be similar to that of mint and sage.

A. tomento'sus. A synonym of A. dic-

tamnus.

Amaranthus.

Ama'ræ. ('Αμάρα, a water course.) The depressions in the cartilage of the ear.

Amaranta ceæ. A synonym of the Amaranthaceæ.

Amaranta ceous. (G. Amaranthähnlich.) Resembling, or related to, the Amaranth. Am'aranth. ('Αμάραντος, unfading.) Α term applied by many poets to an unfading flower; the exact species meant is not known. At present the name denotes the species of the Genus

Also, used to denote a purplish colour.

A. wood. (G. Amarantholz.) The wood

of the Copaifera bracteata.

Amarantha ceæ. (G. Fuchsschwanz-gewachse.) The Amaranth Order. A Nat. Ord. of the Subclass Monochlamydeæ, Class Dicotyledones; or, according to some, a Family of the Order Oleraceae. Herbs or shrubs. Leaves simple, exstipulate, opposite, or alternate; inflorescence spiked or capitate; tlowers usually with an imbricated perianth of dry and scarious persistent bracts, often coloured, 3-5 in number, occasionally

unisexual; stamens 5, hypogynous and opposite to the sepals, or a multiple of that number; anthers 2- or 1-celled; ovary free, 1-celled, with 1 or more ovules; style 1 or 0; stigma simple or compound: fruit a ntricle, caryopsis, or berry; seeds 1 or more, pendulons, embryo curved round mealy abdomen, radicle next the hilum. The plants of this order are most abundant in the tropical regions.

Amarantha ceous. (Same etymon.) Having a resemblance to, or possessing the cha-

racters of, the Amaranthus.

Amaran'thi. Jussieu's term for the Amaranthaceæ.

A. spi'ca. A Species of the Phryma of Linnæus. (Crabb.)

Amarantho affinis. The Gomphrena globosa and Illecebrum sessile of Linneus. (Crabb ) Amaran'thoid. (Amaranthus; &loos,

form.) Like the Amaranthus, as the Celosia, Gomphrena, and Illecebrum, of Linneus.

Amaran'thus. ('A, neg. , μαραίνω, to decay; because the flower does not soon decay when plucked.) Annual herbs with alternate exstipulate leaves, petioles decurrent; thowers green or reddish, in small cymes, which collectively form a spike or a panicle; polygamousdiecious, with three bracts; calyx with 3-5 imbricated sepals; stamens 3-5, filaments free, anthers introrse; ovary superior, unilocular; ovule single, campylotropal, attached to a basilar placenta; style with trifid stigma; fruit a pyxis, containing a single seed, with feculent albumen, surrounded by an arcuate embryo.

A. adscen'dens, Loisl. (L. adscendo, to

climb.) A species used as food.

A. anardha'na. The seeds of this species are used as food.

A. bli'tum. (L. blitum, a salad herb. F. la blette.) Wild Amaranth. All seed. Upright blite. Least amaranth. A small annual plant, indigenous in many parts of Europe; used as a pot herb in France. Said to be refrigerant and slightly astringent.

A. campes'tris. (L. campestris, level field. Sansk. May-kandana; Tam. Siru-kirei; Tel. Tseeri-koora.) Anative of Southern India. The roots are regarded by the Hindoo doctors as demulcent, and are prescribed in decocti n in

A. cauda'tus. (L. caudatus, tailed. F. queuc-de-Renard.) Love-lies-Bleeding. This species, originally from Peru, is now domesticated in all parts of Europe. The dowers are said to be astringent, and were formerly used in uterine and other hæmorrhages.

A. cer'nua. (L. cernuus, bending downwards. Hind. sooryalee.) A native of India. The seeds of this plant are used as a refrigerant and astringent, in doses of one half to two drachms.

A. deb'ilis. (L. debilis, weak.) A native of Madagascar, where it is used in the form of

infusion as a cure for syphilis.

A. frumenta ceus. (L. frumentaceus, of corn. Tam Poong-kirai.) An Indian herbaceous plant. Stem erect; leaves petiolated, lanecolate, acute; panicles terminal, erect; sepals subulate; utricles wrinkled. The flour of the seeds is used largely as an article of diet by the natives.

A. hypochondri'acus. Prince's Feather. The leaves are astringent, and are used both

externally and internally. A. melanchol'icus. (L. melancholicus, melancholy.) A native of Brazil, where it is called Caruru vermelho, and is employed in making emollient poultices.

A. obtusifo lius. (L. obtusus, blunt; folium, a leaf.) This plant is said to be a dinretic.

A. olera ceus. (L. oleraceus, herb-like. Ilind. Mursa; Beng. Sada-nuti; Tel. Tola-Kura; Burm. Hen-kunway.) A native of India and Burmah. Demulcent. In the Taleef Shercef it is said to prove aperient when boiled with salt and butter. The variety Giganteus has a thick succulent stem, which is eaten as a substitute for asparagus.

A. polyg'amas. (Πολύς, many; γαμέω, to take to wife. Hind. Chumli-Sag, Chowlai; Beng. Champa-nuti.) An Indian species, found also in the Moluceas and Cochin China. It possesses demuleent properties, and is said in the Talcef Shereef to prove useful in bilious disorders and to be aperient and diuretic.

A. polygonoi'des. (Πολυγονοειδές; from πολύγουου, the plant polygonum; είδος, likeness.) Goosefoot, sowbane. A native of Barbadoes and Jamaica, where it is alleged to have the property of making a sow east her young. It is a strong rank weed, supposed by some to be poisonous. Barham states that, when made up with lard, it makes a good cataplasm for local inflammations and swellings. It has also been recommended internally for strangury, especially for that arising from the use of canthantees.
sidered very wholesome. (Waring.)
A. prostra'tus. (L. prostratus, low-

lying ) A species used for food.

A. spino'sus. (L. spinosus, spiny. Hind. Kanti-nuti; Duk. Kante mat; Tam. Mulluk-Kirai; Tel. Mundla tota-Kura; Mal. Mullan-chira; Beng. Kanta mari.) A common weed in many parts of India, Ceylon, and Burmah. Erect, glabrous; leaves with two spines in the axils; panicles sparingly branched; utricles 2-3, eleft at top; bracts unequal, bearded; seeds black. The leaves of this plant are bruised and made into emollient poultices; and in the Mauritios a decoction of the leaves and root is administered internally as a diuretic.

A. sylves'tris. (L. sylvestris, belonging

to a wood.) A species used for food.

A. tenuifo'lius. (L. tenuis, thin; folium, a leaf. Sindee, mullcero.) A plant used in

Sindb as fodder for camels.

A. vir'idis. (L. viridis, green.) Anative of Jamaica and Brazil domesticated in Europe. It is used in the form of enema in the dry bellyache of Jamaica as the best and most common emollient herb that the island affords.

Amaran'tine. (Same etymon.) Ever-

lasting, unwithering, underaying.

Amaran'tous. ('Aμάραντος, unfading; from a, neg.; and μαραίνω, to quench, to decay. F. amarante.) Undecaying; unfading.

Amaran tus. ('Aμάραντος, unfading.) Amaranthus. A plant in use amongst the ancients as an emmenagogue and resolvent. It is supposed to be the Celosia cristata, or cock's

Ama'rarit. A plant of Southern Abyssinia possessing emetic properties.

Ama're. (Lat.) Bitter. Amarel'la. (L. amarus, bitter.) A name of the Gentian, Gentiana lutea. Also, the Polygala vulgaris, because of its bitterness.

Amarcl'lus. (Lat.) Bitterish.

Amaril'la del Rey. A name of a bark

furnished by the Cinchona Bonplandiana. It is of the size of a goose-quill, with a tawny-grey epidermis, a fracture clean on the outer part, fibrous within, a slightly aromatic odour, and a bitter, astringent taste. It contains 8 per cent. of alkaloids, of which seven is quinine.

Ama'rin. C<sub>21</sub>.H<sub>18</sub>N<sub>2</sub> (L. amarus, bitter.) An organic base obtained by boiling hydrobenzamide with alkaline solutions. It is insoluble in water, melting at 100° C. (212° F.), and it is

poisonous. Also, an alkaloid (C<sub>12</sub>H<sub>48</sub>N<sub>2</sub>) resulting from the action of ammonia on essence of bitter al-

monds. Also, a name formerly given to the supposed

bitter principle of vegetables. Amarini'te. A name proposed by Desvaux

to be applied to the several bitter vegetable principles.

Amar'itas. (G. Bitterkeit.) Bitterness. Amarities. (Lat.) Bitterness. Amaritudo. (Lat.) Bitterness.

Amaron'cium. A typical Group of the Subfamily Polyclinina, Family Botryllida, Order Ascidia, Class Tunicata. (Schmarda.)
Ama'ror. (Lat.) Bitterness.

Amarthri'tis. ('Aμα, together; ἀρθρῖ-Tis, gout.) Gout of the whole body, or affecting many joints at the same time.

Amarucachu. The Polianthes tube-

Ama'rum. (Lat.) Magnesium sulphate, or Epsom salt. (Crabb.)

A. sim'plex. (L. amarus; simplex, simple.) An old term for the compound infusion of gentian.

Ama'rus. (Lat.) Bitter. Applied to certain substances termed bitters, as distinctive of their medicinal properties.

A. dul'cis orienta'lis. (L. dulcis, sweet; orientalis, eastern.) A name of the Costus.

A. sal. (L. sal, salt.) An old name for magnesium sulphate.

Amary'gæ. ('Αμαρυγή, from αμαρύσσω, to shine.) A term understood by some to mean the eyes, by others, the eyebrows. (Gorraeus.)

Amaryl'leæ. A tribe of bulbons plants, belonging to the Nat. Ord. Amaryllidacea, characterised by the absence of a coronet in the flower.

Amaryllida ceæ. (G. amaryllis-gewachse.) Amaryllids. A Nat. Order of the Section Epigynæ, Subclass Petaloidea, Class Monocotyledones; or, according to some, a Family of the Order Eusata. Chiefly bulbous and scapebearing herbs, not scurfy or woolly, with linear flat root-leaves, and perfect regular (or nearly so) flowers, 6-androus; perianth petaloid, 6-partite, superior, with or without a corona; stameus 6, inserted on the segments of the perianth; anthers introrse; ovary inferior, 3-celled; fruit capsular, 3-celled, 3-valved, with loculicidal dehiscence and numerous seeds, or a berry with I-3 seeds; seeds with flesby or horny albumen; embryo with the radicle next the hilum. Natives of many parts of the world, but most abundant at the Cape of Good Hope

Amaryllid'eæ. A synonym of Amaryl-

Amaryllid eous. (G. amaryllisahnlich.) Resembling, or related to, the Amaryllis. Amaryllidifor'mæ. Applied by G. Herbert to a section of the Amaryllidea, which are more allied to the Amaryllis.

Amaryllis. (Amaryllis, a girl frequently mentioned in Virgil's Eclogues.) A Genus of plants helonging to the Nat. Ord. Amaryllidacco. The bulbs of many species possess acrid properties.

A. atamas'co. The Atamasco fily. The inhabitant of damp soils in Virginia, Georgia, and

other parts of North America.

A. belladon'na. (F. lis rouge; belladonne.) Belladonna lily. A West Indian species, the bulbs of which, according to Endheher and Guibonrt, are poisonous. Lindley, however, thinks that this is a mistake, and that their statement applies to Hippeastea.

A. dis'ticha. (Δίστιχος, with two rows.)

A species said to be poisonous.

A. eques'tris. (L. equester, belonging to horsemen.) The red or Barbadoes lily. A native of the West Indies; the hulbs are said to be poisonous, causing inflammation of the stomach and bowels, and death in two or three hours.

A. lute'a. (L. luteus, yellow, orange-coloured.) False saffron. A native of Southern Europe. The flowers are small, yellow, and appear in autumn. Purgative properties are assigned to

the bulbs.

A. orna'ta. (L. ornatus, adorned.) species is an inhabitant of the Cape and of Sierra Leone. In the former place it is used as an astringent, in the latter the cold aqueous infusion is applied as a wash to children suffering from rickets.

A. prin'ceps, Vell. (L. princeps, a prince.) Used for arrow poison.

A. regi'næ, Lin. (L. regina, a queen.) Used for arrow poison.

Amar'ythrine. The same as Amae-

rythrine.

Amase'sis. ('A, neg.; μάσησις, from μασάομαι, to chew.) Term for inability to chew. Ama'si. Milk rendered sour by being placed in vessels charged with the remains of former operations. It is used by the natives of

Central Africa, and is considered by them more wholesome than fresh milk.

Amasse'sis. See Amassis.

Amas'ta. ('A, neg.; μαστός, the breast, a teat.) A name applied to the Ornithodelphia or Monotremes, from the absence of any nipple to the mammary gland.

Amasthen ic. ("Αμα, together; στενός, narrow.) A term applied to a lens which collects the actinic rays of light into a focus.

Amas'tia. ('A, neg.; μαστός, the breast.) In Teratology, absence of the breasts. This deformity has not been observed in the human male.

Amastozoa'rius. ('A, neg.; μαστός, the breast; ζώον, an animal.) Applied by Blainville to a Sub-type of the Vertebrata, having no hreasts.

Ama'tes. A term for the amethyst. Am'ativeness. (L. amo, to love.) The

sexual passion.

In Phrenology, a term for the sexual propensity common to man and the lower animals; its organ is said to be the cerebellum, and its amount is calculated by the size of the skull between the

mastoid process and the occipital spine.

Amatoria fe'bris. The amatory fever.

In Vogel's nosology amatoria is defined to be a fever of a few hours' continuance, beginning with a great degree of coldness, and arising from ex-

pectation of marriage.

Also, a term for Chlorosis, because occurring when the amatory passion is strongly developed. A. venefic'ia. (L. veneficium, a poisoning.)

The same as Philtra.

Amato'rii mus'culi. A synonym of the superior and inferior oblique muscles of the eye, because they are used in ogling. (Crabb.)

Amato'rium. (L. amatorium, a means of exciting love.) The depression in the middle

line of the upper lip.

A. venefic'ium. (L. veneficium, a poisoning, sorcery.) A term for a philtre. (Castellus.) Amato'rius. (L. amo, to love.) Of or belonging to love, or lovers; amorons; amatory.

A. mus'culus. See Amatorii musculi. In Anatomy, applied to the oblique muscles of the eye, from their use in ogling.

Ama-tsja. A Japanese word signifying tea of heaven, applied to the leaves of Hydranyca thuribergii, or thunbergii, which are employed as

Ama'tum. (Tel.) The Spondias manyifera. Am'atyste. The amethyst.

Amaurochæta'ceæ. ('Δμαυρός,dusky; χαίτη, long, flowing hair.) A Family of the Order Amaurochæteæ, of the Myxomycetous Fungi. Æthalium consisting of numerous elongated, entirely naked sporangia, arranged close together in several layers; along the sporangia of the lower and middle stratum run the columella; the columellæ of the single sporaugia grow to-gether amongst themselves, and form tree-like branches attached to the base of the athalium in several places; sporangia of the middle and upper stratum possessed of a capillitium, with the threads combined into a net, common to all the sporangia; branchings of the net dense at the point of union, expanded triangularly.

Amaurochæ'teæ. (Same etymon.) An Order of the Section Trichophoræ, of the Subdivision Amaurosporæ, of the Myxomyeetous Fungi. Single sporangium or athalium, without true spores, capillitium, and columella, almost always uniformly black or brownish violet colour.

Amauro'sis. ('Αμαύρωσις, a becoming dull of sight, from ἀμαυρόω, to darken. F. amaurose; G. schwartze Staar.) Partial or total loss of vision (when partial the term amblyopia is now usually applied to it), depending on disease of the optic nerve, retina or brain, sometimes without any change appreciable under the ophthalmoscope, but usually accompanied by more or less whiteness of the optic disc. The iris is usually widely dilated and motionless, and there is a peculiar blank expression in the eyes, which has led to the terms gntta serena and aqua serena being applied to it. Many of the conditions formerly classed under the head of amanrosis can now be distinguished from each other by the aid of the ophthalmoscope.

A., abdominal. Reflex amaurosis is due to disease of the abdominal viscera.

A., albuminu'ric. See Retinitis albuminurica.

A., amblyop'ic. An old term for impairment of vision without visible alteration of the eye.

A., cat's eye. A term formerly applied to the bright, glistening, yellowish-white reflection frequently seen in the earlier stages of glioma of the retina.

A., cer'ebral. In this form of amanrosis the loss of vision may be complete or partial, may affect the whole of the field of vision, or only a part, as in hemiopia, and may be immediate or

progressive. It may result from injury, inflammation, hemorrhage, or growth of tumour in the cranium, affecting the cerebrum or cerebellum. The impairment of vision is commonly preceded by optic neuritis, which gradually leads to atrophy of the nerve, recognisable by the whiteness of the optic disc. The vessels are usually diminished in number and size in the later stages. In the treatment the hypodermic injection of strychnia may be tried as well as electricity.

A., cil'iary. A synonym of Abdominal amaurosis.

A., congen'ital. Amaurosis resulting from

imperfect development of the fætus.

A., diabe'tic. This form presents symptoms similar to those of albuminuric retinitis, viz. a preliminary stage of optic neuritis, often accompanied by extravasation of white corpuscles or by hæmorrhage, succeeded by white atrophy. The patient suffers from impaired vision (amblyopia), often from scotomata and hemiopia. The prognosis is bad, and the treatment merges into that of the constitutional affection.

A., diur'nal. (L. diurnus, belonging to

the day.) A synonym of Nyctalopia.

A. from light'ning. This form has occasionally been noticed after exposure of the eye to the light of a vivid flash of lightning, though the shock to the system must be taken into account. Optic neuritis is sometimes present.

A. from tobac'co. See A. toxic.
A., ganglion'ic. A synonym of Abdominal amaurosis.

A., glycosu'ric. A synonym of A. diabetic. A., hæmorrhag'ic. A term applied to impairment or loss of vision from rupture of retinal or choroidal vessels, or from the escape of blood-corpuscles through their walls by diapedesis. When the hamorrhage takes place in the fibrous layer of the retina, the blood spreads in a radial direction, following the course of the fibres, and more or less fusiform or linear spots are the result; but when it occurs in the ganglionic or external layers the spots are more rounded in form. The quantity of blood thrown out is sometimes so large as to separate a great part of the retina from the choroid, or to burst through into the vitreons humour. When small or of moderate size, the harmorrhages may gradually disappear, becoming first darker and diminishing in size, without leaving any impairment of vision behind; but choroidal atrophy and displacement of pigment with scotomata often follow. The symptoms presented are sudden impairment or loss of vision, which is more noticed by the patient as the lesion is nearer the fovea centralis, coming on without known cause, or more frequently after violent coughing or sneezing, and sometimes with, sometimes without, any symptoms of irritation in the eye affected. Sparks or flashes of light may be observed, and a glaucomatous condition is sometimes set up. Atrophy of the optic disc is an occasional sequela. Hæmorrhages of the retina are of common occurrence in Bright's disease, and are not unfrequently observed in hypertrophy of the left ventricle, in diabetes, in pregnancy, seurvy, and some other constitutional diseases. Of course it may result from accident. Its existence without obvious cause should lead to careful investigation of the condition of the vessels and of the brain. The treatment should consist in cautioning the patient against all circumstances that may lead to congestion of the head. Locally cold and a compress bandage may be applied.

A., hysterical. A condition occasionally observed in young persons of both sexes. It is unattended by symptoms of irritation or inflammation, and usually disappears under treatment directed to the general condition of the system.

A. in anasar'ca. This form sometimes occurs in patients shortly after an attack of scarlet fever; the symptoms and treatment are those of

albuminuric retinitis.

A., intermit'tent. A typical form of amaurosis occurring as a complication of intermittent fever, or of masked ague. It presents periodical cessations and returns. (Good.)

Deficient sight from A., mus'cular. weakness of the muscles of accommodation.

A., nocturnal. (L. nox, night.)

synonym of Hemeralopia.

A. of preg'nancy. This condition supervenes usually towards the later months of pregnancy, and is accompanied by symptoms closely resembling those of albuminuric retinitis. The urine commonly contains albumen. Complete recovery may take place, even after optic neuritis is well expressed, and there have been somewhat considerable hæmorrhages. The cause is unknown, but it may perhaps be due either to pressure on the renal veins, or to hypertrophy of the left ventricle, or to blood-poisoning.

A., rachialgic. A synonym of Spinal

amaurosis.

A., re'flex. Amaurosis proceeding from irritation of other nerves, especially of the fifth and sympathetic. Mr. Coleman knew a case in which a boy broke a tooth. It was pegged, which caused great pain, and soon after amaurosis occurred. The tooth was extracted, and recovery of vision took place. Worms are an occasional cause of amaurosis.

A., sat'urnine. The impairment or loss of vision that occurs occasionally from the toxic influence of lead. The amblyopia is usually slowly progressive. The disc becomes paler, the edges are somewhat hlurred, and the retinal vessels smaller than natural. It is a kind of atrophy. The treatment that may be adopted is to remove the patient from the operation of the eause of the disease, to administer potassium iodide, and subsequently strychnia, iron, and quinine, and to promote by all means the general health.

A., sim'ulated. See Feigned diseases. A., spinal. Amaurosis dependent on disease of the spinal cord.

A. syphilitic. Loss or impairment of vision from hereditary or acquired syphilitic disease.

A., tox'ic. This form is most commonly the result of alcoholic excess. It may be observed as the result of the abuse of tobacco, after large doses of quinine or of helladonna, and is sometimes seen in lead-workers. Lastly, it is common as a result of blood-poisoning in the later stages of Bright's disease. There is often a premonitory stage of subacute optic neuritis. In other instances the optic disc presents the appearance of slowly progressive atrophy.

A., traumatic. This may either be direct

and owing to injury of the eye, optic nerve tract, or brain, or reflex, and then due to injury of some sensory or afferent nerve, as the supra orbital. The blow of a suddenly expelled soda-water bottle or champagne cork often produces temporary, and sometimes permanent, amaurosis; in the former case apparently from shock to the retina, in the latter to shock, or separation of the retina, or hamorrhage. In cases where the optic

nerve has been injured, the seat of the injury may sometimes be determined by noticing whether optic neuritis be present or absent. If present, the lesion is probably in front of the penetration of the sheath by the arteria centralis retinæ; if absent, behind this point. The prognosis in cases of shock to the retina, even if blood be poured out, is good. Of injury to the optic nerve, either from penetrating wounds, or from jamming of the nerve at the optic foramen, bad. In injuries of the hrain, the ophthalmic affection is of secondary importance. In all instances rest should be maintained. If inflammatory symptoms arise, moderate antiphlogistic measures may be adopted.

A., trifa'cial. Amaurosis resulting from disease of one of the branches of the fifth nerve, most frequently a dental branch. See A. reflex.

A., uræmic. A synonym of Uræmic retinitis.

Amauro'sis a myo'si. Blindness from closure of the pupil.

A. a syn'chysi. Blindness from closure of the pupil.

A. aton'ica. A form of amaurosis of older authors, with permanent atony and dilatation of

the pupil. A. dimidia'ta. (L. dimidiatus, divided.) A synonym of Hemiopia.

A. ex hæmorrha'gia. See Amaurosis, hæmorrhagie.

A. hysterica. See Amaurosis, hysterical. A. imperfec'ta. (L. imperfectus, incomplete.) Imperfect amaurosis.

A. intermit'tens. See Amaurosis, intermittent.

A. lactan'tium. (L. lactans, giving suck.) Disturbance of vision arising from too prolonged nursing.

A. partia'lis fu'gax. skotom.) A disturbance of vision lasting for some minutes or hours, and usually associated with other nervous affections, and especially with hemicrania. It consists of a dark spot or obscuration affecting some part of the field of vision. Its occurrence should put the surgeon on his guard for glaucoma, of an impending attack of which it is often a sign.

A. pellagro'sa. A form of amaurosis observed to accompany pellagra in the districts where that disease is prevalent, as in Lombardy,

Spain, and some parts of France.

A. progressi'va. That form of the disease which results from gradually advancing atrophy of the optic nerve, or of its central or peripheral termination.

A. reflecto'ria. See Amaurosis, reflex. A. saturn'ina. See Amaurosis, saturnine. A. spasmod'ica. An old division in which the pupil is said to be permanently contracted.

A. uræ'mica. See Amaurosis, uræmic.

Amaurospo'reæ. ('Αμαυρός,dim,dusky; τόρος, seed.) A Subdivision of Division Endo- $\sigma\pi\delta\rho\sigma$ s, seed.) A Subdivision of Division Endosporeæ, of the Class Myxomycetes. The spores are violet or brownish violet.

Amaurotic. Belonging to amaurosis.

Amause. (Ger.) Enamel.

Ama'zia. ('A, neg.; μαζόs, the hreast.)

Absence of one or both breasts.

Am'azon stones. Small green stones used as amulets by the natives of Rio Negro. They consist of Jade or Orthoclase tinged with copper.

Amazo'nios. ('Aμαζόνιοs, named after the target or shield worn by the Amazous,

from its likeness.) Pastil or lozenge used against flatulence and vomiting, according to Galen, de C. M. sec. Loc. l. viii. c. 3. It was composed of seeds of smallage and anise, tops of wormwood, myrrh, pepper, and sugar.

Amazo'nius. Same as Amazonios. Ama-zulus. A tribe of Kaffirs in Africa, near Cape Colony, now, with additions of neighbouring tribes, called simply Zulus.

Am'ba. (Cing.) The cultivated Mango tree. Ambad'edo. (L. ambi, around; ad do, to eat up. G. ringsum befressen, ganz verzehren.) To cat away entirely.

Amba'iba. A tree of Brazil. The Cecropia peltata of Linnæus.

Amba'jo. (G: Irrweg, Tauschung.) Error, illusion.

Am'ba-Kan'da. A gall-like excrescence from the Mango tree, which in Behar is employed medicinally

Am'balam. A name of the Mango tree, Mangifera indica.

Ambalan. (Malay.) Lac, obtained from the Annona squamosa.

Am'bapooree. The Indian name of the inspissated juice of the ripe Mango, which is cut into cakes and sold in the bazaars. It is both acid and sweet, and is used, like red current jelly with certain kinds of meat. (Birdwood.)

Am'bar. (Malay.) Amber. Ambara. (Hind.) The Spondias mangi-

Ambarbarees. (Arab ) The Berberis aristata

Ambaree. A term applied in Bombay to the Hibiscus eannabinus. (Birdwood.) Ambaree-chucka. A term applied in

Bombay to the Rumex resicarius. (Birdwood.)

Amba'rum. A synonym of Ambergris.

A. cinerit ium. (L. cineritius, resembling ashes.) Ambergris. Ambarva'lis flos. (L. ambarvalis, that

goes round the fields; flos, flower.) A synonym of the Polygala.

(Sansk.) The Oxalis cor-Ambashta. niculata. (Birdwood.)

Am'baville. The Creole name in Bourbon of two species of Senecio, which enjoy a high reputation in the treatment of many diseases.

Am'be. ("Αμβη, the ridge or superior prominence of a rock.) A mechanical contrivance, used by the ancients for the reduction of dislocation of the shoulder, the extremity of which was ridged or shaped off for its reception into the axilla, described by Scultetus.

Also, a superficial crest or eminence of a hone. Ambel. The Nymphaa pubescens. (Willd.) Ambe'la. The Arabian name of a tree of which there are two species; the fruit of one is ascescent and is eaten as a condiment, and the wood is boiled with sandal wood and taken in decoction against fevers. The roots of both plants yield a white purgative juice, which is administered in drachm doses.

Also, a synonym of Phyllanthus cieca, and of the Nymphaa lotus of Linnæus.

Ambellania. A Genus of the Nat. Order Apoeunaceæ.

A. ac'ida. A small shrub growing in Guiana and Cayenne. The fruit, though milky, is edible, and when macerated in water communicates to it a pleasant acid flavour and acts as a refrigerant. The unripe fruit is slightly laxative, and is employed in dysentery. (W.)

Ambeloo'na. A fruit of Hindestan, acid and astringent. Considered useful in affections of the throat and in carbuncle. (Waring.)

Amber. (Arab. amb'r; kerabe, an attractor of straw; Gr. ηλεκτρον, άρπαξ, the snatcher; L. succinum, electrum; F. ambre, succin; 1. ambra, succino; S. ambar; G. Amber, Bernstein.) A fossil resin, occurring in irregular nodules and masses of various sizes in connection with Tertiary lignites; it is found in the Tertiary clays of Sicily, Saxony, and Liberia, on the north coast of England, and the Prussian sbores of the Baltic, having been washed up after storms, and in some lignite beds in North Germany; it also occurs in the United States. It is brittle, of vitreous fracture, easily cut, permanent in the air, of various shades of yellow, tasteless, inodorous when cold, fragrant when heated, generally translucent, and of sp. gr. 1.0 to 1.1. It becomes negatively electric on friction. It is often in parts of plants and insects, and is the product of the extinct Conifer Pityoxylon succiniferum of Kraus, the Pinites succinifer of Göppert. Ether dissolves 18-23, alcohol 20-25, turpentine 25, chloroform 20 parts in a 100. It contains carbon 78.9, hydrogen 10.5, oxygen 10.6 parts per cent. It melts at 286.6 °C. (547.5 °F.) On distillation it yields succinic acid and oil of amber, besides resinous and other substances. Amber is made into ornaments, and mouthpieces for pipes; it is used to prepare oil of amber and succinic acid. In olden times it was considered an aphrodisiae; as a fumigation and in tineture it was used as a stimulant and antispasmodic in hysteria and in chronic coughs. Dose, 10-60 grains in powder.

A., ac'id of. A synonym of Succinic acid.
A., balsam of. The resinous material left in the retort during the rectification of oil of

A. bitu'men. A synonym of Succinin, which is a resin obtained from amber, and insoluble in alcohol and other.

A. cam'phor. A yellow-coloured light sublimate, which appears in the neck of the retort in the later stages of the destructive distillation of amber.

A., eu'pion. One of the constituents of oil of amber, according to Elsner.

A., grey. A synonym of Ambergris. A. hap'pi. An electuary containing musk, catechu, and opium; largely used in Constantinople, where it is regarded as a calmative.

A., liq'uid. A term for liquidamber, or copalm balsam; otherwise called liquid storax. Also, a synonym of the Liquidambar styraciflua.

A. oil. (L. oleum succini æthereum; G. Bernsteinol.) An oil obtained by the dry distillation of amber. It is dichroic dark brown by reflected, and olive green by transmitted, light. It has an unpleasant penetrating smell, and is lighter than water. The crude oil is of composite nature, containing acetic and butyric acids, and perhaps also valerianie and capronic acids; when rectified by distillation it is chiefly composed of

two hydrocarbons, probably camphenes.

A. res'in. (L. colophonium succini; G. Bernsteincolophon.) A black resin, with vitreous fracture, obtained by the dry distillation of amber. It dissolves in oil of turpentine, and may be used

as a varnish. A., salt of. A synonym of Succinic acid. A. seed. The seeds of the Abelmoschus moschatus.

A., vol'atile oil of. See Oleum succini. A., volatile res in of. A synonym of the A. cumphor.

A., white, of Brazil. One of the varieties of gum animë.

A., white, of Cay'enne. A term for a variety of gum animë.

A., yel'low. A synonym of Amber. Amberce. A term applied in Bombay to the Glycycarpus racemosus.

Am'bergrease. Same as Ambergris. Am bergris. (Amber; F. gris, grey. I. ambregris; G. ambra, grauer-amber.) A substance exercted by the sperm whale, Physeter macrocephalus, but whether it is merely the inspissated faces or a pathological product is not certainly known. In Japan it is termed Kusuranofu, which, according to Kümpfer, means simply whales' dung. Ambergris is found float-ing on the sea near Madagasear, the Coromandel coast, and Japan, in masses weighing from a few ounces to several pounds of lighter or darker ash colour, opaque, fatty, saponaceous to the feel, and on being warmed exhales a peculiar musk-like odour. The larger fragments often contain the beaks of the Sepia moschata and Octopus, which constitute the ordinary food of the Pott's whale. Its sp. gr. is 780 to 926. It melts at 60° C. (140·6<sup>5</sup> F.), and volatilises, in the form of a white vapour, at 100° C. (212° F.). It is composed of ambreine, an alcoholic extract, with benzoic acid, an aqueous extract. It has no repute in Europe as a medicinal agent, but it enters into the Materia Medica of the Persian and other Indian nations, by whom it is held to be a stimulant, cephalic, and aphrodisiac. It has heen prescribed in adynamic fevers, dyspepsia, and chronic catarrh, in gastric atony, epilepsy. ataxia, hypochondria, spasmodie hiccough, in doses of one, two, or three grains, and as an antiseptic.

A., es'sence of. An alcoholic tineture of ambergris, which is only employed as a perfume. Amberkund. A term used in Bombay to

designate the Eulophia bicolor. (Birdwood.)

Am bert. France; Puy de Dôme; Arrondiss, d'Ambert. Here are four cold springs charged with gas. One of them (Hameau de Rodde) has a temperature of about 11-12° C. (51.8°-53.6° F.). Another contains iron.

Ambet'uway. A plant of Guinea, the leaves of which are given to convalescents to improve the appetite.

Am bi. The same as Ambe.

Am'bia. A yellow liquid petroleum, smelling like tacamahaca, oozing from the soil near the Indian Sea. It is used for the cure of itch,
A. monard. The same as Ambia.
Ambi'cus. (G. Destillerhelm.) An alem-

bie.

Ambidex'ious. ('Αμφί, on both sides; οεξιός, on the right side.) Having two right hands; able to use both hands alike.

Ambidex'ter. (Ambo, both; dexter, the right hand.) Able to use both hands alike; one who uses his left hand as well as his right.

Ambidex trous. (Same etymon.) Having ability to use both hands alike.

Am'bient. (L. ambio, to go around.) A term applied to whatever encompasses other hodies; thus the atmosphere which surrounds all bodies on the earth is called the ambient air.

Ambifa'rius. (G. doppelsinnig, zweideutig.) Doubtful. Am'biga, (L. ambiga, a small pyramidal vessel, from Gr. ἄμβιξ, a cup, the cap of a still.)

An alembie.

(Ambo, hoth; genus, Ambig'enous. race, kind.) A term applied by Mirbel to a multifoliate calyx, of which the outer row of sepals presents the ordinary characters of sepals, and the inner row those of petals, as in Grewia passiflora.

It is also used in the sense of bastard.

Ambiguiflo'rous. (L. ambiguus, doubtful; flos, a flower.) Applied to plauts having flowers with ambiguous corollæ.

Ambi-huldee. (Dec.) The Curcuma

Ambilæ'vus. (L. ambi, hoth; lævus, the left.) Having left hands only; that is,

 $(Ambo; \tilde{\omega}\psi, \text{ the eye.})$ Ambio'pia. A synonym of diplopia.

Ambipa rous. (L. ambo, both; pario, to bring forth.) Applied to a bud that contains the rudiments of both flowers and leaves.

Am'bitus. (L. ambitus, a going round. F. contour; G. umfang, umkreis.) The perimeter of a body or figure.

In Botany, applied to the horder of any organ;

the contour of a surface.

A. genita'lis mulie'bris. (Ambitus, circumference.) The vestibule of the vagina.

Ambje'gua. An odorous vegetable oil, obtained by the Brazilians from a tree that is believed to be the Ambaitinga, a Species of Cv-

Amble. A term applied to that pace of a horse which is characterised by the alternate and exclusive action of two lateral bipeds. In the amble the ear perceives only two heats at each pace, the two limbs on the same side striking the ground at the same instant. The pressure of the body on the ground is said to be lateral.

**Ambleocar'pous.** (' $\Lambda$ μβλόομαι, to he abortive; καρπός, fruit.) Applied to fruits of which the seeds are altogether, or in great part,

abortive.

Ambleteu'se. France; Pas-de-Calais; Arrond. de Boulogne. A sea bathing place, with excellent arrangements for visitors.

Ambli. (Hind.) The Tumarindus in-

Ambli.

Amblig'onal. (Gr. αμβλυγώνιος, obtuse angled.) An epithet for a figure that contains an obtuse angle.

Amblig'onite. The same as Amblygonite. Amblo ma. Abortion.

Amblo'sis. ('Αμβλωσις, an abertion, from ἀμβλόσμαι, to abort.) Another term for ( Αμβλωσις, an abortion, abortion; a misearriage.

Amblos'mus. ('Αμβλωσμός.) Abortion. Amblothrid'ion. (' Αμβλωθρίδιον, an

aborted child.) The product of an abortion. **Amblot'ic.** ('Αμβλωτικ. G. misgeburend.) Of or belonging to amblesis, or abortion; having power to induce abortion.

Amblot'ica. (Same etymon. G. frucht-Medicines which tend to abtreibende mittel.)

produce abortion.

**Amblyaph'ia.** ('Αμβλύς, dulled, dim; ἀφή, the sense of touch.) Diminution, or imperfection of the sense of touch.

Amblyg'onite. ('Αμβλυγώνιος, obtuseangled, from άμβλύς, blunt; γωνία, an angle.) A greenish-white, translucent mineral, occurring in granitic rocks; it is found in oblique rhombic

prisms, and consists of aluminium and lithium phosphate.

Amblyg'onous. ('Αμβλυγώνιος, obtuse

angled.) Having an obtuse angle. **Ambly og mos.** ('Αμβλυγμός, Amblyog'mos. dullsighted, from αμβλώσσω, to be dim-sighted.) An old term used by Hippocrates, the same as Amblyosmos and Amblyopia.

**Amblyo'pia.** (Αμβλυωπία, dim-sightedness, from αμέλύς, dulled; ἄψ, the eye. F. amblyopie; G. Stumpfsichtigkrit, Augenschwache, Generally impaired vision Blodsichtigkseit.) from defective sensibility of the retina; from haziness or cloudiness of the media; from incomplete amaurosis, or the weakness of sight attending certain stages and forms of this disorder, and from errors of refraction.

The causes and forms of amblyopia are for the most part similar to those of amaurosis, though the dimness of vision is less in degree. Amblyopia is, in fact, often premonitory to, or represents,

the early stages of amaurosis.

A., amaurotic. The same as Amblyopia.
A., uræ'mic. The defect of sight which occurs in uramic poisoning.

Amblyo'pia alcohol'ica. Impairment of vision from the toxic influence of alcohol on the optic nerve and central nervous system.

A. asthen'ica. Amblyopia depending on general or local weakness.

A. congesti'va. Amblyopia depending on congestion of some ocular structure.

A. crapulo'sa. (L. crapulosus, drunken.) The same as A. alcoholica.

A. crepuscula'ris. (L. crep twilight.) A synonym of Hemeralopia. (L. crepusculum,

A. dissito'rum. (L. dissitus, distant.)

A synonym of Myopia.

A. ex anop sia. ('A, neg.; ours, eyesight.) Impairment of vision resulting from want of use, as often occurs in an eye affected with strabismus unilateralis.

A. hydrophthal'mica. An old term for enlargement of the eye depending upon increase

of the humours.

A. hyster'ica. Dimness of vision occurring in hysterical patients.

A. lu'minis. A term for hemeralopia. A. meridia'na. (L. meridianus, belonging to mid-day.) A synonym of Nyetalopia.

A. potato'rum. (L. potator, a drinker.) The same as A. alcoholica.

A. proximo'rum. (L. proximus, nearest.) A synonym of Presbyopia.

A. sthen'ica. Amblyopia depending upon over-excitement of nerves.

A. tenebra'rum. A term for nyctalopia. A. tox'ica. Dulness of vision arising from the poisonous influence of certain drugs, as quinine and tobacco.

Amblyos'mos. ('Αμβλυωσμός). Same

as Amblyopia. (Heoper.) **Amblyp terus.** ('Αμβλύς, blunt; πτερύξ, a wing.) A ganoid heterocercal fish of the Millstone Grit and Permian series; hody fusiform, with large obtuse fins.

Amblyrhyn'chus. A Genus of the Family Iguanidæ, Suborder Crassilingues, Order Sauria. A lizard, which is esteemed a very delicate food.

Amblysto'ma. ('Αμβλύς, obtuse; στόμα, the mouth.) The Amphibian termed Siredon.

Amblystom'idæ. (Same etymon.) A Family of the Suborder Salamandrina. Palatine

teeth in two transverse rows; sphenoidal teeth absent.

**Ambolic.** ('Aµ, for  $\dot{a}\nu\dot{a}$ , up;  $\beta\dot{a}\lambda\lambda\omega$ , to throw.) Having the power to produce abortion.

(Aubwe, whatever is elevated on Am bon. a plane.) Applied to the edge or margin of the sockets in which the heads of bones are received. Galen, de U. P. ii. 17.

Am'bor. A term for ambergris.

Ambo'ra. A Genus of the Nat. Order Monimucea.

Also, the Mithradatea of Linnaus. (Crabb.) A. quadrif'ida. This tree is indigenous in the forests of the Mauritius and Madagasear. In the Mauritius the leaves and stems are much used in baths and lotions for cutaneous affections, and a decoetion of them is given internally as a refrigerant and diuretic.

Ambo'reæ. (F. amborées.) A Tribe of the Nat. Ord Monimiaccæ. Authers opening by a longitudinal furrow; seeds inverted; embryo

with the cotyledons often divergent.

Ambos. (Ger. an anvil.) The Incus. Ambotay. (Fr.) The name applied in French Guian to the Anona ambotay, the bitter and aromatic bark of which is used as a remedy in bad pleers.

Ambouton. A plant of Madagascar, probably the Piper betel. It resembles flax, has a slightly bitter and austere taste, and is employed as a masticatory, to blacken the teeth, and render the breath agreeable. (Waring.)

Amboyna. One of the Moluceas or

Spice islands, belonging to the Dutch.

A. cloves. A name given to cloves grown in the Molnecas.

A. ki'no. See Kino, East Indian.

A. pim'ple. A term for a disease which was endemie in the Island of Amboyna. It was described by Bontius in 1718, and is believed to have been syphilis. Its symptoms were uleers of the skin, with indurated and raised edges; pains in the bones and caries.

Am'bra. Arabic for succinum, or amber; also, ambergris, or ambergrease.

Also, a vessel amongst the Saxons, containing

a measure of salt. Am'bra. (Ger.) A term applied by Martius to the agreeably odorous balsam of the Liquidambar styraciflua, now called Copalbalsam.

Also, a term for amber. A. al'ba. (L. albus, white.) A synonym of Cetaeeum.

A. ambrosi'aca. (L. ambrosiacus, ambrosial.) A term for ambergris.

A. arab'ica. A term for ambergris.

(L. cineraceus, ash-A. cinera'ceus. coloured.) A term for ambergris. A. cinerit'ia. (L. cinereus, ash grey.) A

synonym of A. grisea.

A. fla'va. (L. flavus, yellow.) A term for

A. gris'ea. (F. gris, grey.) Ambergris. A. liq'uida. Copalm balsam, from the Liquidambar styraciflua.

A. maritima. (L. maritimus, belonging to the sea.) A synonym of A. grisea.

A. subal'bida. (L. subalbidus, whitish.) A synonym of A. grisea.

Am'bra ambros'ica. Ambergris.

Ambragrisea. Ambergris. Ambram. A term for amber

Am'breine, (G. Amberfett.) C33 U32 O. A peculiar, inodorous, tasteless, non-saponitiable fat, forming 85 per cent. of ambergris, from which it may be extracted by boiling alcohol, which on cooling deposits fine colourless needles of ambreine. It is soluble in alcohol, ether and oils, but insoluble in water, and resembles cholesterin.

Ambrette. (Fr.) The seeds of the Hibiscus abelmoschus. Used as a perfume.

A., graines d'. (Fr.) The seeds of Hibiscus abelmoschus.

Ambri'na. A Genus of the Nat. Order Chenopodiaceæ.

A. ambrosioi'des. This plant has an aromatic, sub-acrid taste, and is regarded in Brazil as a carminative, diaphoretic, and emmenagogue; prescribed in amenorrhœa, and for the expulsion of the dead fœtus.

A. anthelmin'tica. (F. ansérine vermifuge.) Worm-seed; worm goose-foot. Hab. United States. The fruit and its essential oil are a powerful anthelmintie. Dosa, of the powdered fruit, a teaspoonful or more; of the oil, 8 to 10 drops.

A. bo'trys. Possesses an essential oil, which renders it tonic and autispasmodic.

Ambrol'ogy. (Amber; λόγος, a discourse.)

The science of amber, or a treatise on it. **Ambro'sia.** (' $A\mu\beta\rho\sigma\sigma'(\alpha)$ , the food of the gods, from  $\alpha\mu\beta\rho\sigma\sigma'(\sigma)$ , immortal.) The name of a celebrated antidote of the ancients, invented by Zopyrus for King Ptolemy. It consisted of eostus, saffron, einuamon, cassia fistula, pepper, and other aromatics and stimulants.

This term is also applied by Virgil to a plant having odoriferous juice, and of a mythological character, the identification of which it is useless to attempt. The Gr. άμβροσία is closely allied with aμβροτος, and both to the Sanskrit amrta, immortal, from a, neg., and the root Mr, in Latin mori. In Sanskrit, amrtr in the neuter signifies ambrosia, and all objects offered in sacrifice to the gods; amrta in the fem., various plants, such as Phyllanthus, Emblica, Terminalia, and Ocimum, all of which are odoriferous plants. The ambrosia of Dioscorides and of Pliny, which was probably an Artemisia, was applied by the botanists of the middle ages to Ambrosia maritima, which has retained the name. This name is also given to the Ambrina botrys.

Ambrosia. (Same etymon.) A Genus of the Family Ambrosiacea, Nat. Order Composita. Herbaceous plants with deeply cut exstipulate leaves, and monecious flowers, the males forming a spike of capitula, at the base of which are the females. The male florets have a common receptacle, and a common involucre formed by a single row of bracts; ealyx 0; corolla tubular, 5-partite; style rudimentary; female florets regular, ovary unilocular, surmonuted by two flattened styles, the ovule ascending and anatro-pal: embryo without albumen. Hab. North pal; embryo without albumen. America, North Africa, and Tropical Asia.

A. ambrosici'des. The Chenopodium ambrosioides.

A. artemisiæfo'lia. Hab. North Ameriea. It yields an extract that is employed as a febrifuge and anthelmintie.

A. ela'tior. An annual herbaceous plant of North America and the West Indies, growing chiefly in barren, sandy, and rocky localities. is known in Jamaica under the name of Wild Tansy. It has the appearance and taste of wormwood. Barham states that the plant boiled in sesamum oil and wine is serviceable, both externally and internally, in dropsy and abdominal abscesses, and that the root, either boiled in oil or in powder, is a good application to ulcers. It is said also to afford ease to after-pains.

(L. campestris, per-A. campes'tris. taining to a level field.) Swine's cresses and Ruellius' buckshorn.

A. maritima. (L. maritimus, pertaining to the sea.) A plant of Southern Europe, possessing a pleasant odour and bitter taste. It is re-

garded as tonic, stomachic, and anti-pa-modic.

A. trif'ida. (L. trifidus, three-cleft.)

Horse weed, horse mint, rich weed, bitter weed. This plant is common in North America, and has been recommended as a remedy for ptyalism. Dr. Robertson, of Harrodsburg, was led to employ it from observing that it completely cured a horse affected with slabbering. An infusion of the leaves should be employed as a gargle.

A. villosis sima. (L. villosissimus, very hairy.) An Egyptian species. According to Forskal, the vapour of the decoction of this plant

is employed in diseases of the eyes.

Ambrosia'ceæ. (Same etymon.) A family of the Nat. Ord. Compositæ, characterised by the absence of calyx in the male, and of floral envelopes in the female, flowers, and by the ovary being almost always superior.

Ambrosia'ceous. (Same etymon.) Re-

sembling the Ambrosia; having a pleasant dour.

Ambrosie'æ. (Same etymon.) A Subtribe of the Helianthoid compositæ, with heterogamous or unisexual capitula; monœcious; receptacle with subsetous scales between the male florets; female florets apetalous, or with small corolla, tubular; sterile male florets with the limb of the corolla campanulate; anthers contiguous, free, or scarcely coherent, with mucronate and sagittate appendices; style single; achienia naked.

Ambro'sin. A fossil resinous exudation, probably of some coniferons trees of South Georgia. It resembles amber; yields on melting succinic acid, and a fragrant volatile oil. It dissolves freely in oil of turpentine, alcohol, ether, chloroform, and solution of potassium carbonate; in less quantity, but without decomposition, in concentrated mineral acids.

Ambubei'a. A synonym of the Common cichory; and also of the Dandelion.

Ambuj. (Hind.) The Nelumbium speciosum. Ambula cra. (L. ambulacrum, a place for walking.) The perforations in the plates of the ambulacral areas of the Echinodermata,

which give passage to the ambulacral tubes, or tube feet. A. circumscrip'ta. (L. eircumscriptus, bounded.) Applied to that group of Echinoidea

in which the ambulacral areas do not extend from

base to summit. A. perfec'ta. Applied to that group of Echinoidea in which the ambulacral areas extend from base to summit.

Ambula'cral. (Same etymon.) Related to the ambulacra.

A. a'rea. The five double rows of plates alternating with the non-perforated rows in the Echinodermata, which are perforated by minute apertures for the emission of the tube-feet or ambulaeral tubes.

A. os'sicles. (L. ossiculum, a little bone.) The plates which bound the sides and roof of the

ambulaeral groove of Asteroidea.

A. tubes. The prolongations of the radiating branches of the circular canal of Echinodermata,

which are protruded through the ambulacra, and serve for locomotion; they terminate in suctorial dises, and have a lateral dilatation or ampulla at their origin, by the alternate contraction and cilatation of which movement is effected.

A. ves'sels. Water-vascular canals in many of the Echinodermata, which traverse the middle line of the ambulaeral metameses, and unite into a circular canal around the mouth.

A. zone. The same as A. area.

Ambula'criform. (Ambulacra; forma, likeness.) Having the shape or appearance of

Am bulance. (L. ambulo, to walk from place to place. F. ambulance; G. Feldhospital, Feldlazereth; I. ambulanza ospitale ambulante; S. ambulancia militar.) The term ambulance is applied to the surgical staff and arrangements following an army on active service. A part accompanies the combatants to the field of battle, and is charged with the duty of attending to the more serious eases that require immediate assistance during and after the action; whilst a part remains some distance in the rear, and is occupied with the formation of provisional hospitals. The young, strong, and active surgeon should belong to the former, the older and more experienced to the latter division. The ambulance on the field should be placed in a shaded and protected spot, near the combatants. Peasants' houses may be taken possession of, and arrangements made to obtain abundance of clean hay or straw, to admit free ventilation, to secure cleanliness, and to avoid overcrowding.

In the English service the duties are performed by what is termed a bearer company, consisting of I surgeon-major (in command), 3 surgeonsmajor, 4 surgeons, 1 captain of orderlies, 2 lieutenants of orderlies. 1 transport officer. To these are added 36 non-commissioned officers from the Army Service Corps, the number of the latter being increased to 163 from the Militia Reserve on taking the field, making a total of 210. One bearer company is attached to each of the infantry divisions of the army corps, and one to the corps troops, including the eavalry brigade, making a total in all of 4 bearer companies for service with the army corps. The "surgery waggons" are provided with all requisites, and remain at the "dressing station." A proportion of the wheeled transport is reserve transport, and consists of 23 ambulance waggons, known as waggons of the second line.

The "bearers" go through a course of instruction, and are fitted to be dressers. The whole company is drilled in "stretcher" exercise, in loading and unloading ambulance waggons, in improvised methods of removing the wounded, in exercises with mountain equipment, such as cacolets or panniers, litters, country and railway waggons for the transport of wounded.

In France the ambulance staff for a division of infantry of about 10,000 men consists of-

1 Surgeon-major of the first class. 2 Surgeons-major of the second class.

4 Assistant surgeons.

1 Pharmaeien-major of the second class. 1 Assistant pharmacien.

The administrative staff consists of-1 Officier d'administration comptable.

I Adjutant en premier. 2 Adjutants en second.

3 Infirmiers-majors (head nurses).

17 Infirmiers ordinaires.

The materials required by this staff are carried by five waggons. Each waggon is divided into compartments variously arranged, containing 163 kilogrammes (=358 lbs.) of linen for dressing, thus divided:—18 sheets, 300 roll bandages, (spica), 1260 ordinary bandages, 36 bandages, 16 squared body-bandages, 10 'f-bandages, 16 triangular body-bandages, 105 ceharpes, 10 suspensory bandages, 10 fracture bandages for the thigh (prepare avec attell s), 18 cushions, 10 sacs, 114 kilogrammes (250 lbs.) of linen in small quantity for dressing, as 3000 compresses, 100 fenestrated compresses, &c., 120 kilogrammes of

charpie.

No. 20 box, or compartment for instruments, contains 21 medicine bottles, 2 delf pots, 24 sounds, 2 œsophageal sounds, a spatula, a pair of scales and weights, 10 corks, an amputation and trephine case, a box of knives, a box containing 2 lbs. of gum arabie, 2 lbs. of sugar, 2 lbs. of yellow wax and 2 lbs. of waxed cloth, 30 gum elastic bougies and 30 wax bougies, 5 quires of paper, 3 penknives, 6 pencils, 2 lbs. of soap, 8 surgical aprons, 6 nurses' aprons, 14 napkins, 8 dusthorns, 3 inkhorns, 2 candlesticks, 1 lantern, a box of matches, 15 needles in a case, 2 oz. of sewing thread, 1 lb. of cotton wool, 3 surgical boxes with bands, compresses, charpie, ligatures, sponges, &c. Tho waggon also contains 3 wheelbarrows, 3 coverlets, and still some things are omitted, as a reflector, a sbade for candles to prevent them being extinguished, &c.

When ambulance waggons cannot travel, the boxes are placed in canteens carried on the

backs of mules.

American ambulances are of three kinds-fonrwheeled, two-wheeled, and those adapted for pack-saddles. Arnold suspends his cot upon pivots, which enable it to swing in accordance with the inclination of the ground, so as to avoid rolling in the patient. The pivots rest on springs. M'Kean's carriage has stretchers which run in longitudinally upon rollers resting upon a false bottom suspended by rubber springs from the sides of the carriage. A water vessel with flexible pipe is under the control of the patient; a fan is suspended from the roof. In Moss's plan the sectional folding seats are arranged along the sides, and may be converted into Hammocks form an upper tier for couches. patients; an adjustable door serves for a table. Medicines and instruments are carried in cases which fit in and under the seats. The water keg is suspended beneath the rear. Rucker, Allan, and Smith's ambulance has a double or single tier. Each couch of the lower tier is divided longitudinally and hinged. It may lie flat on the floor, while the upper tier is occupied by other patients, or it may be bent so as to form a scat. The twowheeled ambulances are spring carts, with provision for recumbent or sitting patients.

A. volan'te. (Fr.) The tlying ambulance. This consists of two surgeons, a controlling officer,

and two nurses.

Am'bulans. (L. ambulo, to walk.) Walking. Applied to diseases that shift from one part to another, as Erysipelas ambulans, erratic crysipelas, &c.

Ambula'tion. (L. ambulatio, a walk.)
The act of walking.

Ambulati'va. (I. ambulo, to walk.) A term formerly applied to the more rapidly spreading forms of herpes.

Ambulato'res. (L. ambulaton, one who walks about.) A synonym of Passeres.

Ambulato'ria. (L. ambulatorius, movable, changeable.) A term applied to the class of animals now called Dasyuridæ.

Ambulatory. (Same etymon.) Effecting locomotion by, or formed for, walking.

Also, applied in the same way as ambulans.

Ambulei'a. A name of the chicory, Cichorium intybus, Probably erroneous orthography for Ambubeia.

Ambuli. An Indian aquatic herb of the Nat. Order Primulaceæ. Aromatic, hitter, tonic,

and febrifuge.

Ambulia. A Genus of the Nat. Order Scrophulariaece, constituted by a single plant, the A. aromatica of Malabar, named Manganari by the Indians. All the parts of the plant bave a slightly bitter taste, and an agrecable aromatic odour resembling that of pepper. It is employed in fever.

**Ambulipe'des.** (L. ambulo, to walk; pes, a foot.) A Family of carnivorous mammals, according to Blainville, who walk on the feet.

Am'bulo. (L. a'mbulo, to walk.) Old name for a disease, otherwise called Flatulentus, Flatus furiosus, and Vareni, consisting in a painful periodical inflation, arising in various parts of the body.

Ambulo flatulen'tus et furio'sus. A term signifying the same as Ambulo.

Ambus'ta (I ambus'um that which is

Ambus'ta. (L. ambustum, that which is burnt; from amburo, to burn.) Term applied to blisters caused by burns or scalds.

Ambus'tial. (L. ambustio, a burn.)
Produced by, or being in connection with, a burn.

Ambus'tio. (L. ambustio, from amburo, to burn; G. Brandschaden.) A burn or scald on any part of the body; a lesion of the body caused by the application of heat; ambustion.

A. bullo'sa. (L. bulla, a bubble.) Term applied to a burn sufficiently severe to raise a blister.
A. erythemato'sa. Erythematous burning; simple reduces following a burn.

A. escharotica. (L. escharoticus, producing a scar.) A burn producing destruction of the cutaneous tissues.

**A.** gangræno'sa. ( $\Gamma \tilde{a} \gamma \gamma \rho a v a$ , a gangrene). A burn sufficiently severe to destroy the life of the skin.

A. vesiculo'sa. (L. vesiculosus, full of bladders.) A burn or seald producing a blister.

Ambus'tum. (L. ambustum, that which is burnt.) A burn.

A. ex frigo're. (L. frigus, cold. G. Frostschaden.) A term for frostbite.

Ambuti. (Hind. Dec.) The Oxalis cor-

niculata.
Ambu'tua. The Pareira brava.

Ambuya-Embo. A plant of the Nat. Order Aristolochiaeeæ, a Brazilian shrub, used in decoctions by the natives as decohstruent.

Amduri. (Sansk.) The Boswellia thurifera.

Amea. A plant of Guinea which, dried and reduced to powder, is taken as snuff to arrest hæmorrhage from the nose.

Ameda'na. The Ahnus communis. Amei-nerunshil. (Tam.) The Pedalium murex.

Ameisensäure. (Ger.) Formic acid. Amei'vidæ. A Family of the Suborder Fissilingues, Order Sauria, or a Family of the Suborder Cyclosaura, Order Sauria. American lizards with strong, obliquely directed tecth; no palatine

teeth; head covered with plates, the back with rhomboid scales, the abdomen with transverse rows of square plates; two transverse neck folds; tail long and cylindrical or compressed.

Amel corn. French rice, from which

starch is made.

Amelan'chier. A Genus of the Suborder Pomeæ, Nat. Order Rosaceæ. The Shad- or Service-berry. A small tree or bush, with alternate simple leaves, characterised by its gynoecium, the ovary of which contains 2-5 biovulated compartments, subdivided into uniovulated compartments by false dissepiments. The fruit of this plant, which is a small berry with 4-10 seeds, is used in Rupert's Land for mixing with pemmican.

Amelanchier. A synonym of the Chionanthus virginica; also of the Mespilus

amelanehia.

Amelectic. ('Αμελής, indifferent.) Careless.

Amelei'a. ('Αμέλεια, indifference.) The

condition of apathy.

Ameli. A Malabar shrub, genus not ascertained, a decoction of the leaves of which is used against colic, and its roots boiled in oil for the

dispersion of tumours.

Ame'lia. ('A, neg.; μέλος, a limb.) A form of arrested development in which the limbs are entirely absent. In such cases it is impossible to determine whether the condition arises from primitive deficiency of the limb or from subse-

quent arrest followed by atrophy.

Amelie-les-Bains. France; Department Pyrénées Orientales; Arrondiss. de Ceret; formerly known as Bains d'Arles; about eighteen miles from Perpignao. Prettily situated at the foot of a hill at an altitude of 278 mètres, or about 900 feet. The waters are alkaline and sulphuretted, with a temp. of 20-61° C. (68° to 142° F.) There are three establishments here, two due to private enterprise, and one built hy government on a large scale for the military. There are above twenty springs. The favorable climatic conditions—dry and protected from the north winds-of Amélie-les-Bains in winter make it a favourite resort at that season, and it is much recommended for those suffering from cutaneous affections, catarrh, rheumatism, and the early stages of phthisis.

Amella. Same as Spilanthes acmella. Amel'liki. The native name in Guinea of a shrub, the leaves of which, either alone or conjoined with grana paradisa, enjoy a great reputation as a cure for diarrhœa. (Waring.)

Amel'lus. A plant named by Virgil, regarded by some commentators as the Aster amellus, Lin., one of the Compositæ; by others, with more probability, as the Galatella punctata, which is still called amello in Italy.

Also, a Genus of African Compositæ, Tribe Asteroidiæ, characterised by having a short pappus.

A. umbella'tus. Woundwort. A native

of Jamsica. Its taste is sourish, and it is used as a vulnerary.

Amelpodi. An Indian tree, used as an alexipharmic.

Ame'lus. The same as Amelia.

Anienda'nus. An old term for the elder tree, Sambucus nigra.

Amene. (Arab.) Sodic chloride, or common salt. (Ruland.)

Ame'nia. (A, neg.; μήν, a month.) Λ synonym of Amenorrhæa.

Amenoma'nia. (L. amoenus, agrecable ;

Gr. µavia, madness. F. aminomanie; G. lustiger wahnsinn.) A term employed by Rush to indicate gay partial insanity, the monomania proper of Esquirol. It ordinarily manifests itself under the form of a tranquil mania, the patient being infatuated with his beauty, his grace, his mind, his dress, talents, titles, and birth. This class of patients seize on the cheerful side of everything. They are happy, joyous, and communicative. They are susceptible and irritable, their impressions are vivid, their affections energetic, their determinations violent; disliking opposition and restraint, they easily become angry and even furious.

Amenorrhœ'a. ('Λ, priv.; μήν, a month; ρέω, I tlow. L. menstruorum defectus, privatio, or suppressio; F. amenorrhée; I. and S. amenorrea; G. amenorrhoe, verzogerte Menstruation.) The absence, irregularity, or suppression of the menstrual discharge during some part of the period of life in which it is naturally present, thus including both Emansio mensium and Suppressio mensium.

The occurrence of amenorrhoa is referable either to imperfect formation of the secretion, or to some defect or vice of conformation preventing

its discharge.

Imperfect or suppressed formation of the secretion may result from exposure to wet and cold during menstruation, may proceed from constitutional conditions, as general debility, inautiou, anæmia, consequent on syphilis, scrofula, phthisis, cirrhosis, Bright's disease, or other wasting disease; or it may be sympathetic and dependent on disease of some distant organ, or be due to some psychical cause, as mental distress, or it may be caused by indolent and luxurious habits of life, or confinement in a close atmosphere, or by overexertion; and the discharge is commonly, though not always, suppressed in pregnancy.

Retention of the secretion when formed results from congenital or acquired disease of the sexual organs, as from absence of the ovaries, uterus, or vagina; or from occlusion of the passages, as in cases of imperforate hymen; or from contraction of the cervix, the presence of tumours, or other

disease.

Amenorrhea frequently leads to other maladies, as dyspepsia, neuralgia, hysteria, hæmorrhages from other organs, and chlorosis.

The treatment must depend on the cause, and in cases of debility, however produced, merges into that appropriate for anomia, whilst organic changes sometimes demand operative proceedings. Where it has come on suddenly in an otherwise healthy woman, hot hip-baths, leeches to the vulva, and aloetic purges may be prescribed.

A., acciden'tal. A term used in the same sense as A. secondary.

A., prim'itive. A term given to those cases of amenorrhoea in which there has never been any menstrual secretion. It is usually accompanied by the condition called chlorosis, with pale, yellowish skin, deficiency in number of red blood-corpuscles, short breath, bad or unnatural appetite, pain in left side of the chest, edematous feet, anæmic, cardiac, and jugular murmurs, leucorrhea, and often erythema nodosum. Occasionally this form of ameuorrhea is a result of plethora, and it may be caused by imperfect development of the ovaries or uterus, or from closure of the genital passages. When plethora is present, local bloodletting, purgatives, and exercise are advised. In chlorotic cases iron in some form, preceded by salines and aperients, is

the chief remedy; potassium has been much extolled, the liquor ammoniæ acetatis, saffron, Indian hemp, galvanism, strychnia, savin, ergot, apiol, aloctic purgatives, are also used in fitting cases. Great attention is to be paid to general hygiene and to the digestion; good nutritive food and beer or wine, especially a red wine, is to be given; and exercise in the open air and early hours are to be enjoined. When there is pain or heat in the back or pelvis, the occurrence of the discharge may be promoted by hip or foot haths of hot water, with or without mustard; or warm vaginal injections may be used; or two or three leeches may be applied to the anus or the groins. Galvanic pessaries have been used, the interior of the uterus has been dry-eupped, and it has been advised to pass the nterine sound every day for three or four days before the day on which the discharge should be expected. The physical conditions, as imperforate hymen, are themselves to be treated.

A., sec'ondary. A term applied to those cases of amenorrhea in which the discharge, having once existed, has become, from some cause or other, arrested. The remarks on treatment in

the other sections apply here.

Amenorrhœ'a destillato'ria. (L. destillo, to drip down. F. aménorrhée distillante.) A term applied to those cases of retention of menstrual discharge within the uterine cavity, in which there is a continual drop-by-drop escape.

A. difficilis. (L. difficilis, difficult.) A

synonym of Dysmenorrhæa.

A. emansio'nis. (L. emansio, a remaining absent beyond one's furlough.) The nonappearance of the menses at the usual age.

A. hymen'ica. Amenorrhæa depending

upon an imperforate hymen.

A. partia'lis. Partial amenorrhea; a synonym of Dysmenorrhæa.

A. suppressionis. (L. suppressio, a keeping back.) Suppression or absence of the menses subsequent to their first appearance.

Amenorrhœ'al insan'ity. Insanity often attended with homicidal impulse, occurring

at each menstrual period.

Amen'ta lu'puli. A synonym of Strobili humuli, Helv. Ph.; the dried strobiles of the

hop, Humulus lupulus.

A. u'væ marit'imæ. Under this name the flowers and branches of some Species of Ephedra, to which a styptic property was attri-

buted, were formerly sold.

Amenta'ceæ. (L. amentum, a thong; G. Katzehentrager.) A Group of dicotyledonous plan's, under which were formerly ranged Fotbergilla, Ulnus and Cellis, Salix and Populus, Myrica, Betula and Alnus, Carpinus, Fagus, Castanea, Querens, and Corylus, Liquidambar and the Plane; all characterised in common by having diclinous flowers arranged in catkins, achlamydeous or dichlamydeous; ovary onecelled, superior; seeds numerous, almost or quite exalbuminons. These Families are, however, now generally distributed under other groups.

By some botanists it is retained as an Order, including the Families Platanea, Salicinea, Juglandea, Cupulifera, Curpinea, Betulinea,

Myricacea, and Casuarinea

Amenta/ceous. (Same etymon. G. katzekenartig.) Catkin-bearing plants.

Amentales. (Same etymon.) In Lindley's classification, an alliance of Dictinous Exogens, having the flowers in catkins, achlamydeous or monochlamydeous; carpels superior; embryo small, with little or no albumen

Amen'tia. (L. a, neg; mens, the mind. G. Unverstand, Wahnssiere.) A term employed both by Vogel and by Crichton. Vogel included it with mania and melancholia in his class of Paranoiac. In Crichton's classification, Amentia included Fatuitas memoria imminuta, Perceptio imminuta, Vis idearum associandi imminuta, Vis-fingendi imminuta, and Vis judicandi imminuta.

A. acqui'sita. (L. acquisitus, acquired.)

Imbecility from accident.

A. congen'ita. (L. ingenitus, inborn, participle of ingeno, or ingigno, to instil by nature.) A synonym of Idiocy.

A. occul'ta. (L. occultus, hidden.) An old term applied to describe those cases of insanity in which the motive for the injury of a person has been present, but never expressed.

A. seni'lis. (L. senilis, belonging to old age.) The deficiency of intellect of the aged.

Amentif'eræ. (L. amentum, a thong; fero, to bear.) A name of an Order, according to some, which includes the Families Plataneac and Salicinea.

Amentif'erous. (Same etymon.) A term applied to plants whose inflorescence is an

amentum or catkin.

Amen'tum. (L. amentum, a leathern thong attached to the middle of a spear to help in (L. amentum, a leathern throwing it. F. chaton; G. Katzchen Bluthenkatzchen.) In Botany, a catkin; a spike, composed of sessile unisexual dowers, in which the perianth is replaced by simple scales, as in the nnt. Amenta, at least when composed of male flowers, are articulated at their bases, and fall off entire.

A. attenua'tum. (L. attenuatus, from attenuo, to make thin.) Term applied to an amentum which grows thinner towards the point.

A. cylin'dricum. (L. cylindrus, a cylinder.) An amentum that is equally thick above and below.

A. grac'ile. (L. gracilis, slender.) An amentum that is slender in proportion to its

A. ova'tum. (L. oratus, egg-shaped.) An amentum that is thick below and round above. Amer. (Fr.) Bitter.

A. au max'imum. (Fr.) A synonym of Pierie acid.

A. cinchonique. (Fr.) A bitter acid substance obtained by Schwartz from ordinary einchona bark. It is gummy, yellow, slightly soluble in water and ether, very soluble in alcohol and in alkalies. It appears to be a glycoside, and identical with chinovine.

A. d'absin'the. A synonym of Absinthin. A. d'eryth'rine. (Fr.) A synonym of A macrythrine

A. d'in'digo. (Fr.) A synonym of Picric

A. de bœuf. (Fr.) Ox gall.

A. de chino'va. (Fr.) A synonym of A. cinchonique.

A. de rhu'barbe. A synonym of Rhabarbarin.

A. de Scil'le. (Fr.) A synonym of Scillitin.

A. de Séné. (Fr.) A synonym of Ca-

A. de Wel'tre. (Fr.) A synonym of Picric acid.

A. des Al'lemands. (Fr.) Ratafia. Gentian 15, orangette 15, coriander 14, canella 4, calimus 4, inula 2 grammes. Reduce all to coarse powder, macerate for 8 days in 2 litres of hellands, and add 90 parts of sugar.

A. des Hol'landais. (Fr.) A synonym of A. des Allemands.

A. du ro'ti. A synonym of Assamare.

A. quinovi'que. (Fr.) A synonym of Amer einehonique.

(Arab.) Old name for indige. Ameri.

(Quincy.) Amer'ican alcorno'que. A kind of bark imported for tanning purposes from America, and said to be the produce of Byrsonima laurifolia, B. rhopalæfolia, and B. coccolobafolia;
plants belonging to the Malpighiacea.
A. aga've. The Ayare americana.
A. al'oe. The Agare americana.

A. as'pen. The Populus tremuloides.

A. balm of Gil'ead. A kind of balsam produced by the Icica heterophylla, one of the Amyridacea, or, according to Birdwood, by the Iciva earana.

A. bal'sam. See Balsamum peruvianum.
A. beech. The Fugus ferruginea.
A. calum'ba. False calumba. The root

of the Frasera carolinensis, or Walteri, a Gentianaceous plant.

A. cen'taury. The Sabbatia angularis, Nat. Ord. Gentianaceæ. The herb and root are employed in the U.S. for their tonic and febrifugal properties. See Sabbatia.

A. chi'na-root. The rhizomes of the

Smilax lancifolia.

A. col'ocynth. The fruit of the Luffa purgans and Luffa drastica.

A. colom'bo. The root of Frasera carolinensis, or F. Walteri.

A. cress. The Barbarea precox.

The Diospyros virginiana. A. date plum. The Diospyros virgina. dittany. The Cunila mariana.

A. earth-nut. The Arachis hypogea.
A. gen'tian. The root of the Frasera Walteri sliced longitudinally so as to imitate

A. gum'mi gut'tæ. The produce of the Vismia guaianensis of Mexico and Surinam. (Birdwood.)

A. hel'lebore. The Veratrum viride.

A. hemp. The Cannabis sativa, grown in America, and used to prepare an extract, which is employed instead of that of the Indian hemp.

A. hol'ly. The Ilex opaca. A. ipecacuan'ha. The root of Euphorbia ipecacuanha, which is used as an emetic.

A. i'vy. The Virginia creeper, Ampelopsis

quinquefolia.

A. net'tle tree. The Celtis occidentalis. A. pennyroy'al. The Hedeoma pule-

A. pop'lar. The tulip tree, Liriodendron tulipifera.

A. san'icle. The Heuchera americana. A. sarsaparil'la. The roots of Aralia

nudicaulis, which is used as an alterative and stimulant diaphoretic in theumatic affections. A. sen'na. Common name for the Cassia

marilandica, in the United States.

A. sil'ver fir. The Abies balsamea.

A. spike'nard. The Aralia racemosa.
A. tube-well. A pointed iron pipe in lengths, the lower part perforated, which is driven iuto the ground; when the water, which passes through the holes, is drawn up by a pump.

A. tur pentine. The product in part of

the Pinus palustris, and in part of the Pinus taeda.

A. wa'ter hem'lock. The Civuta mavulata.

Americans. The original inhabitants of North and South America are, by most authorities, considered to be alike, and to have no characteristics separating them essentially from the Asiatic Mongols. The hair is long, glossy, black, stiff, and cylindrical in section; the eyebrows and eyelashes are thick, but the beard and the hair of the body is seanty or absent. The colour of the skin varies from a darkish European complexion to an olive brown or a copper red. The eyes are small and sunken; the eyelids are sometimes oblique, sometimes horizontal. The nose is frequently large, prominent, and it may be aquiline; the nostrils are dilated. The malar bours are prominent, and the jaws are heavy and often projecting. The skull is probably merocephalic or brachycephalic. They are divisible into the bunting tribes of the North, the hunting tribes of the South, and the civilised races, as the Mexicans.

America'num tubero'sum. Jerusalem artichoke, Helianthus tuberosum. Also, the potato, Solanum tuberosum.

**Ameristoneu'ra.** ('A, neg., μεριστός, divided; νεῦρον, a nerve.) Ferns, the nervures of which do not undergo division.

A'mes. ("Aμης.) A sort of cake made with milk.

Amesbury. An English surgeon.

A.'s appara'tus for frac'ture. general principle of Amesbury's apparatus for fractures of the lower limb is to make one part of the limb form a point of resistance, from whence extension can be made and kept up at the opposite end without other aid than the machine itself; this being accomplished so as to bring the fractured ends of the boue into proper place, the splints attached to the apparatus are adjusted to the limb, and having been properly fastened there is little chance of displacement. In the apparatus for the upper limb the weight of the arm principally keeps up the extension, but the immobility of the fractured ends is especially provided for by an angular splint applied in front of both upper and forearm.

A.'s appara'tus for frac'tured clav'icle. This is a modification of Earle's apparatus.

Ametab'ola. ('A, neg.; μεταβάλλω, to change.) Term applied to those insects which do not undergo any metamorphosis in the course of their development, and which do not, when mature, possess wings

Ametabol'ic. (Same etymon.) undergoing metabolism or metamorphosis.

Ametallous. ('A, neg.; μεταλλον, a metal.) Non-metallic; a term given to such of the elements as are believed to be not of a metallic character, as oxygen.

Am'ethyst. ('Αμ'θυστος, not drunken; from ά, neg.; μεθύω, to be drunk; because it was supposed to enable to resist intoxication; or hecause its colour approaches that of wine.) well-known beautiful transparent gem, of a rich purple or violet colour, or sometimes without any colour at all. It is quartz tinted with exides of manganese and iron. It was worn as an amulet to counteract the effects of wine, and was also held to be useful in diarrheen.

A., orien'tal. A violet-coloured form of native hydrate of alumina.

**Amethys'ta.** (' $\Lambda \mu i \theta \nu \sigma \tau \sigma s$ , not drunken, from  $\dot{a}$ , neg.;  $\mu \epsilon \theta \dot{\nu} \omega$ , to be drunken with wine.)  $\Lambda$ term for remedies against drunkenness.

A. phar maca. (Φάρμακον, a drug.)

Remedies against drunkenness.

amethystinus; Amethys'tine. (L. G. amethystroth.) Term applied to flowers and fruits of a violet colour tending to blue, like the amethyst.

Amethys'tine. (Fr.) A violet colouring-matter obtained by M. Baudrimont from the

action of sulphuric acid on eacotheline.

Amethys'tus. ('Λμέθυστος, notdrunken; from a, neg.; μεθύω, to be drunk.) A remedy against drunkenness. Certain medicines, used for the purpose of correcting the effects of excess of wine, were termed Amethysta medicamenta.

Also, the gem amethyst.

Also, the name of a now unknown plant.

Ameth'ysum. ('Αμέθυσον.) A remedy for drunkenness.

Ame'tra. ('Λ, neg.; μήτρα, the womb.) The state of a woman without a womb.

Ame'tria. A synonym of Ametra.

Amet'ria. ('A, neg.; μέτρον, a measure; . Unmassigkeit, Masslosigkeit, Ucbermass.) Excess, intemperance.

Ame'trohæ'mia. ('A, neg.; μήτρα, the womh; alua, blood.) Defective supply of blood to the uterus.

Also, a synonym of Amenorrhæa.

Ametro'pia. ('A, neg.; μέτρον, measure;  $\tilde{\omega}\psi$ , the eye.) An abnormal condition of the refraction of the eye. The state in which, when the eye is at rest, or, in other words, no accommodation is exercised, parallel rays are not brought to a focus upon the retina, but either in front of or behind it. When a healthy eye is at rest parallel rays of light, or those proceeding from a remote object, are brought to a focus on the retina. If, by reason of the prolongation of the antero-posterior axis of the eye, parallel rays are brought to a focus in front of the retina, myopia is said to exist. If by reason of the shortness of the antero-posterior axis, they are brought to a focus behind the plane of the retina, hypermetropia is present; or if this last condition be due to the flattening and deficient refractive power of the lens consequent on advancing age, preshyopia exists. Lastly, if the curvature of the cornea differ in different diameters, so that no focus exists for parallel rays, astigmatism is

Ame'trous. ('A, neg.; μήτρα, the womb.)

Having no uterus.

A mez'za a'ria. Italian for the notes which keep the middle compass of the voice.

Amfrac'tus. (Lat.) Synonym of Anfractus. A convolution.

Am-haldi. The Hindu name for the Curcuma amada.

Amhersti'eæ. A Tribe of the Suborder Cæsatpıneæ, Nat. Ord. Leguminosæ.

Ami'adæ. A Group of the Order Ganoidci. Osseous fishes having large, round, enamelled seales; hranchiostegous rays ossified; tail heterocereal. It contains only one living Family, of which there is only one species, the Amia calva of American waters.

Amianta ceous. (F. amiantacé.) Pertaining to the Amianthus.

Am'iante. (Fr.) Asbestos.

Amianthiform. (Amianthus, asbestos;

forma, resemblance.) Feathery and silky, like asbestos.

Amian'thinopsy. ('Λ, neg.; lάνθινος violet; όψις, eyesight.) Inability to distinguish violet-coloured rays of light.

Amian'thium. A Genus of the Nat. Ord. Melanthacea.

Amian'thus. ('Λμίαντος, undefiled, pure; from ά, neg.; μαίνω, to defile; because not destroyed by fire, or because its silvery appearance is not easily soiled. F. amianthe, G. Bergflachs.) Asbestos, especially that form of it which occurs in delicate and regular fibres.

Amian'thus muscætox'icum. Fly poison; fall-poison. Hah. North America. It is a narcotic poison, and is employed for de-stroying flies, for which purpose the bulbs are trituated with molasses; the flies thus secured require to be killed, or they revive. Its foliage is said to prove fatal to eattle in the autumn.

Amiantoi'des. (Amianthus.) Resem-

bling Amianthus: amiantoid.

Also, in Chemistry, applied to arseniate of copper, the filamentous crystals of which are disposed in tufts,

Ami'ba. A synonym of Amæba.

Amici, J. B. An Italian botanist and physician, born at Modena in 1784, died 1863. He constructed the first achromatic microscope.

A.'s cam'era lu'cida. An instrument which serves to take an accurate outline of an object. It consists of a rectangular glass prism, having one of its perpendicular faces touching at right angles an inclined glass plate, and the other presented to the object to be drawn. The rays proceeding from the object are reflected from the base, deflected as they pass out to the glass plate, and are seen by the eye, placed over the plate, as if on a piece of paper, underneath, where the outline may be marked by means of a pencil.

A.'s prism. A prism with its base plane and the two other surfaces convex; used in the microscope as a reflector and condenser, producing oblique illumination. It has toree adjustments, one on a horizontal axis, to direct the rays upwards at the required angle, one for distance from the axis of the microscope, to vary the obliquity, and one by rotation on a vertical axis, to determine the direction whence the rays shall proceed. Amici'num. (Lat., the neck of a wine

sac.) The aperture or mouth of a tube. Amicto'rium. (G. Umschlagtuch, Gewand.) A mantle.

Amic'ulum. (Amicio, to wrap, or cover.)
A little cloak or short garment.

An old name for the amnion in animals, and for the membrane which covers the germ-sac in plants.

It also signified a covering for the pubes, used by those who exercised in the gymnasium.

Ami'cus cu'riæ. (Amicus, a friend; curia, a court.) A friend of the court; one who, as a stander by, when a judge is doubtful or mistaken in a matter of law, may inform the court. (Crabb.)

Amidace tic acid. A synonym of Glucacin.

Am'ide phe'nique. (Fr.) A synonym of Antlin.

Am'ides. A series of compounds derived from ammonium salts by abstraction of water; or from acids by substitution of amidogen, NH2, for hydroxyl, OH; or from one or more molecules of ammonia by substitution of acid-radicles for hydrogen. They are divided into monamides, diamides, and triamides, each of which groups is further subdivided into primary, secondary, and tertiary amides, according as one third, two thirds, or the whole of the hydrogen is replaced by acid radicles. Most of the nitrogenous animal bases are amides.

Amidi'de d'hydrogene.

synonym of Liquor ammoniæ.

Am'idin. (F. amidon, starch.) The soluble matter in the interior of each grain of starch.

Also, a term applied to starch in a state of solution, or rendered gelatinous by the imbibition of water, or altered by heat so as to become a transparent mass, like horn.

Amidi'nus. A name given by Chevreul to the smooth tegument forming the exterior part

of each grain of amylum.

Amidoben'zenes. Compounds in which the hydrogen of hydrocarbons, analogous to benzine, is replaced by amidogen, NII2. Anilin is the best known member of this group.

Amidoben'zine. A synonym of Anilin. A. ben'zol. A synonym of Anilin.

A. capro'ic ac'id. A synonym of Leucin. A. chlo'rure de mer'cure. (Fr.) A synonym of White precipitate.

A. lac'tic ac'id. See Lactamidic acid, also, a synonym of Serin.

A. propion'ic ac'id. A synonym of Lactamidic acid.

A. sulphethyl'ic ac'id. A synonym of Taurin.

A. tol'uine. A synonym of Toluidene. Amidoe'thane. A synonym of Ethyla-

Amid'ogen. NII2. A hypothetical body, according to Kane, occurring in white precipi-

Amidol'ica. (F. amidolique.) Term by Beral for combinations of starch, or some other fecula, to form paste and gum.

Amidome'thane. A synonym of Methylamin.

Am'idon. (Fr.) Starch. A. azoti'que. (Fr.) A synonym of Pyroxam.

A. gril'lée. (Fr.) Dextrin.
A. nitri'que. A synonym of Pyroxam.

A. tung state. (Fr.) A combination of starch with tungstate of soda and steatite; employed in starching linen and cotton to render the tissue uninflammable.

(Fr.) The Arum Amidon'nière. maculatum.

Amidopar'affins.  $\mathbf{A}$ synonym of Amines.

Amidophe nols. A synonym of Anilin. Compounds obtained by the action of reducing agents on the nitro-

phenols.

Amid'ulin. Soluble starch. To prepare it, starch is treated with water and sulphuric acid, as in the preparation of dextrine; the heat is stopped at the moment that all the starch is dissolved; the acid is saturated with chalk, and filtered whilst hot; as the liquid cools amidulin is slowly deposited in white floceuli. When dried this substance resembles sago, dissolves completely in hot water, and is coloured red by iodine.

Am'idum. A synonym of Amylum. Also, a synonym of Amidogen.

Amim'ia. ('A, neg.; μῖμος, an imitator,

nn actor. F. amimie.) Loss of the power of pantomimic expression. It results from cerebral lesion.

Aminæ'um vi'num. (Aminea, or Aminwa; a region of Italy, which produced the richest wines.) Aminean wine, a highly valued wine of the ancients.

• ace'tum. Vinegar of Aminean wine,

or very strong vinegar.

Aminæ us. (Aminæa, a country of Italy, famous for the redness of its wines.) Of or belonging to Aminea.

Am'ines. A series of compounds which may be derived from hydrocarbons by substitution of the univalent radicle amidogen, NH<sub>2</sub>, for an equivalent quantity of hydrogen, or from the alcohols by similar substitution of NH<sub>2</sub> for OH. They are called monamines, diamines, triamines, &c., according to the number of amidogen groups thus introduced. The amines are basic compounds, capable of uniting with acids and forming salts, which hear a close resemblance to the salts of ammonia. In the free state they are also very much like ammonia, being volatile bodies, having a more or less ammoniacal odour and alkaline reaction. They may in fact he regarded as derivatives of ammonia, formed by substitution of alcohol radicles, univalent or multivalent, for an equivalent quantity of hydrogen, in a single, double, or triple molecule of ammonia. The lower members of the group are gases, the higher oily liquids

Aminœ'a. The gum animé.
Amisa'du. (Ar.) Prepared sal ammoniac.
Amizadir. (Ar.) A synonym of Ammonium chloride.

Amkuda. (Tel.) The Wrightia tinc-

Amla. (Beng.) The Phyllanthus emblica. Amlaki. (Hind.) The Phyllanthus em-

Amla-lonika. (Sansk.) The Oxalis cormeulata.

Amlee. (Beng.) The Tamarindus indica.
Amluj. (Arab.) The Phyllanthus emblica.
Am ma. ("Αμμα, a knot, a band.) Hence,
more correctly, Hamma, a band, or a truss.
Ammani'eæ. A Tribe of the Family
Lythracea, characterised by having a mem-

branous calyx, without ribs or striæ, small inconspicuous flowers; petals plain or absent. They are either aquatic or of small size.

Amman'nia. A Genus of the Nat. Ord. Lythracea. Calyx campanulate, with a double row of teeth; petals absent; stamens four.

A.vesicato'ria. (Beng. Bunmurich; Hind. Daderbootee, Dad-mári; Duk. Agui-búti; Tam. Kallurivi, Miumel-neruppa; Tel. Aquivender-paker; Mal. Kallar vauchi.) An herbaceous Indian plant with a strong muriatic odour. Stem erect, branched; leaves sessile, opposite, lanceolate, tapering to the base; flowers small, almost sessile, in close whorls, red. The leaves are extremely acrid, and when bruised and applied to the skin raise a blister; but they produce great pain, and act very slowly. The leaves are also applied in herpetic eruptions, and the jnice has been applied externally in obstinate splenic disease; the pain it causes is said to he agonising.

Ammapteno dytes. ('Auμos, sand;  $\dot{a}\pi\tau\dot{\eta}\nu$ , not winged;  $\dot{c}\dot{v}\omega$ , to get into, and so to live in.) Applied by J. A. Ritgen to a Family of birds that do not fly, and live in sandy regions, as the

ostrich.

Am'mar. (Fr.) Asynonym of Dammar resin. Am'meline. A product of the fusion of nrea at 120° C. (248° F.)

Am'meos vulga'ris fruc'tus. See Ammi fructus.

Am'mi. ('Λμμι, the Ammi conticum, now called Psychotis coptica; from αμμος, sand; from its likeness to particles of gravel; or αμίς, a urinal, from its diuretic effects.) Λ Genus of the Nat. Ord. Umbelliferæ. The calyx almost obsolete; petals obovate, bilobed, emarginate, with an inflected lobule. The dise often depressed, entire; fruit oval-oblong, compressed laterally, with prominent primary ridges; columella bipartite; seeds convex externally, plane or concave internally. Annual or biennial herbs with ternate pinnate leaves, with the last segments serrated; flowers arranged in compound umbels, with involueres and involucels.

A. bolbe'ri. The Ammi majus.

A. cicutæfo'lium. The Ammi majus. A. cop'ticum. A synouym of Ptychotis coptica. Nat. Ord. Umbelliferæ. An erect annual herb cultivated in Egypt and Persia, and especially in India, where it is well known as Ajvan, Ajowan, or Omani, and yields small spicy seeds, known under the name of Ajowan seeds.

A. cre'ticum aromat'icum. A synonym

of Ptychotis verticillata.

A. de Can'die. The Sison ammi.
A. de Crête. The Sison ammi.
A. fruc'tus. The fruit of the Ptychotis

faniculifolia; used as a stomachic, carminative,

and emmenagogue.

A. ma'jus. Common Bishop's weed. The fruit of this plant, which is a native of Europe, has been mistaken for that of the Ammi copticum, but is smooth, whereas the latter is tuberculated.

A. matthi'oli, Daleschamp. A synonym

of Ptychotis verticillata.

A. odo're orig'ani. A drug mentioned by Anguillara in 1540, probably identical with the ajowan seeds obtained from Ptychotis coptica.

A. officina'lis, Fr. Codex. The fruit of

the Ptychotis faniculifolia, D.C. It is small, aerid, and aromatic, and now rarely employed; it is one of the "quatre semences chaudes."

Guibourt affirms that it has been attributed to the Ptychotis verticillata, the P. coptica, and the

P. faniculifolia.

Also, a synonym of A. majus.

A. par'vum fo'liis fœnic'uli. A synonym of the Ptychotis funiculifolia.

A. perpusil'lum. (L. perpusillus, very small.) A drug mentioned by Lobel; probably identical with the ajowan seeds obtained from Ammi copticum.

A. se'men. A term applied to the very small fruits of A. majus and of Sison amomum, which have been often confounded with those of Ammi copticum, but the absence of minute tubercles on the two former, with other differences, negatives any supposition of identity.

A. sem'inæ a'pii, Bauhkin. A synonym

of Ptychotis verticillata.

A. ve'rum. The Ptychotis fæniculifolia. A. visna'ga is the "Herbe aux-eure-dents" or "Herbe aux geneives" of the south of France, The fruit was formerly considered to be diurctic, and was employed in pleurisy.

A. vulga re. The Ammi majus.

Ammin'eæ. A Tribe of the Nat. Ord. Umbelliferæ, characterised by hermaphrodite or polygamous, didynamous, variously arranged flowers, fruit compressed at the sides, with or without alæ.

Ammin'idae. A synonym of Amminea. Am'mion. Minium, or red lead. (Castellos.) Red mereury sulphide. (D.)

Am'mios murica'ta. (L. muricatus,

shaped like the murex shell, pointed.) A synonym of Ammi majus.

Ammis'mus. (Aμμος, sand.) The cure of disease by sand baths. See Psammismus.

Ammium. A synonym of Ammi alica. Am'mo. An African plant, growing in Ashantee, the jnice of which is applied to cuts and bruises. (Bowditch.)

Ammobro'ma sono'ræ. sand; βρώμα, food.) A plant growing in Mexico in sandy places, as a parasite, on the roots of an undetermined plant. It is eaten by the wandering tribes of Papigos Indians.

Ammocæ'tes. ('Λμμος'; κοίτη, bed.) An early stage of development of the sea lamprey

Ammochar'idæ. A Family of the Sub-order Sedentaria, Order Polychæta. Body composed of elongated rings, surrounded in front by the branchial apparatus in the form of a crown of ramified lobes; digestive tube enclosed in a hæmal space.

Ammocho'sia. ('Λμμος, sand; χόω, to heap up. G. Sandbad.) Term for a remedy consisting in drying the body by immersing it in sand or salt heated by the sun's rays, employed by the Greeks in dropsy. (Oribasius, as stated by Gorræus.)

Ammody'tes. ('Αμμοδύτης, a sand burrower; from  $\ddot{a}\mu\mu\sigma$ s, sand;  $\delta\dot{\nu}\omega$ , to enter into, and so to live.) Growing or living in sand.

Also, the name of the sand eel.

The term ammodytes was also formerly applied to a species of Coluber inhabiting Southern Europe.

A. tobia'nus. (F. anguille de sable; G. Sandaal.) Order Anacanthini, Class Pisces. The sand ecl.

Am'moline. (Formed from the first parts of the words ammoniacum, and oleum, oil.) of the salifiable bases of Imppel's animal oil; it is a liquid which is heavier than water. (L. and R.)

Ammonæ'mia. The same as Ammo-

Ammo'nia. (From sal ammoniacum, F. ammoniaque; G. Ammoniak.) NH3. A colourless pungent gus possessing powerful alkaline properties, turning turmeric brown, reddened litmus blue, and neutralising acids. Its sp. gr. is 0.589; a litre weighs 0.76271 gramme. It is obtained by heating ammonium enforide with slaked lime. It assumes the liquid form under a pressure of 6.5 atmospheres at 15.5 C. (60° F.); it has been solidified at a low temperature. Water takes up solidified at a low temperature. Water takes up about 700 times its volume. The salts of ammonia are rather widely distributed in nature, the chloride and sulphate being found near volcanoes, the chloride in sea water and in chalybeate waters generally, the nitrate in hyos-cyamus and other plants. They appear in the urine and freces as products of the regressive metamorphosis of the proteids.

In the gaseous state ammonia is highly irritating to the conjunctive and mucous membranes. It does not act so energetically on the integument as the fixed alkalies, but if its escape be prevented it soon produces redness, burning pain, vesication, and slonghing. The gas excites strong irritation and spasmodie closure of the glottis, and the

solution when swallowed induces most severe pain, swelling, and inflammation of the mouth, pharynx and larynx, and stomach. The voice is lost, and there is terrible distress. Death occurs

from collapse.

Ammonia and its salts have a high diffusionpower, and are rapidly absorbed into and speedily escape from the body. It is probably quickly eliminated from the blood, since no free aumonia nor any increase in the proportion of its salts can be discovered in this fluid after its salts can be discovered in this fluid after its administration, though it has been recovered from the breath; and in large proportion from the urine, either in the form of a salt or as The toxic action of ammonia and its urea. compounds is chiefly exerted on the nervous system and heart. The respiratory movements are at first lowered in frequency or even arrested from stimulation of the peripheric branches of the vagus; they are then greatly increased in frequency ewing to central irritation, since this effect is not interfered with hy section of the vagus. The blood pressure is at first momentarily lowered, and then immensely augmented, unless indeed the dose is overpowering, partly owing to its action on the vaso-motor centre, and partly, perhaps, on its interfering with the oxidation of the blood, and cansing stasis in the capillaries, though these are dilated. The temperature is raised, and the quantity of urine is

Therapentically, ammonia is used as a ready stimulant in fainting; as a rubefacient and derivative in neuralgia and rheumatism; as a speedy vesicant; to relieve itching in various skin diseases; to relieve the pain, by neutralising the acidity of the poisonous fluid, in the bites and stings of many insects; and it has been strongly recommended subcutaneously or intravenously injected in snake hites.

Ammonia and its salts are used as a stimulant and expectorant in eases of chronic bronchial catarrh; as an antacid in flatulent dyspepsia and in the colic of children; as a cardiac stimulant in the acute exanthemata, in asphyxia, typhus, cholera, and adynamic fevers, in poisoning by prussic acid, tobacco, mushrooms, and alcohol; they are also employed as a diaphoretic in catarrhal and rheumatic affections. Amn been recommended in scarlet fever Ammonia has embolic conditions.

In poisoning by the strong solution death has occurred within four minutes, and two drachms bave proved a fatal dose. Dilnte acids or acid fruits, olive oil, and milk may be given, with opium if there be much pain, and stimulants if

there be great depression.

In regard to the tests for ammonia, see Ammoniacal salts.

Aust. Ph. A colourless liquid, sp. gr. 0.960. It contains in 100 parts 10 parts of gaseous ammonia.

A. albu'minoid. See Albuminoid ammonia.

A. al'um. A synonym of Aluminium and ammonium sulphate.

A., arse'niate of. See Ammonia arsenias.

A., benzo'ate of. See Ammoniæ benzoas. A., bicar bonate of. See Ammonia bicarbonas.

A., bo'rate of. See Ammonium biborate, A., carbazo'tate of. A synonym of Ammonium picrate.

A., car'bonate of. See Ammonia carbonas.

A., caus'tic. A synonym of Ammonia. A., chlorby'drate of. A synonym of Ammonii chloridum.

A., ci'trate of. See Ammonia citras. A., for miate of. See Ammonium formate.

A., hydri'odate of. A synonym of Ammonii iodidum.

A., hydrochlorate of. A synonym of Ammonii chloridum.

A., hydrosul'phuret of. A synonym of  $Ammonium\ sulphide.$ 

A., i'odide of. See Ammonii iodidum. A., liquid. A synonym of Liquor am-

A., lith'ate of. A synonym of Ammonium urate. A., mu'riate of. The Ammonii chlori-

dum.

A., ni'trate of. See Ammonii nitras. A., nitrosul'phate of. See Ammonia nitrosulphas.

A., phos'phate of. See Ammonia phosphas.

A., subcar'bonate of. A synonym of Ammoniæ carbonas.

A., suc'cinate of. Fr. Codex. See Succinas ammoniæ impurus.

A., sul'phate of. See Ammonii sulphas. A., sulphuret of. A synonym of Ammonium sulphide.

A., tar'trate of. See Ammonium tartrate. A., u'rate of. See Ammonium urate.

A., vale'rianate of. Sec Ammonii ralerianas.

Ammo'niac. (G. ammoniakhaltig.) Haviog the properties of or related to ammonia.

A. gum. See Ammoniacum.

A., sal. ('Αμμωνιακόν, so-called because it was found near the temple of Jupiter Ammon, in Cyreniaca; or from  $a\mu\mu\sigma$ , sand, because the place in which it was found was sandy.) A synonym of Ammonii chloridum.

Ammoni'aca. A gaseous alkali, composed of three parts hydrogen to one of nitrogen, and which Berzelius regarded as an oxide of ammonium.

Ammoni'acæ ni'tras. A synonym of Ammonii nitras.

A. sul'phas. A synonym of Ammoniæ sulphas.

A. sulphure'tum. A synonym of Ammonium sulphide.

Ammoni'acal. (G. ammoniakalisch.) Belonging to, resembling, or containing ammonia or ammoniaeum.

A. amal'gam. See Ammonium amalgam. A. ce'rate. Four parts of carbonate of ammonia intimately mixed with thirty-two parts of simple cerate.

A. cop'per. A synonym of Cuprum ammoniatum.

A. fermenta'tion. The fermentation of the uriue which occurs when it is long retained in the body, or in the presence of purulent secretion from the mucous surfaces of the urinary passages, and of which one of the chief chemical conditions is the chauge of urea into carbonate of ammonia.

A. gas. Term for ammonia, the volatile nlkali; otherwise called alkaline air.

A. lin'iment. Four parts of strong solution of ammonia mixed with 32 parts of olive or almond oil.

A. lig'uor. A product of dry distillation of coal in the manufacture of gas; it consists of water holding in solution ammonia, ammonium carbonate and sulphide, and other substances. **A. pomma'de.** Λ synonym of *Pommade* 

de Gondret.

A. salt. A synonym of Ammonii sulphas.

A. salts. (F. Sels ammoniacaux.) Salts in which ammonia acts as a base. They are characterised by giving no precipitate hydrosulphuric acid, with ammonium sulphide, nor with the alkaline carbonates. Heated with potash, ammonia is disengaged, recognisable by its odour and the white fumes that appear on the approach of a glass rod dipped in hydrochloric acid. With concentrated solution of tartaric acid crystals of ammonium bitartrate are preciptated; no precipitate with hydrofluosilicic acid or perchloric acid. With platinum chloride a pale yellow precipitate falls, slightly soluble in water, insoluble in alcohol. With aluminium sulphate alum is slowly deposited, but in dilute solutions there is no change. With sodium hypobromite nitrogen gas is disengaged in the cold. Mixed with potash and a solution of mercuric iodide in potassium iodide added, a brown precipitate or discoloration of dimercurammonium iodide is produced (Nessler's test).

A. soap. A synonym of A. liniment. A. tar'tar. A synonym of Ammonium tartrate.

A. tur bith. A synonym of Ammonium and mercury sulphate,

Ammoniaca'lia. A term for stimulaut remedies containing ammonia.

Ammoni'aci præpara'ta. The preparations of ammonia.

A. vegetab'ilis. A synonym of the Liquor ammoniæ acetatis.

Ammoni'aco. A term indicating the presence of ammonium in a compound.

Ammoni'aco-magne'sian phosphate. A synonym of Mugnesium and ammonium phosphate.

A. cal'culus. This form of urinary calculus is white, friable, crystalline on the surface, not laminated on section. It is soluble in dilute acids, insoluble in potash. Under the blowpipe it exhales an ammoniacal odour, and at length melts into a vitreous substance. It sometimes attains a very large size.

**Ammoni'acon.** ('Αμμωνιακόν.) Diescorides, Paulus Ægineta, and other Greek writers, mention άμμωνιακόν; and Pliny, under the same name, describes two kinds of this gum-Thrauston, which resembles male frankincense, and is the most esteemed, and Phyrama, which is of an unctuous and resinous nature. It is now generally admitted that the ammoniacon of the ancients differs from the ammoniacum of the present day, the former being the produce of the Ferula tingitana, and the latter of the Dorema ammoniacum.

Ammoni acum. ('Αμμωνιακόν, so-ealled because the plant yielding it chiefly grew in Cyreniaca, around the temple of Jupiter Ammon. F. ammoniaque; I. Gomma ammoniaco; S. goma amoniaco; G. Ammoniakharz, Ammoniakyummi;

Hind. ooshak-feshook; Arab. fooshook ashek; Pers. ushak, semugh-bilshereen.) A gum resin, the product of the Dorema ammoniacum, collected in Persia, and the Punjaub. One of the chief localities for it is the desert plains about Tezdikhast, between Ispahan and Shiraz. It occurs either in the form of whitish and brittle rounded tears, varying from the size of a small pea to that of a cherry, and breaking with a conchoidal shining fracture, or in large yellowish masses composed of agglutinated tears, and often mixed with foreign fragments. It has a faint odour, and a bitter, acrid, and nauscous taste. The nodules are of a pale creamy yellow, or in old specimens of a cinnamon brown outside, opaque, and milk white within; they easily soften with warmth, but do not melt; they are partly soluble in alcohol, ether, vinegar, alkaline solutions, and water; with the latter they form a milky emulsion. They are coloured yellow by caustic potash, and bright orange by the hypochlorites, as by common bleaching powder. Amnoniacum contains 70 to 72 per cent. resin, 18 to 22 per cent. gum, 2 to 4 per cent. of bassorin, about 2 of volatile oil, and 5 of water and loss. It is stimulant, antispasmodic, expectorant, emmenagogue, and resolvent; in large doses it is an irritant, producing vomiting and diarrhea; and it has also been credited with diaphoretic and diuretic properties. It has been employed in pulmonary affections, especially in asthenic eases, as in spasmodic asthma, hysterical asthma, chronic catarrh of old age, and chronic cough accompanied with torpor of the alimentary canal, in anasarca, in passive dropsy; used in chlorosis, amenorrhœa, and in chronic and painful catarrhal conditions of the intestinal mucous membrane. It has been used in the form of plaster in indoleut swellings of the glands and joints, and in enlarged bursæ. Dose, 10 to 20 grains, in emulsion or pill. Also, a synonym of Ammonia.

A., African. A milky gum resin, having some resemblance to ammoniacum, obtained from the Ferula tingitana, growing in Morocco, and still an object of traffic with Egypt and Arabia, where it is employed in fumigations. Flückiger and Hanbury believe it to be identical with the

ammoniacon of Dioscorides.

A. gum'mi. See Ammoniacum.
A.in gra'nis. (F. ammoniaque en larmes;
G. Ammoniae in Thränen, Körnerammoniuk.)

Ammoniacum in tears or grains.

A. in lac'rymis. The same as A. in granis.

A. in placen'tis. (F. ammoniaque en masse, or en pains; G. Ammoniak in Kuchen, Massenammoniak.) Ammoniaeum in eakes or masses.

A. pulvera'tum. Helv. Ph. Ammoniacum thoroughly dried and reduced to powder.

A. suffimen. (L. suffimen, funnigation, incense.) An ancient term for a variety of ammoniacum.

A. thymia ma. (θυμίαμα, a preparation for fumigation, incense.) An ancient term for a variety of ammoniacum.

Ammoniacum ace'ticum solu'-The Ammonium aceticum solutum. tum. Aust. Ph.

A. carbon'icum. A synonym of the Ammonium carbonicum of the G. Ph.

A. carbon'icum py'ro-oleo'sum. A synonym of the Ammonium carbonicum pyro-oleosum of the G. Ph. A. caus'ticum. The Liquor ammoniæ.

A. caus'ticum solu'tum. A synonym of the Liquor ammonia fortior.

A. cu'prico-sulfu'ricum. A synonym of the Cuprum sulfuricum ammoniatum, G. Ph.

A. depura'tum. Aust. Ph. Purified

ammoniacum.

A.hydrochlora'tum. A synonym of the Ammonium chloratum of the Aust., Helv., and

G. Ph.

A. hydrochlora'tum ferra'tum. A synonym of Ammonium chloratum ferratum, G. Ph.

A. hydroiod'icum. A synonym of Ammonii iodidum.

A. muriat'icum. A synonym of Ammonii chloridum.

A., sal. A synonym of Ammonii chloridum.

A. solu'tum anisa'tum. A synonym of the Liquor ammonii anisatus of the G. Ph. A. succina'tum. A synonym of the Eau

de luce, Spiritus ammoniæ succinatus.

A. succin'lcum solu'tum. A synonym of the Liquor ammonii succinici of the G. Ph.

A. sulfocarbol'icum. A synonym of Ammonium sulphocarbolate.

A. volat'ile mite. A synonym of Ammoniæ carbonas.

**Ammo'niæ ace'tas** (acid).  $NH_4C_2$   $H_3O_2$ ,  $C_2H_4O_2$ . A salt crystallising in transparent, oblique, rhombodal prisms. Obtained as a sublimate by heating ammonium chloride with potassium or calcium acetate.

A. ace'tas. (neutral). NH<sub>4</sub>C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>. A salt prepared by saturating dilute acetic acid with ammonium carbonate. A diffusible stimulant in large, and an antispasmodic in small, does See Ligage appropriate acetatis.

doses. See Liquor animonia acetatis.

A. a'qua. Ed. Ph. A solution of ammonia sp. gr. 0.960

monia, sp. gr. 0.960.
In U.S. Ph. A name of Liquor ammonia.

A. a'qua for'tior. Ed. Ph. A solution of ammonia, sp. gr. 0.880.
In U.S. Ph. A name of Liquor ammonia

fortior.

A. a'qua solu'ta. A synonym of Ammonia, Aust. Ph.

A.arse'nias. (F. arséniate d'ammoniaque; G. arseniksaires ammonium.) Prepared by saturating a solution of arsenious acid with ammonia. It crystallises in rhomboidal prisms. It is a neutral salt, and is soluble in water and alcohol. Recommended by Biett as an efficient remedy in one sixth to a quarter of a grain doses for psoriasis

and other obstinate skin diseases.

A. benzo'as. B. Ph. NH<sub>4</sub>C<sub>7</sub>H<sub>5</sub>O<sub>2</sub>. (F. benzoate d'ammoniaque.) Benzoate of ammonia. Two ounces of benzoic acid is dissolved in three fluid ounces of solution of ammonia mixed with four fluid ounces of water; the solution is evaporated at a gentle heat, keeping ammonia in slight excess, and then set aside that crystals may form. A salt crystallising in colourless laminæ, which are soluble in 5 parts of water and 12 of rectified spirit. When heated it sublimes without residue. It gives a bulky yellow precipitate with persalts of iron; beated with caustic potash it evolves ammonia; and on the addition of hydrochloric acid benzoic acid is precipitated. It is converted in the system into hippuric acid, possibly by taking up the elements of glycocoll, and acts as a slight diuretic. It has been recommended in chronic inflammation of the vesical and pulmonary

mucous membranes, accompanied with mucous discharge, in cases of phosphatic urine, in gout to procure the solution of chalk stones, and in jaundice. Dose, from 10 to 20 grains in solution.

A. bicarbonas. NH, HCO<sub>2</sub>. Mild carbonate of ammonia; also called hydrogen ammonium carbonate. This salt may be obtained as a white powder by exposing the commercial sesquicarbonate of ammonia to the air for 24 hours; one equivalent of ammonia passes off, leaving bicarbonate. It crystallises in six-sided prisms, is permanent in air, and soluble in 8 parts of water. Its medicinal properties resemble those of the carbonate, but are milder. It is antacid, stimulant, and diaphoretic. Dose, 5—30 grains in solution. For effervescing draughts, 20 grains require 18 grains of citric or 19 of tartaric acid.

A. bo'ras. See Ammonium biborate.

A. carbo nas. N<sub>2</sub>H<sub>11</sub>C<sub>3</sub>O<sub>5</sub>. (L. ammonium carboneum. F. carbonate d'ammoniaque; G. ammoniumcarbonat, Flüchtiges Langensalz.) Carbonate or sesquicarbonate of ammonia. A volatile, pangent salt produced by submitting a mixture of sulphate of ammonia or chloride of ammonium and carbonate of lime to sublimation. It occurs in translucent crystalline masses, with ammoniacal odour and alkalıne reaction. When slowly formed it occurs in large rhombic crystals. It is soluble in 4 parts of water, and sparingly in spirit. It is dissolved by acids with effervescence; 15 grains are neutralised by 17 grains of citric acid or a tablespoonful of lemon jnice. It is a compound of hydrogen ammonium carbonate with ammonium carbonate with ammonium carbonate.

It is a stimulant, antacid, diaphoretic, expectorant, and antispasmode. In large doses it proves emetic, and is an irritant poison. It has been recommended in diabetes, scarlatina, measles, and crysipelas; in psoriasis and other skin diseases; in chronic brouchitis; and as a stimulant in states of debility, and in narcotic poisoning. Dose, 2 to 10 grains, in pill or solution. See Ammonium carbonate.

A. carbo'nas alkali'nus. The Ammoniae carbonas.

A. carbo'nas incomple'tus. A synonym of A. carbonas.

A. caus'tica. A synonym of Ammonia.
A. caus'tica liq'uida. Λ synonym of Liquor ammoniæ.

A. chlorhy'dras. A synonym of Ammonium chloratum.

A. ci'tras. A crystalline salt, refrigerant and diuretic; used in febrile and inflammatory attacks, scarlet fever, and gastric irritation; recommended by Dr. Prout in diabetes.

A. cuprosul'phas. A synonym of the Cuprum ammoniatum, U.S. Ph.

A. et fer'ri mu'rias. A synonym of Ferri anmonio-chloridum.

A. hydri'odas. A synonym of Ammonii iodidum.

A. hydrochlo'ras. A synonym of Ammonii chloridum.

A. hydrosul'phas. A synonym of Ammonium sulphide.

A. hydrosulphure'tum. A synonym of Ammonium sulphide.

A. hypocarbo'nas. A synonym of A. carbonas.

A. liq'uida. Belg. Ph. Solution of ammonia, prepared in the same way as the Liquor ammonia, B. Ph.

A. liq'uida. Belg. Ph. A synonym of Liquor ammonite fortior.

A. H'quor. Dub. Ph. A solution of am-

monia. Sp. gr. 0.950.

A. li'quor for'tior. Dub. Ph. A solution of ammonia. Sp. gr. 0 900.

A. mu'rias. A synonym of Ammonii chloridum.

A. muria'ta. A synonym of Ammonii chloridum.

A. muriat'ica. A synonym of Ammonii chloridum.

A. ni'tras. See Ammonii nitras.

A. nitrosul'phas. A salt formed by transmitting nitric oxide gas through a solution of sulphate of ammonia. It has been used in France as a remedy in typhoid fever.

A. ox alas. (H<sub>4</sub>N)<sub>2</sub>C<sub>2</sub>O<sub>4</sub>,H<sub>2</sub>O. B. Ph. Oxalate of ammonia. One ounce of oxalic acid dissolved in eight fluid ounces of water is neutralised with carbonate of ammonia at 100° C. (212° F.), filtered while hot, and set aside that crystals may form; these are long, colourless, efflorescent, rhombic prisms; not very soluble in eold, freely in hot water. It is used, in solution of half an ounce to a pint of water, as a test of the presence of lime.

A. phos'phas. (NII<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub>. B. Ph. (L. ammonium phosphoricum. G. ammoniumphosphat.) Phosphate of ammonia. Solution of ammonia is added to twenty fluid onnces of dilute phosphoric acid nutil the solution is slightly alkaline; it is evaporated, with the occasional addition of ammonia, to the formation of crystals as the solution cools. A salt crystallising in transparent colourless prisms, which become opaque on exposure to air from loss of water and ammonia. They are soluble in 2 parts of water, insoluble in rectified spirit. When heated with potash ammonia is evolved. The aqueous solution gives a yellow precipitate with nitrate of silver. It has been chiefly recommended in the urie acid and gouty diatheses. It has also been employed in rheumatism, and as a diaphoretic and discutient. Dose, 5-20 grains.

A. prepara'ta. (L. præparatus, prepared.) A synonym of Ammoniæ carbonas.

A. pu'ra. (L. purus, pure.) Ammonia

A. pu'ra liq'uida. A synonym of the Ammonia of the Aust. Ph., and the Liquor ammoniae, Br. Ph.

A. scsquicarbo'nas. A synonym of Ammoniæ carbonas.

A. sul'phas. See Ammonii sulphas. A. sulphure'tum. A synonym of Ammonium sulphide.

A. superammoni'acus. A synonym of A. carbonas.

A. tar'tras. See Ammonium tartrate. A. u'ras. See Ammonium urate.

Ammoniæ'mia. (Ammonia, and alua, blood.) A term applied to that condition of the blood supposed to be due to the decomposition of urea in the system into carbonate of ammonia, and the absorption of this into the circulation. The decomposition of the urea in the urinary passages, as a consequence of its retention, may result from sacculated kidneys, dilatation of the ureter and pelvis of the kidney, renal abscess, paralysis of the bladder, enlarged prostate with retention, and stricture with retention. In this condition the urine is said to be ammoniacal when passed, and to contain mucous or muco-purulent scere-

tion; the breath and perspiration are ammoniacal. The mucous membrane of the mouth is remarkably dry and shining, the complexion is sallow, the temperature high, and there is emaciation. No dropsical symptoms are present; convulsions are rare. In the acute form, vomiting and diarrhea may occur, but these symptoms are not present in the more common chronic form. Death is usually preceded by coma. The intestines are said to contain a greenish yellow, alkaline, mucous fluid, having an ammoniacal odour; and their mucous coat to be edematous and sometimes ulcerated. In the general absence of vomiting, diarrhoea, and convulsious, ammoniæmia differs from uræmia.

In the treatment, the cause of the retention of urine should, if possible, be removed, in other respects it resembles the troatment of uramia.

Ammoniam'eter. (Απησηία; μέτρου, a measure.) An instrument used for the purpose of determining the density of solutions of ammonia gas.

Ammonia que al coolisée. A synonym of Liquor ammonii caustici spiritussus, Ph. G.

A. an'isée. A synenym of Liquor ammonii anisatus, Ph. G.

A. suc'cinée. A name of one of the formulæ of Eau de luce.

Ammonia'ted. (G. ammoniakhaltig.) Charged with or containing ammonia.

A. cop'per. The Cuprum ammoniatum. A. i'ron. A syuonym of Ferri ammoniochloridum.

The Hydrargyrum am-A. mer'curv. moniatum.

Ammon'ic. Of or belonging to ammonia.

A. salts. Salts of ammonium.

Ammonii arsenias. A synonym of Ammoniæ arsenias.

A. bromi'dum. B. Ph., U.S. Ph. NH, Br. Bromide of ammonium. A salt crystallising in small colourless crystals. It dissolves in 1½ parts of water, and in 13 parts of rectified spirit. It becomes yellow on exposure to the air. It is an excellent nervine, and has been found u-eful in epilepsy, hooping-cough, in hysteria, and in the sleeplessness of nervous persons. It relieves neuralgic pains, and is recommended in strumous

ophthalmia. The dose is from 5-20 grains or more.

The U.S. Ph. orders a troy ounce of iron wire to be added to half a pint of distilled water and shaken until the smell of bromine has gone and the liquid becomes of a greenish colour; four fluid onnees and a half of solution of ammonia and half a pint of distilled water are then added; the mixture is heated and filtered, the precipitate on the filter washed in boiling distilled water, evaporated until a pelliele forms, and stirred at a moderate heat until granulation occurs.

A. caus'tici li'quor. Ph. Bor. and Russ. synonym of Liquor ammoniæ.

A. chloridum. B. Ph. NH, Cl. Chloride of ammonium or sal ammoniae. This salt occurs in the fumeroles of volcanoes and in the fissures of recent lava streams. It is obtained by heating the ammoniacal liquor of gasworks with lime, and passing the ammonia which then escapes through dilute hydrochloric acid until it saturated; the solution is evaporated, and the crystals dissolved in hot water and recrystallised, or they are sublimed. It is a colourless, ino-dorous, translucent, fibrous mass, tough and difficult to powder; soluble in 4 parts of water and 55 of rectified spirit. Ammonium chloride in over-doses acts as an irritant poison; in small medicinal doses it is stated to be alterative, sedative, diaphoretic, diurctic, emmenagogue, resolvent, liquefacient, discntient, refrigerant, and, in larger doses, purgative. It has been recommended as a substitute for mercury and iodide of potassium for the removal of chronic indurations and chlargements and in chronic inflammatory diseases; it has been given in neuralgic and rheumatic affections; in passive dropsies, especially of hepatic origin; in chronic hepatitis, in syphilis, typhoid, and intermittent fevers; in chronic bronchitis and hooping-cough; in vesical catarrh, and in amenorthose and dysmenorrhose. In facial neuralgia it frequently gives great relief. Externally, as a discutient lotion, applied to glandular enlargements, incipient absesses, eechymoses, and as a refrigerant lotion in sprains, or to cool a heated head.

Dose, from 5 to 20 grains, in powder, pills, or solution. It has been used externally as a discutient lotion, 2 to 4 drachms in a pint of water or vinegar, with or without rectified spirit. As a refrigerant lotion, 2 ounces with 5 ounces of

nitre, dissolved in water.

A. chlori'dum purifica'tum, U.S. Ph. Twenty troy ounces of ammoniam chloride is dissolved in two pints of water, with the aid of heat, and the addition of five fluid drachms of water of ammonia; the heat is continued for a while, the solution filtered while hot, and then evaporated, constantly stirring until it granulates. It is a suow-white crystalline powder, soluble in two and a half parts of cold water. The object of the process is to remove any iron chloride.

A. hydrochlo'ras. A synonym of A.

chloridum.

A. hydrosulphure'tum. A synonym of Ammonium sulphide.

A. iodi'dum. NH<sub>4</sub>I. Obtained by saturating ammonia with hydriodic acid. It consists of colourless cubes, soluble in water and alcohol. It closely resembles iodide of potassium in its properties and uses. The dose is from 2—5 grains three times daily.

A. iodure'tum. A synonym of A. iodidum. A. ni'tras. Ph. U.S. NH<sub>4</sub>NH<sub>3</sub>. Nitrate of ammonia. Prepared by treating earbonate of ammonia with nitric acid till effervescence ecases, filtering the solution and evaporating. A white deliquescent salt, in coofused masses, or in long prismatic crystals, having a bitter acrid taste; soluble in less than its own weight of water, and sparingly soluble in rectified spirit. It fuses at a temperature of 160° C. (320° F.), and at 176·6° C.—232·2° C. (350° F.—450° F.) it is entirely resolved into nitrons oxide gas (NO<sub>2</sub>) and the vapour of water. Used for the making of nitrous oxide gas.

A. phos'phas. See Ammonia phosphas.
A. præpara'ta. Preparations of ammonia.
A. sesquicarbo'nas. A synonym of

Ammoniæ carbonas.

A. sul'phas. U.S. Ph. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. The impure salt resulting from the sublimation of gas liquor or fetid bone spirit, saturated with sulphuric acid, is submitted repeatedly to solution and crystallisation until it is obtained pure. It is in colourless rhombic prisms, easily soluble in water. It is used in the preparation of ammoniaalum, and ammoninm and iron sulphate.

A. valeria'nas. NH<sub>4</sub>0,C<sub>10</sub>H<sub>9</sub>0<sub>3</sub>. Valerianate of ammonium. Valerianic acid four fluid

ounces, ammonium chloride and lime, of each a sufficiency; the two latter being mixed, gaseous ammonia is evolved, and after passing over lime is directed into the valerianic acid to neutralisation, when, on being set aside, crystals of ammonium valerianate form. They are snow-white, pearly, four-sided and tabular, of valerianic odour, and sharp, sweetish taste. Very soluble in water and alcohol. It has been recommended in neuralgia, chorea, hysteria, cpilepsy, and other nervous diseases. Dose, 2 to 8 grains.

Ammo'nii collyr'ium. (Αμμος, sand.) A collyrium formerly believed to be useful in removing sand or gravel from the eyes. (Parr.)

Ammonim'eter. (Ammonia; μίτρον, a measure.) The same as Ammoniameter.

Ammonio-. A prefix indicating the presence of ammonium or one of its salts in a com-

Ammo'nio-chlo'ride of iron. See Ferri ammonio-chlorudum.

**A.-chloride of mer'cury.**  $NII_2IIgCl$ . White precipitate. See *Hydrargyri ammonio-chloridum*.

A.-chloride of sil'ver. See Argenti ammonio-chloridum.

A.-fer'ric al'um. See Ferri et ammonii sulphas.

A.-magne'sian phos'phate. A synonym of Magnesium and ammonium phosphate.

A.-ni'trate of silver, solu'tion of. B. P. Nitrate of silver, \( \frac{1}{4} \) oz. is dissolved in eight fluid onnees of water, and solution of ammonia added until the first-formed precipitate is nearly dissolved; it is then filtered and made up to ten onnees by the addition of distilled water. A test solution, used to detect arsenious and phosphoric acids; the produce a pale yellow precipitate.

A.-sul'phate of cop'per, solu'tion of. B. P. Half an ounce of sulphate of copper is dissolved in eight ounces of distilled water, and solution of ammonia added until the first-formed precipitate is nearly dissolved; the fluid is filtered, and distilled water added to make it up to ten fluid ounces. Used as a test for the presence of sulphur in strong solutions of ammonia, which produces a black precipitate; and for arsenic, which produces an emerald-green precipitate.

A.-sul phate of magne'sia, solu'tion of. B. P. An ounce of sulphate of magnesia and half an ounce of chloride of ammonium is dissolved in eight fluid ounces of water, and half a fluid onnee of solution of ammonia and distilled water to make ten fluid onnees are then added. Filter. Used as a test for phosphorie acid and the phosphates, which produce a white precipitate of triple phosphate.

Ammoniocu'pricus subsul'phas. A synonym of Caprum ammoniatum.
Ammo'nion. (Gr. ἀμμώνιου.) Collyrium, said to be of great efficacy in curing many dis-

cases of the eye; referred to by Aëtius, l. vii.

Ammoniorrhœ'a. (Ammonia; ρίω, to flow.) The occurrence of a large quantity of ammonia in the urine, perspiration, or other exerction.

Ammonites. Snake stones, a Genus of Ammonitude. So called from the resemblance to the horn of the Egyptian god Ammon.

Also, a term employed by Porat to designate mushrooms and boleti, several of the edible species of which are called ammoniti in Naples.

Ammonit'idæ. A Family of the Order

Tetrabranchiata, Class Cephalopoda. Fossil species only. Septa many times folded and complex; sutures angulated, zigzag, lobed, or foliaceous; tube external.

 $NII_4$ . Ammo'nium. A hypothetical compound metallic base, capable of replacing potassium and sodium, to which metals it presents close analogies.

A. aceta'tum. A synonym of Ammonia acetas.

A. ace'ticum liq'uidum. A synonym of

the Liquor ammoniæ acetatis.

A. ace'ticum solu'tum. Anst. Ph. Dilnted acctic acid 100, coarsely powdered ammonium carbonate about 20.5 parts, distilled water in sufficient quantity to make the solution of sp. gr. 1.03; a diapheretic. Dose, ½ draehm to 5 drachms.

A. al'um. The Alumen of the B. Ph.

A. amal'gam. A soft, selid substance produced when a globule of mercury, connected with the negative pole of a voltaic battery, is placed on a piece of moistened ammonium chloride and laid on platimm attached to the positive pole of the battery. It is believed to be an amalgam of ammonium and mercury.

An amalgam of the same nature has been believed to be formed when a globule of mercury is placed in a solution of ammonium chloride and connected with the negative pole of a voltaic battery; it swells up and floats to the snrface; very shortly it contracts, expels hydrogen and ammonia, and the mercury resumes its original appearance. It is probable that this is caused merely by the interposition of gas in the substance of the mercury.

A. and hy drogen sul phide. A syno-

nym of A. hydrosulphide.

A. arse'niate. See Ammoniæ arsenias. A. arsenic'icum. Ph. Russ. A solution containing I part of arsenic acid dissolved in 8 parts of water, and to which 3 parts of liquor ammonia have been added, is evaporated till crystals form. These are directed to he dried and kept in a glass vessel.

Also a synonym of Ammoniae arsenias.

A. arsenic'icum solu'tum. Ph. Rnss. A solution containing one part of crystals of arsemate of ammonia, dissolved in 480 parts of distilled water.

A. arsen'icum. A synonym of Ammonia

A. benzo'ate. See Ammoniæ benzoas.

A. benzo'icum. Fr. Codex. A solution of 10 parts of benzoic acid in 8 parts of liquor ammoniæ. Sp. gr. 0.92.

Also a synonym of Ammoniæ benzoas.

A. benzo'icum solu'tum. Ph. Russ. Two parts of benzoic acid are dissolved in 16 parts of distilled water; and to the warmed solution 1 part of earbonate of ammonia is added, or as much as is required for saturation; 8 parts contain 1 part of dry benzoate of ammonia.

A. bibo'rate. Boracic acid in excess is dissolved in a solution of ammonia, gently heated, and then allowed to cool, when the salt crystallises in semitransparent, truncated, rhombic octohedra. It is alkaline, and dissolves in twelve parts of water. It has been given in doses of 10 to 20 grains every hour in renal and vesical calculus, and in chronic vesical catarrh.

A. bicarbon'icum. A synonym of Ammoniæ bicarbonas.

A. bitartar'icum. (F. Tartre ammonia-

cal acidule, tartre d'ammoniaque acidule, alcalivolatil tartreux acidule, tartrate d'ammoniaque acidule, bitartrate d'ammoniaque; G. Ueber-saures weinsteinsaures ammonium, uebersaurer weinsteinsaurer Salmiak; fluchtiger Weinsteinrahm.) Bitartrate of ammonia, or ammonium tartrate (acid).

A. biwolfram'icum. Tungstate of ammenia.

A. borac'icum. See A. biborate.

A. bo'rate. See A. biborate. A. broma'tum. A synonym of the Ammonii bromidum.

A. bro'mide. See Ammonii bromidum. A. car'bamate. NII<sub>4</sub>CO<sub>2</sub>NH<sub>2</sub>. Formed

when dry earbon dioxide is brought into contact with dry ammonia. It is a crystalline powder with an ammoniaeal odour, and soluble in ammonia. It is contained in commercial carbonate of ammonia.

A. carbazo'tate. A synonym of A.

picrate.

- A. car'bonate. See Ammoniæ carbonas. A. car'bonates. The carbonates of ammonia are normal ammonium carbonate, (NII4)2 CO<sub>3</sub>+H<sub>2</sub>O, and hydrogen ammonium carbonate or bicarbonate, H(NH<sub>4</sub>)CO<sub>3</sub>. The former is prepared by digesting commercial carbonate of ammonia, at a temp. of 12° C. (53·6° F.), with strong solution of ammonia, when a crystalline powder falls; and the latter is the white mealy powder formed on the surface of the crystals of the normal carbonate.
- A. carbon'icum. Aust., Belg., Helv., G., and Russ. Ph. A synonym of the Ammonia carbonas.
- A. carbon'icum py'ro-oleo'sum. G. and Helv. Ph. (G. breuzlich-kohlensaures Ammonium.) Sal volatile cornu cervi. Impure or empyreumatic carbonate of ammonia. Ammonium carbonicum, reduced to powder, 32 parts, ethereal animal oil 1 part; mix gradually. A whitish powder, becoming yellow with time; soluble in water, to which it imparts a yellow colour. The dose is from 3-6 grains.

The Swiss Pharmacopæia directs it to be prepared by mixing 100 parts of earbonate of ammonia with 1 part of ethereal animal oil.

A. carbon'icum pyro-oleo'seum liq'uidum. The Carbonas ammoniæ pyro-oleosus liquidus.

A. carbon'icum py'ro-oleo'sum so-lu'tum. Fr. Codex. A hquid obtained from the dry distillation of hartshorn purified by one distillation.

G. Ph. A liquid prepared by dissolving 1 part of impure or empyreumatic carbonate of ammonia in 5 parts of distilled water. Sp. gr. 1.065-1.070.

Russ. Ph. Prepared in the same way as that

directed by the G. Ph. Sp. gr. 1.070-1 074.

A. carbon'icum solu'tum. Ger. and Rnss. Ph. A liquid prepared by dissolving 1 part of carbonate of ammonia in 5 parts of distilled water. Sp. gr. 1.070-1.075.

A. caus'tleum. A synonym of Liquor

A. caus'ticum solu'tum. A synonym of Liquor ammoniæ. B. Ph. Sp. gr. 0.059. Fr. Codex. Sp. gr. 0.92; 100 parts contain 21

of gaseous ammonia.

G., Rnss., and Swiss Ph. Sp. gr. 0.960; 100 parts contain 10 parts of gaseous ammonia.

A. caus'ticum solu'tum for'tius. A

synonym of the Liquor ammoniæ fortior, Br. Ph., which has a sp. gr. of 0.891, and contains 32 5 per cent. of gaseous ammonia. That of the Fr. Ph. has a sp. gr. of 0.920.

A. caus'ticum spir'itu solu'tum. A synonym of the Liquor ammonii caustici spiritu-

osus of the G. Ph.

A. chlora'tum. Aust. Ph. Ordinary sublimed ammonium chloride 500, hot distilled water 1500 parts; dissolve, and add of pure liquid ammonia 20 parts; filter and evaporate. A white crystalline powder.

G. Ph. (G. Salmiak; S. ammonium-succinat.)

The Ammonii chloridum of the B. Ph.

A. chlora'tum ferra'tum. G. Ph. (G. Eisensalmiak.) Take of ammonium chloride 16 parts, distilled water 32 parts; when complete solution is effected, add fluid chloride of iron 3 parts. An orange-coloured deliquescent powder, parts. All trange-considered defiquences powder, completely soluble in water which contains 2.5 per cent. of iron and 7.25 per cent. of iron chloride. Dose, 3—7 grains.

A. chlo'ride. See Ammonii chloridum.

A. chlori'dum. See Ammonii chlori-

A. cit'ricum. A synonym of Ammoniæ citras.

A. cit'ricum solu'tum. A synonym of Liquor ammoniæ citratis.

A. cu'prico-sulphu'ricum. A synonym

of Cuprum ammoniatum, U.S. Ph. A. cyanate. NH<sub>4</sub>OCN. Produced by the action of dry ammonia on cyanic acid. It is floc-culent and crystalline: soluble in water, and easily undergoes molecular change into isomeric

A. cy'anide. NH<sub>4</sub>Cy. A colourless. crystalline, volatile salt, very soluble in water. It is produced by distilling together potassium cyanide and ammonium chloride; by mixing an-hydrous hydrocyanic gas with ammonia; and also by passing ammonia over red-hot charcoal. It is very poisonous.

A. for'mate. (F. formiate d'ammonium; G. ameisensaures Ammon.) CHO2NH4. Crystallises in square prisms, and is very soluble in water. It is decomposed, when heated to 180° C. (356° F.), into water and hydrocyanic acid. It has been recommended in chronic paralytic dis-

eases, when the central irritation has subsided, in

doses of five grains.

A. for miate. See A. formate. A. hy'drate. NH<sub>4</sub>.HO. A compound supposed to exist in solution of ammonia, but not known to exist in the solid state.

A. hydri'odate. A synonym of Ammonii iodidum.

A. hydrobro'mate. A synonyn of Am-

monii bromidum. A. hydrobro'micum. A synonym of

Ammonii bromidum. A. hydrochlo'rate. A synonym of Ammonii chloridum.

A. hydrochlora'tum. A synonym of Ammonii chloridum.

A. hydrochlora'tum ferra'tum. synonym of A. chloratum ferratum.

A. hydroiod'icum. A synonym of Ammonii iodidum.

A. hydrosul'phate. A synonym of A. sulphide.

A. hydrosul'phide. H(NH<sub>4</sub>)S. name now usually given to ammonium sulphide, as used in solution.

A. hydrosulphura'tum. A synonym of A. sulphrde.

A. ioda'tum. A synonym of Ammonii iodidum.

A. i'odide. See Ammonii iodidum. A. joda'tum. A synouym of Ammonii iodidum.

A. molybdana'tum. A solution of this salt in distilled water, in the proportion of about 5 per cent., is employed to stain microscopical sections.

A. muriat'ieum. A synonym of Ammonii chloridum.

A. muriat'icum depura'tum. A synonym of A. chloratum. Aust. Ph.

A. muriat'icum ferra'tum. A synonym of A. chloratum ferratum.

A. muriat'icum martia tum.

synonym of the A. chloratum ferratum of the G. Ph.

A. muria'tum. A synonym of Ammonii chloridum.

A. ni'trate. See Ammonii nitras.

A. nitra'tum. The same as Ammonii nitras.

A. ni'tricum. (F. nitrate d'ammoniaque, G. Salpetersaures Ammonium.) A synonym of Ammonii nitras.

A. nitrosul'phate. A salt described by Pelouze under this name, was made by him by passing nitric oxide gas through a solution of ammonium sulphate, and five or six times its volume of solution of ammonia; crystals are formed, which, after being washed with solution of ammonia, are dried without heat. It has been recommended in typhoid fever, in doses of twelve grains.

A. oxalate. See Ammoniæ oxalas.

A. oxal'icum. (F. oxalute d'ammoniaque, sel ammoniaque d'oscille; G. Sauerkleesaures Ammonium, zuckersaures flüchtiges alkali.) A synonym of Ammoniæ oxalas.

A. ox'ide. A hypothetical compound, sup-posed by Berzelius to have the composition NH4.0.

A. phos'phate. See Ammonia phos-

A. phos'phates. There are three phosphates of ammonium: normal ammonium phosphate, (NH<sub>4</sub>)<sub>2</sub>PO<sub>4</sub>; hydrogen diammonium phosphate, II(NH<sub>4</sub>)<sub>2</sub>PO<sub>4</sub>; and dihydrogen ammonium phosphate, H<sub>1</sub>(NH<sub>4</sub>)PO<sub>4</sub>; in the two latter of which hydrogen takes the place of one and two

equivalents of ammonium respectively.

A. phosphoricum. G. Ph. (G. Phosphorsaures Ammonium.) A synonym of Am-

moniæ phosphas.

A. pi'crate. A salt that has been used as a substitute for quinine in ague and in neuroses. A yellow discoloration of the skin and orangecoloured nrine may occur after its use. Dose,  $\frac{1}{4} - \frac{1}{2}$  grain.

A. pierin'icum. A synenym of A. picrate.

A. plero-ni'tricum. See A. pierate.

A. saccharicum. A synonym of Ammoniæ oxalas.

A. salicyl'ate. (G. salicylsaure ammonium.) The crystals are soluble in water and alcohol, and have a faint sweetish taste. It is used for the same purposes as salicylic acid.

A. salicyl'icum. A synonym of A. sulicylate.

A. schee'licum. Tungstate of ammonia.

A. sesquicar'bonate. A synonym of Ammonia carbonas.

A. sesquicarbon'icum. A synonym of Ammonia carbonas.

A. subcarbon'icum. A synonym of Ammoniæ carbonas.

A. suc'cinate. (G. Ammonium succinat.) C4H4O4NH3. When added to a solution of a ferric salt, ammonium succinate throws down a reddishbrown precipitate of ferric succinate. It has been recommended in delirium tremens.

A. succin'icum liq'uidum. A synonym

of the Eau de luce.

A. succin'icum solu'tum. and Helv. Ph. A liquid obtained by dissolving 1 part of succinic acid in 8 parts of distilled water, and adding 1 part, or as much as may be required to effect neutralisation, of empyreumatic carbonate of ammonia. Sp. gr. 1.050—1.054.

Russ. Ph. Succinic acid 24 parts, distilled water

192 parts, rectified oil of smber 1 part, and empyreumatic carbonate of ammonia 24 parts, or as much as may be necessary. Sp. gr. 1.050-

1.054.

A. sul'phate. See Ammonii sulphas. B. Ph. A. sul'phide, solu'tion of. Three fluid ounces of solution of ammonia are put into a bottle and a stream of hydrogen sulphide passed through until gas ceases to be absorbed; two fluid ounces of solution of ammonia are then added. Ammonium hydrosulphide, II (NH<sub>4</sub>)S, called in the B. Ph. ammonium sulphide, is formed and is held in solution. A fætid, dark green fluid, possessing sedative and emetic properties, which has been administered in diabetes in doses of from 7-20 drops for the purpose of controlling the morbid appetite. It has also been recommended, though rarely employed, in cardiac disease and consumption. Used in testing for the metals.

A. sul'phides. The sulphides of ammonium are: ammonium monosulphide, (NII4)2S; ammonium hydrosulphide, II (NH<sub>4</sub>)S; ammonium tetrasulphide, (NH<sub>4</sub>)<sub>2</sub>S<sub>4</sub>; ammonium pentasulphide, (NH<sub>4</sub>)<sub>2</sub>S<sub>5</sub>; and ammonium heptasulphide,

(NH<sub>4</sub>)<sub>2</sub>S<sub>7</sub>.

A. sulphocar'bolate. A salt prepared in the same way as Sodium sulphocarbolate, and used for the same purposes; it crystallises in

A. sulphu'ricum. A synonym of Ammonii sulphus.

A. sulphydra'tum. A synonym of A. sulphide.

A. tartar'icum. A synonym of Potassium and ammonium tartrate.

A. tartar'icum acid'ulum. (F. tartre ammoniacal acidule; G. Uebersüures weinsteinsäures Ammonium.) Bitartrate of ammonia, or A. bitartrate (acid).

A. tar'trate (Neutral).  $C_4\Pi_4(NH_4)_2O_6$ It is a soluble and efflorescent salt.

A. tar'trate (Acid ) C4H5(NH4)O5. A salt very similar to acid potassium tartrate.

A. u'rate. C<sub>5</sub>H<sub>3</sub>(NH<sub>4</sub>)N<sub>4</sub>O<sub>5</sub>. A salt fre-

quently found in urinary sediments and calculi. It constitutes a large portion of the urine of birds and serpents, and is generally obtained from the exerement of the boa. It is usually a white, amorphous, and sparingly soluble powder. Under the microscope it is occasionally seen to form crystalline needles, but more frequently spheroids with crystalline spines. It has been used as an ointment, in the proportion of one scruple to one ounce of lard, in skin diseases, and in tuberculous disease of the lung. It has also been given internally in phthisis, in doses of 4-7 grains. It should be given cautiously, lest it occasion the formation of oxalic acid in the urine.

A. u'ricum. (F. urate d'anmoniaque; G. harnsaure sammoniak.) The A. urate.
A. vale'rianate. Seo Ammonii valeri-

A. valerian'icum. (G. Baldriansaures Ammoniak.) A synonym of Ammonii valeri-

wolfram'icum. (F. wolframate d'ammoniaque; G. wolframsaures Ammoniak.) Tungstate of ammonia.

Ammoni'uret. (F. ammoniate, ammoniure; 1. ammoniuro; S. amoniuro.) Term for a combination of ammonia with a metallic oxide, as ammoniuret of silver, copper.

A. of perox'ide of gold. See Aurie

fulminate.

Am'mon's horn. A synonym of the Hippocampus major or Cornu ammonis.

Ammo num. (NH<sub>4</sub>)<sub>2</sub>0. A term for the hypothetical oxide of ammonium.
This word has also been used as synonymous

with ammonium in many pharmaceutical preparations.

Ammoph'ilous. ('Aμμος, sand; φιλέω, to love.) Loving sand.

In Botany, applied to plants growing in sandy

places.

Am'mos. ('Aμμος, sand. L. arena.) Sand. Used as a dry fomentation and sudorific in dropsy by the ancients. (Dioscorides, Celsus.)

Ammox'alon. (G. Sandsaüre.) A synonym of Silicic acid.

Am'na. Ancient term for aqua, or water, or rather that which flows through lime, and where the earth is white; in other words, water impregnated with saline matters. (Quincy.)

A. alkalisa ta. Same as Amna.

Amnemon'ic. ('A, neg.; μνημονικός, of memory.) Applied to affections characterised by loss of memory.

Amnemos'yne. ('A, neg.; μνημοσύνη. remembrance. G. Vergessenheit.) Forgetful-

Amne'sia. ('Aμνησία, forgetfulness. G. Gedachtnisswache.) Absence or want of remembrance; defect of memory; forgetfulness; amnesy; amnesty. It may be congenital or acquired, in the former case being associated with the organic changes producing idiocy; it may result from gunshot or other wounds of the head, from disease of the brain or of its envelopes, as fungus of the dura mater or arachnoid, cancer, tuberele, ramollissement, chronic diffuse meningoencephalitis, hæmorrhages, cysts, abscesses, exostosis, syphilitic tumours, from insolution; from chronic intoxication with lead, alcohol, and opium, anamic states of the constitution during convalescence; from fevers, cholera, &c., hæmorrhages, venereal excess, from epilepsy, and old age. Of late it has been restricted to the loss of memory of words. In typical cases the organs of articulation, of vision, and of motion of the right arm may be perfect, and yet the person can neither talk, nor read, nor write, in consequence of the forgetfulness of words.

Amne'sic. (Same etymon.) Belonging to or connected with Amnesia.

A. apha'sia. Loss of the memory of words. Same as Amnesia.

Amnes'tia. ('Auνηστία, forgetfulness.) Same as Amnesia.

Amnes'tic. (Same etymon. F. amnestique; G. vergesslich, vergessen.) Applied to poisonous agents, or cerebral diseases or injuries, causing loss of memory.

Amnestotha'leæ. ('A, neg.; μνηστεία, a wooing; θάλεια, flourishing.) A term applied by G. Allman to plants having the sexes

in separate flowers.

Am'nic. The same as Amniotic.

A.ac'id. A synonym of Amniotic acid Amnic'olous. (L. annis, a river; colo, to inhabit. G. flussliebend.) Living on the

borders of rivers.

Amnii'tis. Same as Amnitis.
Amnioclep'sis. (Amnion; κλέπτω, to get rid of imperceptibly.) The unperceived es-

cape of the liquor amnii. **Am'nion.** ('Αμνίον, the membrane round the fætus. In Anatomy (L. angina tunica. F. aminos; G. Schaafhautchen), a double non-vascular membrane (the inner layer derived from the epiblast, the outer consisting of a fold of the somato-pleural layer of the mesoblast), which, rising up at the sides and two extremities of the embryo, meet on the dorsum. The outer layer fuses with the chorion, and is fibrous in structure; the inner or amnion proper is continuous with the skin of the fætus, and consists of nucleated cells. Between the inner layer and the embryo is the liquor amnii. The cavity between the two layers of the amnion is part of the colom or pleuro-peritoneal cavity, and is lined by two layers of cells, one, the deeper of the two, flat and pavement-like, the other, large, nucleated, and with crenulated out-line. In the chick the amnion on the seventh day begins to pulsate slowly and rhythmically, due to contraction of muscular fibres, which are developed apparently in the mesoblastic laver. The folds of the two layers, as above described, being inflected backward at each extremity of the embryo, and having reached each other, respectively unite, and form two eavities; that enelosed by the union of the inner folds is the true annion, that enclosed by the onter folds is the false amnion. The amnion is absent in amphibia and fishes.

Also, in Botany (G. Keimsack), the internal membrane of the seed or germ sac.

Also, a former name for the Hydrargyri sul-

phuretum rubrum.

A., false. The outer cavity formed by the union of the external one of the folds which form the amnion. In birds and reptiles it is probably absorbed, in mammals it is believed to aid in the development of the chorion.

A., drop'sy of. A condition of pregnancy, in which there is excessive secretion of liquor amnii; it is sometimes a cause of protracted labour, in consequence of over-distension and inertia of the muscular structure of the uterus.

Amniorrhœ'a. (Amnion; ρέω, to flow.) Discharge of the waters.

Am'nios. Same as Amnion.

Amnio'sis. Same as Amnitis.

(Amnion.) An mals which. **Amnio'ta.** (Amnion.) Animals which, in the course of their embryonic development, possess an amnion and allantois. It includes reptiles, birds, and mammals.

Am'niotate. A salt of amniotic acid. Amniotic. (Amnion, the amnion.) Of or belonging to the amnion.

A. ac'id. A synenym of Allantoic acid.

A. liq'uid. The Liquor amnii.

A. sac. A term applied to the inner layer

of the Amnion.

In Botany, the term is applied to an inner central compartment, or sac, in which the embryo of some plants, as the Canna, is contained. The perisperm is consequently here double.

Amni'tis. Indammation of the amnion. Am'nium. A synonym of Amnion.

Amœ'ba. (Αμείβω, to change. F. amihr.) A monocellular organism found chiefly in fresh water, but also in the sea and damp earth. It is one of the types of Haeckel's Subkingdom Protista. It is composed of a mass of finely granular sarcode or protoplasm, soft, transparent, colourless, like a speck of white of egg or jelly, containing a nucleus with nucleolus, capable of performing movements both of change of form and place. Its nutrition is effected by extending itself over and enclosing minute organisms like diatoms, and after extracting the contents eliminating the exnviæ by simply withdrawal of its body from them. It multiplies by fission.

Amoe'bea. (Same etymon.) One of the Orders into which the Class Rhizopoda is divided by some anthors, and is described as comprising, with one or two exceptions, naked forms, having short, blunt, lobose psendopodia, which do not anastomose with each other, and containing a nucleus and one or more contractile vesicles.

Amœ'bidæ. A Family of the Suborder Lobularia, Order Foraminifera, Class Rhizopoda, Subkingdom Protozoa. The position of the living beings included in this group is variously determined; they have a great similarity to many low vegetable organisms, and possess only one general characteristic, namely, their faculty of amadeid movement.

**Amœ'biform.** (Amæba; form, a likess.) Resembling the amæba; especially in ness.) regard to the slow and characteristic changes of form and place executed by various cell structures.

A. cells. A term which has been applied to the white corpuscles of the blood.

Amœ'bina. A Suborder of the Order

Amæbea, having the body naked. Amœ'boid. (Amæba; ɛloos, likeness.) Having the characteristic movements of the

Amæba.

A. move'ments. Movements typically performed by the Ameha, but seen also in the white corpuscles of the blood and in various other free masses of sarcode. The movements are most active at temperatures between 20°C, and 40°C. (68° F. and 104° F.) They are greatly retarded or altogether arrested at temperatures near the freezing point, and the sarcode is coagulated and deprived of vitality in general a few degrees above 100° F. (100°, F. Schultze). The sarcodal substance appears to be composed of fine granules distributed through a transparent substance. In the movements the initiative seems to be taken by the transparent substance which protrudes itself in the form of fingers, more or less obtuse or acuminate, and a rush of the protoplasmic granules then follows. After a time the stream becomes slower and ceases, a new protrusion occurring towards some other point, whilst the first one is retracted.

Amœnoma'nia. See Amenomania. Amoga briel. Arabic for Cinnabar. (Wallich, Dornæus, Ruland, and Johnson.) Amoma'ceæ. A synonym of Amomere.

According to some, a Family of monocotyle-

donous plants, divided into two Tribes, Maran-

Amoma les. In Lindley's classification, an alliance of the Class Endogens, having unsymmetrical flowers with 1-5 stamens, some of which at least are petaloid, and albuminous seeds.

Amo'meæ. A Group of the Nat. Ord. Zingiberaceæ or Scitamineæ, characterised by a bilocular anther and multiovulated ovarian loculi. They are usually annuals, with tuberous, fasciculated, and woody roots.

Amo'meous. Resembling or related to the Amomum.

Amo'mi bac'cæ. Belg. Ph. The berries of the Pimenta.

A. u'va. The substance mentioned by Pliny under this name was probably the round cardamom, the fruit of the Amomum cardamomum.

Amo'mis. A plant mentioued by Dioscorides and Pliny, identified by Cordus and Casalpinus with Anastatica hierochuntica.

A. pimen'to. A synonym of Myrtus pi-

A. pimento'ides, Berg. A synonym of Myrtus pimentoides. (Nees.)

A. pseudocaryoph'yllus. A synonym

of Myrtus pseudo-caryophyllus.

Amo'mum. ('Αμωμον ) An odoriferous plant not well characterised in the writings Avicenna, in describing the of the ancients. Hamama of the Arabs, which corresponds to the 'Aμωμον of the Greeks, gives details which have enabled Sprengel to identify it with the Cissus viliginea of Armenia. By others, in consequence of Hamama signifying Columba, the plant has been identified with Forstera muscifolia and with Geranium columbinum. During the renaissance period Pimeuta was termed Amome in the shops of Paris. The term has also been applied to the Solanum pseudocapsicum.

Also, a synonym of Pimenta. Amo'mum. A Genus of the Tribe Amomee, Nat. Ord. Zingiberaceæ. They are plants of the tropical regions of the Old World, characterised by having a short calyx, trifid at the apex, corolla with 3 external unequal divisions, and a single internal division, which is plane and of large size, and constitutes the labellum, and is auterior in position. The andrecium is reduced to a single fertile stamen with bilocular anther, the filament forming a crest over it. The gynoscium consists of an inferior ovary with a filiform style lying between the lobes of the auther. The ovary has 3 multiovulated loculi. The fruit, though usually fleshy, is loculicidal, and contain

numerous arillated seeds.

A. Afze'lii. The A. grana-paradisi.

A. angustifo lium, Sonnerat. (L. angustus, narrow; folium, a leaf.) Hab. Madagascar. The fruit of which is the Great Cardaniom of Madagascar.

A. aromat'icum, Roxb. This plant is a native of the valleys on the eastern frontier of Bengal. According to Roxburgh the plant blossoms during the hot season before the periodical rains, and matures its fruit in September; the latter, which is fleshy and the size of a nutmeg, is then gathered and sold to the drug dealers under the name of Morung elachi or Bengal cardamom.

A. cardamo'mum, Willd. (F. amome en grappes.) A native of Cambodia, Siam, Sumatra, and Java. It is from this plant that the Round or Cluster Cardamoms are obtained.

A. citra tum, Pereira. (L. eitratus, eitreu

flavoured.) The species said to supply the Cardamomum majus citratum. The seeds of this cardamom are remarkable for their strong flavour of verbeua.

A. Clu'sii. A species described by Clusius, having polished seeds, probably supplying the

large cardamom.

A. curcu'ma. A synonym of Curcuma tinctoria.

A. Daniel'li. The bastard Melegneta of Pereira, probably identical with A. angustifolium.

A. exsca'pum. (L. ex, forth from; seapus, a stem.) A synonym of the A. grana-paradisi. A. galan'ga. A synonym of Alpinia galanga.

A. genui'num. (L. genuinus, natural.)

A synonym of A. cardamomum.

A. globo'sum. (L. globosus, spherical.) The species which supplies the Round Cardamoni of China, called Tsao-Keu.

A. gra'na-paradi'si, Smith. A species yielding one of the varieties of Grains of paradise.

A., great wing ed. The A. maximum. A. hirsu'tum, Lam. (L. hirsutus, hairy.) The Costus speciosus, Linn.

A term suggested by A. korari'ma. Pereira for a species of Cardamom producing fruits, which are strung and used as necklaces by the inhabitants of Uganda in Central Africa. The fruit is named Korarima by the natives.

A. latifo'lium. (L. latifolius, broadleaved.) Long or grape-seeded amomum. Hah. Sierra Leone. Fruit very large; pulp refrigerant.

A. longisca'pum. (L. longus, long; scapus, a stem.) The long-scaped amomnu. Hab. Sierra Leone. Feebly aromatic.

A. macrosper'mum, Swith. (Μακρός, long; σπέρμα, a seed.) This plant is probably identical with A. melequeta.

A. Madagascarien'se. The A. angustifolium.

A. max'imum, Roxb. (L. maximus, largest. F. cardamome aile de Java.) The plant producing the Java Cardamom. It is cultivated in Java, and the fruits are sold for the sake of their agreeable edible pulp.

A. me'dium. (L. medius, middle.) This plant produces the Ovoid Cardamom of China.

A. melegue ta (F. méléguette or maniguette.) An herbaceous recd-like plant, 3-5 feet high, producing on a scape, rising scarcely an inch above the ground, a delicate, wax-like, pale purple flower, which is succeeded by a smooth, scarlet, evoid, fruit 3—4 inches in leugth, rising out of sheathing bracts. The fruit has a thick, deshy pericarp, enclosing a colourless acid pulp of pleasant taste, in which are embedded numerous seeds known as Grains of paradise. It is widely distributed in tropical West Africa.

A. monta'num. (L. montanus, of a mountain.) The Zingiber cassumunar.

A. palus'tre. (L. paluster, marshy.) Swamp amomum. Hah. Western Africa. Seeds highly aromatic. Used locally in neuralgia. A. pimen'ta. A synonym of Pimento.

A. racemo'sum. (L. racemosus, clustering. F. l'amome en grappes.) A term given to the Round Cardamom of Java when met with in clusters. It is the A. cardamomum.

A. re'pens, Roscoe. (L. repens, from reno, to creep.) The Elettaria cardamomum.

A. re'pens, Willd. This plant supplies the

small Cardamom of Malabar.

A. sylves'tre. (L. sylvestris, of a wood.) A synonym of the Zingiber zerumbet.

A. ve'rum. (L. verus, true.) The Elet-

taria cardamomum.

A. villo'sum. (L. villosus, hairy.) This plant probably supplies the Harry Cardamom of China.

A. xanthioï'des. Wild or bastard Cardamom of Siam and Tenasserim. The seeds of this plant deprived of their capsules are sometimes imported into the London market. They closely resemble the seeds of Malabar Cardamom, differing chiefly in flavour and in being rather more finely rugose. Occasionally they are imported still cohering in ovoid three-lobed masses, as packed in the pericarp. The fruits of this species grow in round clusters, and are remarkable for having the pericarp thickly beset with weak fleshy spines, which gives them some resemblance to a xanthium, and has suggested the specific name.

A. zedoa'ria. A synonym of the Cureuma

zedoaria.

A. zerum'bet. An Indian plant, yielding cassumunar, the root of the Zingiber cassumunar or Z. zerumbet.

A. zin'giber, Linu. A synonym of Zingiber

officinale.

Amongeaba. The Brazilian name of a grass resembling *Panicum spicatum*. Used in S. America in fomentations and baths as an emollient in tenesmus and other painful affections.

Amoorta. The Sanskrit name of the

Tricospora cordifolia.

Amoos. The Arabic name of the Ptychotis

**Amor'ge.** (' $\Lambda \mu \delta \rho \gamma \eta$ , fine flax from the island of Amorgos.) See Amurea.

Amorginë.

A synonym used by Dioscorides of the plant Parietaria. Amor'pha. A Genus of the Tribe Galegea.

Nat. Order Leguminosæ, consisting of a single species, growing in America.

A. frutico'sa. (G. Zierstrauch.) Hab. America. It has irregularly formed flowers; the bruised root is used against toothache. Bastard indigo, according to Quincy.

Amorphia. ('A, neg.; μορφή, form. F. amorphie; G. Formlosigkeit.) Formless; shape-

less; destitute of definite form.

Amor'phism. (Same etymon. F. amor-phisme; G. Gestaltlosigkeit.) A condition of shapelessness.

Amorphogran'ular. Consisting of

amorphous granules.

Amorphophallus. ("Αμοφφος, misshapen; φαλλός, the penis.) A Genus of the Nat. Order Araceæ. It is characterised by having an androgynous spadix without sterile flowers, terminating in avoluminous, irregularly-shaped, somewhat conical body, the whole snrrounded by a spathe convoluted at the base and dilated, spotted with brown and white. The ovaries have 2-4 locali, with an anatropal ovum in each. The plants constituting the genus are chiefly Indian.

A. campanula us. (L. campana, a bell.) Telinga potato. Mal. and Tam. Karuna; Tel. Muncha Kunda; Hind. Ol. The flower exhales a fætid carrion-like odour. Stemless; leaves decompound; spathe campanulate, margins curled; club ovate, lobate; anthers two-celled. The acrid corms are used medicinally in boils and ophthalmia, as a stimulant and expectorant, as an emmenagogue, and in acute rhenmatism. After roasting, the corms are sometimes eaten.

A. gigante'us, Bl. Hab. India. corms of this species are also used as food.

A. montainum. (L. montanus, of the mountain.) Another species, similarly used.

A. orixen'sis. Ilab. India. The root is very acrid, and is used when fresh as an irritant poultice to swellings to promote suppuration.

Amor'phophyte. (Δμοφφος, misshapen; from α, neg.; μοφφή, form; φυτόν, a plant.) Applied by Necker to plants that have irregular or anomalous flowers.

Amorphopyga gra. (Pygagra, pain in the anus.) Irregular pain in the anus.

Amorpho'sis. See Anamorphosis. Amorphos teophyte. ( Δμορφος, shapeless; osteophutum, an osseous tumour.) A shapeless outgrowth of bone,

**Amor'phous.** (Λμορφος; from å, neg., μορφή, form. F. amorphé, difforme, informe: G. amorphisch, misgebildet, missgestaltet.) Wanting form or shape; shapeless.

A. car'bon. Carbon in its uncrystallisable

forms, as charcoal.

A. phos'phorus. See Phosphorus, amorphous.

A. quini'ne. This substance, which has also been called quinoidine, is a vellowish or brownish uncrystallisable substance precipitated from the mother-liquor of sulphate of quinine by an alkaline carbonate. It is generally impure, but is believed to consist chiefly of quinicine and cinchonicine. It is used in the same manner and for the same purposes as the snlphate of quinine.

A. rocks. Rocks which have no regular

structure.

Amorphozo'a. ('A, neg.; μορφή, form; ωον, an animal.) A term applied to the lower forms of the animal kingdom, as to the sponges and their allies, so called from their want of regular symmetrical structure.

Amorphozo'ary. (Same etymon.)

sponge.

Amorphozo'ous. (Same etymon.) Related to or resembling the Amorphozoa. **Amor'phy.** ('Αμορφία, shapelessness.)

Same as Amorphia.

Amos'teus. Osteocolla, or petrified carbonate of lime.

Amo'tes. Potatoes. (Quincy.) Am'pac. Name of an East Indian tree Am'pac. which yields a highly odoriferous resin, and the leaves of which are used to medicate baths.

Am'par. A synonym of Amber. Am'pelas a'gria. A synonym nsed by

Pliny of the Tamus communis. A. idai'a. A synonym used by Theophrastus of the Vaccinium vitis idaa.

Ampelida'eeæ. ('Αμπελος, a vine.) Λ synonym of Vitacca.

Ampel'idæ. (Same etymon) A synonym of the Vitaccæ.

Ampelid'eæ. (Same etymon. G. Weinstockgewachse.) A synonym of Vitacea. According to some systems, a Family of the

Nat. Order Discantha of Polypetalous exogens Ampelid'eous. (Same ctymon.) sembling the vine.

Ampelides. Same as Ampelidæ. Ampelion. (' $\Delta \mu \pi \epsilon \lambda \cos$ , dim. of  $\alpha \mu \pi \epsilon \lambda \cos$ , a vine.) Vine leaves, or the tendrils of the vine, recommended by Hippocrates for pessaries to induce the catamenia. (Quincy.)

**Ampelitis.** (' $\Lambda \mu \pi \epsilon \lambda \iota \tau \iota s$ , belonging to the vine.) The ancient name of an earth resembling bitumen, regarded as refrigerant and resolvent. Cannel coal. (Waring.)

Ampelocar pus. (Λμπελος, a vine; καρπός, fruit.) A synonym of the Galium aparine; so called because of the likeness be-

tween its seed and young grapes.

**Ampelodes mos.** (A $\mu\pi\epsilon\lambda$ os, a vine;  $\partial\epsilon\sigma\mu$ os, a band. So called because of its use in tying up vines.) A Genus of Graminaeea, closely resembling the Arundo, from which it chiefly differs in its subulate glumes.

A. te'nax. (L. tenax, holding fast.) The Diss of the Arabs is well known in Algeria; it is liable to the growth of the mycelium of the Claviceps purpurea, from which is developed a peculiar form of ergot. See Ergot of Diss.

**Ampelog raphy.** (Λμπελος, the vine; γράφω, to write.) A treatise on the vine.

**Ampeloleu'ce.** (\*Aμπελος, a vine; λεωκός, white.) A synonym used by Pliny of the *Bryonia alba*.

Ampelop'rason. (Gr.) A synonym used by Dioscorides of the Allium porrum.

It has also been identified with Allium ampeloprason. Used by the ancients as an emmenagogue, diuretic, and antidote to the bites of serpents.

Ampelop'sis. (Λαπελος, the vine; δψις, appearance. G. Epheuspringer.) Nat. Ord. Vitaeea. A genns including some tropical species of vines, characterised by having the discentirely confluent with the ovary.

A. hedera'cea. (L hederaceus, of ivy.) Nat. Ord. Vitacea. Its fresh leaves contain

pyrocatechin.

A. quinquefo'lia. (L. quinque, five; folium, a leaf. F. vigne vierge; G. wilder Wein.) The Virginian creeper. An indigenous American plant, said to be expectorant, alterative, and tonic. The bark, collected late in autumn, has been recommended in decoction for the enre of dropsy.

Am pelos. A synonym of the white

bryony, Bryonia alba.

Also of the vine, Vitis vinifera.

A. a'gria. (L. agrius, wild) The Bryonia alba.

A. idæ'a. (L. idæus, belonging to Mount Ida.) The Vaccinium vitis idæa.

A. melæ'na. (Μελαιναΐος, black.) The Tamus communis.

A. oinophorus. (Oivos, wine; φορέω, to bear.) The Vitis vinifera.

Ampelosagria. (Αμπελος, a vine; ἄγοιος, wild.) Another name for the Bryonia alba.

Ampelo-ther apy. (Αμπελος, the vine; θεραπεία, treatment.) The grape cure.

Ampeluk'kia. A synonym used by Dioscorides of the Atriplex halimus.

Ampelurgia. (Αμπελος; έργου, a work. G. Weinbau.) The culture of wine-bearing vines.

Ampère, André Marie. French physicist. Born 1775, at Lyons; died 1836, in Marseilles. Especially devoted himself to electrodynamics.

A.'s laws. These relate to the material forces between conductors conveying currents. They are—1. That successive portions of the same rectilinear current repel one another. 2. That parallel currents, if in the same direction, attract, and, if in the opposite direction, repel

one another; and 3. That currents whose directions are inclined to each other at any angle, attract each other if they both flow towards the vertex of the angle (or if they are not in the same plane, towards the feet of their common perpendicular), or if they both flow from it; and repel each other if one of them flows towards the angle and the other from it.

The law that equal volumes of all substances, when in the state of gas, and under like conditions, contain the same number of molecules, first enunciated by Avogadro, is often called Ampère's

law.

A.'s rule relates to the direction in which either pole of a needle is deflected by a current, whatever their relative position may be. It may be thus expressed: if an observer be so placed that the current passes through him, entering at his feet and leaving at his head, then the deflection of a north-seeking pole will be to the left as seen by him. The deflection of the south-seeking pole will be in the opposite direction.

Ampetokos. A synonym used by Dioscorides either of the Athanasia maritima, or of some Gnaphalium with white flowers.

Amphamphoterodiplo pia. (Λαφω, both; ἀμφότερος, both of two; diplopia, double sight.) Double sight in both eyes together, and particularly with a single eye.

**Amphan'thium.** ('Aµ $\phi$ i, about;  $\check{a}\nu\theta$ os, a flower.) Name by Link for a receptacle dilated by the opening of the peduncles which support, as in Synanthereæ, or contain, as in Fici, the flowers.

Amphare'tidæ. A Family of the Suborder Sedentaria, usually included in the Terebellidæ.

Ampharis teros. ('Αμφαρίστερος, with two left hands.) Left-handed; awkward.

Amphemer'inus. ('Αμφημερινόs. G. taglich.) Occurring daily; quotidian; applied by the ancients to a quotidian ague.

Amphe merus. Same as Amphemerinus. Am phiam. An old name of opium.

Amphiarthro'sis. ('Appi, on both sides; a,otoon, an articulation.) An articulation partaking of the characters of diarthrosis and synarthrosis, in which there is some amount of motion between the bones, and also a more or less complete connection by means of intervening ligament or other substance; as that between the bodies of the vertebre.

bodies of the vertebre.

Amphib'ia. ('Αμφί, both; βίος, life. G. Lurche.) A Class of the Subkingdom Vertebrata represented by the Frog (Anura), Newt (Urodela), Caecilia (Peromela), and extinct Labyrinthodonts. Their essential characters are that the skin is naked, rarely presenting scales or ossifications; the limbs, seldom absent, have the same segments as those of higher animals, and terminate in feet; the median fins, if present, are never supported by rays; the occipital bone has two condyles, and the basioecipital region of the skull is very incompletely, if at all, ossified; there is no basisphenoidal ossification; the vertebral centra are always bony; true ribs are either absent or quite rudimentary; the visceral arches of the embryo develop gills, which are either subsequently supplanted by lungs, or continue to perform a respiratory function through life; the blood is red and cold; the heart has a single ventricle and a more or less completely divided auricle; the yolk undergoes complete cleavage; there is no trace of un amnion or allantois.

**Amphib'ial.** (Same etymon. G. dop-vellebig.) Capable of living in water or air.

Amphib'ian. (Same etymon.) Related to or resembling the Amphibia.

Amphibichni'tes. (Amphibia; ἴχνος, a footstep.) The generic term for fossil footprints that seem to have been impressed by the feet of amphibious reptiles as they passed over the soft yielding beach.

Amphibicori'sæ. (Amphibia; κόρις, a bug.) Applied by L. Dufour to a Family of Hemiptera heteroptera. Latreille had already created this Family in 1804 under the name

Ploteres.

(Amphibia; λίθος, a Amphib'iolith.

stone.) A fossil amphibian.

Amphibiol'ogy. (Amphibia; a discourse.) A treatise on the amphibia. (Amphibia; λόγος,

Amphibiot'ica. ('Αμφί, both; βίος, life.) A group of the Suborder Orthoptera pseudoneuroptera. Larvæ live in water, and have branchial tracheæ.

**Amphib'ious.** (' $\Lambda\mu\phi$ i, both;  $\beta$ ios, life. G. amphibisch.) Capable of living in water or

Amphiblas'tic. ('Λμφί, on both sides ;  $\beta\lambda u\sigma\tau \delta s$ , a bud.) One of the forms of egg cleavage in which the cleavage cells are of unequal size, whilst some of them are charged with food material. The eggs of the Amphibia, Petromyzon, and the majority of Mollusca, are instances of this type of development. The series of this type are the Amphimonerula, Amphieytula, Amphimorula, Amphiblastula, and Amphigastrula.

Amphiblestrocarcino'ma. ('Auρίβληστρου, a net; carcinoma.) Careinoma of the amphiblestroid membrane, or retina.

Amphiblestro'des. ('Λμφιβληστροsions, the retina.) Net-like; the retina.

Amphiblestrodomala'cia. ame as Amphiblestroidcomalacia.

Amphibles'troid. ('Λμφιβληστροειδής, net-like, the retina.) Resembling a net; retiform. Sometimes applied to the retina, or retiform membrane of the eve.

A. apoplex'ia. Apoplexy of the retina. A. atrophy. Atrophy of the retina.
A. mala'cia. Softening of the retina.

A. mem'brane. The retina.
A. phthi'sis. Wasting of the retina.

Amphiblestroideapoplex'ia. ('Αμφιβληστροειδής; apoplexia.) Apoplexy of,

or hæmorrbage in or on, the retina. Amphiblestroideatro'phia. ('Αμ-φιβληστροειδής; atrophia.) Atrophy of the retina.

Amphiblestroideomala'cia. ('Aµφιβληστροειδής, the retina; μαλακία, softness.) Softening of the retina.

Amphiblestroideophthi'sis. ('Aµφιβληστροειδής; phthisis.) Atrophy of the retina.

Amphiblestroiditis. (Same etymon.) Term applied to retiuitis, or inflammation of the retina.

Amphiblestromala'cia. (Same etymon.) Same as Amphiblestroideomalacia.

Amphiblestrophthi'sis. The same as Amphiblestroideophthisis.

Amphibles tron. ('Δμφίβληστρον, a net; from ἀμφί, around, and βάλλω, to east.) A net.

**Amphib'ola.** ('Aμφίβολος, doubtful.) In Botany, applied by K. Sprengel to a Section of Hydrophyta corresponding to the Diatomea of Agardh.

In Omithol., applied by Illiger and Goldfuss to a Family, by Savi to a Tribe, of Passeres having two toes in front and two behind, the external posterior of which is versatile.

Amphibolia. The same as Amphibolite.
Amphibolia. ('Αμφιβολία, double meaning. G. Zweidenteykeit.) Ambiguity; double meaning.

**Amphibol'ic.** ('Αμφίβολος, ambiguous.) Containing or relating to amphibolite; doubtful.

A.pe'riod. The period of perturbation, or doubtful stage, which usually follows the acme of a disease, and in which the temperatures generally show a more or less irregular course.

Amphibolif'erous. (Amphibolite; fero. to bear.) Containing amphibolite, as am-

phiboliferous granite.

Amphiboli'nus. A term synonymous with Amphibolite.

Amphib'olite. ('Λμφίβυλος, doubtful.) A synonym of Horublende.

Amphibol'ogy. ('Λμφίβολος, doubtful. G. Zweidentigkeit.) An ambiguity in the formation of a sentence, which renders it capable of more than one construction.

Amphibolosty lous. ('Αμφίβολος, doubtful; στύλος, a pillar.) Applied by Wachendorff to plants in which the style is not apparent.

Amphibran'chia. ( Αμφίβράγχια.) A term applied by Hippocrates, l. de. Int. Affect. lx, 6, to the tonsils and parts near

Amphibron'chia. The same as Amphibranchia

**Amphibry'a.** ('Λμφί, around; βρύου, a kind of moss. G. Umsprosser.) Λ term employed by Eudlicher to indicate those plants in which the stem grows at the circumference. It included the Gramineæ, Liliaceæ, Iridaceæ, Orchidaceæ, and Palmaceæ, and corresponded therefore nearly to the Monocotyledons of other authors.

Amphicar pium. ('Αμφί, about; καρ-πος, fruit. G. Samenkapsel, Fruchthülle.) The

capsule or envelope of fruit.

**Amphicar'pous.** (' $\Lambda \mu \phi i$ , on both sides, double;  $\kappa a \rho \pi \delta s$ , fruit. G. doppelfruchttragend.) Having fruit of two kinds, either as to form or time of maturation.

Amphicaus'tis. A kind of wild barley. Some (but not medical writers) use this word to express the pudenda muliebræ. (Quincy.)

Amphiceph'alus. A sexually mature form of Trematode worm. One species of which the A. paradoxus of v. Beneden has been found iu the intestines of Zoarces viviparus

Amphicœ'lia. A Suborder of the Order Crocodilia, having amphicelous vertebræ. They are entirely extinct.

Amphicœ'lous. ('Λμφί, en both sides; koilos, hollow.) A term applied to vertebra, both surfaces of which are concave, as in most fishes and some reptiles.

**Amphicon**'dyla. ('A $\mu\phi$ i, on both sides; A synonym for the Mamκόνδυλος, a knob.) malia, from the fact that all mammals have two convex occipital condyles, which are co-existent with a well ossified basi-occipital bone.

Amphicotyle. A sexually mature form of Cestoid worm, of which one species, A. typica, has been found in the intestines of Centrolophus

pompulius

Amphicten'idæ. A Family of the Suborder Sedentaria, Order Polychata. Tentacles disposed in two bundles on the buccal ring; two pairs of tentacular cirrhi; branchiae pectinated on the second and third ring; tube straight, or slightly curved.

**Amphicur'tous.** ('Αμφίκυρτος, eurved on each side like the moon in its third quarter.) Curved on both sides, as the umbel of the

Equoria amphicurta.

Am'phide salts. ('Αμφί, on both sides.) A term used by Berzelius to denote those salts which arise from the combination of an oxyacid with an oxybase, of a sulphide with a sulphiret, of a selenide with a seleniuret, of a telluride with a tellururet, because they are due to the combination of compounds produced by amphigenous bodies. (L. and R.)

Amphid con. ('Αμφίδεα, a woman's bracelets; from άμφι, about; δέω, to bind.) This word, which properly signifies a bracelet, either for the neck or the arm, has been applied by Hippocrates, l. i, de Morb. Mul., lxxxiii, 8, to the round extremity, or the mouth, of the uterus.

Amphider'mis. (' $\Lambda \mu \phi i$ , on both sides; δέρμα, the skin. G. Hulthaut.) A term applied by some botanists to the cutiele of the epidermis.

Amphidesmit'ic. ('Λμφί; δεσμός, a band.) Applied by Latreille to a Family of Conchifera having a double cardinal ligament.

two right hands.) Equally dextrous with the right hand as with the left.

Amphidianth. Amphid'eum. Same as Amphideon.

**Amphidiarthro'sis.** ('Aμφί, both; διάρθρωσις, an articulation.) A term applied to the articulation of the lower jaw with the temporal bone, because it is of the nature both of ginglymus and arthrodia,

Amphid'ion. Same as Amphideon.

Am'phidiscs. ('Αμφί; δίσκος, a quoit.) Peculiar asteroid spicula, resembling two toothed wheels united by an axle, which form a layer surrounding the genmules of sponges.

Amphies'ma cor'dis. ('Λμφίεσμα, a

covering; L. cor, the heart.) The pericardium. **Amphig'amous.** ('Αμφί; γάμος, marriage. F. amphigame.) A term formerly employed synonymously with Agamous and Cryptogamous, to designate the lower forms of vegetable

**Amphigas'tria.** ('Αμφί, around; γαστήρ, belly. G. Beiblatter, Bauchblatter.) A term applied to that row of leaves in the Jungermannieae and Hepatiem, which is developed upon the under or shaded side of the slender filiform stem. They are of smaller size than those which form the ordinary double longitudinal row, and are commonly regarded as being stipular in character.

Amphigas'trium. (Same etymon.) A stipule which is inserted on the stem, which it

covers and surrounds.

Amphig'enæ. A synonym of Thallogen. Amphig'enous. (Same etymon as Having the characteristics of Amphigens.) Amphigens.

It has also been applied to fungi in which the hymenium is not restricted to a particular sur-

It has also been applied to organisms supposed to occupy an intermediate position between plants and animals.

A.bod'ies. Bodies, according to Berzelius, which are capable, in combining with metals, of forming electro-positive and electro-negative bodies (bases and acids). He included under this term oxygen, sulphur, selenium, and tellurium. (L. and R.)

**Am'phigens.** ('Λμφί; γεννάω, to engender. F. amphigene.) Brougniart applied this name to those Cryptogams which were classed as Thallogens by Lindley, namely, the Algae, Fungi, and Lichens. The term is applied because in these plants the organs of vegetation or thalli grow in all directions, whilst in the Acrogen

group they grow only by the apex. **Amphig'ony.** ( $\Lambda \mu \phi i$ , on both sides;  $\gamma \phi \nu \rho s$ , offspring.)  $\Lambda$  term for bisexual repro-

duction.

Amphihe'lia. A Genus of the Family Oculinida, Group Aporosa, Suborder Madreporaria, Order Zoanthasia. A coral in which the ecenenchyma is well developed.

A. ocula'ta, Edw. (L. oculatus, having eyes.) Hab. India. Furnishes white coral, which was used in powder or electuary as a tonic and

absorbent.

Amphiline. A sexually mature form of Trematode worm, one species of which, A. foliacea, has been found encapsuled in the abdominal eavity of Sciana aquita.

Amphimas chalus. ('Αμφιμάσχαλος, covering both arms; from αμφί, on both sides; μασχάλη, the armpit. G. geflügelt.) Winged.

Amphimer ina. (λμφί; ἡμέρα, a day.)

Hectic fever; tertian fever.

A. angino'sa. (L. angina, quinsy.) A kind of quinsy termed, by Huxham, febris anginosa; erysipelatous quinsy; scarlatina anginosa.

A. catarrhalis. (L. catarrhus, a catarrh.)

A synonym of Quotidian ague.

A. Hungarica. A synonym of Tertian ague, occurring among soldiers in camp. Sauvages believed it to differ little from typhus.

A. tussiculo'sa. (L. tussiculosus, full of cough.) A synonym of ordinary eatarrh.

Amphimer'inos. (Same etymen.) Quotidian fever. (D.)

Amphime trion. ('Αμφιμήτριος, that · which is about, or near the womb; from αμφί, about;  $\mu i \tau \rho a$ , the womb.) Applied by Hippocrates, l. vi, Epid. s. 8, t. 38, as an epithet for a sign or symptom of an affection of the womb.

Amphime'trium. Same as Amphi-

**Amphimor'phæ.** ('Αμφί, on both sides; μορφή, form.) An Order of the Desmognathous Aves, according to Huxley, having the lachrymal region remarkably long; the basi-sphenoidal rostrum has oval, sessile, basi-pterygoid facets; the flat and lamellar maxillo-palatines unite and form a bridge across the palate

Amphinoma'cea. The same as  $\Delta m$ nhinomina.

Amphinom'ea. Applied by Blainville to a Family of Chetopoda; by Savigny, Lamarck, Latreille, to a Family of Annelides.

Amphinom'eae. A Family of Appendiculata polychata; synonymous with Amphinomidæ.

Amphinom'idæ. ('Αμφίνομη, a daughter of Nereus and Doris.) A Family of the Suborder Nereidew, or a Family of Notobranchiata. Body quadrate or flat, with a small number of similar rings; cephalic tube indistinct, or represented on the dorsal surface by a nodule; usually three

tentacles, two palpi, and one or two pairs of eyes; mouth ventral; proboseis well developed, toothless; branchiæ wantiog only on the last ring.

Amphinom'inæ. A Subfamily of the Family Amphinomidæ. A caruncle and two

branchial trunks on each ring.

Am'phion. France; department of Savoy: a village on the south shore of the lake of Geneva, about three miles from Evian. The water contains sulphuretted hydrogen gas, calcium, magnesium and sodinm carbonate, calcium sulphate and chloride, with some iron. It is used in abdominal congestions, urinary deposits, hypochondriasis, hysteria, and menstrual irregularities.

Also, a Turkish compound containing opium.

(Dunglison.)

**Amphiox'us.** ('Aμφί, on both sides; οξύς, sharp.) The only Genns of the Subclass Leptocardia, or Pharyngobranchii, Class Pisces.

A. lanceola'tus. (L. lanceolatus, lanceshaped.) The Lancelet lives in sand, at moderate depths in the sea; it is noticeable because it is the only vertebrate whose cranium in the adult condition is wholly membrauous; hecause it has no brain, auditory, or renal organs, such as exist in the higher Vertebrata; because the heart is not centralised, whilst the main longitudinal trunks are contractile; because the liver is saccular; and because the notochord extends to the anterior end of the body. In some respects the Amphioxus shows affinity to the Ascidians. The endoskeleton is reduced to the notochord. The mandible and limbs are absent. The skin is naked. There are no fin rays. The gills are replaced by a per-torated pharynx. There are no red blood-cornuscles. Pallas was the first to describe this form, which he supposed to be a naked Mollusc, and so called it Limax lanceolatus. Costa, in 1834, gave it the name Branchiostoma; whilst Yarrell, in 1836, denominated it Amphioxns.

Amphipleu'ra. A Genus of Diatomacca, certain species of which are frequently employed as test objects to determine the relative excellence of microscopes, on account of the delicacy of the strize on their valves, the closeness of which has been estimated to be so great that there are from

125 to 130 in 1-1000th of au inch.

Am'phiplex. Old name for the peri-

næum (Unincy.)

Amphipneu'ma. ('Δμφί, on both sides; πυνεῦμα, breath.) Used by Hippocrates, l. iv. Epid. xxiv, 17, for strong and laborious breathing; urgent respiration on both sides; a species and symptom of great difficulty of breathing.

Amphipneus ta. ('Αμφί, of both kinds; πνίω, to breathe.) Applied by Merrem to a Tribe of Reptiles having both branchiæ and lungs, i.e. two respiratory apparatus, otherwise called pereu-

**Amphip'oda.** ('Αμφί, both; πούς, a foot.) A Suborder of the Order Edriophthalma, Class Crustaceæ. Body generally compressed laterally, having seven, rarely six, free thoracic segments, possessing branchiæ and carrying limbs, the four anterior of which are directed forwards, the others backwards; abdomen long, consisting of six segments, the three anterior bearing swimming feet, the three posterior bearing natatory limbs projecting backwards.

Amphipod'ifo'rm. (Amphipoda; forma, likeness.) Term applied by Kirby to hexapodons, herbivorons larvæ which, with long antennæ, have a body short and compressed, like that

of Amphipoda.

Amphip'odous. ('Aμφί, on both sides; πόνε, a foot. G. doppelfussig.) Having feet on both sides, or all round, or possessing both swim-

ming and walking feet. **Amphiri na.** ('Αμφί, on both sides; ρίν, a nose.) Animals having double or paired nostrils in Haeckel's classification, including all Vertebrata except Leptocardia (Amphioxus) and Cyclostoma

(Lamprey, Myxine).

Amphisar ca. ('Λuφί; σάρξ, flesh.) Name by Desvaux for a fruit indehiscent, superior, multilocular, dry, and ligheons on the exterior, pulpy in the interior, as Adansonia Baobab

Amphisar'cous. (Same etymon.)

Fleshy on both or on all sides.

Amphisbæ'næ ve'næ. ('Δμφίσβαινα, a serpent that can go either forwards or backwards.) An old term for the veins running between the uterus and breast, probably the internal mammary and the epigastric.

Amphisbænidæ. ('Δυφίς, on both sides; βαίνω, to walk.) A Family of the Suborder Amphisbænoidea, Order Sauria. The only family

having the characters of the Suborder.

Amphisbænoi'dæ. (Same etymon.) A Suborder of the Order Sauria. Tongue short, thick; pupil round; tail short; anus terminal.

**Amphisbæ'nous.** ('Αμφίς; βαίνω, to walk.) Walking equally in opposite directions.

('Aμφί; σκιά, a shade.) Amphis'cii. Applied to the people that inhabit the torrid zone, because their shadows turn now to the sonth, now to the north, according to the position of the earth in relation to the sun.

Amphismi'la. ('Αμφίσμίλη, from ἀμφί, on both sides; σμιλη, an incision-knife or scalpel.) A double-edged knife, mentioned by Galen, l. i,

Anut. Adm. c. 10. (Castelius.)

Amphiso'rex. A synonym of Sorex fodicus, the water shrew.

**Amphisper'mium.** ('Αμφί, abont; σπίρμα, a seed. G. Samenhulle.) A unilocular, one-seeded fruit, as the achenia.

('Αμφίσφαλσις.) Amphisphal'sis. Used by Hippocrates, iv, de Artic. t. 47, for cir-

enmdnetion.

**Amphis'toma.** ('Aμφί, on both sides; στόμα month. F. amphistome.) A Genus of Trematode Entozoa, the members of which infest many ruminants and other mammals. They agree in having a single large sucker at their posterior extremity. The body is muscular, rather thick, attenuated in front, larger and obliquely truncated behind. The mouth is orbicular, followed by an oval esophageal sac and bifurcated intestine, nervons system distinct; highly developed system of excretory canals; genital orifice situated beneath the œsophagus; eggs elliptical, rather large; embryo elliated. (Davaine.)

A. asperum occurs in the Tapirus americanns; A. attenuatum in Myletes bidens; A. cheloniæ imbricatæ in that animal; A. conicum in the rumen and psalterium of the Bos urus and other Herbivora; A. cornu in the Doras vacu; A. erumeniferum in the Bostanrus; A. celindricum in Doras muricus; A. emarginatum in Nyctipithecus trivirgatus; A. explanatum in the bile ducts and gall-bladder of the Bos taurus; A. fabaceum in Manatus exunguis; A. ferrum equinum in Doras costatus; A. giganteum in Dicotyles labiatus; A. grande in Peltocephalus dumerilianus; Podocnemis expansa and P. tracaxa in Rhinemys nasuta and Phrynops geoffroams, gibbus, miliusii, and in Chelys timbriata; A. harado in Palamadea cornuta; A. harado in Palamadea cornuta; A. harado in Palamadea cornuta; in Ageneiosus militaris; A. oxycephalum in Punelodus megacephalus; A. oxycephalum in Punelodus megacephalus; A. subcraparum in Halichetys atra; A. subcravatum in the intestines of Rana viridis; A. subtripuctrum in Castor fiber; A. truncatum in Phoea græniandica and in the domestic eat; and A. unciforme in Ieterus cristatus.

A. hom'ints. (L. homo, man.) Body red, pointed in front, rounded behind, 1.5" to 1.8" long; mouth at the anterior extremity; genital pore near the centre; candal termination very large and contractile, enclosing a large sucker: interument smooth, studded with many small glands and hyaline cells. Eggs ovoid, having an operculum. Found in the execum and colon of two natives who had died of cholera in India.

**Amphisty'lic.** (' $\Lambda\mu\phi i$ , on both sides;  $\sigma\tau\bar{\nu}\lambda os$ , a pillar.) A term applied to the skulls of certain sharks, as Notidanus and Cestracion, in which the mandible is partly supported by its own pier, the quadrate, and partly by that of the hyoid arch, the hyomandibular.

Amphite rium. A Genus of Didelphous mammals of small size, the jaws of which have been found in the great Oolite of Stonesfield.

Amphitritime. A Subfamily of the

Amphitritine. A Subfamily of the Family Terebellide. Usually with branchia; cephalic lobe short, furnished with many tentacles; possessing both simple and hooked setze.

Amphit ropal. ('Auchi, on both sides; \tau\_{pimo}, to turn. G. doppellaufg, ringsum umlaufend.) A term employed by Mirbel to designate Campylotropal ovules that have a short raphé. A term applied to the ovule when it is horizontal or in an intermediate position between straight and inverted, the adherent funiculus pushing up the chalaza at one end, while the micropyle descends to a corresponding extent until the axis of the ovule becomes horizontal and parallel with, instead of at right angles to, the placenta. An example is seen in the ovule of Lemna trisulca.

Amphit'ropous. (Same etymon.) A

synonym of Amphitropal.

Amphiu'midæ. A Family of the Group Derotrema, of Urodelous Amphibia. Body long, snake-like; feet short, distant from each other; three rudimentary toes.

Amphiu'ridæ. A Family of the Order Ophuroidea, Class Stelleridæ, Snbkingdom Echinodermata. Disc rugose, scaly; arms covered with spines; buccal papillæ variable in number; no dentiform papillæ.

**Amphodiplo'pia.** ('Λμφω, both; dipiopia, double sight.) Double vision with both

cycs together.

Amphodon'tus. ('Δμφω, both; οδούς,

a tooth.) If wing teeth in both jaws.

Am'phora. (Λμφορεύς, shortened form of ἀμφικροριύς; from ἀμφίς on both sides; φέρω, to carry; because it had two aurieles, by which it could be carried.) Name of an ancient winevessel, or liquid measure, a foot square, and capable of containing about 9 gallons; of oil, 72 pounds; wine, 80 pounds; honey, 180 pounds The Attic amphoreus was about half as large again.

Also, in Botany, the lower part of a Pyxi-

dium.

Amphor'ic. (Same etymon.) Belonging or relating to an amphora.

A. brea'thing. A synonym of A. respira-

A. bronchoph'ony. The same as A. vocal resonance.

A. bub ble. A sound occasionally heard in cases of pneumothorax, like that produced in the pouring of fluid out of a wine bottle. It is beard in the interscapular region when the patient, after sitting upright, slowly leans forwards, and is caused by the air passing under the dependent lung from the front to the back part of the chest as the position is gradually changed.

A. cough. (F. toux amphorique.) Amphorie resonance accompanying the sound of cough

as heard through the stethescope.

A. ech'o. A synonym of A. resonance.
A. hum. A synonym of A. resonance.
A. note. The amphoric resonance produced
by percussion over a large lung cavity, or a

stomach distended with air.

A. res'onance. (G. metallisches Nach-klange.) A term used in auscultation for a variety of the metallic tinkling accompanying the respiratory murmur and resembling the sound produced by blowing or speaking into any large vessel, or bottle, having a narrow aperture. The cause of its occurrence is the reverberation of sound in the interior of a cavity. Its presence does not absolutely prove that there is communication between the cavity and the outer air, though this is usually the case. It is sometimes due to fluid in a stomach distended with air. It attends the respiratory sounds, especially that of inspiration, and is heard both during vocalisation and in coughing. When the cavity is large it may be produced by percussion of its walls. It gives a metallic quality to the various moist râlea produced in or near the cavity, and it may accompany the heart sounds when heard through a pneumotherax, a lung cavity, or a flatulent stomach.

A. respira'tion. The amphoric character

A. respira'tion. The amphoric character accompanying the respiratory sounds, especially

the expiratory.

A. ring. The same as A. note.

A. vocal resonance. The amphoric note communicated sometimes to brouchophony in cases of pneumothorax.

**A. voice.** (F. voix amphorique.) The condition of amphoric resonance accompanying the voice when heard through the stethoscope; the same as A. vocal resonance.

Amphoricity. The condition in which an amphoric resonance is heard.

A., pleuritic. The condition in which an amphoric resonance is heard in the pleura.

**Amphoteramphodiplo pia.** ('Λμ-φότεροs, both of two; άμφω, both; diplopia.) The same as Δmphamphoterodiplopia.

Amphoteric. ('Aμφότερος, both of two; F. amphotere.) A term applied to substances that are indifferent, neither acid nor alkaliue, as gum and sugar.

Amphoterocot'yle el'egans. A sexually mature form of Cestoid worm found in the intestines of *Procellaria capensis*.

**Amphoterodiplo'pia.** ('Λμφόστερος, both of two; diplopia, double sight.) Double vision of both eyes.

Amphoterodiop sia. ('Λμφότερος, on both sides; δίς, twice; ὅψις, cyesight, sight.) Double vision.

Amphoteremor'phus penic'ulus. ('Λμφότεροs, double; μορφή, form. L. peniculus, a brush.) Λ sexually mature form of

Cestoid worm found in the intestines of Bagrus Goliath.

Amphyt'oky. ('Αμφί, both; τόκος, rth.) The production in Parthenogenesis of birth.) both male and female forms, as in Aphides on the setting in of cold weather.

Amplec'tens. (L. amplector, to embrace F. embrassante; G. umfassend, umgebend.) That

which clasps or embraces.

In Botany, usually applied to sessile leaves or to petioles which surround the whole of the

Amplec'tive. (L. amplecticus, from amplector, to clasp. F. amplectif.) Embracing;

clasping.

In Botany, usually applied to that arrangement of leaves (amplective prefoliation) in which a leaf completely envelopes those which are to appear after it. Examples are seen in the Aroideæ.

Amplex'ans. (L. amplexo, to embrace. G. umfassend.) A term synonymous with Am-

plectens.

Amplex'atile. (Same etymon.) A term employed in Botany by L. C. Richard to a radicle

that envelopes the embryo.

Amplexatio. (Same etymon.) Coition.
Amplexation. (L. amplexor, to embrace.) A method of treating fracture of the clayiele. It consists of resorting to certain attitudes, such as the forced elevation of the point of the shoulder, combined with the application of an irremovable baudage, as a plaster apparatus, the pressure of which can be conveniently extended over the whole upper limb and the lateral part of the neck. (Chassaignae.)

Amplexicau'date. (L. amplexo, to embrace; cauda, a tail. F. amplexicaude; G. umar-meschwanzig.) Term applied to insects having the tail entirely enveloped in the interfemoral membrane, as Phyllostoma amplexicaudata.

Amplex'icaul. (L. amplexicaulis, from amplezor, to embrace; caulis, a stem. F. amplexicaule; G. stengelumfassend.) Iu Botauy, a term applied to a sessile leaf or a petiole which, at its insertion, envelopes the whole circumference of the stem.

Amplexicau'line. (Same etymon.)

Embracing or surrounding the stem.

Amplexiflo'ral. (L. amplexiflorus, from amplexo, to embrace; flos, a flower.) this term Cassini designated the squamellæ of the clinanthium of Synanthereæ.

Amplexifo liate. (L. amplexo; folium, a leaf.) Having amplexicalline leaves, as Loranthus amplexifolius.

(L. amplexus, an embrace. Amplex'us. G. umfasst.) A term applied to an organ surrounded or embraced by another.

A synonym of Equitant vernation.

Also, a term for coition.

Ampliatiflorus. (L. amplio, to widen; flos, a flower.) Applied by H. Cassiri to the corona of Synantherea when composed of flowers with amplified corollæ.

Amplia tiform. (L. amplio, to widen; forma, likeness) In Botany, applied to organs of large dimensions, capable of enclosing or covering another.

Ampliation. (L. ampliatio, an extending. F. ampliation; I. ampliazione; G. Erweiterung.) Increase of size; as of the th racio cavity during inspiration, or of the abdomen in ascites.

Amplia'tus. (L. amplio, to wideu. G. crueitert, rergrossert.) Amplified; enlarged. In Botany, applied by H. Cassini to every corol of Synantherew, the limb of which, notably enlarged or dilated, is widened in all directions, as Cyunus segetum.

In Entomology, applied by Kirby to elytra when disproportionably broad at their extremity,

as Lycus fasciatus.

Amplicol'lis. (L. amplus, large; collis, neck.) In Botany, a term applied to the neck of an organ, as of a fruit, when larger than usual.

Amplificatio. (Lat.; from amplifico, to extend. G. Erweiterung, vermehrung.) An extending; a term formerly applied to a morbid extension of an organ.

Amplio pia. Same as Amblyopia.

Amplipen'nis. (L. amplus, full; penna, a wing.) In Entomology, having large or broad wings.

Am'plitude. (L. amplitudo, the wide extent of a thing. G. Weite, Umfang.) Fulness; especially applied to the extent or height of undulations, hence applied to the pulse, and to the height of the sphygmographic tracing of it.

Applied to the vibrations of sound or light, it signifies the distance of the extreme positions from the middle position; in other words, the extent of the vibration on either side of the position of rest.

The arc of the horizon comprised between the true point of east or west and the centre of a star at the instant of its rising or setting.

Am'po. A ferruginous earth eaten in Java

to prevent obesity. (Humboldt.)

Ampo'sis. (Άμπωσις, contraction for ἀνάπωσις, drinking up or swallowing down; a doubtful form from ἄμπωτις. L. resorptio; G. aufsaugung, einsaugung.) Absorption, resorption. A term applied by Hippocrates to indicate the retreat of the fluids from the circumference to the centre of the body.

Also, the ebb and flow of the sea.

Ampulla. (L. ampulla, a flask with narrow neck and bulged body. F. ampoule; I. and S. ampolla.) The dilated, or trumpet-mouthed termination of a canal.

In Chemistry, a term applied to all bulged-out

or flask-shaped vessels.

In Botany (G. Blase) this term has been applied to a small membranous bag attached to the rocts and immersed leaves of certain aquatic plants.

A. canalic'uli lacryma'lis. (L. canaliculus, a small channel; lacrima, a tear.) A slight eulargement of the lacrymal canaliculus at the angle of junction between the vertical and horizontal portions of its course. It is about two lines distant from the punctum in each lid.

A. chy'll. (L. chylus, juice, chyle. citerne de Pecquet; G. Milchsaftbehalter.) enlargement at the lower end of the thoracic duct;

the Receptaculum chyli.

A. chylif'era. (L. chylus, chyle; fero, to carry.) The Receptaculum chyli.

A. duc'tus lactif'eri. (L. ductus, a

A. duc'tus lactif'eri. (L. ductus, a leading; lactificrus, milk carrying) The dilatation of the excretory ducts of the mammary gland uear the nipple.

A. Fallo'piæ tu'bæ. (L. tuba, a straight trumpet.) The outer extremity of the Fallopian tube; that part of it which is near the ovary.

A. lactifera. (L. lac, milk; firo, to carry, G. Milchsackchen.) A small enlargement or dilatation of the several ducts of the mammary gland just before they enter the nipple. They serve as a reserveir of the secretion during the intervals of suckling. They are each from 5-8 nm. in diameter.

A. membrana'cea labyrin'thi. The dilatation of the membranous semicircular canal which occupies the ampulla of each osseous semicircular canal. The ampulla of the superior vertical semicircular canal is at the outer and anterior oritice, that of the posterior vertical semicircular canal is at its lower and posterior oritice, that of the horizontal semicircular canal is at its outer oritice.

A. op tici ner'vi. The dilatation of the subvaginal lymphatic space surrounding the anterior extremity of the optic nerve. It is connected with the supravaginal space by lacunæ in the sheath of the nerve.

A. os'sea externa. (L. osseus, bony.) The dilatation of the anterior extremity of the horizontal semicircular caual. It lies immediately beneath the superior ampulla above, in front of and to the outer side of the fenestra ovalis.

A. os'sea infe'rior. The dilatation of the outer limb of the posterior vertical semicircular canal. It opens into the inferior and posterior portion of the vestibule near the aqueduct.

A. os'sea labyrin'thi. The dilatation at one end of each of the semicircular canals of the internal ear.

A. os'sea supe'rior. Situated at the anterior extremity of the superior vertical semicircular canal. It opens near the roof of the vestibule.

A. va'sis deferen'tiæ. The sacculated enlargement presented by the vas deferens at its vesical extremity.

A. Vate'ri. The dilatation presented by the combined pancreatic and biliary ducts as they traverse the walls of the intestine.

A. vit'rea. (L. vitreus, of glass.) An alembic or retort.

**Ampulla'ceous.** (Same etymon. G. blasenformig, flaschinformig.) Having the appearance of an Ampulla.

Ampul'læ of Fallo'pian tube. See Ampulla Fallopiæ tubæ.

A. of mam mary gland. See Ampulla lactifera.

A. of semicir'cular canal's. The dilated extremities of the osseous and membranous semicircular canals. See under Ampulla.

A. of vas de'ferens. See Âmpulla rasis deferentue.

Ampullar. (Same etymon. F. ampul-

larre.) Having the appearance of an Ampulla.

Ampullari'idæ. A Family of the Suhgroup Holostomata. Shell conical, spherical, or discoidal, closing by a concentric, lamellar operculam; buccal and pulmonary cavities and respiratory tubes are present.

Ampullas'cens. A synonym of the Receptaculum chyti.

Ampullate. Possessing an Ampulla. Ampullula. (L dim. of ampulla.) Term applied to the expanded extremities of the vilbi of the intestines.

Amputa'tion. (L. amputatio, a pruning, from amputo, to cut away. Gr. ἀποτορό, ἀποκοπή; F. and S. amputation; I. amputation; G. Amputation, Abschneidung, Beschneidung.) The complete removal of any limb or segment of the hody, by the knife, ligature, or other means.

The chief reasons for which it is resorted to

are mortification, the presence of cancer or other kind of tumour, diseases of joints, especially those attended with suppuration, severe injuries of one of the extremities, as comminuted and compound fractures and dislocations, extensive necrosis and caries, burns, extensive laceration of skin, division of arteries and nerves, aneurysm, gunshot wounds, malformations and deformities, tetanus, ulcers. To prevent the loss of blood in the operation Esmarch has proposed that the limb, when practicable, should have an clastic bandage applied from below upwards, and a strong clastic cord wound tightly round the limb above the seat of operation, and this proceeding is now commonly practised. Amputations performed immediately after the receipt of an injury are termed primary; whilst, if some days be all wed to clapse, or inflammation to be established, they are termed secondary, and are always more serious. As a general rule it may be stated that the nearer the trunk an amoutation is performed the greater is the danger to life. The incision should, however, pass through healthy tissue, yet no more should be removed than is absolutely necessary.

The instruments and apparatus required in ordinary amputations are an Esmarch's bandage or a tourniquet, two or more knives of length proportionate to the cut to be made, a bistoury, saws, common and artery forceps, tenaculum, cutting pliers, scissors, osteotrite, needles, carbolised catgot, silver wire, horsehair or silk ligatures, lint, bandages, and strapping, a piece of strong sheeting to act as a retractor, sponges,

and hot water.

The various methods of performing amputations are described below under their several names. See Circular, Flap, Oval, Culaneous amputation, as well as Hey, Lisfranc, Syme, &c. In all the different methods the patient should, if possible, be rendered insensible by the use of anaesthetics. An elastic bandage may be applied from the extremity of the limb upwards with a view of pressing as much blood as possible out of the limb. The main artery or arteries may be compressed by the fingers of an assistant, or by the tourniquet. An assistant should take charge of the limb, supporting it, especially during the section of the bone, so that no splintering may occur. Another assistant is required to retract the flaps, and to pick up the divided ends of the vessels. The limb being removed, hæmorrhage from the blood-vessels is suppressed by catgut or other ligatures, or by torsion, or by the application of a styptic or cautery, or by a compress.

In the after treatment, early and complete closure of the wound is the object to be attained, with, in the case of the lower extremity, the preservation of such fulness and roundness of the stump as may enable an artificial limb to be worn. With these objects in view some, after applying sutures, leave the wound open to the air. Others endeavour to prevent the access of septic gerns. Others carefully arrange for thorough drainage of the wound by the method called pneumatic occlusion; others adopt the antiseptic method; whilst by many a few straps of adhesive plaster are placed across the edges of the wound, and a compress and bundage are applied. Some have recommended the application of acids; others of nitrate of silver, or chloride of zinc, or balsam of Peru, to the cut surface, but these are rarely employed. The

patient is generally kept on somewhat spare dict, as beef tea, broth, rice panada, during the first few days; but if there be much exhaustion, wine or spirits and stronger food may be given in

moderate quantity.

The early troubles and dangers of amputation are shock, hæmorrhage, retention of nrine, erysipelas, spasms of muscles, pain, indammation, osteomyehtis and retraction of muscles, and tetanus. The later troubles and dangers are secondary hemorrhage, pyamia, septicemia, necrosis, caries, exostosis from the cut surface of the bone, neuralgia, trembling of the muscles, bursa over the bone, fibroid degeneration of the museles, ulceration and malignant disease of the stump, shortening of the tendons, heetie. Each of these conditions requires early and prompt treatment. Shock must be met by the eareful administration of stimulants, warmth to the surface, and perfect rest; hæmorrhage, by the local application of cold, by pressure, position, or by cutting the sutures and applying pressure, torsion, a ligature, or the actual cautery, to the bleeding vessel. The employment of a catheter will relieve retention of urine; and the application of a moderately firm bandage will sometimes arrest painful jumpings and spasms of the divided muscles.

If superficial closure of the wound occur, and matter appear to have accumulated beneath, it must be allowed to escape, and a drainage tube

may be inserted.

Erysipelas may be combated by the administration of the perebloride of iron, quinine, or salicine, and by the local application of belladonna and glycerin, collodion, or nitrate of

Phlebitis and septicæmia may be treated with quinine, or salieine, or salicylate of soda, and

stimulants.

Conical stnmp sometimes involves a second operation for the removal of a portion of the protriding bone, or demands very careful adaptation of apparatus.

Neuromata, if very painful, may be removed by the operation of excision, but in some instances

require a second amputation.

A., cir'cular meth'od of. This, the most ancient method, was originally performed by division of all the parts at the same level, a proceeding that led to necrosis and conical stnmp. Now, a modification of the plan of double incision, suggested by Cheselden, is adopted. The surgeon, standing on the left side of the patient, with an amputating knife of appropriate length, held lightly, commences the incision just external to the median line of the limb, and divides with one cireular sweep the iuteguments and subentaneous tissue down to the museles, and forcibly draws them np or turns them back for about two inches; the muscles are then cut through and drawn up, after being freed from the bone for two inches more; the bone is then sawn through, splintering at the end of the section being avoided by the himb being well supported. In amputation of the forearm, both bones should be divided simultaneonsly; in amputation of the leg, the fibula should be divided first; in amputation at the joints, the cartilages should, if possible, be preserved.

The advantages of the circular operation are, that the soft parts are divided vertically to the plane of the limb. Arteries, veins, and nerves, are all cut transversely, and the wound in the muscles is exactly equal to their transverse breadth. The larger arteries are readily seized and tied, and the smaller ones retract and cease to bleed, or are twisted. The integuments are brought over the cut extremities of the museles, and unite to them and to each other by adhesion. The stump obtained by this method is in general inferior to that made by other plans of proeceding.

A., cuta'neous meth'od of. In this method of amputation, the flaps are composed exclusively of the integuments, and may be taken from either side of the limb, and be two or several in number. They are said to unite with less chance of suppuration; caries and necrosis are stated to be less frequeut; and they are thought to be better adapted to bear the pressure of an artificial limb. The chief objections are the liability of the skin to slough and to retract.

A., flap meth'od of. This operation consists either in transfixing the limb and cutting from within outwards, as in the thigh and arm; or, in commencing at the surface and cutting from without inwards; or, in a combination of these methods, as is usual in the case of the forearm, leg, and smaller segments of the lumbs. The flaps are generally made of the same length, and should be sufficiently long to form, after allowing for retraction, a good cushion for the bone. As a general rule, their length should be three fourths of the diameter of the limb. Before applying the saw to the hone, the knife is passed circularly round it, to divide all muscular fibres and the periosteum. The limb being removed, and the vessels tied, Professor Gross recommends that the principal nervous trunks should be again eut off a little above the level of the surface of the stump, in order to avoid, as far as possible, subsequent irritation and the formation of neuromata.

The advantages of the flap chiefly consist in the greater rapidity, and the consequently less pain and smaller loss of blood, with which it can be executed, points, however, of less importance since the introduction of anæsthetics and of Esmarch's elastic bandage. It has the advantage also that the cuts may be made to suit the special conditions of disease or accident, and thus a longer and more useful stump obtained.

Its disadvantages are, that the soft parts are all cut through obliquely; the smaller arteries cannot, therefore, retract, and a larger number of ligatures are required. The difficulty of finding the vessels is also increased; the ent surfaces of the muscles are large, and cannot be accurately adapted.

A., interme'diate. An amputation performed immediately, or soon after the supervention of inflammation, and before the establishment of suppuration.

A., intrau'terine. The same as A. spontaneous.

A., ma'jor. The operation on the two chief sections of a limb.

A., mi'nor. The operation on the fingers

A., mix'ed. A term applied to a combination of the flap with the circular method of opera-

A., obli'que meth'od of. See A., oval method of.

A., o'val meth'od of. In this mode of operation, which was practised by Scultetus, and is best adapted to amputation at the smaller joints, though occasionally employed for amputation at the larger, the flaps are formed by cutting from without inwards, or one is formed in this way, and the other by cutting in the opposite direction, or from within outwards. The two incisions are in the form of a V reversed, the angle of union falling a little above the place where it is intended to saw the bone or effect disarticulation. The tissues left undivided and periosteum are then divided by a circular cut, and the bone sawn through. By adopting this plan, the principal vessels and nerves can be left till the operation is nearly completed, thus diminishing the amount of bleeding, whilst the resulting stump is an excellent one. (Gross.)

A., patholog'ical. Amputation performed

on account of disease.

A., pri'mary. An amputation performed

immediately after the occurrence of reaction.

A., rectang ular method of. This method was suggested by Mr. T. P. Teale, and consists in substituting a long and a short rectangular flap for the double flap operation. The long flap should be made from the portion of the limb which does not contain important blood-vessels and nerves. The lines of the incision may be previously traced with ink. The large flap should be equal in length and breadth to one half of the circumference of the limb at the point amputated. The short tlap, which should be made last, should be one fourth the length of the long one. The parts having been dissected off in close contact with the periosteum, the leng flap will be found to be square, and to form a good cushion for the end of the bone. The short flap is attached to the long by several points of the interrupted suture, both in front and laterally, as is also the reflected portion of the long flap to its unreflected portion. No dressings are cmployed unless the wound gapes, when a few strips of adhesive plaster may be used for support.

A., sec'ondary. An amputation performed after the limb has passed through the several

stages of inflammation.

More frequently the term is used so as to include all amputations performed after the supervention of inflammation, thus including intermediate amputations.

A., sponta'neous. This occurs neensionally in the feetus as the result of constriction of some of the limbs by a band of plastic matter arising from the amnion or by the umbilical cord. The division may be complete or partial.

Spontaneous amputation occurs in the remark-

able affection termed Ainhum.

A., subperios teal. The plan by which a longer er shorter flap of periosteum, attached or not to its superficial surroundings, is retained on the upper and lower surface of the bone to cover the cut end; necrosis of the end of the bone, and adhesion of the skin to it, is by this means said to be avoided.

A., syn'chronous. In some cases of accident it becomes necessary to amputate two or more limbs simultaneously, or in immediate succession This constitutes what is termed the synchronous double operation. It may be performed by two surgeons, er by one alone. It is founded on the assumption that the shock and hæmorrhage are less, recovery more rapid, and mental anxiety to a considerable extent removed.

A., traumatic. Amputation performed

on account of injury.

Am'ra. (Sansk ) The Mangifera indien. Also, the Bengali and Hindu name for the Spondias mangifera.

Amrata'ka. (San-k.) The Spondias mangifera.

Amrool. (Beng., Hind.) The Oxalis corniculata.

(Hind.) The Psidium guayava. Amrut. Am'sterdam, Isle of. One of the group of volcanic islands of Western Australia, proup of voicante islands of western Austrana, noted by John Barrow for its numerous hot springs. The waters appear to be both chalybeate and sulphuretted, the temperature in different springs varying from 35°-45° C. (95°-113° F.).

Amuctica. ('Αμυκτικός; from αμύσσω, to tear.) Preveeative medicines, specially those

which provoke expectoration.

Amuk-kara. (Cing.) The Physalis sommitera.

Amul changerie. The Hindustani name of an acid fruit, probably a species of Solanum. It enters into the Indian Materia Medica, and is said to be stomachie, to promote digestion, and to cure relaxation of the bowels. (Waring).

Amulbedh. The Hindustani name of a very acid fruit, probably a species of Citrus. It is said to be aperient, and to prove useful in promoting digestion and in relieving rheumatism.

Amuleh. (Pers.) The Phyllanthus emblica. Am'ulet. (L. amuletum, from amolior, to put away. Gr. βασκάνιον, περεαπτον, φυλακτήριον; F. amulette; I. and S. amuleto; G. amulet.) Term for a gem or stone of some particular form, or having mystical characters engraved upon it; or for a piece of paper with certain words in-scribed upon it, formerly believed to have the power of endowing with some special giftstrength, eloquence, courage, &c., or of guarding against some evil. They were used as prophylactic against various diseases.

Amulki. (Sansk.) The Phyllanthus emblica.

Amul'la. The native name in Queensland of the Myoporum diffusum, the fruit of which is edible though slightly bitter.

Am'ulum. The same as Amylum. Am'ulung ka'lung. (Tamul.) (Tamul.) Indian name of the root of the Withania somnifera. (Dunal.)

Amur'ca. ('Aμόργη. L. amurea; G. Ochlhefen Ochlsalz ) Lees of wine, and also the seum of the olive after the expression of the oil. Used as an application to ulcers. Also, applied to a kind of expectoration, and to fæces rescubling the lees of olive.

Amur'ga. The same as Amurca.

Amu'sa. A synonym of the Musa paradisiaca.

Am'ussat, J. Z. French surgeen, b. 1796, d. 1856.

A.'s operation for artificial a'nus. This operation consists in the re-establishment of an anus in its normal position. It is applicable to cases of complete anal atresia, to recto-vaginal atresia, and to ano-rectal atresia. The child is placed on the wack on a hard cushion, with the thighs raised and separated. The perincal region is carefully explored with the fingers, assisted by a catheter in troduced into the bladder or vagina. An incision is made in the middle line from the central point of the perineum to the tip of the eoccyx through the skiu and subjacent tissue. As the infant cries the projection or the peuch-like closed extremity of the rectum can usually be felt, but the dissection, which should be carefully conducted, may require to be extended to the depth of an inch or more. When recognised, the intestine must be drawn down with a hook, or hy means of a loop of silk made to pass twice through the wall with a needle. Two wire sutures are passed through the integuments and the intestine, which is then divided in the middle line, and the mucous membrane and skin are sutured together on either side. This operation succeeds best when undertaken at a very early period after birth, and when the extremity of the rectum is near the surface. In other cases, it is better to make the artificial anus in the inguinal region.

A.'s operation of colot'omy. The establishment of an artificial anus in the lumbar region, by making a transverse incision outside the quadratus lumborum muscle and midway between the crest of the ilium and the last rib, through the parietes of the abdomen and the

colon.

Amycetosep'tin. See Amykosaseptin. **Am ychæ.** ('Aμυχή, scarification. G. Schropfwunden.) Slight and superficial wounds; scratches.

**Am'yche.** ('Αμυχή, a scratch.) Slight exulceration, excertation, or abrasion. Hipp. l. de

Int. Affect. xxxv, 7, and in Coac. prænot. 444.

Amyc'tic. ('Αμυκτικόs, provocative.) Excoriating; irritating; vellicating. Applied by Joh. Tagaultius, Instit. Chir. vi, ii, p. m. 467, and Aurelianus, de Morb. Chron. ii, 6, to irritating medicines, used for the purpose of exciting torpid parts into action.

Am'ydes. Name by Oppel for a Family

established by him in the Chelonian reptiles.

Amydri'asis. (A, intens.; mydriasis.) The same as Mydriasis.

Amydro'sis. ('Αμύδρως indistinct.) Same as Amaurosis. ('Αμύδρωσις, a making Am'ydum. A synonym of Amylum.

Amyelencepha'lia. ('A, neg; μυελός, marrow; ἐγκέφαλος, the encephalon.) In Teratology, the complete absence of the central nervous system.

Amyelia. ('A, neg.; μυελός, marrow.) In Teratology, a monster feetus, with partial or

complete absence of the spinal marrow.

Amyeloner via. The same as Amyelo-

Amyeloneu'ria. ('Λ; μυελός; νεῦρον, a nerve. F. amyelonevrie.) Defective action, or paralysis of the spinal cord. (L. and R.)

Amyelotroph'ia. The same as Amyelotroph'ia.

elotrophy.

**Amyelot'rophy.** ('A; μυελός; τροφή, nourishment. F. amyelotrophie.) Atrophy of the spinal cord.

Amyg'dala. ('Λμυγδάλη, the almoud. F. amande; I. mandorla; S. almendra; G. Mandel, mandelkern ) The almond; the fruit of the Amygdalus communis.

Also, a synonym of the Tonsil.

A. ama'ra. B. Ph. (L. amarus, bitter. F. amande amère; I. mandorle amare; S. almendra amarga; G. bitter Mandel.) Bitter almond. The seed of the Amygdalus communis, var. amara, brought chiefly from Mogador. It is hitter to the taste, and has a peculiar odour when moist. In addition to the constituents of the sweet almond it contains amygdalin, which, when mixed with emulsin and water forms hydrocyanic acid. An emulsion is used as a sedative application in irritable skin diseases; and internally in troublesome cough, in ague, and in tapeworm. Bitter almonds sometimes produce urticaria, and in large quantities may produce poisonous symptoms. They are used as a flavouring in

cookery.

A. dul'cis. B. Ph. (L. dulcis, sweet. F. amande douce; I. mandorle dolee; S. almendra dulce; G. süss Mandel.) The sweet almond. It contains more than 50 per cent. of oil, 24 of a form of albumen called chulsin, with a little sugar and gum. Almonds are nutrient and demulcent; for the former purpose they are used, because of the absence of starch, as a food in diabetes, and for the latter as a mixture in catarrhs, and as a vehicle for other medicines.

The pharmacopocial name (Ed., Dub., and U.S.A.) of the fruit of the Amygdalus communis, varieties  $\beta$  and  $\gamma$  (De Candolle), or

sweet.

A. of cerebel'lum. A rounded lobe ou each side of the uvula of the cerebellum.

Amygdala'ceous. (L. amygdala, an almond. G. mandelartig.) Resembling or related to the almond.

Amyg'dalæ cerasorum. (L. cerasus, the cherry tree. F. noix des cerises, noyaux des cerises; G. Kirschenkerne, Kirschenmundeln.) The kernels of cherry stones.

A.Jordan'icæ. A synonym of Amygdalus

communis, var. duleis.

A. pas'ta. (L. pasta, paste.) See Almond paste.

A. pecunia'riæ. (L. peeuniarus, belouging to money.) The fruit of the Theobroma eacao or chocolate hean.

A. persico'rum. (L. persieus, Persian F. noix des pêches; G. Pfirsich-Kerne, Pfirsich mandeln.) The kernels of peach stones.

A. pi'neæ. (L. pineus, belonging to the pine. F. noix or amandes de piquier, pignons; G. Pinienmandeln, Harzmandeln, Pignolen.) Pine nuts obtained from the Pinus pinea, Linn.

A. placen'ta. (L. placenta, a cake.) See Almond cake.

A. terrae. (L. terra, the earth. F. racine de souchet esculent, amandes de terre; G. essbare Cyperngraswurzel, Binsennuss.) The root of Cyperus esculentus.

Amyg'dalatc. (Amygdala.) Prepared

from or mixed with almonds.

(G. Mandelmilch.) Amygdala'tum. Term for almond emulsion.

Amygda lea. (G. Mandel- or Steinfruchtgewachse.) A Suborder of the Nat. Ord. Rosacca, or a Family of the Order Rosactora, called also Drupacea and Prunca. They are trees or shrubs, with simple leaves and free stipules. Calyx deciduous; carpel solitary, not adherent to the calyx; style terminal; fruit a drupe; seed suspended. This Suborder comprehends all the Rosaceæ that have stone fruit, as plums, peaches, almonds.

Amyg'dali fruc'tus. (L. fructus, uit.) The fruit of the almond tree. See fruit.)

Amygdala.

A. per'siese flo'res. Belg. Ph. flowers of the Amyydalus persica.

Amygdal'ic ac'id. C20 II 28 O13. Formed by boiling amygdalin with an alkali.

Amygdalif erous. (L. amygdala, an almond; fero, to bear.) In Botany, applied to a plant that yields almonds.

In Geology, applied to rocks containing pale oval substances of different composition.

**Amyg'dalin.** (' $A\mu\nu\gamma\delta\dot{a}\lambda\eta$ , an almond. G. Bittermandelstoff.)  $C_{20}H_{27}NO_{11}+3H_2O.$  A

glucoside obtained in two different forms, viz. in the crystalline form, in which state it is contained in the seeds of Amygdalus communis, A. persica, Prunus domestica, P. laurocerasus, P. padus, and from the leaves, dowers, and bark of the list; and in the amorphous form, in which form it exists in the leaves of Amygdalus persica and Prunus laurocirusus, and from the seeds of P. cerasus. Its existence has been deduced from the presence of hydrocyanic acid in the distillate of the following plants:—Prunus capricula (leaves); P. spinosa (flowers and seeds); P. virginiana (bark); Amelanchier seeds); I. crymonia (wars), Amecanenary vulgaris, Cotoneuster vulgaris, Crataegus oxyacantha, Pyrus aucuparua, hybrida, and torminalis (flowers), Spiræa aruneus, Japonica sorbifolia (leaves). It is obtained by extracting with alcohol, and precipitating with ether. It erystallises from alcohol in white shining laminæ, has a taste at first sweet and then hitter. It dissolves in 15 parts of water and in 12 parts of hot alcohol of 0.939. By boiling with dilute acids and by contact with water and emulsin or synaptuse, a ferment contained in bitter almonds, amygdalin is resolved into bitter almond oil, glucose, and hydrocyanic acid,  $C_{20}H_{27}NO_{11} + 2H_2$   $O = C_7H_6O + CNH + 2C_6H_{12}O_6$ . Bitter almonds contain from  $1-2\frac{1}{2}$  per cent. of amygdalin.

When taken into the stomach it is decomposed in the body, and appears in the urine as formic

acid.

Amygdalina. See Amygdalin. Amygdalina'ccous. Having flowers like those of Amygdalus.

Amygdalin'eous. Same as Amygdalinaceous.

Amygdali'num. See Amygdalin. Amygdali'nus. Same as Amygdalinaccous.

Amygdali'tis. (Amygdala, the tonsil. F. amygdalite.) Inflammation of the tonsils.

Amyg'dalo-glos'sus. (L. amygdala, tonsil; glossus, tongue.) A muscle of the tongue, arising from that part of the pharyngeal aponeurosis which invests the outer surface of the tonsil, descends between the tonsil and the pharyngoglossus to the base of the tongue, where it changes its direction and runs transversely to the median line, appearing to meet its fellow of the opposite side. It aids the stylo-glossus in raising the margin of the tongue and rendering the dorsum concave.

A.-hypertroph'ia. (L. Amygdala, ton-Gr. ὑπέρ, excessive; προφή, nourishment; Mandelgeschwulst.) Enlargement of the G. Mandelgeschwulst.) tonsils.

Amyg'daloid. (L. amygdalus, the almond; sloos, like. F. amygdaloide; G. mandelsteinartig.) Resembling an almond: or containing white bodies, like almonds, distributed through it.

In Botany, this term has been applied by Fée to plants or products resembling in smell that of

the bitter almond.

In Geology, igneous rocks containing small oval cavities which are, partially or entirely, filled with agate, jasper, calcareous spar, or other mineral.

Amygdalon'cus. (Amygdala, the tonsil; ογκος, a mass.) Enlargement of the tonsil. Amygdalopath'ia. (Amygdala; máttos, disease.) Disease of the tonsils.

Amygdalopletho'ra. -(Amygilala;πληθώρη, fulness.) Congestion of the tonsils. Amyg'dalotome. (Δmygdala; τομή, a cutting, from  $\tau i \mu \nu \omega$ , to cut.) An instrument for removing the tonsil; a tonsillotome.

Amyg dalus. (G. Mandelbaum.) Genus of the Section Prums, Nat. Ord. Rosacea, characterised by baving a drupe with coarsely furrowed and wrinkled putamen; young leaves conduplicate.

A. commu'nis. (L. communis, common. F. amander; 1. mandorla; S. almendra; G., Dan., and Swed. Mandel; Port. amendo; Arab. Lonz; Dut. amundelboom; Sans. Inghardi; Turk. Badem aghadji.) Nut. Amygdalew, or Drupacew, or Rosacew. Nat. Ord. almond tree. A tree originally growing in the South of Europe and Barbary, and now cultivated in Provence. Gen. Char. Flowers, solitary; calyx, 5-eleft, inferior; petals 5; drupe downy, with a tough fibrous sarcocarp; leaves oblonglanceolate, serrulate.

A. communis (var.) ama'ra. (L. amarus, bitter; F. amandiers amere; S. almendra amargu; G. Bitter mandelbaum.) Bitter almond tree. A variety of the A. communis, characterised by having the style as long as the stamens, and the petioles spotted with glandulæ. The seeds contain about 28 per cent. of oil, 30 of emulsin or synaptase and  $1-1\frac{1}{2}$  of amygdalia.

A. communis (var.) dul'cis. (L. dulcis, sweet. F. amande douce; I. mandorla dolce; S. almendra dulce; G. süss mandelbaum; Dut. zoete amandelen.) Sweet almond tree. A variety of the A. communis, in which the style is much longer than the stamens, and the glands, instead of being on the petioles, are at the base of the dentations of the leaves. The seeds contain 54 per cent. of fixed oil, 24 of albumen, emulsin, or synaptase, 6 of uncrystallisable sugar, 5 of pellicic, 4 of fibrous matter, 3 of gum, 3.5 of water, and 0.5 acetie acid and loss. Used in the form of emulsion, as a demulcent in eatarrhal affections, and to make a kind of bread. By Dr. Pavy in diabetes. The pharmacopocial preparations are Mistura Amygdalæ, Oleum Amygdalæ, and Pulvis Amygdalæ comp., containing almonds 8 parts, sugar 4, and gum arabic.

A. per'sica. (L. persicus, Persian; F. pêcher; I. persico; G. Persich.) The peach. The nectarine. Leaves oblong-lanceolate, serrulate; flowers solitary; drupe downy or smooth, with a tender, succulent, sapid sarcocurp. Hab. North of India, Persia. The fruit is nutritious and refrigerant. The blossoms have been employed

as a laxative and vermifuge.

A. sativa. (L. sativus, that which is sown.) A synonym of A. communis.

Amyg'mus. (Λμυγμόs, a rending; from αμυσσω, to scratch.) Scartication.

Am'ykos. An antiseptic liquid made of infusion of cloves, borie acid, and glycerin.

**Amykosasep'tin.** (A, neg.; mucor, mildew;  $\sigma \tilde{\eta} \psi \iota s$ , fermentation.) An antiseptic solution of borget in a decoction of cloves.

Am'yl. C<sub>3</sub>H<sub>11</sub>. The fifth term of the series of alcohol radicles, Call<sub>2</sub>n<sub>+1</sub>, the presence of which is admitted in the derivatives of amylic alcohol. When attempts are made to isolate it, it doubles its molecule and gives the diamyl C<sub>10</sub>H<sub>22</sub>, identical or isomeric with hydride of decyl. It was first obtained in the free state by Frankland, by the action of zine amalgam upon iodide of amyl, the reaction being completed by the action of potassium, or by the action of sodium upon iodide of amyl, or by the electrolysis of caproate of potassium, or lastly, by the destructive distillation of certain kinds of coal. It is a transparent colourless liquid, of agreeable smell and burning taste. Sp. gr. 0.77 at 11°C. (52°F.); boiling point 155°—1.9°C. (311°—318°F); vapour density 4.90. It is miscible with alcohol, unmiscible with water. It is not acted on by fuming sulphure acid, and is only slowly attacked by nitric and nitro-sulphuric acids.

A. ac'etate. Has a very similar action to amyl nitrite, but is much less active.

A. al'cohol. See Alcohol, amylic. A. chlo'ride. C<sub>3</sub>II<sub>11</sub>Cl. This compound, which boils at 102° C. (216° F.), has been used as an anesthetic.

**A.e'ther.**  $(C_5H_{11})_2O$ . A colourless liquid, obtained by the action of amyl iodide on potassium or sodium amylate. It boils at  $176^\circ$  C.  $(318^\circ8^\circ F_*)$ .

A. hy'drate. A synonym of Alcohol, amylic.

A., hy'drated ox'ide of. A synonym of Alcohol, amylic.

A. By dride. C<sub>5</sub>H<sub>11</sub>H. A volatile liquid, occurring, along with other hydrides, in American petroleum; it may be obtained by heating amyliodide with zine and water. It boils at 30° C.

(86° F.) It is an anæsthetic.

A., hy'druret of. A synonym of A. hydride.

A. i'odide. Possesses the same properties in a minor degree as *Amyl nitrite*, and produces tremors, like those caused by amylic alcohol.

A., ni'trate of. A synonym of A. nitrite. A. ni'tris. See A. nitrite.

**A.** ni'trite.  $C_{10}H_{11}O,NO_3$  or  $C_5H_{11}NO_2$ . A compound produced by the action of nitric or nitrous acid on amylic alcohol. It is of yellowish colour, and possesses a peculiar odour. Sp. gr. 0.877, boiling point 96° C. (204.8° F.), insoluble in water, very soluble in alcohol. When inspired, a powerful cardiac stimulant. It increases the frequency of the pulse, and by paralysing the vasomotor branches of the sympathetic nerves, especially of the head and neck, from the periphery towards the centre, causes dilatation of the vessels, and diminution of the blood pressure; it ultimately causes paralysis and diminishes mus-cular contractility. It prevents hæmoglobiu from giving up its oxygen. It has been found useful in angiua pectoris, in spasmodic asthma, cardiac dyspnœa, syncope, tetanus, epilepsy, laryngeal spasm, colic and enteralgia, headache and facial neuralgia, and has been used as an antidote in cases where toxic doses of chloroform have been administered, and has been recommended in strychnia poisoning. Care, however, should be taken in giving it to elderly people. Dose, 2 to 5 minims, carefully inhaled.

A. ox'ide. A synonym of A. ether.

A., vale'rianate of. A preparation recommended as a good and pleasant substitute for the more disagreeable preparations of valerian.

Amyla'cea cor'pora. (I. amylum, starch; corpus, body. F. corpuscules amylac's.)
See Amyloid bodies.

Amyla'ceous. (L. amylum, starch. G. starkemehlartig.) Consisting of or containing starch.

A. bod'ies. See Amyloid bodies.

Also, a term including starch and its congeners.

Amyl'amine. (F. amyliaque.) C<sub>5</sub>H<sub>13</sub>N. Is obtained by distilling isopeutyl isocyanate with

potash. It is a colourless liquid, of ammoniacal odour, slightly soluble in water, which it renders alkaliue. It boils at 95° C. (203° F.), and has a sp. gr. of 0.7503 at 18° C (64.4° F.)

sp. gr. of 0.7503 at 18° C. (6±4° F.)

A. hydrochlo'rate. C<sub>5</sub>ll<sub>13</sub>NHCl. Recommended in doses of half to one gramme to reduce febrile action. In small doses, in animals, it lowers the force and frequency of the pulse and reduces the temperature; in large doses it produces convulsions and death.

Amylate of am'yl. A synonym of Amyl ether.

A. of hy'drogen. A synonym of Alcohol, amylic.

Amyl'ea fari'na. A synonym of Amylum.

Am'ylene. C<sub>5</sub>H<sub>10</sub>. (G. amylen.) This hydrocarbon is a homologue of ethylene or obe-fiant gas and the fith term of the series CnH<sub>2</sub>n, and is produced by the dehydration of amylis alcohol by sulphuric acid, phosphoric anhydride, or chloride of zinc; also by the dry distillation of amyl sulphate of calcium. It is a transparent, colourless, very thin liquid, having a faint but disagreeable odom. Sp. gr. 0.663 at 0° C. (32° F.), boiling at 35° C. (95° F.) It possesses anexthetic properties, and has been tried as a substitute for chloroform, but in several instances it has led to fatal results.

Amyle'num. See Amylenc.
A. hy'dricum. See Amyl hydride.
A. nitro'sum. A synonym of Amyl nitrite.

Amyl'eon. Amylum.
Amyl'eous. A term synonymous with
Amylaecous.

Am'yli iodi'dum. See Amyl iodide.
A. iodure tum. A synonym of A. iodidum.

A. ni'tris. See Amyl nitris. A. nitri tum. See Amyl nitrite.

Amylic. (L. amylum, starch.) Of, or belonging to starch. Applied to an acid obtained from starch moistened in water, and submitted to gentle heat in a retort with an equal weight of peroxide of manganese.

A. al'cohol. See Alcohol, amulic.
A. e'ther. A synonym of Imul other.
A. e'ther, ac'etate of. U.S. Ph. See
Amul acetate.

A. e'ther, vale'rianate of, U.S. Ph. See Amyl, valerianate of.

A. ni'trite. A synonym of Amyl nitrite. Am'ylide cell. A term used by Kützing as synonymous with Primordial utricle.

Am'ylin. A synonym of Glycogen. Also, a term for that part of a granule of starch which is soluble in water.

Amylina. The same as Amylin.
Amylinum. The same as Amylin.
Amylinen. A synonym of Amylina.
Amyllier. An old name of the almond tree, Amygdalus communis.

Amylobac'ter. A term used by Trecal for certain microscopic forms, probably Micrococci and Bacteria, which are found in the cells of plants.

Am'ylo-cel'lulose. One of the constituents, according to Nageli, of starch granules, the other being granulose; it is coloured copperred by iodine. The existence of these substances is by no means certain.

Amylogen. A term applied by Delffs to that part of granulose which is soluble in water.

Am'yloïd. (L. amylum, starch; εἶδος, G. starkenmehlahulich.) The amyloid of Schleiden and Vögel is a starch-like substance, forming the cell-walls in the cotyledons of various leguminous plants, as in those of Scholia latifolia and speciesa, Hymenæa courbaril. Alcanna urens, and Tamarindus indicus. When dry it is soft and horny, but on boiling with water it swells up and forms a paste, which is coloured yellow with watery solution of iodine, but blue with alcoholic solution of iodine. It is soluble in hot water and in solution of potash, but is insoluble in alcohol and

ether.

The amyloid of Virchow is an albuminous substance, found in pathologically degenerated spleen and in cerebral granulations, from which it may be obtained by treatment with water, pure spirit, and alcohol acidulated with hydrochloric acid, artificial gastric juice, and again with acidulated alcohol and ether. It remains as a vitreous mass, which neither dissolves nor swells up in water or diluted acids, though dissolving, like albumen, in strong nitric or hydrochloric acid. It swells up in deluted alkaline solutions and ultimately dissolves, forming a cloudy fluid. On hoiling with diluted potash it forms potash-albuminate. It undergoes no change in artificial gastric juice, nor by decomposition. In the purest condition as yet obtained it contains 53.6 per cent. carbon, 15.5

nitrogen, 1.3 sulphur. (Fehling.) A. bod'ies. Round or oval bodies, varying in size from 1-25th to 1-650th of an inch, composed of concentric layers of a homogeneous material, surrounding one or more granular nuclei, without any disposition to coalesce. Under polarised light they present, like starch grains, a black cross; with feeble solutions of iodine they give a blue reaction, especially if a little sulphuric acid be added; when the acid is more concentrated, the colour passes into violet or reddish or blackish brown. They occur in various organs, especially in the nervous substance and in the They have also been noticed in the degenerated connective tissue surrounding the capillaries of the grey matter of the brain in the general paralysis of the insane. The corpuscles found in the prostatic liquid and in the canals of the epididymis are large, yellowish, or brownishred, transparent, and become of a greenish tint on the addition of a solution of iodized iodide of potassium; those that are of a brownish colour are searcely affected, but when sulphuric acid is added they become purple or yellowish; with dilute sulphuric acid alone they become blue, passing into indigo. They dissolve in sulphuric acid, and also in potash solution when heated.

Some consider them to be primarily of a composition analogous to starch, though admitting that this material may be replaced by azotised calcareous and colouring substances (Paulicky). Others, as Robin, regard them as being transitional between ternary compounds and nitrogenous substances, in favour of which is the lively red colour they give when acted on by Millon's reagent, and the orange tint of xauthoproteic acid they assume when treated with ammonia and nitric acid. They are insoluble in alcohol, by which they are sharply dis-tinguished from cholesterin and fatty bodies generally.

A. degenera'tion. (F. amyloide degene-

rescence, metamorphose lardacée; G. Amyloidentartung, Speek-krankheit.) Sometimes called waxy or lardaceous degeneration. A form of disease most frequently observed in the spleen, liver, and kidney, but also seen in the lymphatic glands, the intestinal mucous membrane, the great omentum, and the adrenals, and more rarely in the pancreas, thyroid body, in the heart and muscular tissue of the intestines, in the lungs, muscles of animal life, and even in the skin. The occurrence of the disease is an indication of profound impairment of the nutritive functions, and it is most commonly developed in the course of chronic suppurative diseases, such as chronic disease of bones, pulmonary phthisis, pyelitis, and such like, and in tertiary syphilis. It has been noticed in chronic diarrhea. The organ affected, as the liver or kidney, when examined with the naked eye, is enlarged from the infiltration if a translucent material, and at the same time is paler than natural, partly from the pressure of the deposit, partly from diminished supply of blood. Its substance is firm and resistant, the surface of its section polished and homogeneous. so that in advanced cases neither the vessels nor the proper tissue of the gland, nor the connective When the distissue, can be distinguished. When the dis-eased structure, except in the very early and late stages, is touched with a solution of iodine it becomes of a dark red-brown colour, which gradually fades and leaves the surface its original colour; with care, a blue colour may frequently be obtained by touching the iodine-stained surface with a drop of concentrated sulphuric acid; in this latter respect the reaction is similar to that of cholestering and cellulose; but with starch, iodine alone produces a blue colour. Amy loid matter is also stained blue by solution of sulphate of indigo. Microscopic examination has shown that the smaller arteries are first affected, the deposit being formed in the middle coat. The unstriated muscular-fibre cells are replaced by a compact homogeneous material, and the vascular wall is transformed into a uniform friable mass, through which the blood is tran-mitted with difficulty or not at all. By degrees, this extends to the cells and intercellular structure of the affected organs; and gradually the nuclei, together with the cell-walls of adjoining cells, become obliterated. Amyloid degeneration is frequently accompanied by a deposit of fat or of cholesterin in the substance of the tissue. In the case of the spleen, the corpora Malpighii, and in the kidney, the glomeruli are primarily affected; the term sago-spleen being applied at a certain stage to the former, and the affection constituting one of the forms of Bright's disease in the latter, organ. In 1200 autopsies, Wagner met with 48 cases of amyloid degeneration, 13 of which occurred in males from 20 to 30 years of age.

Late observations clearly show that amyloid substance is not a starch, but a nitrogenous body; its exact composition is not known, but it is generally regarded as a modification of albumen or fibrin and a new formation. It has been suggested that it is the result of diminution of

potash salts in the blood.

A. mat'ter. A synonym of Glycogen.
M'vloïds. Non-nitrogenous starchy Am'ylords. foods.

Amylolyt'ic. (L. amylum, starch; λόω, to loosen.) Term applied to ferments that are capable of converting starch into dextrine and sugar, like those of the saliva and pancreatic Am'ylen. According to Maumené, a body which, in grape-juice, is combined with a substance he calls zymoproteine; these substances determine, by their separation in contact with air, fermentation. (L. and R.)

Also, a synonym of Amulum. Also, a synonym of Glycogen.

Amylonin. A term applied to a substance produced by the united action of sulphunic and nitrie acids on starch.

Amyloni'trous e'ther. A synonym of Amyl nitrite.

Amylop'sine. A name given by Defresne to that ferment of the pancreatic juice which converts starch into sngar.

Amyloscle'ma. (Amylum; σκλήμα, dryuess. G. Starkemehlkleien.) Bran; the refuse of starch.

Amylo'ses. One of three classes, the others being sucroses and glucoses, into which the earbo-hydrates have been divided. They are starch, glycogen, dextrin, innlin, gums, cellulose, and tunicin.

Amylum. B. Ph. ('Anndor, fine meal, prepared more carefully than by grinding; from a, neg.: μύλη, a mill. F. amidon; I. amido; S. almidon; G. Stärkemehl, Starke.) The starch from the seeds of common wheat, Triticum vulgare, It is white, opaque, and pulverulent, and, as found in the shops, in columnar masses. It is insoluble in alcohol, ether, and cold water; with boiling water it forms a gelatinous fluid, which, when dried in thin layers, is converted into a yellowish horny substance like gum. Starch is nutritive and demulcent. It is used as a powder to sore surfaces, dissolved in glycerin as a vehicle for other medicines, and in boiling water as a demulcent application or injection.

A. al'bum. (L. albus, white.) starch.

A. america'num. A synonym of Arrowroot.

A. a'ri triphyl'li. The starch from the tuber of the Arum, or Caladium sequinum, used as a substitute for arrowroot.

A. ave'næ. (L. avena, oats. G. Haferstärke.) Oat starch. Starch obtained from the Avena sativa. It is composed of simple and compound granules; the former are spheroidal or barrel-shaped; the latter contain from 2-70, nsually regularly 3-6-angled granules, 0.003-0.008 mm, in size.

A. canna'ceum. (L. canna, a reed.) synonym of Tous-les-mois, a starch obtained from the Canna edulis.

A. curcu'mæ. (G. Tikmehl.) East Indian arrowroot, obtained from the tuber of Curcuma angustifolia and C. leucorrhiza.

A. en'ulæ. Starch from the root of ele-campane. See Inulin.

A. glutino'sum. (L. glutinosus, gluey.) A synonym of Mucilago amyli.

A. hele'nii. The same as A. enula.
A. hor'dei. (L. hordeum, barley. G. Gerstenstärke.) Starch made from barley.

A. ioda'tum, Russ. Ph. (G. Jodstärkemehl.) Pure iodine 1 part, spiritus vini alcoholisati 10 parts; mix, and rub down with starch 29 parts. Dose I-5 grammes.

A. ioda'tum solu'tum. The A. iodatum after being heated for some time in a water bath. when it becomes liquid from the production of dextrin and glucose.

A. ipecac'uanhæ. A synonym of Ipecacuanha, white.

A. leguminosa'rum. (L. legumen, pulse.) Starch obtained from peas, beans, lentils, and other leguminons plants.

A.ma'idis. (G. Hulsenfrüchtestarkemehl.) Starch obtained from maize, or Indian corn.

A. mandiocæ. The starch of the Jatropha

manihot, or Mandioc plant.

A. man'ihot. (G. Cassawasturke.) A. synonym of Tapioca, which is obtained from the Jatropha manihot.

A. maran'tæ. (F. amidon de marante; feilwurzelstärke.) West Indian arrowroot, G. Pfeilwurzelstärke.) from the Maranta arundinacea.

A. maranta'ceum. A synonym of Arrowroot, a product of the Maranta arundinacea. A. nitro'sum. A synonym of Amyl ni-

A. ory'zæ. (L. oryza, rice. G. Reisstärke.) Rice starch.

A. palma'ceum. (L. palma, a palm-tree.) A synouym of Sago, the product of several species of Palma.

A. palma'rum. (L. palma, a palm-tree.) Sago.

A. quer'neum. (L. querneus, belonging to the oak.) A synonym of Racahout; a starch which, according to some, is obtained from the acorn of the Quercus ilex.

A. sa'gi. Sago.

A. sagitta'riæ. Arrowroot.
A. seca'lis. (L. secale, rye. G. Roggen-

stärke.) Starch obtained from the rye.

A. sola ni. (F. fécule de pomme de terre, f cule de parmentière; G. Kartoffelstarke.) Potato starch, Solanum tuberosum.

A. sola'ni tubero'si, Belg. Ph. Potato

A. tac'cæ. Tahiti arrowroot, obtained from the Tacca pinnatifida.

A. tritic'eum. (L. triticeus, of wheat.) A term for the starch of wheat.

A. trit'ici. (L. triticum, wheat. F. amidon ; G. Weizenstärkemehl.) Wheat starch.

Amy'lus. The same as Amylum. Am'yon. The same as Amyos.

Amyos. (A, neg.; μῦς, a muscle. G. muskellos, fleischlos.) Without muscle or flesh; fleshless. Applied to limbs in a state of extreme emaciation, so that they appear to be without flesh or muscle altogether.

('A, neg.; μῦς, a Failure of muscular Amyosthe'nia. muscle; σθένος, force.) Failure of muscular power. Impaired contractibility of the muscles without obvious disease of the muscles or verves. It is best seen in cases of anæmia, chlorosis, dyspepsia, hysteria, and hypochondria. The treatment should be directed both to the improvement of the general health by tonics and hydrotherapentic means; and of the local debility by active and passive movements, the application of electricity, and shampooing.

(Same etymon. F. Amyosthenics. amyostheniques.) Medicines which depress muscular action. They are divisible into general and special amyosthenics; to the former belong belladonna, opium, curare, nicotine, chloral, chloroform, amyl nitrite, camphor, bromides; to the latter. calumba and creasote, as gastro-intestinal, and

stramonium as a pulmonary amyosthenic.

Amyotroph'ic. (Δ, neg.; μῦς, a muscle; τροφή, nutrition.) Muscular atrophy. Amyctrophic paralysis is paralysis that is due to muscular atrophy.

Amyot'rophy. (Same etymon. F. amyotrophie.) Atrophy of muscle. (Hammond.) **Am'yous.** (A, neg.; μῦς, a muscle.) Weak

or poor in musclo,

Amyridæ. ('A, intens.; μύρου, a fragrant juice.) According to Lindley, a Tribe of the Nat. Ord. Amyridaceæ, having the ovary onecelled.

Amyrida'ceæ. (Same etymon.) cording to Lindley, Rutal Exogens, with consolidated, hard, dry, and somewhat valvular fruit. valvate petals, free stamens, and generally dotted

leaves.

Amyrid'eæ. (Same etymon.) Bentham and Hooker, instead of forming a separate class of these plants, as Lindley has done (see Amyridaceae), make them a Suborder of Burscraceae, whilst Jussieu places them under the Terebinthacea, and Baillon makes them a Tribe of Rutaceae. Trees or shrubs with compound leaves, chiefly natives of America. Flowers regular, hermaphrodite; petals free, valvate, or imbricated; andrœeium iso- or diplo-stemonous; gynceium consisting of one carpel; ovary unilocular, containing two descending ovules, with micropyle external and superior; fruit fleshy; embryo without albumen.

Am'yrin. (Same etymon.) C25 II420. A snow-white crystalline resin, obtained from Manilla elemi, of which it constitutes about 20 per cent., by treating it with cold spirit of wine. The fusing point of the crystals is 171°-176° C. (340°-319° F.). Water does not dissolve it, but ether, chloroform, and carbon bisulphide dis-solve it easily. The alcoholic solution rotates the plane of polarised light to the right. Concentrated sulphuric acid dissolves amyrin with a reddish colour. It is not attacked by solution of

potash.

Amyri'na. (Same etymon.) Name by Bonastre for a sub-resin obtained from the resinous juice of Amyris elemifera; Amyrin.

Am'yris. ('A, intens.; μύρου, a fragran' ice.) The name of a Genus of the Nnt. Old Rutacea. Trees or shrubs, chiefly found in the Antilles and North and South America. Leaves exstipulate, compound, imparipinnate; flowers cymese, regular, hermaphrodite, or polygamous, with convex receptacle; calyx gamos palous, persistent, quadriid; corolla with 4 imbricated petals; stamens 8, 4 being opposite the petals; anthers introrse, with longitudinal dehiscence; ovary with fleshy disc, and short capitate style, unilocular, with two anatropal ovules; fruit a drupe; seed solitary, exalbuminous. Every part of these plants is charged with glandular fronds, containing a resinous and odorous fluid.

A. agal'locha, Roxb. ('Αγάλλοχον, hitter aloe wood.) The source of the elemi of Bengal. A. ambrosi'aca. ('Λμβρόσιος, immortal.)

A synonym of Icica icicariba.

A. balsamit'era. (L. balsamum, a fra-grant gum; fero, to yield.) Hab Jamaica. Furnishes one of the kinds of resewood, Lignum rhodii.

A. caran'na. Hab. Mexico. A tree said to yield caranna resin or gum.

A. commiph'ora. (Κόμμι, gum; φορέω, to bear.) The Bulsamodendron agallocha.

A. elemifera. (Elemi; fero, to bear.) The plant to which the elemi resin of the London and Dubliu Pharmacopecias was formerly ascribed.

A. gileaden'sis. Hab. Shores of the Red Sea. A tree which yields the balm of Giload.

A. gummif'era. (L. gummi, gam; fero, to yield.) A synonym of Balsamodendron Roxburghii.

A. gummiph'ora. (L. gummi; φορέω, to bear.) A synonym of Balsamodendron Roxburghiv. A. heterophyl'la, Willd. ("Ετερος, different; φύλλον, lenf.) A synonym of Icica aracouchini.

A. hexan'dra. (Hexandra, six stamens.) A species which is said to yield a part of the gum elemi of commerce

A. ka'taf, Forsk. A tree believed at one time to yield myrrh.

A Mexican tree, from the A. lign-aloe. wood of which a perfume is distilled.

A. niout'tout. The source of African bdell'am which is often used for myrch.

A. opobal'samum. A tree growing in Arabia Felix, and yielding balsam of Mecca.

A. papyra'cea, Del. (L. papyraceus, made of papyrus.) A synonym of Plosslea papyracea.

A. plumie'ri. A plant of the Antilles, which yields a resin, formerly supposed to be elemi.

A. sylvat'ica. (L. silvaticus, belonging to a wood.) One of the trees yielding the Bois de citron, and also a kind of elemi. It grows in St. Domingo. It is said to be poisonous.

A. tomento'sa. (L. tomentum, a stuffing for cushions.) A synonym of Elaphrium tomen-

tosum.

A. toxifera. (L. toxicum, a poison; fero, to bear.) A synonym of A. sylvatica.

A. zeylan'ica. A tree growing in Ethiopia, which is believed by some to produce elemi. Am'yron. A synonym of Kentrophyllum

lanatum, or Carthamus tinctorius.

Amythao'nis medicamen'tum. A compound, ascribed to Amythaon, either for plasters or used in malagmata, applied in tension of the pracordia, contracted and convulsed limbs, as described by Paulus Ægineta, Adams's Transl. vol. ii. p. 89, and recommended by him for scirrhous and other tumours.

Amyx'ia. ('A, neg.; μέξα, mucus. G. Schleimmangel.) A want or deficiency of mucus:

amyxy.

Amyx'is. (\*Αμυξις, a tearing. G. Stechen, Kratzen, Schrupfen.) Scarification. Amyxo'des. (\*Α, neg.; myxodes, having mucus. F. amyxeux; G. ohne Schleim.) Without or having no mucus.

Also (ἀμυξις, a scratch), scratched or scarified.

An. (Arab.) Term for Sulphur. An'a. ('Ava', a distributive preposition with numerals.) Of each; abbreviated, as  $\bar{a}\bar{a}$ , in the writing of prescriptions.

Anabæ'ria. ('Αναβαίνω, to elimb; F. anabène.) Name by J. A. Ritgen for a Family of Saurian Reptiles that climb to the tops of trees, as chameleons.

Anabænodac'tylous. δάκτυλος, a finger. F. anabénodactyle.) Applied by J. A. Ritgen to a Family of Saurian Reptiles having the toes proper for elimbing, as chamelcons.

Anabænosaurus. ('Αναβαίνω, to climb; σαύρος, a lizard. F. anabenosaurien.)
Applied by J. A. Ritgen to a Family of Reptilia, comprising saurians that, as chameleons, climb to the tops of trees.

Anabai'na. ('Aναβαίνω, to mount up.) One of the Genera of filamentous Algae found in

Buregine.

Many authors refer this Genus to Trichormus. Anabantoid'ei. (F. anabantoide.)
Term applied by Eichwald to a Family of Osseous Acanthopterygii, having the Anabas for their type.

Anaba'seæ. (F. anabasé.) Applied by C. A. Meyer to a Tribe of Chenopodeæ, having

the Anabasis for their type.

Anab'ases. ('Αναβαίνω, to go up ) An old term for fevers which increase steadily as they proceed to the period of decline.

Anabasis. ('Ανάβασις, a going up. G. Aufsteigen.) Used by Galen for the increase either of a disease, or of a particular par-

oxysm.

Anab'asis. A Genus of the Nat. Order Chenopodiaceæ. A Genus presenting the characters of Salsola, from which it only differs in its thick and fleshy calyx, its five staminodes, alternate with the stamens, and its spiral and upright embryo. Under-shrubs growing in cold and temperate regions.

**A. aphyl'ia.** ('A, neg.; φύλλον, a leaf.) A plant employed in Persia as a detergent.

A. creta'cea. (L. cretaceous, chalk-like.) A perennial growing in Siberia.

A. folio'sa. (L. foliosus, leafy.) Leafy anabasis. An annual growing in the south of Europe.

A.tamarisclfo'lia. (Tamarisk; folium, a leaf) A plant yielding the drug named Chouan. All parts of the plant yield soda.

**Anabat'ic.** ('Aναβατικόs.) Of, or belonging to, anabasis; angmenting; increasing.

Anabatica. A term applied formerly to a continued fever, the symptoms of which gradually increase in severity.

Anabe'nic acid. (F. acide anubénique.)

A synonym of Oxaluric acid.

Anabex'is. ('Αναβήσσω, to congli up.)
Term to merly used for expectoration and ptyal-

Anabiot'ic. ('Aναβιόω, to come to life again.) A term applied to stimulants and tonics which restore strength.

Anablaste ma. ('Αναβλάστημα, a shooting up again. F. anablasteme; G. thallodische Legersprosse.) Applied by Wallroth to peculiar productions of certain lichens, called by Gærtner Propagines bractcolatæ, by Dillenins Fimbriæ furinosæ crispæ.

Anablaste'sis. (F. anablastèse; G. Legersprossenbildung.) The production of ana-(F. anablastise; G.

blastemata.

Anablep'sis. ('Αναβλέπω, to see again.)

A term for the recovery of sight.

Anaboa ma. ('Αναβοαμα, a loud shont.) The same as Anaboesis.

Anaboe'sis. ('Αναβόησις.) A lond cry or scream.

Anaboe'tic. ('Αναβοήσις.) Causing loud

**Anabolæ'on.** ('Λναβόλαιων, from ἀνά-βαλλω, to lift up.) Applied to forceps used to extract darts, or other foreign bodies.

Anab'ole. ('Αναβοδή, from ἀναβάλλω, to throw up.) Term, nsed by Galen, de C. M. sec. Loc. viii. 3, for the rejection or discharge of anything by vomiting. It also came to mean expectoration and regurgitation.

Anabroch'esis. ('Δναβροχίζω, to draw

out. F. anabrochèse; G. Aufsaugung.) Resorption, as of pus.

Anabrochis mus. ('Αναβροχισμός ) Used by Galen for the extraction or turning up of the eyelashes by a small loop.

Formerly applied to the ablation of the eyelashes, and the operation for trichiasis.

Also, the application of a ligature to a limb or tumour.

Anabronchis mus. The same as Anabrochismus.

Anabro'sis. ('Ανάβρωσις, an eating up. G. Anfressen, Actzen.) Used by Galen, de Loc. Affect., v, 5, for a corrosion, or ulceration of the soft parts.

Anabro tic. **Anabro'tic.** ('Αναβρωτικόs, corrosive.) A term formerly applied to corrosive agents.

Anacahui'te wood. (G. Anacahuiteholz.) A Mexican plant, exported from Tampico, believed to belong to the Papilionaceae. It appears to be the Cordia boissieri. The decection of the wood is almost tasteless, and it contains no special constituent on which any medicinal action could be supposed to depend. It has been greatly extolled in the treatment of phthisis, but its use in Europe has not been productive of benefit: its action has been attributed to the large amount of oxalate of lime it contains.

Anacamp'seros. ('Ανακαμαψέρως, from ανακάμπτω, to make to turn; ἔρως, love. L. amoris redux.) A plant that can reanimate decaying love; the Scaum telephium.

Anacamp'sis. ('Ανακάμψις, from ανακάμπτω, to bend back. F. anacampsie; G. Zurückbeugung, Rückwirkung, Gegenwirkung.) Reflection; also, reaction or reciprocation.

Anacamptic. (Δνακάμπτω, to bend back. F. anacamptique.) Pertaining to anacampsis. Applied to a body which reflects sound or light.

Anacamp'tics. (Same etymon.) synonym of Catoptrics.

Anacamp'tis. (Same etymon.) A Genus of the Nat. Order Orchidacea.

A. pyramidalis. (F. orchis pyramidal.)

A species supplying Salep.

Anacam'pyla. ('Λνακάμπτω, to bend back. F. unacumpyle.) Name by Hedwig for scales exposed and bent back at the summit, found in some Cryptogamia; on the pilens of certain Agarici; on the thallus of certain lichens, as Lichen squamosus.

**ean'thini.** ('Λν, neg.; ἄκανθα, a A Suborder of the Order *Teleostei*. Anacan'thini. thorn.) Fishes with fins supported by soft rays, not spiny ones; ventral fins absent, or if present attached to the throat, beneath or in front of the pretoral fins; they approximate to the Acanthoptervgii in having a swim-bladder without an esophageal

**An'acar.** ('Ανάκάρ, up to the head, npwards.) Ruising up to the head.

Old term signifying (etym. as Anacardium) in the superior part. (Gorræus.)

Anacardia ceæ. (Same etymon as Anacardium.) A group of plants regarded by Lindley as a distinct Order, and by Baillon as a Tribe of Terebinthacea.

They are Rutal Exogens with apocarpous fruit, and a single ovule rising by a cord from the base of the cell. Seeds exalbuminous, or nearly so.

Anacardiæ. (Same etymon. F. ana-cardié.) A Tribe or Section of the Family Terebinthacea, having a single unilocular monospermous carpel; seed borne on a basilar podosperm; radiele folded en thick cotyledons.

Anacar'dic ac'id. An acid substance

found in the Anacardium occidentale.

Anacar'dium. ('Ανά, up to; καρδία, the heart; because its fruit was thought to be like the heart of a small bird.) A Genns of the Nat. Order Anacardiaceæ. The plants belonging to this Genus are trees or shrubs; with alternate, petiolated, simple, and entire leaves; flowers in compound terminal clusters, irregular, polygamous, and pentamerous; recep-tacle concave; calvx with five sepals, cadneous; corolla with five petals, imbricated or twisted; stamens 8-10; ovary surmounted with a simple lateral style, containing in its single cell a placenta. en which is placed the long single fertile stamen, and to which is attached a single anatropal ovule; the fruit a reniform achenium, supported by the greatly hypertrophied peduncle; the pericarp presents cavities filled with a resinous juice, and containing a seed; embryo fleshy, exalbuminous.

A. hu'mile. (L. humilis, low.) A bush resembling in its character the A. occidentale.

A. in'dicum. A synonym of A. orientale. A. latifo'lium. (L. latus, broad; folium, a leaf. F. Anacarde d'Orient.) A synonym of Semecarpus anacardium.

A.longifo'lium. (L. longus, long; folium,

a leaf.) A synonym of A. orientale.

A.na'num. (L. nanus, a dwarf.) A small tree or bush, the properties of which resemble

those of A. occidentale.

A. occidenta'le. (L. occidentalis, belonging to the West. F. anacardier d'Occident, or Acajou à pommes, or Acajou à fruit, noix d'acajou; I. anacardio; S. anacardo; G. Elephantenlaus, Hind. and Duk. Kaju; Tem. Mindiri marum; Tel. Jidi-mamidi, Munta-Tam. mamidi; Mal. Parauki-mava, Kappa-marakum; Hind, Hijli-badam.) The Cashew-nut tree. A large tree; leaves oval, very blunt or emarginate. a little narrowed to the base, rather longer than bread. The nntshell or husk contains an acrid oil, known as Cardol, capable of blistering the skin. and used to destroy warts, stimulate ulcers, and for the cure of chronic skin diseases. It forms a good marking ink. On roasting the nut the juice volatilises; the vapour irritates the larynx, provoking cough, but is said to act beneficially on eyes suffering from scrofulous ophthalmia. The seed is edible and contains a sweet oil. In Brazili: is sometimes named the Salsepareille des pauvres, which indicates its sudorific or antisyphilitic properties. The juice of the fruit and the hypertrophied peduncle, when fermented, yields an agreeably flavoured wine; when fresh, it is used in diarrhosa and diabetes; when fermented, it produces a diuretic wine. The bark is a good astringent, and from it a gum resembling gum Arabic exudes, named Cashew gum. In fusion of the bark is given for syphilitie swellings.

A. officina rum. (L. officina, a shop.) See

Semecarpus.

A. orlenta'le. (L. orientalis, belonging to the East. F. anacarde orientale.) The Malacen bean tree. Hab. India. A species the fruit of which is said to have an intoxicating effect; the pericarp supplies a corrosive oil. See Semecarpus.

A. rhinocar'pus. ('Pίν, the nose; καρ- $\pi \dot{o}s$ , fruit.) Hab. South America. The bark is poisonous, and is used by the natives to poison

Anacathar'sis. ('Ανακάθαρσις, a clearing away; from ἀνακαθαίρω, to cleanse npwards. F. anacatharsic.) Used by Hippocrates, Aph. v, 8, for purgation by sputa, or expectoration; it has also been applied to purging upwards by any medicament, emetic, sternutatory, or masticatory. A. catarrha'lls sim'plex. Catarrh.

Anacathar'tic. (Anacatharsis, expectoration. F. anacathartique.) Of, or belonging to, Anacatharsis. Premoting expectoration, or

veniting.

Anacathar'tica. (Same etymon., dicines which act as emeties or expectorants.

(Aνακεφαλ: two-mitulatio.) The reous, a summary; L. recapitulatio.) Teapitulation of facts of a chapter or book.

Also, applied to man, as the microcesm, or summary of the whole animal kingdom.

Anaces'tus. ('Ανάκεστος; L. insanabilis. F. incurable; G. unheilbar.) Incurable; unhealthy.

Anacharid'eæ. A Tribe of the Nat. Order Hydrocharidacea.

Anach'mus. Arabic term for an incorperated spirit. Dornaus in Diet. Paracels.

Anachonchylis'mus. Same as Anaconchulismus.

Anachremp'sis. ('Ανάχρεμψις; from άναχρέμπτομαι, to cough up.) Expectoration, according to Hippocrates, Coac. pranot. 320.

Anachremp'tum. (Same etymon.) Same as Sputum.

An'achron. A synonym of soda.

Anacine ma. ( Ανάκινημα, motion of the arms; from ἀνακινέω, to sway to and fro ) Ancient term used by Hippocrates, l. ii, de Iriata xlii, 5, for a movement of the arms upwards, forming a species of exercise then employed.

Anacine'sis. ('Avakivnous, the gestionlations used by combatants before they entered the lists. F. anacinese; G. Anakinesis.) Term for excitement.

**Anaclasis.** ('Ανάκλασις; from ἀνακλάω, to bend back. F. anaclase.) Reflection, as of light or sound.

Also, a figure of speech which is understood by the auditor in a sense contrary to what was intended by the speaker.

Used by Hippocrates for the bending back of a joint upon its external parts; or of a broken

Anaclas'tic. (F. anaclastique.) Relating to Anaclasis. Applied to that point where a luminous ray is refracted. **Anaclas tics.** ('Ανακλάω, to refract.)

That department of Optics which treats of the refraction of light; synonymous with Dioptrics.

Anaclinte'rium. ('Ανακλιντήριον, α recumbent chair; from ἀνακλίνω, to lean back, as of persons asleep, or rowers.) Λ kind of couch or seat, so fermed that a man could lie down or it in a reclining posture; a pillow.

Anaclin'trum. Same as Anaclinterium.

Anaclisis. ( Ανάκλιστε, a lying back; from ἀνακλίνω.) The mode of reclining, or the attitude of the sick in bed, which affords important indications in several diseases, according to Hippocrates, de Dec. Orn. xi, l.

Anaclis mos. ('Ανακλισμός, the back of a chair or couch.) That part of a chair or couch on which the back of a sick person rests.

Anacnes'mus. ('Λνά, up to; κνησμός,

an itching. F. anacnesme.) An itching on or in a part.

An'acoche. Properly Anocoche.
An'acock. The name of the seed of an

nudetermined Leguminous plant, probably Abrus. **Anacœlias'mus.** ('Ανά, up to; κοιλία, the belly.) A remedy used by Dioeles, which seems to have been geutle purging, to relieve the

lungs. (Parr.)

**Anacolle'ma.** ('Ανακόλλημα, that which is glued on; from ἀνακολλάω, to glue together. G. Klebmittel.) Used by Galen, de Rem fac. Par. c. 10, for an epithem of medicinal substances, employed to prevent defluxion of humours into the eyes.

Also, any substance eausing rapid bealing. Anacolle mata. (Same etymon.) Fron-

tal bandages

Anacolup'pa. A Malabar plant, used as a remedy in epilepsy, and an antidote against the bite of the Naja, a Genus of highly venomous serpents. Believed to be the Zappania nodi-

Anacolu'thon. ('Ανακολουθία, a sentence in which the construction changes and so becomes ungrammatical. F. Révasserie; G.

\_1erwirrtheit.) Incoherence.

**Anacom'ide.** ('Ανακομιδή, a recovery: from ἀνακομίζω, to bring back, to recover.) Used by Hippocrates, Coac. Prænot. t. 220, 335, for the refreshing or recreating of the convalescent after sickness

Anacomp'tis. An undetermined species of tree growing in Madagascar, the milky fruit

of which is used to curdle milk.

**Anaconchylias mus.** ('Ανακογχυλιασμός; from ἀνακογχυλίζω, to gargle.) Used by Galen, according to Gorræus, for a gargling, or the act of using a gargle.

Anaconchylis'mus. The same as Anaconchyliasmus.

Anac ope. ('Ανακοπή, the act of foreing

back. L. fastidium.) Nausea.

Anacouphis'ma. See Anacuphisma. **Anacrotic.** ('Ανακροτέω, to lift up and strike together.) A term applied to a secondary wave observed on the ascending line of a sphygmographic curve.

Pertuning to, or exhibiting, anacrotism.

Anacrotism. (Same etymon.) oscillation in the ascending portion of the enrve obtained in a syphygmographic tracing. Landois, using a schematic artery, obtained it under one of three conditions: when the exit opening was narrowed; when the elasticity of the walls was diminished; and when from increased volume of the contents the internal tension was augmented. Eulenberg showed that an anacrotic elevation may be obtained by compression of the artery beyond the point at which a sphygmograph is applied.

It occurs in dilatation and hypertrophy of the left ventricle; in conditions in which the vessels possess diminished extensibility; in conditions in which the flow of blood is greatly diminished in rspidity, as in paralysed limbs; in vessels given off distally to the point where a ligature has been applied to the main vessels, and in which the channels of communication are small or narrow; and in cases of insufficiency of the mitral

**Anacrot'ous.** ('Aνά, npwards; κρότος, a striking.) A term applied to a dierotic pulse in which the dierotism occurs in the rise of the blood-wave, and is shown in the upward stroke of the sphygmographic tracing.

Anacter'ion. See Anactirion. Anacte'sis. ('Ανάκτησις, a regaining. F. anactesic.) Restoration of strength, and recovery of health; the same as Analepsis; used by Hippocrates, de Vet. Med. ix, 6.

Anactir'ion. This plant, regarded as a

vermifuge by Dioscorides, has been identified with

Artemisia.

A.au'reus. (L. aureus, golden.) A plant that is employed in Spain in the same way as chamomile.

A. officina'rum. (L. officina, a shop. F. pyréthre commun, or de Germanie.) A plant used in the South of Europe in the same way as the Pellitory of Spain.

\* A. valentinus. (Valentinus, from Valentia.) A plant growing in the South of Enrope, and used for the same purposes as the Pellitory of

Spain.

Anacto'rion. A synonym of the Gladiolus communis

**Anacuphis'ma.** ('Ανακούφισμα, a relief; from ἀνακουφίζω, to lift, or hold up.) Λ term used by Hippoerates, l. i, dv Diæt. xlii, 6, for the raising up, or swaying up the body, as a species of exercise.

Anacycleon. ('Ανακύκλέω, to turn.) Λ mountebank, a quaek. Same as Agyrta. Anacycle'sis. (Ανακύκλησις. L. eir-

cumactio.) The phenomena of circulation in cells. See Cuclosis.

Anacycles mus. ('Ανακύκλησμός.) The same as Anacyclosis.

Anacyclo'sis. (Ανακύκλωσις.) same as Cuclosis.

Anacyc'lus. A Genus of the Nat. Order Composite, differing from Anthemis only in that the achenia are winged and obcordate.

A. officina'rum. (L. officina, a shop. G. Deutscher Bertram.) A species cultivated in Thuringia for medical purposes, and said to be

substituted for the A. pyrethrum.

A. pyre'thrum. (F. pyréthre officinal; I. piretro; S. piletre; G. Romisher Bertram.) Pellitory of Spain. Hab. Barbary, Spain, Levant. Stems procumbent, downy; radical leaves nearly smooth, pinnate, with pinnatifid seg-ments and linear subulate lobes; branches monocephalous; pappus 0; florets of the ray P or 0, in one row of the disc &; bracts imbricated; receptacle conical, scaly; achaenia winged and obcordate. The root, which is the part employed in medicine, is perennial, and sends up numerous stems; when dried it is slightly curved, wrinkled, and ash-brown, whitish withiu, hard, and brittle. Its taste is burning, and it excites a free flow of saliva. It contains 0.59 of an aerid resin, insoluble in potash; 1.06 of a dark brown oil; 0.35 of a yellow aerid oil, both soluble in potash; 9.40 parts of gum, inulin; 7.60 parts of potassic sulphate, carbonate, and chloride, calcie, and other salts; and 19.80 of lignin. It is used as a sialogogue in toothache, neuralgia, and paralysis of the tongue, and as a gargle in relaxed nvula. Dose, 30 grains as a masticatory. See Pyrethri radix.

Anacyrio sis. ('Ανακυρίωσις, authoritative confirmation.) An ancient term used by Hippocrates, de Decent. Ornat. ix, 9, for the authority and gravity which the physician ought

to maintain at the sickbed.

Anacys'tis. ('Ανά, throughout; κύστις,

the bladder.) An Alga belonging to the Tribe of Palmellew. It consists of isolated gelatinous cells containing colored gonidia.

A. Grevillei. Inhabits certain thermal waters; it is one of the species which form

Baregine.

A. margina'ta. (L. marginatus, hordered.) Grows on the dead stems of asparagus.
A. parasitica. (L. parasiticus, parasitic.)
Lives on the Cladophora of ponds.

Anadendromala chia. ('Αναδενδρομαλάχη, the tree mallow; from ανά, up; δίνδρον, a tree; μαλάχη, the mallow.) A synonym of the Althæa rosea. Apuleius also nses it, in all probability, as a synonym of the Lavatera arborea.

**Anaden'dron.** ('Ανά, up to; δίνδρον, a tree.) Name for Althuea.

Anades ma. ('Αναδέσμη, a band for women's hair.) A bandage for wounds.

Anades'mus. (Same etymon.) A fascia,

or bandage.

Anadicrotic. ('Aνά, upwards; δίς, twice; κρότος, a striking.) A term applied to the venous pulse-wave which is dicrotic, but in which the dicrotism occurs in the rise of the blood-wave, as shown in the npward stroke of the sphygmographic tracing.

Anadicrotous. The same in etymology

and meaning as Anudicrotic.

Anadiplo'sis. ('Αναδίπλωσις; from ἀναδιπλόομαι, to be made double. F. anadiplose.) A figure in rhetoric, otherwise, reduplication. Used by Galen, de Typis, c. 4, to the reduplication of the paroxysm in ague of a double type. (Gorræus.)

**Anadip'sia.** ('Aνά, intensive; δίψα, thirst. F. anadipsic.) Intense thirst.

Anadipsic. (Same etymon. F. anadipsique.) Applied to things which produce excessive thirst.

**Anadora.** ('Λναδορά, a stripping off the skin.) Executation, especially of the methra.

Anadosis. (Avãcoris, a yielding np. distribution; from avacicoma, to send forth or produce. F. anadose.) Used by Galen, l. 2, de Fac. Nat. c. 6, for the distribution of chyle through its proper vessels, or of nourisliment through the vessels generally; digestion; congestion of the upper parts of the body.

Anadrome. ('Αναδρομή, a running up; from ανατρέχω, to run back.) Used by Hippocrates, Coac. Prænot. t, 308, 314, 316, for the retreat of a pain from the lower to the upper parts of the body; also a recession of the humours, according to Charlton and Thompson.

Anad'romi. ('Ανάδρομος, a running up. F. anadrome; G. aufwartzlaufig.) Applied to those fishes that swim up from the sea into the

interior of rivers.

Anadyomen'eæ. A Subtribe of the Tribe of Acctabularieæ, Group Algæ, characterised by its being formed of articulated, branched, anastomosing tubes connected by an amorphous membrane, the whole forming a flat frond. The species are found in the Mediterranean, the Atlantic, and the Southern Seas.

Anædœus. ('Av, neg.; aiĉoïa, the privy parts. F. anædé; G. ohne Geschlichtstheile.)

Wanting the genitals.

Anæ'ma. ('Av, neg.; a'µa, blood. F. aneme; G. bhatlos.) Applied by latreille to every animal without organs of circulation and without blood, as intestinal worms.

Anæ'masis. Same as Anæmia.

**Anæmatopoie** sis. ('A $\nu$ , neg.;  $al\mu a$ , blood;  $\pi o \iota \iota \omega$ , to make.) Imperfect formation or development of the blood. (Dnnglison.)

Anæmatopoiet'ic. (Same etymon.)
Interfering with the formation of blood.

**Anæmato'sis.** (An, neg.; hæmatosis. F. anėmatose.) Deficient action and preparation of the blood.

Also, a synonym of Anamia, idiopathic.

Anæmia. ('Av, neg.; alµa, hlood. F. oligemie, anemie; G. Blutarmuth, Blutleese, Blutmangel.) A want, or deficiency, of blood; the condition of the body after great loss of blood; exsanguinity. There may either be a defect in the total quantity of blood, as oecurs for a short time, perhaps, after profuse hæmorrhages, or a diminntion in the relative amount of red corpuscles as compared with the other constituents of this fluid, as occurs in chlorosis. In many organic diseases, as in cancer, both conditions are present. In an extreme case the proportion of red corpuscles, which is normally 127 in 1000, but may fall, without decided indication of disease, to SO, has been known to be reduced to 21 (Lorain); the white corpnseles are probably not much diminished in number; the fibrin and the solids of the serum are not diminished; the water is increased. The causes of anæmia are hæmorrhages, such as those occurring in menorrhagia after delivery, and from injury; long-continued discharges, as from lencorrhea, diarrhœa, chronic suppurations; general disorders of the system, as fever; affections without organic lesion, as chlorosis, dysmenorrhæa, hysteria, and dyspepsia; cachectic conditions resulting from the development of disease, impairing the functions of nutrition, as organic disease of the stomach, cancer, pulmonary tubercle; the toxic influence of lead, alcohol, tobacco, insufficient food, and deprivation of light. Amongst the more important symptoms are pallor, debility, loss of appetite, dyspnœa on slight exertion, diminished activity of all the functions, leading again to many indications of defective nerve power, indicated by convulsive neuroses, paralysis, neuralgia, dyspepsia, palpitation of the heart, perverted mental faculties; murmurs are heard over the heart, in the veins, and occasionally in the arteries. The treatment of anamia consists in removing the cause if practicable, in paying the strictest attention to the diet and regimen, in the administration of various remedies, amongst which iron holds the first place, and manganese, zinc, arsenic, and the vegetable tonics, a secondary; in extreme cases transfusion.

A., acu'te. Anamia depending on rapid and great loss of blood, on great muscular exertion, on pregnancy, and such like.

A., cer'ebral. (L. cerebrum, the brain.)
A synonym of Supcope.

Also, a synonym of Hydrocepholoid disease.

A., chronic. Ancunia arising from repeated small losses of blood, from chronic suppurations, from chronic disturbances of digestion, from insufficient food, or other slowly acting cause.

A., collat'eral. Anamia the result of dilatation of the arteries and hyperamia of a contiguous and connected part.

A., compens'atory. The same as A mechanical.

A., essen'tial fe'brile. A synenym of A., idiopathic.

A., essen'tial mailg'nant. A synonym

of A., idiopathic.

A form of anæmia, A., idiopath'ic. tending uninterruptedly towards a fatal issue. The causes of the disease are unknown, though its frequent occurrence in the Canton of Zurich renders it possible that it may have an endemic origin. Lebert thinks it not unlikely that there is a special neurosis of the great sympathetic. It is more common in females than in males, pregnancy being a powerful predisposing cause, and between the ages of twenty and forty years than at other periods of life. The subjects of it have often been exposed to debilitating influences, but the removal of these does not effect the cure of the disease. The affection commences insidiously, the patient gradually presenting the aspect of chlorosis or extreme anamia with the concomitant symptoms, as palpitation, dyspnea, digestive atony, fainting fits, and anasarca of the legs. There is no bronzing of the skin, nor any disproportion between the number of the red and white blood-corpuseles, nor eulargement of the spleeu or lymphatic glands, as in leukæmia, nor is emaciation at all frequent. Loud blowing systolic murmur, with purring tremor, is usually andible at the base of the beart and in the jugular veins. Epistaxis, retinal ecchymoses, or some other form of hæmorrhage, is of common occurrence. Febrile symptoms of an irregular character are almost always present, until a little before death. It must he diagnosed from chlorosis, lenkæmia, and Hodgkin's disease. The duration of the dis-ease is from six weeks to eight months. After death the lesions found are cedema, eechymosis of the serous membranes and other parts, fatty degeneration of the abdominal viscera, and specially of the heart. Minute red rorpuscles have been found in the blood, as also under other circumstances; and the medulla of the bones has in many cases been found with all its cytogenic structures hypertrophied.

Tonics and nutritive diet have been found useless, and transfusiou of blood has been recom-

mended.

A., lo'cal. Deficient supply of blood to an organ or part.

A., lymphat'ic. A synonym of Hodgkin's disease.

A., mechan'ical. Local anamia resulting from pressure.

A., pas'sive. Local anæmia resulting from pressure.

A., progres'sive pernic'ious. A synonym of A., idiopathie.

A., spi'nal. A synonym of the condition known as Spinal irritation.

A., splen'ic. A synonym of Hodgkin's disease.

Or, according to some, a condition of simple anæmia connected with enlargement of the

A., trop'ical. A form of anæmia which occurs in Europeans resident in hot climates, and which appears to be the direct effect of the high temperature. The development of Entozoa in the blood bas been found to be concurrent with the symptoms of this form of anamia.

Anæ'miæ cuta'neæ. (L. cutis, the skin.) Morbid appearances of the skin caused by deficiency of blood in the cutaneous capillaries.

Anæ'mial. (Anæmia, a want of blood.)

In a state of anemia; bloodless; exsanguine.

Anæmic. (Anæmia.) Wanting in blood.

A. bruit. See A. murmur.

A. gol'tre. A synonym of Exophthalmic

A. insan'ity. One of Batty Tuke's classes of insanity.

A. murmur. A soft sound heard on applying the stethoscope over various parts of the vasenlar system.

Cardiae muruurs are systolic, and are heard as a soft bellows sound over the base of the heart, where they are loudest; the murmur heard in diastole is probably venous.

Arterial murmurs are only occasionally heard in anamia; they are synchronous with the systole of the heart, and are confined to the larger

arteries.

Venous murmurs are of a different character and are more common; they have been likened to the sound made by a humming-top, and are heard in the jugular vein, sometimes in the femoral, and also over the site of the torcular herophili.

Anæmoch'röous. ('Aν, neg.; αἴμα, blood; χρώς, the colour of the skin. G. bloss, ohne Blutfarbe.) Pale; exsanguine; of a bloodless complexion.

Anæmosar'cous. ('Aν; αΙμα; σάρξ, flesh. F. anemosarque.) Without red flesh; applied to animals with white blood

Anæmo'sis. A synonym of Anæmia.

**Anæmot'rophy.** ('Aν, neg.; αἶμα, blood; τροφή, nourishment.) A deficiency of nourishment or formation of the blood.

Anæmyd'ria. (An. neg.; hæmyd'r, serum. F. anemydrie; G. Blutwassermangel.)

Defect of serum in the blood.

Anæret'ics. ('Αναιρετικός, from ἀναιρέω, to destroy. F. anérésiques.) Agents which destroy more or less rapidly the tissues; a term used by Fonssagrives, who divides them in the several tollowing heads:

A., an'imal. The gastric juice and vaccine lymph.

A., electrolyt'ic. The several modes of producing destruction of tissue by electrolysis.

A., mechan'ical. A term under which is included all operative procedures resulting in loss of tissue, whether healthy or diseased.

A., medic'inal. All caustics which produce destruction of tissue by chemical action.

A., ther'mic. The actual cautery in its various forms, the application of solar heat by means of a condensing lens, and the galvanic cantery.

**Anaero'bia.** ('Aν, n-g.; ἀήρ, air; βιός, life. F. anaérobie.) A term applied by Pasteur to Bacterium, Vibrio and other minute organisms which absorb oxygen from a state of combination, and which can not only live without free oxygeu, but are even killed by the action of air. The term is opposed to aerobia, but Pasteur observes that some of these organisms are aerobia at one time and anaerobia at another. In one sense the living tissues of the body of the higher animals may be regarded as anaerobia.

Anaero'bic. (Same etymon.) to live in ordinary atmospheric air.

Anaeroplas'tic. ('Aν, neg.; ἀήρ, air; πλάσσω, to form. F. anaéroplastique.) A term applied to an apparatus for the application of warm-water dressing, by which the admission of nii to healing wounds is prevented. (Valette.)

**Ancesthe'sia.** ('Αναισθησία, want of feeling; from à, neg.; ἀισθάνομαι, to understand, or to feel. F. anæsthesis; I. anestesia; G. Unempfindlichkeit, Empfindungslahmung.) Loss of sensation. It may be the result either of disease of the central nervous system or of the nerves; or of the action of agents abolishing the functional activity of the peripheral terminations of the nerves, their conducting power, or the perceptivity of the nerve centres.

(L. dolorosus, painful.) A. doloro'sa. That form of anaesthesia in which, although the sensation of touch, the special sensation, is lost, there is great pain in the part.

A. gustato'ria. (L. gusto, to taste.) Loss See Ageustia.

A. ling uae. (L. lingua, the tongue.) Loss of taste. See Ageustia.

A. olfactato'ria. (L. olfacto, to smell.) A loss of smell.

A. op'tica. ('θπτικός, relating to sight.) A synonym of Amaurosis.

Anæsthe'sia, bul'bar. depending on disease of the pons Varolii or the medulla oblongata.

Anæsthesia depending on A., cen'tral. disease of the central nervous system.

(G. Gefühlsparalyse.) A., comple'te. Total loss of sensation.

A., gen'eral. A term used to express a condition of total loss of sensation from disease of the nervous system.

Also, and much more generally, the word is used to describe the condition of insensibility to pain produced by the inhalation of chloroform or other anæstheties.

A., in'complete. (G. Gefühlsparalyse.) Partial loss of sensation.

A., lo'cal. Loss of sensibility occurring in isolated and restricted parts or surfaces of the body.

Also, it is used to denote the condition of insensibility to pain produced by the application of eold by ice, other spray, or other means, to the surface of the body.

A., mus'cular. A loss of the muscular sense, without paralysis or necessary loss of ordinary sensation. It is seldom alone, but is generally accompanied by symptoms of serious nervous dis-It produces awkwardness of movement of the affected muscles, and inability to perform any desired action unless the person looks carefully at the limb to be moved; in darkness it often occurs that no combined movement can be accomplished. It is sometimes hysterical.

A., periph'eral. (Περιφέρεια, the line round a circular body.) Anaesthesia depending upon disorder of the peripheral or distal ter-

minations of the nerves.

Anæsthe siants. (Same etymon.) The same as Anæsthetics.

Anæsthesim'eter. (Anæsthesia; μέτpov, a measure.) An instrument by which the quantity of an ansesthetic administered in a given time can be measured.

**Anæsthe**'sis. ('Αναισθησία, want of feeling.) A term for loss of feeling or perception, ('Aναισθησία, want of and of the sense of touch.

Anæsthet'ic. (Same etymon.) Having no perception nor sense of touch; deprived of sensation, or feeling; applied specially of late to the state of persons rendered insensible by inhalation of ether or chloroform.

A. lep rosy. A synonym of the anæsthetic form of Elephantiasis gracorum.

Anæsthetics. ('A, neg.; ἀισθάνομαι, to perceive. F. agents anesthesiques.) Remedies by means of which the sensations of pain are dulled or abolished. They may be divided into local and general anaesthetics. The simplest local anaesthetic is the application of cold, which may either be effected by the employment of ice or by directing the spray of very pure other, or other neutral low-boiling liquid, on the part, the rapid evaporation of which is sufficient to lower the temperature to the freezing point. Incisions may then be made into the skin and small tumours removed without the patient perceiving any pain. Another simple means of effecting local anaesthesia is by obstructing the circulation of the part, as in the common experiment of tying a string tightly round the finger, when the part beyond the ligature becomes shortly destitute of sensation. burns of the first or second degree it is said that immediate relief from the pain can be obtained by plunging the part into alcohol or ether.

General anæstheties are commonly employed in the form of vapour, though alcohol and ether, if taken internally, have a well-marked anæsthetic action. The amesthetics in present use are chiefly chloroform, sulphurie ether, and nitrous oxide gas, but amylene, methylene, acetic other, and kerosene are also occasionally used, as well as earbonie acid gas and carbonic oxide gas. Quite recently M'Kendrick has found isobutyl ehloride

and ethidene dichloride to aet well.

In the employment of anæstheties it is expedient that the stomach should be empty, so that in the event of vomiting occurring, suffocation may not result from the entry of foreign matters into the larynx, no longer properly guarded, owing to the insensibility of the superior laryngeal nerve. If stertorous breathing supervene, and the elevators of the lower jaw cease to act, the jaw should be raised, or in serious cases the tongue should be pulled forward with a pair of forceps, whilst artificial respiration should at once

be practised.

The credit of the introduction of the anæsthetic method of treatment into practice is divided between Horace Wells of Connecticut, Dr. Morton of Boston, and Charles Jackson, in 1844-46; it soon became general throughout Europe.

Local anæsthetics are used for the relief of pain, whether during operation or not. General anæstheties are employed for the relief of pain during operation; to relieve the pain during labour; for producing muscular relaxation, as in the reduction of dislocations; for the relaxation of spasm, as in spasmodie urethral stricture; in convulsions, in epilepsy, in hooping-eough, in the passage of concretions, in asthma, and in similar conditions.

Anæsthetisa tion. (Same etymon.) The condition of insensibility produced by aniesthetics.

Also, the process of inducing insensibility by ana sthetics.

Anæs'thetise. (Same clymon.) The act of producing insensibility by means of an anæsthetie agent.

**Anaesthetole pra**. ('Αναίσθητος, unfeeling; λέπρα, leprosy.) Torpid or painless lepra.

Anæsthetospas mus. ('Αναίσθητος;

σπασμός, a spasm. F. anesthétospasme.) Cramp or spasm with loss of sensibility.

Anæsthe'tus. ('Αναίσθητος.) Same as Anasthetic.

Anafalis. A synonym of Gnaphalium.
Anafolis. Old term by Haly Abbas for the cure of denuded gums.

Anafus'tos. A synonym of Veratrum. Anagallid'eæ. A Family of the Nat. Order Primulacea. Herbs with hermaphrodite and regular flowers; corolla gamopetalous; stamens introrse; ovary superior; fruit capsular, a pyxis; seeds with albumen.

Anagal'lides. Asynonym of Primulacea.

Used by Adanson.

Anagallis. (G. Gauchheil.) A Genus of the Family Anagallidea, Nat. Order Primulacea. Annual or perennial plants inhabiting the cold and temperate regions of Europe and Asia, with opposite, simple, and entire leaves; axillary peduuculated flowers; the ealyx 5-partite; a rotate corolla; stamens epipetalons, and sometimes slightly monadelphous; fruit a pyxis; seeds numerous, peltate, albumiuous; embryo parallel to the plane of the umbilious.

A. aquatica. (L. aquaticus, living in water.) A synonym of the Veronica beccabunga.

A. arven'sis. (L. arvensis, of the fields. F. mouron rouge or male, and mouron bleu or femelle, menuchon, menuet, miroir du temps; G. Ackergauchheil.) The scarlet or blue pimpernel, poor man's weatherglass. An annual, either erect or procumbent; leaves sessile, ovate, or lanceolate, dotted beneath; sepals almost equalling the rotate corolla, which is either scarlet, as in the var. A. phunicea, or blue, as in A. cwrulea. It has been extelled as a preventive of hydrophobia, and has been used in phthisis, mania, epilepsy, dropsy, and other diseases, and as a local application to ulcers.

A. cœru'lea. (L. cœruleus, dark blue.) A variety of A. arvensis, having a bright blue corolla, with lobes rarely eiliate, and possessing

the same properties.

**A. phoenic'ea.** (Φοινίκεος, red.) A synonym of the searlet flowering form of A. arvensis.

A. tenel'la. (L. tenellus, delicate.) Bog pimpernel. A perennial creeping herb; leaves short, petioled, broadly ovate or orbicular, not dotted; sepals much shorter than the funnel-shaped corolla. An aerid plant, which has been prescribed in epilepsy, dropsy, and mania. Phiny states that the Anagallis possesses the property of dilating the pupil, hence it was used for anointing the eye in the operation of cataract and in opacities of the cornea.

Anagargalic'ta. ('Αναγαργάλικτον; from αναγαργαλίξω, to gargle or wash the throat.) Old term for a gargle.

Anagargaris ma. ('Αναγαργάρισμα.) A gargle.

Anagargaris'tum. ('Αναγαργάρισ-

 $\tau o \nu$ .) Old term for a gargle.

Anagen'nesis. ('Αναγέννεσις, regeneration; from άναγεννάω, to beget anew. F. ana-gennèse; G. Wiedererzeugung.) A renewal; a growing again; regeneration of structure.

Anag lyphe. ('Αναγλυφή, a work in low relief.) The calamus scriptorius, or furrow, at the bottom of the fourth ventricle of the hrain, from its likeness to the style used by the ancients in writing. (Quincy.)

Ana'gni. Italy; in the Pontine Marshes.

Four strong sulphur springs-Scrofino, Scrofinella, Fontana olente, and Bagnatojo-arise in the neighbourhood; they have only a local reputation.

Anagnos'takis. A Greek physician.

A.'s opera'tion for distichiasis. The cilia are excised between two vertical incisions somewhat divergent above; the skin left between the incisions is dissected from the subjacent structures for a short distance, and is then attached by suture to each edge of the tarsal margin from which the cilia have been removed; and by this means shortening of the margin of the eyelid is prevented.

A.'s ophthal'moscope. This instrument consists of a round concave mirror, two inches in diameter, perforated in the centre by an opening one sixth of an inch in diameter, and having a focal length of four and a half inches.

Anago'ge. (Άναγωγή, from ἀνάγω, to raise up, or to reduce.) Ancient term, used by Dioscorides, Parab. ii, 30, for rejection, or vomiting of blood.

Anagraph. ('Αναγραφή, from civa-γράφη, to write, or prescribe. F. anagraphe, formule, recette; G. Recept.) Term, used by Hippocrates, l. de Dec. Ornat. viii, 18, for a physician's prescription or recipe.

Anag'yris. ('Ανά and γύρος, a circle.) A Genus of the Nat. Order Leguminosæ.

**A. foe'tida.** (L. fætidus, stinking. F. ana-ayre, bois puant; G. Stinkbaum.) A plant growing in Italy and the South of France, the wood of which exhales a very fætid odour; its leaves are strongly cathartic, and were anciently used to facilitate parturition and to reduce cedema. The roots were employed as a resolvent, and the seeds as an emetic; the latter are said to be poisonous.

A. non-fœ'tida. A synonym of the Cytisus alpinus.

Anaha'men. The Arabic name for the Anemone. Anai'ma. ('Aν, neg.; αἶμα, blood.) An

old term for invertebrate animals, which were thought to have no blood.

Anaisthe'sia. The same as Anasthesia. Anaisthe'sis. The same as Anasthesia. Anakrot'ia. The same as Anaerotism. Anakrotis'mus. See Anacrotism.

A'nal. (L. anus, the fundament.) Belonging to, or connected with, the anus.

A. fas'cia. A thin sheet of connective tissue covering the surface of the levator ani muscle, and connected in front with the posterior layer of the deep perinæal fascia.

A. fin. The fin of a fish which is attached to the under surface of the body, between the

anns and the tail.

A. fis'tula. See Fistula in ano.

A. glands. Aggregations of cutaneous glands found on each side of the anus in certain Lemuroids.

A. mus'cles. The internal and the external sphincter, the levator ani, and the cocevgeus muscles.

A. nerves. The pudic, the fourth and fifth sacral, and the coccygeal nerves; the sphincter and levator ani derive their supply from all these nerves, the eoccygeus muscle only from the three

Anal'ces. ('Αναλκής, feeble.) applied by Hippocrates to the Asiatic nations. Anal'cime. ('Αν, neg.; ἄλκιμος, strong.)

A hexahedral zoolite found in trap rocks, which

has obtained its name from its feeble electric

properties.

Anal'dia. ('Αναλδής, not thriving, from άν, neg.; ἀλδαίνω, to nourish.) Defective nutrition. (Dunglison.)

The condition of Analec tronous.

Anelectrotonus.

Analem'sia. The same as Analepsia. The same as Analepsia. Analem'tia.

Analen'tia. A Paracelsian term for a species of cpilepsy. Perhaps a corruption of Analensia.

Analep'sia. Epilepsy, arising from disorder of the stomach, according to Joh. Auglieus,

Ros. Angl. p. 35.

**Analep'sis.** ('Ανάληψις, from ἀναλαμ-βάνω, to recover. F. analepsie, analepsia; G. Desserung, Erholung, Genesung, Wiederzunchmen.) Recovery from sickness.

Also, the support given to a fractured extremity.

(Dunglison.)

Analep'tic. (Analepsis, recovery from sickness. F. analeptique; G. herzstärkend, nervenstärkend, stärkend.) Applied to those things calculated to restore strength lost by sickness.

A. foods. The starches, soups, and animal

jellies especially.

A. med'icines. Tonics in general.

Analeptica. (Same etymon.) Medicines which restore strength.

Analep'tics. (F. analeptiques.) term, though generally understood to include medicines, is by some restricted to restorative

A., fat'ty. Under this head are included milk, eggs, cream, butter, and all animal and

vegetable oils.

A., gelat'inous. Animal jellies and vegetable gelatinous substances, as the decoction of Iceland moss.

A., protein'ous. A term which includes

foods derived from animal structures.

A., sac'charine. Sugar, and all substances, especially fruits, such as grapes, which contain much sugar.

A., star'chy. Such alimentary materials

as arrowroot, tapioca, and sago.

Analge'sia. ('Αναλγησία, void of pain; from aν, priv.; άλγος, pain. F. analgisie; G. Schmerzlosigkeit.) Indolence; insensibility to,

or a want of, pain; a condition of ease.

This condition is more or less present in drunkenness, in the torpor produced by chloroform, in commencing frostbite, and similar conditions; it is present also in certain diseases of the brain, in epileptic seizures and the immediately following period, in some forms of hysteria, and in poisoning by many narcotics and the salts of lead. According to Schiff, it occurs when the spinal cord is divided, with the exception of the posterior columns.

Analge'sics. (Same etymon.) A term given to remedies which relieve pain.

Anal'gia. Same as Analgesia.

Anallantoid'ea. (L. an, neg.; allantois. F. anallantoidien.) Synonymous with one of the two great divisions into which the Vertebrate Subkingdom is divided; it is coextensive with the Branchiata and Ichthyopsida, as it includes the Pisces and Amphibia, that is to say, forms in which the embryo is without an amnion, and the gills are present at some period of existence. It is at present, however, a moot point as to whether or not an allantois is present in Pisces and Amphibia.

Anal'ogism. ('Αναλόγισμα, a result of reasoning. F. analogisme.) Term used by Galen for any very strong argument from cause to effect, implying an unanswerable necessity. Anciently applied to the judgment of diseases by similar appearances, or the discovering of a thing unknown by its likeness or analogy with something already known. This was called Rational or Dogmatic Medicine, as contrasted with the Empirical, or that conducted by symptoms or appearances alone without theory.

Analogous. ('Avaloyos, conformable.) F. analogue; G. ubereinstimmend, ähnlich.) Answering in fashion; bearing relation, resemblance, or proportion to. Applied to things or parts of a different nature, but having a similar relation of functions, and therefore contradistingnished from the term Homologous, which see.

A. pole. That end of a pyroelectric crystal which is positively electric with a rising temperature, and negatively with a sinking tempera-

ture.

('Aνάλογος, conformable. An'alogue. F. analogue; I. analogo; G. Analog.) which resembles, or runs a parallel course to

something else.

Term applied by Professor Owen, in his 'Homologies,' to a part or organ in one animal which has the same function as another part or organ in a different animal. It is thus used as a correlative to Homologne. The wing of a butterfly is the analogue of the wing of a bird, since, though differing in structure, they resemble each other in function; but the wing of the bird is the homologue of the arm of man or foreleg of quadrupeds, being composed of the same bones, yet differing in function.

Anal'ogy. ('Αναλογία, equality of ratios, proportiou. F. analogie; I. analogia; G. Aenlichkeit, übereinstimmung.) The relation which one thing bears to another. A term for the condition or relation of things, or parts of a different nature, but similar in their functions, and so contradistinguished from the term Homology, which see.

Analo'sis. ('Ανάλωσις, from άναλόω, for άνάλισκω, to consume, or waste. F. analose; G. Auszebrung.) A consumption, wasting, or Auszeorang.) A consumption, wasting, or atrophy. Applied to the cerebrum by Hippocrates, l. vi, Epid. s. 3, t. 1.

Anal'thes. ('Αναλθής, from ἀν, neg.; ἀλθάνο, to heal. F. analthe.) Incurable.

Analthetic. ('Ανάλθητος.) Incurable. **Anal'tos.** ('A $\nu$ , neg.;  $\ddot{a}\lambda s$ , salt.)

salted. An'alyser. ('Αναλύω, to unloose, to examine.) A doubly retracting prism forming the upper or eye prism of a polarising apparatus.

Analysis. ('Λνάλυσις, from ἀναλύω, to undo. F. analyse; I. analisi; S. analisis; G. Zerlegung, Auslosung.) A breaking up or resolution of anything compound or complex, be it substance, sentence, or mental operation, into simpler or into elementary constituents.

A., absorptiometric. (L. absorptio; μέτρου, a measure.) A method by which the proportion of the different constituents of a gaseous mixture may be calculated by observation of the amount of absorption which takes place on exposure to a fluid, the coefficient of absorption being previously known.

A., chem'ical. (F. analyse chimique.) The separation and recognition of the several elementary principles of a compound substance, or its resolution into simpler bodies, although not necessarily elementary.

A., clin'ical. The method which consists in the determination and isolation of the several symptoms which collectively constitute a disease.

A., colorimet'rlc. (L. color, colour ; μέτρου, a measure.) A method by which the proportionate quantity of a substance may be estimated by the intensity of the colour, either alone or after the addition of some reagent.

A., densimet'ric. (L. densitas, thickness: μέτρου.) A method by which the proportionate quantity of a substance may be estimated by

determining its specific gravity.

A., elemen'tary. The form of analysis which deals only with the nature and weight of the elementary constituents of a compound.

A., eudiomet'ric. See Eudiometry A., gasomet'ric. A synonym of Eudiometry.

A., gravimet'ric. (L. gravis, heavy; μέτρου, a measure.) A mode of analysing compounds by weighing the elements after separation, or by weighing after separation and combination with another element whose combining proportion is known.

A., imme'diate. A term used to describe the separation of the several substances of which

a compound body is made up.

A., Indirect'. A mode of analysis, dependent on the law of constant proportion, whereby the amount of a substance can be determined by combining it with a known quantity of another body whose combining proportion is known.

A., log'ical. The analytical mental

A., consideration or resolution into elementary conceptions of a subject or object considered ab-

stractedly.

A., mathematical. By Euclid it was considered to be that form of reasoning on mathematical questions in which, the conclusion being assumed, consequences are deduced from it which can be proved to be true and consistent. At a subsequent period it was held to be the resolution of problems by reducing them to equations by the help of symbolical characters. In modern times it signifies the employment of the algebraical and higher calculus, or any direct treatment of the properties of geometrical figures in the manner of the ancients, without the use of algebraical notation and transformations.

A., organ'ic. The process by which the different elementary substances contained in an

organic compound are determined.

A., prismatic. A synonym of Spectrum analusis.

The reduction to A., psycholog'ical.

simpler conditions of complicated mental states.

A., qual'itative. The method by which the constituents of a compound are distinguished and recognised.

A., quan'titative. The method by which the proportionate or absolute weight or volume of the constituents of a compound are determined.

A., spec'tral. See Spectrum analysis. A., spectromet'ric. A term for Spectrum analysis.

A., spec'trum. See Spectrum analysis.
A., thermomet'ric. (Θέρμη, beat; μέτρον, measure.) A method of analysis which has been proposed for the determination of the quantity of a body by thermometric observation during its solution in or combination with other bodies.

A., ultimate. The determination of the elementary constitution of a body.

A., volumet'ric. A mode of analysis by which the amount of an element or compound in a body may be calculated by observation of the volume of another substance needed to combine

A., zoochem'ical. The qualitative analysis of chemical substances.

Analytic. (Etym. as Analysis.) Having

the power or capacity of analysis.

A. crys'tals. A term applied to crystalline structures, as tourmaline, which have the power of analysing polarised light.

A Mongolian people of the An'amese. Altaian division.

Anamir'ta. A Genus of the Nat. Order Menispermacea. Stamens monadelphous; anthers

indefinite, forming a globose head; drupes 1-3.

A. coc'culus. (F. coque du Levant; G. Kokkel; Tam. Penkottai, Kaka-coollie; Tel. Kaki-chempoo; Hind. Kakmari; Mal. Polla or Kaandaka-conuveh.) Hab. Malabar. It is a climbing plant. The only known species of the Genns. The flowers are regular and diecions; the calvx is formed of two to four trimerous verticilli; corolla absent; stamens 6-9, sterile in the female flowers, but forming a short column of six vertical series; anthers with transverse dehiscence; fruit composed of two or three arched drupes, each containing a single seed; albumen horny; embryo with divergent cotyledons. The fruit is sometimes used to adulterate beer. Powdered, the berries destroy pediculi; in ointment, are used to allay inflammation, and in cases of itch and herpes. The poisonous principle of the seeds is Picrotoxin, of the pericarp, Menispermin. See Cocculus indicus.

A. panicula'ta. (L. paniculatus, panicled.) A synonym of A. cocculus.
A. racemo'sa, Colebr. (L. racemosus, full

of clusters.) A synonym of A, cocculus, **Anamir'tic ac'id.**  $C_{70}H_{68}O_3llO$ . An acid resulting from the saponification of anamirtin; white, crystallisable; melts at 68° C. (154° F.)

Anamir'tin. C76H72O4. A peculiar oil obtained from the Anamirta cocculus. It is white, crystallisable, fusible at 36°C. (97°F.) It yields acroleine on distillation.

Anamne'sia. ('Δνάμνησις; from ἀνά, anew, and μυησις, memory.) In Pathology, the recalling of the phenomena preceding a given period of the disease. (L. and R.)

Anamne'sis. (Same etymon.) Same as Anamnesia.

Anamnes'tic. ('Ανάμνησις'; from ανα-αιμνήσκω, to recall to mind. F. anamuestique.) Recalling to the memory; bringing to mind; reminding.

A. symp'toms. Phenomena occurring in a previous stage of an illness, by the remembrance of which the present condition is made more manifest.

Anamnes'tica reme'dia. μνηστικός, able to recall to mind readily; L. remedium, a cure.) Medicines which are supposed to restore the memory.

A. sig'na. (L. signum, a sign.) Signs or symptoms which discover the precedent state of

a sick person or a disease.

Anamnes'tical. Same as Anamnestic. Anamni na. (L. an, neg.; amnion.) One of the four divisions of the Vertebrata in Haeckel's Classification. It embraces Pisces, Dipnoi (Lepidosiren), Halisauria (Ichthyosaurns), and Amphibia.

Anamnio'ta. (L. an, neg.; amnion.) Animals which possess no amnion; the Abranchiate Vertebrata, with the possible exception of Pisces and Amphibia.

Anamor phism. ('Ανά, ηρ; μορφή, form.) Progression from a lower to a higher type. ('Αναμόρφωσις, α

Anamorpho'sis. forming anew. F. anamorphose; I. anamorphosi; G. Umbildung, Umgestultung, Umformung.) Applied by Wallroth and Fries to degenerations which the Cryptogamia, especially Algæ, frequently undergo, and which transform them into a typic species, i.e. their natural form is changed either by excess or by arrest of development.

Also, applied to the progressively higher de-

velopment of species.

Also, applied to any kind of degeneration which so modifies the aspect of a plant as to render it

unrecognisable.

Applied to figures that, beheld in a certain point of view, or with the aid of glasses, represent another thing than when examined under a different point of view, or without glasses.

Anamphodon'ta. (L. an, neg.; amphodonta.) Animals not having continuous rows of

teeth, as the Cetacea and Ungulata.

Anamu'lu. Under this name Rheede has described a Leguminous plant growing in Malabar, the decoction of which, in rice water or milk, is employed in the form of baths to eure ascites and tympanitis.

Ana'nas. See Ananassa.

A. aculea'ta. (L. aculeatus, pointed.) A synonym of Ananassa sativa.

A. America'na. The Bromelia pinguin.
A. lu'cida. (L. lucidus, shining.) A species the fruit of which is caten.

A. ova'ta. (L. ovatus, egg-shaped.) The Inanassa sativa.

A. semiserra'ta. (L. semi, half; serratus, saw-shaped, notched.) A species the fruit of which is caten.

A., wild. The Bromelia pinguin.

Ananas'sa. A Genns of the Nat. Order Bromeliaceae. Fruit succulent, in spikes, consolidated into a single, tuberculated, comose mass.

A. sativa. (L. sativus, that which is planted. F. ananas; S. unanas piante; G. Ananas; Tam. Anasa; Mal. Pooreethei.) The pineapple. Hab. Molnceas, China, Ceylon, India. Leaves glaucous, mealy; bracts shorter than the fruits. The plant succeeds well in the open air as far north as 30°. The leaves yield a fine white abre. The fruit, which is much esteemed, is yellow in colonr, conical in form, and pleasant in ilavour.

Ananazip'ta. A word or motto written on an amulet to charm away disease.

**Ananchit'inæ.** A Subfamily of the Family *Spatangidæ*. Echinoderms having an A Subfamily of the oblong test, with a lengthened apical apparatns,

and inhabiting deep waters. **Anan'der.** ('Aν, neg. ; ἀνήρ, a man. F. anandre; G. unmännlich.) An impotent man. Anan'dræ. (Same etymon.)

without stamens.

Also, applied by Link to those classes of plants, as fungi, in which the male sex was supposed to be absent.

Anan'dria. ('Ανανδρία, nnmanliness.) Impotence in the male.

Anan'dria. A Genus of the Nat. Order Compositæ

A. discoï dea. (Δίσκος, a round plate; εlĉos, likeness.) The leaves of this species are mucilaginous and bitter, and are used by the Chinese in shortness of breath.

Anan'dricus. Same as Anandrious. Anan'dricus. In Mediciue, impotent. In Botany, wanting stamens.

Ananeo'sis. ('Ανανεόομαι, to renew.) Renewal, or reformation, of any fluid, tissue, or organ.

Anani. A lofty Brazilian tree. The wounded bark yields a yellow viscid gum; becoming red and then umber coloured on drying. Plasters made of it are used by the Indians in chest disorders. . It is probably the Potalia resinifera. (Waring.)

Ananpala. Probably the Rhus lazones. Hab. Phillipine Isles. The bark is astringent.

(Waring.)

Anan'thæ. ('Aν, neg.; ἄνθος, a flower.)
Term employed by Martius to indicate Cryptogamous plants, as having no flowers.

Anan'therate. (L. an, neg.; anther. G. staubbeutellos.) Having no anthers.

Anan'therum. (L. an, neg; anther.) In Botany, a filament having no anther.

Anan'thous. ('Aν, neg.; άνθος, a flower. F. ananthe; G. blüthenlos.) Having no flowers. Anapai'ma. A tree of British Guiana, the bark of which is aromatic, and is used by the

Indians in fever and dysentery. (Waring.) **Anap'alin.** (Ανάπαλιν, contrariwise.)
On the contrary side; as if nature endeavoured to free herself from some disease, by her exertions on the side opposite to that wherein the affection arose. It is opposed to Catixis. (Parr.)

Anapal'lus. A synonym of Cuctus opuntia.

Anapau'sis. ('Ανάπανσις; from ἀναπαύω, to rest.) Used by Hippocrates, Aph. iv, 13, for rest, ease, or quiet; also remission from suffering or pain.

Anapeirat'ic. ('Αναπειράσμαι, to do again, to renew exercises.) A term applied by Dr. Hammond to a class of paralyses produced by the habitual use of certain inuscles in the same way for a long time. Thus, we have writer's paralysis, telegrapher's paralysis, hammer paralysis. It occurs chiefly in adult life, and is accompanied by symptoms indicative of disorder of the central nervous system, as headache, pain in the back, want of power to co-ordinate the muscles of articulation. The treatment is rest and the application of the galvanic current.

Anaperia. ('Ανάπηρος, crippled. F. anperie; G. Verstümmelung.) Mutilation, or a

crippled condition.

Anapetia. ('Αναπέτεια; from ἀναπετάω, to expand.) Used by Galen, l. i, de Morb. Diff. c, 5, for an expansion of the orifices of the vessels or canals.

Anaphalanti'asis. ('Αναφαλαντίασις, forchead baldness.) A falling off of hair from, or baldness of, the eyebrows.

Anaphalanto'ma. ('Αναφαλάντωμα, forehead baldness.) The same as Inaphalantiasis.

An'aphe. Same as Anaphia.
An'aphi. An island situated to the east of
Thera, in the Greek Archipelago. A hot salphuretted spring rises in it, which is in repute in the treatment of entaneous diseases.

Anaphia. ('Aν, neg.; ἄφή, touch.) Defect or loss of the sense of touch.

Anaphlas'mus. ('Αναφλασμός.) Mas-

turbation.

Anaphone'sis. ('Αναφωνέω, to speak aloud. F. anaphonese; I. anafonest; G. Schreieur.) Term for loud speaking, or vociferation, which was anciently practised as a means of strengthening the lungs. (Gorræus.)

Anaphora. ('Αναφορά.) Used by Hippocrates, de Arte, v, 13, for the bringing up of anything by the mouth, as in spitting of blood.

Anaphoricoi. ('Αναφορικός.) Those

who spit blood.

Anaphrodis'1a. ('Aν, neg.; 'Αφροδίτη, Venus. F. anaphrodisie; G. Geschlechtsabnei-gung; I. and S. anafrodisi.) Absence of venereal desires; diminution or abolition of genital sensi-

Anaphrodis'iac. (Same etymon. F. anaphrodisiaque.) Applied to medicines or remedies allaying or preventing sexual excite-The chief anaphrodisiacs are camphor, ment. digitalis, potassium bromide, and carbon sulphide; and tohacco and opium when used in excess.

**Anaphrodit'ic.** ('Aν, neg.; 'Αφρο-δίτη, Venus. F. anaphroditique.) Applied to an organised body developed without concourse of the sexes, i.e. not the product of generation, properly so called.

Anaphrod'itous. (Same etymon. F. anaphrodite.) Not enjoying physical love; im-

**Anaphrom'eli.** ('Aν, priv.; ἀφρός, froth; μέλι, honey.) Clarified honey. Mel des-

pumatum. (Quiney.)

Anaphyses. (F. filaments ostiolaires) Filaments often articulated, attached to the in-(F. filaments ostiolaires) terior of the cavity of pyrenocarpous apothecia near the mouth, and directed downwards or towards the centre of the organ. Their direction, therefore, is opposed to that of the paraphyses, and they have been named periphyses. They are believed to aid in the expulsion of the spores

Anaph'ysis. ('Ανάφυσις. F. anaphyse, G. Wiederwachsen.) A growing again, or regene-

ration. See Anagennesis.

Anaphytopy Ta. ( Άναφοω, to produce again; πορ, a fever. F. anaphytopyre; G. Entwickelungsfieber, Wechselfieber.) A fever or irritable condition arising at the period of evolution of the organism; a growing fever. **Anap'lasis.** ('Δνάπλασιε; from ἀνα-

πλάσσω, to form again. F. anaplasie.) A renewal, or forming anew; applied by Hippocrates to the reunion of a fractured hone.

The same as Ana-Anaplasmat'ic.

Anaplas'mus. The same as Anaplasis. Same etymon as Anaplasty. F. anaplastque.) Of or belonging to anaplasty. Term applied to the new formation of the property of the same as Anaplasis. of deformed or lost parts.

Also, applied to agents which increase the

plastic matter of the blood.

An'aplasty. ('Αναπλάσσω, to form anew. F. anaplastic.) Term for operations by which reparation is made of superficial lesions, or solutions of continuity, by the use of the adjacent healthy structure, as in operating for vesicovaginal fistula.

**Anaplero'sis.** ('Αναπλήρωσις, a filling up; from ἀναπληρόω, to fill up, or supply. F. anaplerose; G. Anfüllung, Ausfüllung.)

for the supplement or filling up of parts that have been destroyed, as in wounds, and cicatrices.

Anaplerotic. (Same etymon as Anaplerosis. F. anaplerotique.) Of or belonging to anaplerosis; applied by Galen, de Dynamid., to medicinal substances which promote the restoration of deficiencies in wounds.

**Anapleu sis.** ('Ανάπλευσις.) Term used by Hippocrates, Coac. Pranot. t. 239, for the exfoliation and throwing off of dead portions of bone; also applied to carious teeth and the decaved portions which scale off from them.

**Anaplo'sis.** ('Aνάπλωσιs, an unfolding. anaplose; G. Entfaltung, Entwickelung.) Applied to the evolution of the organs of the

('Δναπνέω, to respire.) Anapneu'sis. Term formerly employed for respiration. (Quincy.)

Anap'noe. ('Αναπνοή; from ἀναπνέω, to respire.) Another term for respiration. See Anapneusis, Apneusis.

Anapnoenu'si. (Anapnoe; νοῦσος, for νόσος, disease.) Diseases of the respiratory organs.

Anap'nograph. ( Αναπνοή, respiration; γοάφω, to write. F. anapne graph.) An instrument invented by MM. Bergeon and Kastus, which is capable of registering at one and the same time the movements of inspiration and expiration, the variations of the pressure of the current of air at each movement of respiration, and the quantity of air inspired or expired.

Anapno'ic. ('Λναπνοή, drawing breath. F. anapnoique.) Belonging to respiration. A. rem'edies. Medicines which render

respiration easier.

**Anapnom'eter.** ('Aναπνοή, a drawing breath; μετρόν, a measure. F. anapnéometre.) A spirometer.

Anapnoonu'si. ('Αναπνοή ; νοῦσος, for νόσος, disease. F. maladies de respiration; G. Krankheiten der Respiration.) Diseases of respiration.

Anapod'isis. ('Αναπόδισις, a going back, from ἀναποδίζω, to go back.) Retrover-

A. u'teri. Retroversion of the uterus. Anapodis'mus. ('Αναποδισμός.) Same as Anapodisis.

Anapodophyl'lum canaden'se. The Podophyllim peltatum. (Dunglison.)

Anapoph'ysis. ('Aνά, backwards; ἀπόφυσις, an offshoot.) Asmall projection springing from the neural arch of a vertebra between the upper articular and the transverse processes, and having a backward direction.

Anapo'sis. Same as Amposis.

Anapothym'ia. ('Aν, neg.; ἀποθύμως, not according to the mind. F. anapothymic; G. Abscheulosigkeit.) The absence of aversion.

Anapo'tis. Same as Amposis.

Anapsec'tic. ('Αναψάω, to wipe up.)

Detergent.

Anapsye'tica. ('Αναψυκτικόs. G. ab-kühlend, abfrischend.) Refreshing, cooling. Anapsye'is. ('Ανάψυξις.) Old term used by Hippocrates, iii, de Fraet. t. 8, for refrigera-

Anap'tysis. ('Ανάπτυσις, from ἀναπτύω, to spue up, or spit.) Old term for expectoration.

**Anaptyx'is.** ('Ανάπτυξις, from άναπτύσσω, to unrol. F. anap/yxis.) An unfolding

or mechanical obliteration of morbidly wrinkled parts.

Anarcotina. A name proposed for Narrotine

('Aνά, upward; ρίν, the Anarhi'non. ('Aνά, upward; βίν, the nose.) Things which return through the nose. Also (ἀνὰ; ρινός, the skin), things which return through the skin.

Anarraphe. ('Αναρραφή; from ἀνά, up; ραφη, a seam; from ράπτω, to sew together.) A term formerly applied to the operation of excising a horizontal fold of skin from the upper eyelid and sewing the edges together, so as to cure a ptosis dependent on over-abundance or hypertrophy of skin.

Anarrhegnu'minos. ('Αυαρρήγυυμεvos; from αναρρήγνυμι, to break out.) Breaking out. Applied to ulcers which healed quickly and then broke out again; or fractures when they become disunited, Hipp. i, de Morb., xix, 6.

Anarrheg'nymous. Same as Anarrhegnuminos.

Anarrhex'is. ('Ανάρρηξις, a breaking up. F. anarrhexis; G. Wiederaufreissung, Zerreissung.) Disruption or breaking again of a united fracture.

Anar'rhicas. ('Αναφριχάσμαι, to scramble up.) A Genus of the Family Blenniidæ, Order Acanthopteri, Class Pisces. Body clothed with rudimentary scales; mouth large; teeth, of which the anterior are conical and the molars rounded, situated on the sides of the jaws and on the palate; abdominal fin separate from the caudal fin.

A. lu'pus. (L. lupus, a wolf. F. loup de mer, chat de mer.) The wolf fish, sea cat. Hab. Coasts of Northern Europe and America. The liver furnishes an oil, which, mixed with that of many other fishes, especially of the eod family, was

formerly used in medicine, as well as in the arts. **Anarrhi'num.** ('Ανάρρινον.) Returning through the nostril or skin.

Also, a sternutatory.

Name for Nasturtinm; also for Antirrhinum. **Anarrhi** zeæ. ('Ανά, upwards; ρίζα, a root.) A term applied by L. C. Richard to plants which have no true or earth roots.

Anarrho'e. Same as Anarrhwa.

Anarrhœa. (Λνά, upwards; ρίω, to flow.) Term used by Schneiderus, l. i, de Catarrh. c. 3, for a flow of humours upwards, or rather of humonrs brought upwards from the inferior parts; also, regurgitation of the faces, through inversion of the peristaltic action of the intestines.

Anarrhophe. ('Αναρροφέω, to suck down again.) A term for absorption.

Anarrhophenu'si. (Anarrhophe; vouσος, for νόσος, disease.) Diseases of the lymphatics.

Anarrhophe'sis. ('Αναρρόφησις, α gulping down again.) A term for absorption.

('Αναρροπία; ανά, up-**Anarrho'pia.** ('Αναρροπία; ἀνά, upwards; ἡέπω, to tend.) Term used by Hippocrates, l. de Humor. i, 11, for a flow or tending of the

humours from below upwards.

Anarthria. ('Aν, neg.; ἄρθρα, the limbs.
F. anarthrie; G. Gliedlosigkeit.) Defect or Defect or

absence of the limbs.

Also (dvaptpia, want of vigour), disjointed speech, an impairment of the articulation usually dependent upon hulbar paralysis; when the loss of power is complete, it appears to be invariably accompanied by aphonia.

A. litera'lis. (L. literalis, belonging to a letter. G. Stammeln.) Inability to pronounce the letters properly; stammering.

A. syllaba'ris spasmod'ica. (L. sullaba, a syllable; spasmus, spasm. G. Stottern.) Stuttering. A temporary spasmodic inability to vocalise certain sounds, especially the explosive consonants.

Anarthrop'oda. ('Aν, neg.; ἄρθρον, a joint; πούs, a foot.) A Division of the Sub-kingdom Annulosa. Animals having no jointed

limbs.

Anar'throus. ( Aν, priv.; ἄρθρον, a joint. F. anarthre; G. ohne Gelenke.) Without joints; applied to a man stont and fleshy, so as

to appear jointless.

Anas. (F. canard; It. anitra; G. Ente.) The dnck. A Genus of the Family Lamellirostres, Order Palmipedes, or Natatores. Feet placed far back; neck short; beak broad in front, longer than the head; nostrils near base of keel; tail short and wedge shaped. This genus includes the domestic duck, the mallard, widgeon, and other species used for food.

A. bos'chus. (Βοσκάς, a kind of duck.)

The wild duck, largely consumed as food. **Anasar'ca.** ('Aνά, through; σάρξ, the flesh. F. anasarque; I. and S. anasarca; G. Hautwassersucht, Wassersucht.) A term for dropsy in the integuments of the body. Anasarca differs from adema in being more extensive, the latter affecting some part of the body only, as the foot, hand, or eyelid; whilst the former is general, and affects either the entire subentaneous tissue, or at least the whole of a limb. The causes to which it is attributable are renal disease, when it often commences in the face; and cardiac, pulmonary, and hepatic affections, interfering with the course of the circulation, and leading to venous congestion, when it usually commences in the lower limbs, and extends nowards; it is said to occur sometimes in cases of retention of urine. In either case it may be acute or chronic. The skin is pale or rosy, and pits on pressure. The removal of the fluid is partly to be effected by treatment directed to the primary disease, of which the anasarea is only symptomatic, and partly by direct or indirect revulsive and derivative treatment :- Small punctures with a triangularly-pointed needle (Paget), the introduction of one or more drainage tubes, as Sonthey's cannulas, flying blisters, frictions with eroton oil (Bouchut), diuretics, sudorifies, bydragogue cathartics, chalybeates, are amongst the more important means of treatment.

A. anæ mia. (Anæmia, poverty of blood.) Anasarea dependent on anæmic conditions, the

result of hæmorrhage.

A. debil'ium. (L. debilis, feeble.) sarca occurring in weakened conditions of body.

A. exanthematica. ('Εξάνθημα, an eruption.) Anasarca after erysipelas and eruptive diseases.

A. hyster'icum. A transient swelling in an hysterical person.

(L. oppilo, to stop up.) A. oppila'ta. Anasarca from pressure on veins, as in preg-

A. pulmo'num. (L. pulmo, the lung.) Œdema of the lung.

A. rena'lis. (L. ren, the kidney.) Anasarca depending on kidney disease.

A. sero'sa. (L. serum, the watery part of things.) A term to describe anasarea dependent on the suppression of some customary evacuation, or from too fluid a condition of the blood.

Also, applied to Phlegmasia dolens.

Anasar'cous. (Same etymon.) Having

or relating to Anasarca.

A.sound. A moist sound, like fine bubbling, heard on the first application of the stethoscope to the chest when the integuments are cedema-

Anasis'mus. ('Ανα, up; σείω, to sbake.) Concussion.

Anaso'mia. ('Ανά, upon; σῶμα, a body. F. anasomie.) Adhesion of the more outward limbs to the body.

Anaspa'dia. The condition of Anaspa-

dias.

Anaspadiæ'us. (Same etymon as Anaspadias. F. anaspadiæus.) One whose urethra opens on the upper portion of the penis.

Anaspa dias. ('Ανά, upwards; aud σπάω, to draw out, to tear.) In Teratology, the opening of the urethra on the upper surface of the

Anaspad'isis. The same as Anaspasis. Anaspadis'mus. The same as Ana-

Anas'pasis. ('Ανασπάω, to draw up.) Contraction, or retraction; applied specially to contraction of the stomach.

The same as Ana-Anaspas'mus. spasis.

The pine-apple, Ananassa

Anas'sa.

satira. **Anastal'tic.** ('Αναστέλλω, to gird up. F. anastaltique; G. hemmend, blutstiliend.) Formerly applied to medicines that were styptic or astringent.

Term used by Dr. M. Hall, in his 'Diastaltic Nervous System,' for the course of the vis nervosa

upwards.

Anas'tasis. ('Ανάστασις, from ἀνίστημι. to raise up.) Used by Hippocrates, Coac. Prænot. t. 616, 620, 621, for a recovery from sickness, or restoration to health.

Anastat'ic. Of or belonging to anastasis, or a recovery from sickness; having the power of restoring to health.

Anastat'ica. A Genus of the Family

Arabidæ, Nat. Order Crucifera.

A. hierochun'tica. (L. hierochunticus, from Jerieho. F. Rose de Jéricho, jérose hygrométrique; G. Rose von Jericho.) The only known Species of the Genus. A branching herb, with alternate, ohlong, dentated leaves; flowers presenting the ordinary cruciferous type disposed in small spikes. The fruit a short silicula, with two mono- or dispermous loculi. After the fall of the leaves and fruits the branches curve inwards, forming a kind of ball, which may be carried by the wind to great distances in the deserts of Syria. It is collected by charlatans and placed in water near the bed of women in labour. The branches then expand, and the more quickly this occurs the more easy and rapid is the labour expected to be.

A. hierochun'tina. The same as A.

hierochuntica.

Anastœcheio'sis. ('Αναστοιχείωσις, dissolution. F. anastachiose.) A dissolving of matter into its first elements.

Anas'tole. ('Αναστολή, a putting back. F. anastole; G. Zurückbeugen, Zurückschlugen.) A putting back, as of the bair, but, especially, the ragged portions of a large wound.

(Same etymon as Anastomo'sant. Anastomosis. F. anastomosant; G. anastomosirend, aderastig.) That which anastomoses.
Applied to Jussiaa anastomosans, because the lateral nervures of the leaves unite into one unique nerve parallel to the borders.

Anas'tomose. (Same etymon as Anastomosis.) To effect anastomosis; to unite with

each other.

Anastomo'sis. ('Αναστομόω, to bring to a mouth. F. abouchement, anastomose; G. Ineinanderminduny, Einmündung, Zusammenmündung, Mündung, Vereinigung, Ausfluss, Zusammenfluss.) Term for the communication of branches of vessels with each other, as if one mouth or open end of a vessel were joined to

In Botany, applied to the union of two nervures in leaves or vessels in fruits and seeds. It is rare in stems, except at the level of the nodes or

between laticiferous vessels.

A., an'eurysm by. See Aneurysm by anastomosis.

A. aneurysmatica. (Aneurysm.) A synonym of Telangiectusis.

A. Jacobso'nii. (G. Pankengeflecht.) The communications in the tympanum, the tympanic plexus, of the branches of Jacobson's nerve.

Anastomotic. (Anastomosis. F. anastomotique.) Belonging to, or of the nature of, anastomosis.

Applied to medicines like aperients and diureties, believed to open the mouths of vessels.

A. arch. (F. arcude anastomotique.) The curved line or arch sometimes formed by the anastomosis of two vessels, as in the mesentery.

A. ar'tery of arm. (G. untere, innere Nebenschlagader.) A branch of the brachial artery arting about two inches above the bend of the elbow, which, running trans-versely inwards on the brachialis anticus and penetrating the intermuscular septum, turns outwards behind the humerus, underneath the triceps, and joins the superior profunda to form the areus dorsalis humeri posticus immediately above the olecranon fossa. In front of the humerus it gives off a branch to the pronator teres which unites with anterior ulnar recurrent, and at the back of the humerus several branches to the hone and joint, one of which joins the posterior uluar recurrent.

A. ar'tery of thigh. (G. oberste Knie-gelenkschlagader.) A branch of the femoral in Hunter's canal, the anterior wall of which it pierces and then descends, under cover of some fibres of the vastus internus, along the tendon of the adductor magnus to anastomose with the internal articular arteries and the recurrent branch of the anterior tibial artery. gives off a superficial branch, which accompanies the long saphenous nerve, and supplies the integument on the inner side of the knee; and an external branch, which sends twigs to the kneejoint and, forming an arch above the articular surface, anastomoses with the superior external

articular artery.

A. arttery, pu'bic. Branches of the obturator artery given off as it is about to escape from the pelvis; they lie on the inner side of the crural ring and anastomose with branches of the epigastric artery.

A. ar'tery, trans'verse. (G. quere Verbindungsarterie.) A synonym of the communicating branch of the peroneal artery.

A. branches. Twigs of nervo or bloodvessel which connect two branches.

Anastomotica mag'na. The Anas-

tomotic artery of the arm.

**Anas'trophe.** ('Λναστροφή; from αναστρέφω, to turn upside down. F. anastrophie; G. Umkehrung.) Inversion, as of the uterus, or urinary bladder.

An'atase. ('Ανάτασις, extension; from άνατείνω, to stretch forth.) A mineral consisting chiefly of titanic oxide, and deriving its name from its long pyramidal crystals; it is blue, red,

or yellowish brown; it is very electric. **Anat'asis.** ('Ανάτασις; from ανατείνω, to stretch up. F. anatase; G. Ausstrecken.)

Term for extension.

Anatech'nia. Köchlin's Atrehnia.

Ana'tes. Old term for disease of the anus. Anatherapeu'sis. ('Αναθεραπεύω, to rear with care. F. anatherapeusis.) A progressive cure.

Anather'mum. ('Αναθερμαίνω, to warm up. F. anathermon.) A warming medicine.

Anathe'rum murica'tum. (L. mu-catus, pointed like a murex shell.) The Anricatus, pointed like a murex shell.) dropogon muricatum.

A. nar'dus. The Andropogon nardus. Anath'lasis. ('Ανάθλασις, a squeezing out.) Same as Ecthlipsis.

Anatho'mia. Anatomy.

('Ανάθρεψις, Anathrep'sis. fresh growth.) Renovation of health after illness.

An'athron. The older authors describe this as a salt which vegetates on rocks in the form of a white stony moss, and as being a form of sodium chloride.

Anathymia'ma. The same as Anathymiasis.

**Anathymia**'sis. ('Αναθυμίασις; from αναθυμιάω, to make to rise in vapour. F. anathymiase; G. Rauchern, das hysterische Aufstossen.) A fumigating, or an evaporating.

Also, hysterical flatus, or the vapours. Anathymionu'si. ('Αναθυμίασις; νοῦσος, for νόσος, disease. F. maladies de vapeur; G. Krankheiten der Ausdünstung.) arising from vapour or evaporation.

Anat'idæ. (L. anas, the duck. F. canard; 1. anutra; G. Ente.) A Subfamily of the Family Lamellirostres, Order Natutores, or a Family of the Order Chenomorphæ, Class Aves. The duck tribe. The legs are shorter than the middle toe, hallux with no broad membrane.

Anatiferus. (L. anas, a duck; fero, to bear. F. anatifere; G. entetragend.) Applied to Lepas anatifera, from an absurd notion of the inhabitauts of the north of Europe that it produces

wild ducks.

Anat'inae. A synonym of Anatidae. Anatin'inæ. A Subfamily of the Family Myidæ. Molluses having a delicate shell with a granular surface; cardinal teeth obsolete; siphons long and fimbriated.

Anatinus. (L. anas, a duck. F. anatin.)
Pertaining to the Anas; applied to Lingula unatina, because its shell resembles the bill of a

Anat'ipes. (L. anas; pes, a foot. F. anatipede; G. entfussig.) Resembling a duck's foot, as Spongia anatipes

Anat'ole un'guium. ('Ανατολή, a growing. L. unguis, a uail.) The demilune of the unils.

Anat'ome. (Λυατομοί, dissection; from ανατέμνω, to cut up.) Anatomy.
A. anima'ta. (L. animatus, animated.)

A term for physiology.

Anatom'ia. (Lat., from άνατομή, dissection.) Anatomy.

A. anima'lis. (L. animalis, living.) A term for Comparative Anatomy, or the dissection of animals.

A. compara'ta. (L. comparatus, to compare.) Comparative Anatomy, or the dissection of animals.

A. comparativa. (L. comparativus, comparative; from compara.) Comparative Anatomy. A. vi'va. (L. vivus, alive.) A term for

Physiology. Anatom'ical. (G. anatomisch.) Of or

belonging to Anatomy.

The doctrine that the Anat'omism. physical arrangement of parts explain the phenomena of life.

Anat'omist. Term for a dissector of organised bodies, whether human, brute-animal (called also Zoötomist), or vegetable (then also

termed Phytotomist.)

**Anat'omy.** ('Aνατομή, dissection; from ανατέμνω, to cut up. F. anatomie; I. anatomia, notomia; S. anatomia; G. Anatomie, Zergliederung, Zergliederungskunst, Zergliederungskunde.) Generally, the cutting up, or dissection, of organised bodies, whether human, brute-animal (also called Zoötomy) or vegetable (otherwise termed Phytotomy), to expose the structure, uses, &c., of their different parts.

A., analog'ical. The study of the bodily structures and organs in their relationship to each

other in the different animals.

A., an'imal. A term for Comparative Anatomy.

A., artific'ial. (F. anatomie artificielle.) The imitation of dissections in wax, or other material.

A., chirur'gical. The same as A., surgical. A., clas'tic. (Κλάω, to break.) study of the hodily structures from models which may be separated into pieces.

A., comparative. (F. anatomie comparce ; G. vergleichende Anatomie, Zergliederung der unteren Thiere.) This expresses the dissection of the lower animals and plants, in order to ascertain their resemblance to, or difference from, the human body, and to illustrate the general principles of organisation.

A., descrip'tive. (F. anatomie descrip-tive; G. beschreibende Anatomie.) This term includes the details of the situation, form, or shape, and the relative attachments of the vari-

ous parts. A., development'al. A synonym of Embryology.

A., foren'sic. A term given to morbid or Pathological Anatomy when applied to jurispru-

A., gen'eral. (F. anatomie g'nérale; G. allgemeine Anatomie.) The description of the structure and physical nature of the various tissues composing the body is embraced in this term, apart from any consideration of the organs they compose.

A., homolog'ical. The study of the bodily structures and organs in their relationship to each other in the same animal.

A., hu'man. (F. l'anatomie de l'homme, or du corps humain; G. Anatomie des Menschen,

or des menschlichen Körpers.) Term for the dissection of man.

A., medical. (F. anatomic me'dicule; G. medicinische Anatomic.) Term embracing Descriptive, Physiological, and Pathological Anatomy, with special regard to the situation of the various internal organs, and their nervous connections.

A., medico-chirur'gical. The same as

A., regional.

A., microscop'ical. The minute struc-

tural anatomy of the tissues.

A., morbid. (L. morbidus, having disease.) The dissection of bodies for the purpose of displaying the diseased organs or struc-

A., patholog'ical. (F. anatomie pathologique; G. pathologische Anatomie.) Term for Term for the investigation of changes in the structure of organs, produced by disease, or as effects of congenital malformation.

A., philosoph'ical. See A. transcenden-

A., physiolog'ical. (F. anatomie physiologique; G. physiologische Anatomie.) for the examination of the numerous organs of animals, in order to understand their respective functions in the healthy state.

A., prac'tical. A term for dissection.
A., re'gional. The special and relative description of the anatomy of regions of the body, the parts of which region have some relationship to each other in regard either to disease,

or injury, or operation.

A., spec'ial. Same as A., descriptive. A., sur'gical. (F. anatomie chirurgicale; G. chirurgische Anatomie.) Term for the examination of the various organs, particularly the muscles, nerves, and blood-vessels, and the precise points of situation in which they are found, their connections with, and relations to, each other, and where they are most exposed to injury under all circumstances.

A., tex'tural. The minute structural

anatomy of the tissues.

A., topograph'ical. The same as A.,

regional.

A., transcendent'al. (F. anatomie transsendante.) A term for that branch which (F. anatomie treats of the development of parts, their analogies, the primary model or type according to which they are formed, and their approximation to, or deviation from, that model; also termed philosophical anatomy.

A., veg'etable. The study of the struc-

ture of plants.

A., vet'erinary. (L. veterinarius, of or belonging to veterine, or draught-cattle.)

Anaton. The same as Anatron.

Anatre'sis. ('Ανάπρησις, a boring; from ανατιτράω, to bore through, to perforate. F. anatre'se.) Term for a perforation; applied by Galen, de C. M. per Gen. vi, 2, to the operation of trepanning the skull.

Anatri'be. ('Aνατρίβω, to rub well.)

Friction.

Anatripsiolo'gia. See Anatripsology. Anatrip'sis. ('Ανάτριψις; from ἀνατρίβω, to ruh well. F. anatribe, anatripsie; G. Aureiben. Einreiben.) Term used by Galen for friction of the body, but more particularly from the inferior parts upwards.

Anatripsology. ('Ανάπριψις, friction; λόγος, a discourse. F. and G. anatripsiologie.)

Ancient term for a history of, or treatise on, the employment of friction.

Anatripticus. ('Aνατρίβω, to rub well. F. anatriptique; G. eingereiben, Zerrie-bend.) Belonging to friction; applied to medicines having a mechanical action of this kind in the bowels; anatriptic.

Anatriptology. The same as Ana-

tripsology.

Anatris. (Arab.) Old name for hydrar-Anatris. (Arao.) Old name for hydrargyrum, or mercury. (Ruland and Johnson.)
Anatron. Arabic for soda, which was formerly called Natron. (Dornaus, R. and J.)
Also, a synonym of Potassæ sulphas.

Also, a synonym of the seum which rises to the surface in the manufacture of glass. It consists chiefly of sodium or potassium chloride, and sodium or potassium sulphate. It was formerly used as a laxative.

**Anat'ropal.** ('Δνατρέπω, to turn up. L. anatropus; F. anatrope; G. gegenlaufig, um-gewendet.) In Botany, a term applied to an ovule, which becomes in the course of growth and development recurved, so that the micropyle or organic apex is applied to the hilus or point of insertion of the funiculus, and is situated at one extremity of the ovule, whilst the chalaza or organic base of the ovule is at the other extremity, and is connected with the hilus by a raised vascular band termed the raphe. It is well seen in ranunculaceæ.

Anat'rope. ('Ανατροπή, an overthrow from αυατρέπω, to upset. F. anatrope.) Used by Galen, l. viii, de C. M. sec. Loc. s. 1, for inverted action of the stomach; nausea and

Anat'ropous. The same as Anatropal. Anat'to. See Annatto.

Ana'tum. An old term for egg-shells.

Anau'dia. ('Avavôla; from a, neg.; avôŋ, speech. F. anaudie; G. Sprachlosigkeit, ein hoher Grad von Heiserkeit.) Another term for aphonia, or loss of voice, according to Hippocrates, Coac. Pranot. t. 34, and 359.

Also, a term for Catalepsy.

Anax'yris. The common sorrel, Rumex acetosa. Anay'cal. A local name for Barbadoes

Ana'ze. A name given in the Masearene Islands to the acidulous pulp which surrounds the seeds of the common baohab.

Anaz'esis. ('Ανάζεσις, a boiling.) Ebullition; the act of boiling.

Anazo'tic. (L. an, priv.; azotum, nitrogen. F. anazotique; G. kein Azot.) Without Without azote or nitrogen; anazotic.

Anazoturia. (L. an, neg.; azotum, azote, or nitrogen, the chief constituent of urea; urina, the urine.) Name given to a variety of chronic diuresis, in which urea is partially or entirely absent from the urine.

An'berry. A warty condition of the roots of cruciferous plants caused by insects.

Also, a term given to pedunculated warts often seen on the helly and throat of horses.

An'ceps. (L. an, abbreviation of ambi, around; caput, a head. G. doppelt, zweiseitig.) Two-headed, and by metonymy double, wavering. Used to imply doubt as to the nature of a dis-

ease, or of the action of a medicine. In Botany, applied to leaves having both edges sharp.

An'cha. (Arabic.) The coxa, or hipjoint, according to Avicenna, iv, fen. 5, tr. 1, e.

An'chæ os. (Ancha; os, a bone.) The femur.

Anchæ'los. Old term for the femur, or thigh bone.

**raph'tha.** ( $^{\prime}$ Λγχω, to strangle; F. anchaphthe; G. Apthenbräune.) Anchaph tha. aphtha. Term by Bateman for Aphtha anginosa.

Anchie'tea. A Genus of the Nat. Order Violacca.

A. saluta'ris. (L. salutaris, healthful.) A climbing plant, native of Brazil, the root of which, under the name of Piriguar, is often employed as a purgative, and as a remedy in cutaneous diseases.

An'chilops. (Άγχι, near to; ωψ, the eye. F. anchilops; 1. anchilope; S. anguilops; G. Augenwinkelgeschwulst.) Term for an abscess near to the inner angle of the eye superficial to

the lachrymal sac.

**Anchithe rium.** ('Αγχι, near; θήρ, a wild beast.) A fossil animal of much interest in regard to the pedigree of the horse, to which it presents many points of similarity; the hones are found in the Eocene deposits of some parts of Europe. It differs from the horse, however, in having had three complete toes, the lateral toes being much larger in proportion to the middle toe than in Hipparion, and probably resting on the ground in ordinary locomotion.

The Mexican name of the Ancho'as.

Amomum zingiber.

**An'chonë.** ( $\Lambda \gamma \chi \delta \nu \eta$ , from  $\chi \chi \chi \psi$ , to strangle. G. *Halsversehnürung.*)  $\Lambda$  term for the sensation of strangling, as experienced in hysteria; suffocation.

Anchon'idæ. A Family of the Nat.

Order Crucifera.

Anchonidro'a. ('Ανχόνη, a strangling; ίδοωa, heat-spots. G. Braunefriesel.) Term for Miliaria anginosa.

Anchonie'æ. (F. anchonié.) Applied by de Candolle to a Tribe of Cruciferæ, having

Anchonium for their type.

Anchonoporphyroty phus. ('A $\gamma$ χώνη; L. porphyrotyphus. F. anchonoporphyro-typhus.) Term for Porphyrotyphus anginosus, or typhous scarlatina.

Anchora'lis. (L. anchora, an anchor. G. ankerformig.) Of or belonging to an anchor;

anchor-like.

A. proces'sus. The coracoid process of the scapula.

Ancho'vy. (F. anchois; I. acciuga; S. anchou; G. Anchove, Anschove.) The Engraulis, or Clupea enerasicholus, belenging to the Clupeida, Hab. Mediter-Mulacopterygii abdominales. ranean. It is salted, or otherwise prepared, and used as a condiment. They are said to be aphrodisiac. Several other species of fish are substituted for the true anchovy, and they are generally coloured with Venetian red, or Armenian bole.

The fruit of the tree Grias A. pear. caulittera.

Anchu'sa. A Genus of the Nat. Order Boraginaceæ. Corolla hypocrateriform, with five inflexed scales in the orifice; nuts surrounded at the base by a tumid edge.

The Aγχουσα of the ancients appears to have been the Anchusa tinetoria of the moderns. They recognised four kinds: (1) Λ. δνόκλεια (Anchusa tinetoria); (2) A. Norayos (Echium italicum); (3) Α. άλκιβιάδειον (Echium diffusum); and a fourth, identified with Lithospermum fruticosum. The root was employed as an astringent, and was given internally in affections of the liver, spleen, and kidneys, in bites of venomous animals. (Waring.)

A. angustifo'lia. (L. angustus, narrow; folium, a leaf.) A synonym of A. officinalis.

A. incarna'tus. (L. incarnatus, in the flesh, flesh-coloured.) A synonym of A. officinalis.

A. ital'ica. (F. Buglosse; G. Ochsenzunge.) A plant formerly employed as an emollient. Divisions of the cally somewhat long and pointed; appendages of corolla bearded; limb unequally divided.

A.lute'a. (L. luteus, yellow.) The Onosma

echioides.

A. lycopsol'des. (Lycopsis, the plant so named; ¿los, likeness.) A synonym of A. offcinalis.

A. officina'lis. (L. officina, a shop. F. buglosse; G. Ochecuzunge.) Root stout, biennial; leaves narrow, lanceolate; cymes forked or in pairs; bracts and calyx-lobes ovate-lanceolate; dowers subsessile; appendages of corolla velvety; limb regular. The root is mueilaginous, and the flowers slightly bitter. It was formerly used as a cordial in hypochondriasis,

A. tineto'ria. (L. tinetorius, belonging to a dyer. F. orcanette; G. Alkanna schminkwurzel, Ochsenzungenwurzel.) The alkanet plant. Garden Stem herbaceous, with rough hairs; hugloss. leaves lanceolate, obtuse, hoary; nuts warty. The roots yield a reddish colouring matter. Alkanet is used to colour fatty substances, as ointments; alkalies render it blue. See Alkanet.

Anchu'seæ. A Family of the Nat. Order Boraginaccæ.

Anchu'sic ac'id. A synonym of Anchusin.

Anchu'sin. C35H40O8. (G. Anchusaroth Alkannaroth.) A red-coloured principle obtained from the Anchusa tinetoria. It is amorphous, insoluble in water, but soluble in alcohol, ether, fixed or volatile oils, carbon bisulphide, and acetic acid. It melts at 60° C. (140° F.), volatilising in violet vapours. It combines with alkalies and alkaline earths. The alkaline s lutions are precipitated by alum and lead acetate.

An'chyle. See Ankule. Anchylobleph'aron. See Ankyloblepharon.

Anchylomeris ma. ('Αγκύλη, a contracted joint, a noose; μέρισμα, a part.) A growing together of the soft parts.

Anchylo'sis. See Ankylosis.
Anchylos'toma. The same as Anchy-

Anchylos'tomum. ('Λγκύλος, curved; στόμα, mouth. F. ankylostome.) A Genus of Nematoid Entozoa found in the intestine of man. The worms are ash-coloured, cylindrical; the head slightly attenuated, mouth in form of a sucker, subcorneous, with a large circular opening directed dorsally, containing four teeth situated within its inferior margin; pharynx infundibuli-form, with resistant walls; esophagus muscular, expanding posteriorly, integement transversely striated, two conical papillae situated opposite to one another at the junction of the first sixth with the remainder of the body; anus lateral, a little in front of the extremity of the tail. The sexes separate—male provided with a caudal terminal sac, entire, excised below, multiradiate, penis double and very long; female with obtuse tail, vulva situated behind.

A. duodena'ie. A werm cemmon in Northern Italy, and attacking the fourth part of the whole population in Egypt, where it is the cause of the disease named Egyptian chlorosis. In form it is thick and cylindrical; anterior extremity recurved; head obliquely truncated, with a hard chitinous and bell-shaped capsule for the mouth; at the anterior margin of this are four, and at the posterior margin two, strong claw-like hooks; still more internally are two more pointed projections; pharynx muscular; intestine simple, wide. The male is from 6-10 mm. long, and ends in a three-lobed bursa, in which are placed two thin spicula; the sexual organs consist of a long convoluted canal, forming the testis and efferent duct, an oval or fusiform seminal vesicle, and a long and broad ejaculatory duct. female is from 10-18 mm. long and about I mm. thick; the tail pointed; genital opening behind the middle of the body, and through a short tube, leading into a muscular double vagina; the nterus long and double, with tubes and ovaries; the ova are 0.05 mm. long and 0.023 mm. broad. Segmentation has already commenced in them when laid, and after twenty-four hours' exposure to moist air a worm-like embryo escapes through the thin shell. The worm is probably a stage in the development of the Dochmius trigonocephalus of the dog, which is taken into the system in its Rhabditis form with fonl water. It attaches itself to the lower portion of the human duodenum and jejunum. The symptoms of the presence of the worm are those of anæmia, some cases running an acute course and terminating fatally in a few weeks; whilst others, especially if the food supply be abundant, may last for years. The remedies found most useful have heen the milky juice of the Ficus doliaria and the milky juice of the Carica dodekaphylla.

Anchyroides. (Άγκυρα, an ancher; είδος, form.) Having the form of an ancher.

A. proces'sus. The coracoid process of the scapula.

An'ci. The same as Ancus.

An'cinar. An old term for borax.

An cinar. An old term for borax. Ancipital. (L. anceps, double. F. ancipité; G. zweischneidig.) In Botany, having two sharp edges like the stem of Narcissus.

Ancip'itate. (L. anceps, double.) A term applied to any organ presenting flat faces and two cutting edges.

Ancis troid. ('Αγκιστροειδής, hookshaped, barbed; from ἀγκιστρου; εἶδος, form. F. ancistroïde.) Hook-shaped.

Ancis'tron. ("Αγκιστρου, a fish-heek.) A hook-like or hamular process.

**Ancistrop'odous.** ("Αγκιστρου; πούs, foot. F. ancistropode; G. hakenfüssig.) Having long claws. Applied by some authors to a Suborder of Birds.

Anci'sus. (L. ancisus, cut all round; from an, for ambi, around; and cado, to cut. G. ringsumbeschnitten.) Incised all round.

Anclam. A mineral spring in Pomerania.

An'cle. See Ankle. An'cler. The malle The malleolus. (Dunglison.)
The malleolus. (Dunglison.) An'clet. The malleolus. (Dunglison.)
An'cliff. The malleolus. (Dunglison.)

An'clowe. The malleolus. (Dunglison.)
An'colie. (Fr.) The Aquilegia vulyaris.
An'con. ('Αγκών, the bend of the arm, the elbow.) Term for the elbow; or the trian-

gular surface of the electanon process of the ulna, being the part on which pressure is made when leaning on the elbow.

Anco'nad. (Same etymon.) Used by Dr. Barelay as meaning towards the aneon, or trian-

gular surface of the oleeranon.

Ancona gra. ('Αγκών; ἄγρα, a seizure. F. anconagre; G. Ellenbogengicht.) Arthritic pain of the elbow.

Anco'nal. ('Αγκών.) Of or belonging to

the ancon, or elbow.

The surface on which the aucon is situated.

(' $\Lambda \gamma \kappa \omega \nu$ , the elbow. Ancone'us. A small, triancone; G. Knorrenmuskel.) angular muscle at the back of the elbow-joint. Also, called Cubitalis musculus, Epicondylo-cubitalis. It arises from the posterior surface of the outer condyle of the humerus by a separate tendon, and is inserted into the onter part of the elecranon and the upper fourth of the posterior surface of the shaft of the ulna. It is covered by a strong fascia, and is in contact by its deep surface with the supinator brevis. An anastomis between the superior prefunda and recurrent intero-seous arteries lies between the two muscles. It is supplied by a branch from the musculo-spiral nerve, which enters its upper border. It helps to extend the forearm. In the armadillos and some seals it is a very large muscle.

The term was formerly applied to all the

muscles inserted into the oleranon.

A. exter'nus. (L. externus, ontward.)

An extensor muscle of the pterygo-radial joint in Craniote Vertebrates, extending from the preaxial side of the pterygium to the fore limb. It is the external head of the triceps extensor cubiti muscle, and corresponds to the vastus internus in the hind limb.

A. inter'nus. (L. intermus, inward.) An extensor muscle of the pterygio-radial joint in Craniote Vertebrates, extending from the postaxial side of the pterygium to the fore limb. It is the inner head of the triceps extensor cubiti muscle, and corresponds to the vastus externns of the hind limb.

A. lon'gus. (L. longus, long.) An extensor muscle of the ptergio-radial joint in Craniote Vertebrates, extending from the scapula to the fore limb. It is the long head of the triceps muscle, and corresponds to the rectus femoris of the hind limb.

A. ma'jor. (L. major, comp. of magnus, great.) The long head of the triceps extensor eubiti.

A. mi'nor. (L. minor, comp. of parvus,

small.) The anceneus muscle.

A. sex'tus. (L. sextus, the sixth.) A small muscular slip, which in man is sometimes independent, sometimes a factor of the triceps brachii. but in the rest of the mammalia is always an independent structure. It extends from the hnmerus to the nina, nearly at right angles to the triceps, and arches over the uluar nerve.

A. tertius. (L. tertius, the third.) The

Epitrochleo-anconeus muscle.

Anconoca'ce. ('Αγκών ; κακός, bad. F. anconocace; G. Ellenbogengelenkverderbniss, Ellenbogengicht.) Term by J. F. Lobstein for pain in the elbow-joint.

('Aγκών.) Resembling the An'conoïd. ancon, or elbow.

Ancora. Arabic for calyx, or lime. (R. and J.) Ancora'lis. Same as Anchoralis.

Ancorin'ide. (Aykuoa, an anchor. L. ancora, an anchor.) A Family of the Order Fibrospongia, Class Spongia. Spenges in which the cortical layer contains no stars or spherules of silies but of silica, but is traversed by anchor-shaped spicules, which project externally.

Ancosa. Arabic for lacea, or lac. Anc ter. ( $\Lambda \gamma \kappa \tau i \rho$ , from  $\tilde{\alpha} \gamma \chi \omega$ , to press tight. G. Heftnadel.) Name for a clasp or fibula with which the lips of a gaping wound, which did not allow of the suture, were maintained in apposition, according to Langius, l. i, cp. 77. See Intibulatio.

Ancte'res. (Same etymon.) The plural

of Aneter.

Ancterias mus. ('Αγκτηριασμός.) Used by Galen for the operation of employing aneteres. or of keeping the lips of wounds together by clasps, or tibule, according to Gorraus. See Infibulatio.

Ancubitus. A disease of the eyes and eyelids, as if they contained sand; also called petrification, according to John Anglicus, Ros. Angl. p. 867

An'culë. See Ankulë.

Ancunulen'ta. (Lat.) A woman during

menstruation.

An'cus. ('Αγκών, the elbow.) Term applied to one whose arm is fixed in the bent position, whether from congenital deformity or accident.

An'cyle. See Ankule. **Ancylen'terum.** ('Αγκύλη, a loop, or noose; ἔντερον, an intestine. F. ancylenteron; G. Darmverwachsung.) Adhesion or growing together of the bowels, eausing obstruction.

Ancylobleph'aron. See Ankyloblepharon.

Ancylocheilia. (Άγκύλη, a loop; χείλος, the lip. F. ancylochilon; G. die Verwachsung der Lippen.) Adhesion of the lips.

Ancylocolpus. See Ankylocolpus.

Ancyloderis. See Ankyloderie.

Ancyloderis. See Ankyloderis.

Ancylodon'tia. See Ankylodontia. Ancyloglos'sia. See Ankyloglossia

Ancyloid. (Α<sub>γ</sub>κόλη, a loop or noose. F. ancyloide; G. hakenähulieh, hakenförmig.) Resembling a clasp. noose, or hook.

Ancylom'ele. (Αγκόλος, curved; μήλε, a probe.) A curved probe. See Ankylomete.

Ancylomeris'mus. See Ankylomeris-41/1/8

Ancylopo'dia. ('Αγιόλος, crooked; πους, a foot. F. ancylopodie; G. Fusskrümmung.) A curvature of the feet.

**Ancyloproc'tus.** ('Αγκύλη, a noose;  $\pi_{pωκτόs}$ , the anus. **F.** anus imperfore; **G.** der verwachsende After.) Atresia, or imperforation of the anns.

Ancylorrhin'ia. See Ankylorrhinia. Ancylo'sis. See Ankylosis.

Ancyles'toma duodena'le. See Anchylostomum duodenale.

Ancylo'tia. See Ankylotia.

An'cylotome. See Ankylotome. An'cyra. See Ankyra.

Ancyracanthop'sis bilabia'ta. (Λγκυρα, an anchor; ἄκανθα, a prickle; ωψ, the eye; L. bis, double; labia, a lip.) A sexuallymature Nematoid Entozoon found in the coats of the stomach of Eurypyga helias.

Ancyracanth us. ( Αγκυρα, an anchor; äκανθα, a spine.) A Genus of sexually-mature Nematoid Entozoa, of which five species have

been named:

A. bi'dens. (L. bidens, with two teeth.) Found in the walls of the stomach of the Merops apiaster.

A. cystidic'ola. (Κύστις, the bladder; L. colo, to inbabit.) Found in the swim-bladder of Trutta fario.

A. im'par. (L. impar, uneven.) Found in the swim-bladder of Osmerus eperlanus.

A.longicor'nis. (L. longus, long; cornu, a horn.) Found in the coats of the stomach of Tringa alpina.

A. pinnatifidus. (Pinnatifidus, from L. pinna, a feather; findo, to cleave.) Found in the intestine of Podocnemis erythrocephalus.

An'cyroid. See Ankuroid. Ancyroides. See Ankyroides.

An'da. A Genus of the Nat. Order Euphorbiacea.

A .- a'cu. Same as Anda.

A. Brazilien'sis. A species yielding Anda oil.

A. de pison. Same as Anda.

A. Gome'sll. A Brazilian species yielding oval nuts, each containing two seeds, which are strongly cathartic, and also emetic, the green rind or shell being astringent, and used in diarrhea. The bark thrown into the water intoxicates fishes.

A. oil. (G. Andaöl.) A fixed oil prepared by expression from the seeds of Anda Braziliensis or Anda Gomesii, a tree of Brazil. The bark yields a milky juice, which is used for stupefying fish. In doses of fifty drops it operates moderately on the howels, and copionsly in large doses.

Anda bre. France; Aveyron, Arrond. St. Affrique. About 30 miles from Lodeve and 40 from Albi. Here are cold bicarbonated ferruginous springs, resembling those of Vichy, but containing a larger proportion of iron. These waters are recommended in disorders of the digestive tract, and in passive dropsy dependent on abdominal engorgement. They are contra-indicated in states of nervous irritability and in inflamma-

The lotus, Nelumbium Andacho'ca. speciosum.

Andalu'site. (From Andalusia, where it was first discovered.) One of the garnet family found in mica schist, consisting of silica and alumina, with small amounts of iron, manganese, and calcium.

An'damans. Inhabitants of the Andaman Islands, members of the Negrito type. They are sbort, bave square shoulders, and well developed chest; they are glossy black, and have little beard. Forehead prominent, face squarish, lips large.

An'darac. Arabic for Sandaracha græ-corum, or realgar. (R. and J.)

Andas. A solution of salt. (Paracelsus.) Andas'su. Same as Anda.

Ande. Breath; halitus.

An'deer. Switzerland; Canton Graubünden. Two springs arising in a moorland district at Pignieu are conveyed in troughs to Andeer. They contain a considerable amount of hydrogen sulphide and some calcium sulphate. Temp. 193 C. (66·2° F.) The bathing arrangements are complete; and there is a whey cure.

An'delys. France. A cold chalybeate

spring near Rouen, prescribed in anæmia,

Andena. Arabie for soft steel. Anderfa. The native name of a Species of Euphorbia, the berries of which, according to Harris ( Highlands of Ethiopia'), serve as a dras-

tic eathartic. (Waring.)

Anderjow. Hindustani name of the seeds

of Holarrhena antidysenterica.

An'ders. Name given in Auvergne to a slight cutaneous disease affecting calves, and attributed to insufficient food. (L. and R.)

An'dersch. A German anatomist, who lived at the close of the 18th century.

A's.gan'glion. A synonym of the petrous ganglion of the glosso-pharyngeal nerve.

Moravia; about An'dersdorf. miles from Neustadt. A bicarbonated calcic spring rises here, with a temperature of 12° C. (54° F.). The water is recommended in catarrhal affections of the respiratory organs.

An'derson. A Scottish physician of the

seventeenth century.

A.'s pills. Barbadoes aloes, 3xxiv; gamboge, 3j; soap, ziv; colocynth, 3j; oil of anisced, 3ss; mix, and divide into 3-grain pills. A purgative. Dose, 1-4.

Andes. The lefty continuous belt of

mountain district along the western coast of South America. Very many high-lying stations, at heights varying from 5000 to 10,000 feet above sea level, are much frequented as resorts for pulmonary invalids.

An'desite. (From Andes been found.) A form of trachyte. (From Andes, where it has

Andic'olus. (Andes; colo, to inhabit. F. andicole.) Inhabiting the Andes mountains.

Andi'nus. Similar to Andicolus. Andi'ra. (G. Kohlbaum) A Genus of the Group Andireæ, represented by trees with alternate imparipinnate leaves, either exstipulate or with setaceous stipels, and straight and very small stipules. The flowers are in terminal clusters or thick cymes; calyx gamosepalous, with five short teeth, or almost absent; the vexillum orbicular, unguienlate at the base; alæ oblong, and resembling the carina, which is formed of two free petals; andrecium didelphons, occasionally monadel-phons; ovary stipitate; fruit a drupe; mesocarp more or less fleshy; endocarp forming an indehiscent and monospermons nut; the seed descending; embryo fleshy, without albumen.

A. anthelmin'tica, Bentli. ('Αντί against; ελμινς, a worm. F. semences d' Angelin'.) A tree growing in Brazil. The fruit is called Angelin amargozo. The seeds are emetic, cathartic, and anthelmintic. The dust produced by sawing the wood causes great irritation of the

eyes, throat, and skin.

A. Harsfroel'dii. Hab. Java; on the mountains of Tingar. The fruit is said to be used as an antidote to the poisons upas antiar

and upas tienté.

A. ibai-ariba. A synonym of A. rosea. A. iner'mis, Kunth. (L. inermis, without defensive armour. F. Bois palmiste sauvage des Antilles, Geoffrée de Jamaique.) The wild cabbage tree. A tree growing in the tropical and subtropical regions of America and in Sene-It is believed to be the source of the bark called by the French Ecorce de Geoffrée des Antilles, or de la Jamaique. It is a drastic cathartie, an anthelmintic, and when given in a large dose, a violent narcotic poison. See Cubbage tree bark.

A. racemo'sa, Lamarek. (L. racemosus, clustering.) A species having the same properties as A. inermis.

A. retu'sa, Kunth. (L. retusus, blunted.) A tree growing in all the Guianas, and producing the bark called by the French l'écorce de Geoffrie de Surinam. It is said to have the same properties as the bark of the A. inermis, but is more actively anthelmintic.

A. ro'sea, Benth. (L. roseus, belonging to roses, red-coloured.) A species acting like A.

anthelmintica.

A. stipula'cea, Benth. (Stipulaceus. having stipules.) A vermifuge, like A. anthelmintica.

A. surinamen'sis, De Candolle, A species growing in Surinam, and having similar properties to the A. inermis.

A. vermifu'ga, Benth. (L. rermis, a worm; fugo, to drive away.) A tree growing in Brazil. The seeds are employed as an anthelmintie.

Andi'reæ. A Group of the Family Papilionuceæ, Nat. Order Leguminusæ. The ovary is uni- or panciovulated, and becomes a monospermons indehiseent fruit, sometimes fleshy and drupaceous, sometimes thin and swollen.

The bitter substance of the Andi'rin. wood of Andira anthelmintica. It is yellow brown, and soluble in water, alcohol, and ether.

And'janc. An Indian name of a Species of Electropus, the seeds of which are very oily.

Andol-andol. A Chinese fly used, like cantharides, in tineture as a vesicant.

Andorn-kraut. (Ger.) The Herba

marrubii albi, white horehound. Andrachaha'ra. A synonym of the

houseleek, Sempervivum tectorum. A. cad'ishaw. A tree producing a poison-

ons Indian fruit, probably the Chrytia collina.

Andrach'le. See Andrachne. Andrach'ne. ('Ανδράχνη.) given to a Euphorhiaceous plant, and also to an Arbutus, but chiefly to the Portulucca oleracea, Linn., or purslane.

Dioscorides (Lib. ii, cap. 150) recommends andrachne as a cooling and astringent medicine, internally in fevers, intestinal inflammation, worms, piles, and locally for pains in the head, ophtbalmia, and other external affections. (Waring.)

Andræ'cium. A misspelling of Andræcium

Andrædæ'a. ('Avno, a man; alĉoŭa, the pudenda. F. andredee; G. die männliche Geschlechtstheile.) The male genitals.

Andrædæoblennorrhæ'a. drædwa, blennorrhwa. F. andrædwoblennorrhée.) A flow of mneus from the male genitals.

Andrai'da. A plant of the I. of Lemnos. The infusion is employed by the inhabitants for the relief of pain in the stomach and chest. (Belon, 'Singularitus,' p. 71.)

Andralogome'lia. ('Avno, a man; άλογος, deprived of reason; μῆλον, any domestic animal. F. andralogomelie.) In Teratology, term suggested by Malacarne to signify a monster having the body of a man and the extremities of some lower animal.

Andranat'omy. ('Ανήο, a man; σατομή, dissection.) The dissection of the άνατομή, dissection.)

Andraphax. ('Ανδράφαξις.) An name of the Chinopodium vulvuria. An old

Andrea Japoi, mineral waters of. A chalybeate spring in Tver, Russia. Temp. 8° (46° F.).

Andrewa'ccw. Split mosses. In Lindley's classification, a Nat. Order of the Alliance Muscales. Spore cases opening by valves, with an operculum, without elaters. They are natives of cold and temperate regions, on rocks up to snow level.

In other arrangements, a Family of the Order

Schizocarpa, Class Musci.

An dreasberg. Germany; in the Harz mountains, 1800 feet high. Climate rather severe. Here is an establishment where pine-leaf baths

can be obtained.

Andrejapol. Russia; in the government of Zwer. A min-ral water—temperature 5° C. (41° F.)—containing ferric and magnesium carbunate, calcium, magnesium and sodium chloride, and carbouic acid. Used in dyspepsia, pyrosis, abdominal congestions, hypochondriasis, glandular enlargements, serofula, hysteria, and atonic nerve disorders.

**Andrene'tæ.** (F. andrenètes.) Applied by Latreille to a Tribe of Mellifera, by Lamarek and Goldfuss to a Family of Hymenoptera, having

the Andrena for their type.

Andreni da. (G. Grabbienen.) A Group of Family Anthophila, Order Hymenoptera, Class Insecta, or Condytopoda; a similar Group to Andrenine.

Andreni'næ. A Subfamily of the Family Apidw. Bees, with the lower lip provided with a short and broad tongue; mentum very long; labial palpi with four joints.

Andreno' des. (Andrena. F. andrenade.) Applied by Latreille to a Subtribe of Anjariæ, because they resemble the Andrena.

Apianae, be cause they resemble the Andrena.

Andreoïd'eæ. (F. andréoïde.) Applied by Bridel to a Family of Musci, having the Andrewa for their type.

An drews, Henry C. English botanist, who published monographs on heaths, geraniums, and roses, between 1797 and 1828.

An dria. (Δυδρεία, manliness.) Old name,

An'dria. ('Aνδρεία, manliness.) Old name, used by Bonettus, Med. Septentr. 1. iii, for a hermaphrodite woman.

Also, the adult condition.

Androa'rium. ('Aνήρ; διάριον, a little egg. F. androarion') The testicle.

Andro'cium. A misspelling of Andrw-cium.

**An'drocline.** ('Aνήρ, a man; κλίνη, a bcd. G. Staubbeutelgrube.) A term applied by Blume to the extremity of the gynostemium of orchids, on which lie the lobes of the anthers.

Androda'mas. A black mineral substance mentioned by Pliny (probably spicular iron), which was considered an excellent remedy in diseases of the liver. (Waring.)

Androdiæ cious. ('Arrip; diacious.)
Term suggested for plants that produce hermaphredite flowers on one individual and males on
another. No instance, however, seems to be
known of such a condition.

Androdyn'amous. ('Av´ıp', ĉ´evaµcs, power. F. androdyname.) Applied by Fries to Dicotyledonous vegetables, which he terms Plantæ androdynamæ, because of the great development of the stamens and their analogues the petals.

Andrœ'cium. ('Ανήρ, a man; οῖκος, a house. F. androcie.)

The entire male sexual apparatus of a flower. The whole of the male organs of a flower. The whole or whorls of organs situated between the corolla on the untside and the gynœcium on the inside.

The stamens taken collectively. The number of parts is variable. In Centranthus, some willows, and in the Amomeæ, there is only one stamen; in the jasmins, lilacs, and valerian, two; in the iris and Crocus sativus, three; in Rubiaceæ, Labiatæ, Verbenaceæ, many Scrophulariaceæ, four; in most dicotyledons, five; in many monocotyledons, and almost constantly in Crucifera amongst dicotyledonous plants, six; in the Horse-chestnut, seven; in some Eleagnaceæ, Combretaceæ, Myriceæ, eight; in Rhubarb, nine; in the Oxalidaceæ, many Leguminoseæ, Rutaceæ. and Phytolaccaceæ, ten; the number eleven is not known to occur as a permanent condition; in some Aristolochiaceæ, twelve; in Rosaceæ, Ranunculaceæ, Magnoliaceæ, and some others, a greater, but usually variable, number. The parts of the andrœcium are usually separate, but may be united to a greater or less extent, either to each other or to adjoining parts. See Stamen.

Androgalactoze mia. ('Ανήρ; γάλα, milk; ζιμια, loss. F. androgalactozemie; G. der Milchverlust bei Männern.) Secretion of

milk in the male breast.

Androgenei'a. ('Ανδρογίνεια.) Used by Hippocrates for the propagation of the male sex; descent by the man's side; the succession of their race by men, according to Foësius, Ec. p. 57.

Androgonid'ia. The male reproductive

Androgonidia. The male reproductive cells of Volvox globator.

Andrograph'idæ. A Family of the

Nat. Order Acanthacee.

Androg'raphis. A Genus of the Nat. Order Acanthacee. Herbaeeous annuals, or suffruteseent plants, growing in tropical Asia, with opposite leaves. Flowers hermaphrodite, regular, with two opposite bracts; corolla gamopetalous,

with two lips; stamens two; ovary with two loculi, bi- or multiovulated.

A. panicula'ta. (Tam. Shirat-kuch-chi; Tel. Nella venu; Mal. Nila-veppa; Ilind. Mahatita; Duk. Kalafnath; Beng. Cherota.) Kariyat or Creyat. An annual, much valued for its stomachie and tonic properties, especially the root. It is occasionally used in cholera and dysentery. The whole plant is very bitter, and is the basis of the preparation termed "La drogue amère," which is tonic and anti-dysenteric.

Androg'yna. ('Avip, man; γυνή, woman.) Term applied to monœcious plants which have male and female flowers in the same inflorescence, as in the Ricinus and certain Species of Carex, of which the spike bears female flowers at the base and male flowers at the summit. Many Euphorbiaceous plants and many species of Moreæ are androgynous. The word is also often used synonymously with hermaphrodite.

Androg yna. ('Ανήο; γυνή, a woman. F. androgynaire; G. Zwitter.) A female in whom, from imperfect development, the genital organs approach in character to those of the male.

Androg ynak (Same etymon.) The same as Androgynous.

Androgyna'ris. (Same etymon.) Applied by Candelle to double flowers in which the change into petals recurs on both kinds of sexual organs without the floral teguments being altered.

Androgy nary. (F. androgymaire.) A term applied by De Candolle to double flowers in which the male and female organs are transformed without the perianth being altered.

Androgyn'ia. (Same etymon. F. androgynie; G. zugleich mannlich und weiblich.)
The union of the sexes either in one flower or only

on the same individual. Synonymous with her-

maphrodite.

Applied, by Malacarne, to a Class of monsters characterised by the presence of both sexes in the same individual; by Breschet, to a Genns of organic deviations, or of diplogenesis characterised by the union of more or less imperfect organs proper to different sexes.

Androgyn'ic. (F. androgynique.) Pertaining to that which is androgynous.

(Andronynus; Androgyniflo'rous. (Androgynus; flos, a flower. F. adrogynflore.) Applied by H. Cassini to the calathidium and disens of Synantheræ when all the flowers are hermaphrodites.

Androg'yni-maculiflo'rus. (F. androgyni-maculiflore.) Applied by H. Cassini to the discus of Synantheræ when the internal flowers are males and the external hermaphrodites, as in Chaptalia; or when males and hermaphrodites are mingled together, as in Amellus.

Androgyn'ius. Same as Androgynia. Androgynoarion. (L. androgynus G. Zwittereierstock.) A term applied by Berthold to the common generative organ of the lower

organisms.

Androg'ynous. ('Avno, man; yvvn, woman.) Having an inflorescence of both male and female flowers.

Androgy'nus. ('Ανδρόγυνος. zwitterig, mannweibig.) An hermaphrodite; an effeminate person.

Usually applied to males in whom, from imperfect development, the genital organs approach in character to those of the female.

**Androlep'sia.** ('Ανδροληψία, from ἀνήρ, a man; λαμβάνω, to seize.) The act of conception in the female.

Andro'ma. (Mod. Greek 'Ανδρομή.) Elephantiasis of the scrotum. A disease seen chiefly in Egypt and Greece.

Androm'achi theri'aca. The treacle of Andromachus. See Electuaire thériaque.

Androma'nia. ('Ανήρ; μανία, inadness. G. Manntollheit.) Insane love of men; a term formerly used synonymously with Nymphomania.

Andro'me. The same as Androma.

Andromeda. (From Andromeda, daughter of the Ethiopian king Cepheus and Cassiope. F. andromede.) A Genus of the Tribe Ericea, Nat. Order Ericacea. Capsule five-valved, loculicidal, naked; anthers obtuse, with two dorsal awns; corolla hypogynons, globose.

A. arbo'rea. (L. arboreus, tree-like.) The Sorrel tree. A beantiful tree indigenous to the United States of America. The leaves have a pleasant acid taste. They are refrigerant and astringent, and are used by hunters to allay thirst.

A. kotagherren'sis, Hook. A synonym of A. leschenaultii.

A. Leschenaul'tli, De C. Indian wintergreen. A glabrous shrnh growing in the Neilgherries. Leaves petioled, ovate, crenulate, terminating in a gland; racemes axillary or lateral, pubescent, erect; bracts concave, acute, one under the pedicel, two near the flower; flowers white; berries blne. It yields an oil, which is identical with that of the Gualtheria procumbens, or Canadian oil of wintergreen, and from which carbolic acid can easily be formed. It is used as an antispasmodie.

A. Maria'na. The broad-leaved moorwort. A tree indigenous in the Southern States of America, a decoction of the leaves of which is used in the disease toe-itch, or ground-itch, common among the coloured races in the southern

A. nar'dus. (L. nardus, spikenard.) tree growing in the Molnecas, and yielding an oil used to adulterate the oil of rose-leaf geranium.

A. nitida. (L. nitidus, shining.) Ilab. United States. It has the same properties as A. arborea.

 A. ovalifo'lia. The oval-leaved andromeda. Hab. Nepaul. The shoots are poisonous.
 A. polifo'lia. (Πολιός, bright; folium, a leaf.) A small shrub growing in bogs of North Europe. Leaves alternate, elliptic-lanceolate, glabrous, shining; flowers terminal, nearly umbellate. It is an aerid narcotic, and proves fatal to sheep.

A. specio'sa. (L. speciosus, beantiful.) The powder upon the leaves and buds of this plant are said to be a powerful errhine.

Andromed'idæ. A Family of the Nat. Order Ericaceæ.

Andromonœ'cious. ('Awhp; monæ-cious') Term applied in Botany to plants bearing on the same individual male flowers and hermaphrodite flowers, as in some Species of Galium.

Andro'nia. (F. andronie.) A term employed by Winterl and Schubert for the atmosphere.

Andro'nion. (Andron, an ancient physician, its inventor.) Troches made of alum and balaustines, used against carbuncle and herpes; described by Panlus Egineta, iv, 25, and 20.

Andro'nium. Same as Andronion.

Andropet'al. ('Aυὴρ; πέταλου, a petal.)

A petal produced from a metamorphosed stamen, as in the rose and other double flowers.

Andropet'alar. (Same etymon. F. andropétalaire; G. staubfadenbluttlich.) Applied by De Candolle to every double flower where the corolla is multiplied by the stamens becoming changed into simple or multiple petals, the pistil remaining normal.

Andropet'alous. Same as Andropeta-

**Androph'erus.** ('Ανήρ, a man; φέρω, to hear.) Name given to the slender pillar which supports the united anthers in monodelphous and diadelphous plants; distinct from a stamen by the latter supporting only one anther; the Andro-

Andropho'bia. Same as Anthropophobia.

Androphon'ia. ('Δνήρ; φόνος, murder.) Homicidal inclinations.

Androphonici. (Same etymon.) Diseases in which there are homicidal tendencies.

Androphonoma'nia. ('Avńo, a man ; φόνος, murder; μανία, madness.) Homicidal insanity.

Androphore. (Λνήρ; φορέω, to hear. G. Staubbeuteltrager.) A name given by Mirhel to the united filaments of several anthers. In Malva it is a tube supporting numerous stamens.

Also, applied to the more or less columniform portion of the receptacle which supports the stamens.

Also, the male gonophore of certain of the Physophoridæ

(Same etymon. Androph'orum. Staubbeuteltrager.) That part of the filaments of a whorl of stamens which are united by their edges to form a cup, hell, or tube, which supports the anthers. Same as Androphore.

Andropo'gon. (' $A\nu\dot{\eta}\rho$ , a man;  $\pi\dot{\omega}\gamma\omega\nu$ , a

beard. G. Bartgras.) A Genus of the Nat. Order Graminacea. Found in all het and temperate regions. Spikelets composed of two flowers, the inferior neutral and with a single glumella, the superior hermaphrodite or unisexual. The glumes become hard and are muticons. The glumella are shorter than the glumes; the inferior is muticous or aristate in the hermaphrodite flower; the superior smaller, muticous, and sometimes absent. The two glumellules are truncated and ordinarily glabrous. Stamens one to three; ovary sessile, glabrous, with two terminal styles and plumose stigmata. The caryopsis does not adhere to the glumes.

A. bicor'nis. (L. bis, twice; cornu, a horn.) A synonym of A. citratus.

A. cal'amus aromaticus. A Species said by Dr. Royle to be the plant of that name described by Dioscorides, and the "sweet cane" and "rich aromatic reed from a far country" of the Bible. It is used as A. citratus and as a

A. citra'tus, De C. (L. citratus, furnished with citron leaves, and so citron-smelling. F. sewnanthe de l' Inde; G. Wohlriechendes Bartgras, Kameelheu; Hind. Akya-ghas; Duk. Hazar-masaleh; Tam. Vashanap-pullu; Tel. Nim-ma-gaddi; Beng. Agya-ghaus.) Lemon grass, camel's hay, or sweet rush. Root perennial; panicles somewhat secured, linear, leafy; spikelets in pairs, having a common footstalk furnished with a spathe; florets sessile, awnless; male with only one valve. The roots of this plant are whitish, about a foot long, and nearly straight. An infusion of the leaves of this fragrant grass is given to children as an excellent stomachie, and when roasted they are used as a tonic. An essential oil prepared from them is used externally in sprains, rheumatism, and neuralgia. It allays vomiting in cholera. Mixed with butter-milk the leaves are used in cases of ringworm, and when young as a substitute for tea.

A. citriodo'rus. (L. citrus, the citron tree; odorus, fragrant.) Asynonym of A. citru-

A. erioph'orus, Willd. ('Εριοφόρος, hearing wool.) A synonym of A. lanigerus.

A. iwarancu'sa, Roxb. Root perennial, fibrous; panieles axillary and terminal, consisting of numerons fascicles of pedicelled, five-jointed spikes, each pair having a spathe; terminal florets three, one hermaphrodite, two male. Used by the natives of Northern India in intermittent fevers. It is said not to furnish an oil.

A. lanig'erus, Desfont. (L. laniger, wool-bearing. F. schwnanthe officinal.) An Arabian plant, the leaves and stems of which constitute the Schenanthus employed by Hippoerates and Dioscorides. It enters into the

composition of Theriacum diascordium. A. Marti'ni, Roxb. Roussa grass, Ginger Yields the pale, straw-colonred, aromatic grass oil of Nemanr, which is valuable as a rube-

facient, and is employed as a substitute for cajeput oil in rheumatic affections. Applied externally it prevents the hair from falling off after fevers.

It is a stimulant and diuretic. A. murica tus, Retz. (L. muricatus, pointed like a murex shell. F. vetiver, chiendent des Indes.) Cuseus grass. Root perennial; culms numerons, smooth; florets in pairs, awnless, one pedicelled and male, the other sessile and hermaphredite. The root of this plant is yellow, short, and fibrous, it is known as Khus-khus and Vetivert, and has a strong and aromatic odour resembling that of myrrh. It is employed in India and many other countries to perfumo apartments and prevent the attacks of insects. Antispasmodic, diaphoretic, diuretic, and cumenagogue properties have been somewhat doubtfully ascribed to this grass. The infusion of the root is used as a grateful drink in fevers, powdered it is used in liver disorders, and mixed with milk it is applied to irritable skin diseases.

A. nar'dus, Linn. (L. nardus, spikenard.)

A synonym of A. Martini.

A. pachno'des. (Παχνώδης, frosty.) The essential oil of this species, known as Rusa-ka-tel, is sometimes adulterate ofto of roses. It is used as an external application in rheumatic and neuralgie affections.

A. parancu'ra. Hab. India.

is employed as a stimulant.

A. sacchara'tus. (L. saccharatus, containing sugar.) The Sorghum saccharatum.

A. scheenan'thus, Linu. (Σχοινάνθος, tho flower of the aromatic rush; from oxolvos, the aromatic rush; ανθος, a flower.) A synonym of A. citratus.

A. sor'ghum. The Sorghum vulgare.

A. squarro'sus. (L. squarrosus, scurfy.)

A synonym of A. muricatus.

Andropogo'neæ. A Family of the Nat. Order Graminacea, characterised by having bifloral spikelets, the inferior flower of which is always complete, and by having glumellæ that are usually byaline and more delicate than the

Andros'ace. ('Ανδρόσακες.) The Umbilicus marinus.

A. mathi'oli. The Umbilious marinus.

Androsæ'mon. ('Ανήρ; αΙμα, blood; from the colour of its juice. G. Blutheit.) Tutsan.

The Hypericum androsæmum.

Androsel'la. A Genus of the Nat. Order Primulacea. The plants are small herbs, with leaves in the form of a rosette, and resembling the Primulæ, from which it differs by its calyx, which is often accrescent after the expansion of the flowers, and by its infundibuliform or hypocrateriform corolla contracted at the threat, and possessing small appendices. The flowers are either solitary or form a cyme or umbel at the extremity of a long peduncle.

A. maxima. (L. maximus, greatest.) A native of France, and in considerable repute as a

diuretic.

Androsæ'mum officina'le. The Hy-

pericum androsæmum.

('Ανήρ; σπόρος, seed.) An'drospore. ('Ανῆρ; σπόρος, seed.)
A term applied by Pringsheim to the zoospore which in Edogonium produces the male reproductive organs. It is in the first instance represented by the protoplasmic contents of one of the cells of the filaments of Œdogonium, which contracts, becomes clothed with cilia, then canses the rupture of the mother-cell, and after being set free moves rapidly through the fluid. soon becomes attached near the female organ or sporangium, loses its eilia, and obtains an investing membrane. It then divides into two er three cells, which remain attached to each other. These are collectively called in German the Männchen, or little male. The two terminal cells become the antheridia. Their protoplasm condenses to form a large antherozoid, which, as soon as it becomes free, feeundates by fusing with the

Androsty'lium. ('Δνήρ; στύλος, α pillar.) A name given to an organ which, in the Orchids and in some Asclepiads, is formed by the fusion of the stamens and the style, so that the stigma is adherent to the authors.

Androsymphys'ia. The same as An-

therosymphysis.

Androt'omous. ('Ανήο; τέμνω, to cut. F. androtome.) Applied by H. Cassini to Synantherea, because the filaments of their stamens are divided into two parts by a kind of articulation.

Androt'omy. ('Ανήρ; τέμνω, to cut. F. adrotomie.) Term for human anatomy; the androtomie.)

dissection of man.

**An'drous.** (' $\Lambda \nu i \rho$ .)  $\Lambda$  term indicating the possession of stamens by a plant, the number being indicated by a prefix, as monaudrous, tri-

(G. Wasserfleischbruck.) An'drum. kind of ædema of the scrotum, associated with elephantiasis, and endemie in the south of Africa. According to some authors, the term is also

applied to hydrocele. Andsjuda'en. Term used by Avicenna

for assafætida.

The root of the Anchusa tinc-Ane'bion. toria, or alkanet plant.

Ane bium. The same as Anchion.
Ane bous. (Ανηβος; from αν, neg.; ήβη, puberty. L. impuber; F. anche; G. ummannbur.) Immature; not come to man's estate.

Anec crisis. ('Aν, neg.; ἔκκοισις, secretion. F. aneccrise.) The non-appearance of a

critical secretion.

Anecpue tous. ('Δνεκπύητος; from άν, neg.; ἐκπυέω, to suppurate.) Not liable to suppurate.

Anectasis. ('Aν, neg.; ἔκτασις, extension. F. anictase.) The want of due extent of an organ.

An'egen. Arabic synonym of Dictamnus cretica.

Anegerities. ('Ανεγείρω, to rouse. F. anégertique; G. Wiederbelebungskunst.) The art of resuscitating asphyxiated and apparently dead

Aneile'ma. A Genus of the Nat. Order

Commelynaceæ.

A. tubero'sum. (L. tuberosus, full of swellings.) The tubers of this Indian plant are employed by the natives in headaches and giddiness, in fevers, jaundice, and deafness; also, as an antidote to animal poisons.

Aneile'ma. (ἀνείλημα, a rolling up, flatulent colie. G. Leibschmerzen.) Term used by Hippoerates, de Vet. Med. xl, 16, for the rolling about or rising up of air in the intestines, and the

tormina thereby caused; flatulence. ('Ανείλησις.) Aneile'sis. Same as Ancilema.

Tamul name of Pe-Anei-neringie. dalium murex, which is employed by the natives as a remedy in inflammation and in gonorrheea.

A'nel. A French surgeon, who wrote from 1707—1722.

A.'s sound. A very fine silver probe, awlshaped at one end, used for insertion into the lachrymal puncta.

A.'s syr'inge. A syringe with a very fine nozzle for injecting fluids into the lachrymal sac through the puncta lachrymatia.

Anelas'ma squalic'ola. An Ectizcon found on the Squalus glacialis.

Anelcodis'cus. A larval form of Nematode worm

A. pellu'cidus. Found in the intestine of Stylaria fossularis.

Anelectric. (G. unelectrisch.) Non-ectric. Term applied to bodies like metals electric. which, being good conductors, lose any eleetricity that may be developed in them quickly to surrounding bodies.

Formerly used to denote those bodies which do not become electric by friction; the term is disused in this sense, inasmuch as it is now known that all bodies may be electrified by friction.

Anelectrot'onus. ('Av, neg.; cleetro, for electricity; \( \tau\rho vos, \tension. \) The state of depressed irritability which is produced in a nerve in the vicinity of the positive pole when a current of electricity is made to traverse a certain portion of its length.

Anella'ta. (L. anellus, a little ring.) A synonym of A melida.

Anely trous. (Av. neg.; ελυτρου, a eovering. F. anily/re; G. ohne Deckschilde.) Applied by Lister and Charleton to insects with two or four membranous wings, naked, or covered only by hairs or scales.

Anemarrhi'na. A Genus of the Nat.

Order Liliarea.

A. asphodeloï'des. Hab. China. Used as an expectorant and diuretic instead of squills.

An Order of the Section Anem'eæ. Atrichæ, of the Subdivision Lamprosporæ, Division Endosporæ, of the Class Myxomycetes; or a Division of the Suborder Endosporeæ, Order Myxomycetes. The sporangium or æthalium is without capillitium or calcareous columella; wall of sporangium without net-like thickenings, now and then symmetrically perforated.

Ane'mia. See Anamia. Ane'mial. See Anamial. Ane'mic. See Anamic.

Ane mious. ('Arimos, windy. G. windig.)
Windy. Applied to plants growing in windy and exposed situations.

Anemocym'eter. ("Δυεμος, wind; ωκυς, swift; μέτρου, measure. Γ. anemocymetre; G. Luftsschnelligkeitsmesser.) A synonym of Anemometer.

Anemog'raphy. (Ανεμος, the wind; ράφω, to write. F. animographie; G. Windγράφω, to write. F. animographie; G. I beschreibung.) A description of the winds.

Anemol'ogy. (Ανεμος, the wind; λόγος. an account. G. Windlehre.) An account of the

Anemoman'tia. ( $^{\prime}$ Λνεμος, the wind;  $\mu$ αντεία, divination.) The art of divination by the winds.

Anemom'eter. ('Ανεμος, wind; μέτρου, a measure. F. anémomètre; G. Windmesser.) An instrument serving to measure the velocity of the wind. The simplest form is a board of given area attached to a spring, the degree of compression of which, as shown by an index, measures the force, as in the ordinary spring balance. Lind's instrument is simple and accurate; it is a bent tube containing water, one arm is bent again at right angles, and its open mouth is presented to the wind. The depression in the level of the water in this arm affords the means of determining the force of the wind blowing on it. Thus, if the force is sufficient to cause a difference of level of one inch in the two branches of the tube this indicates a pressure equivalent to 1 of 1 of the whole weight of the atmosphere, and as this is

about 2060 pounds on the square foot, it would amount to 5.2 pounds to the square inch. having a velocity of 3 miles an hour is just perceptible, of 5 miles is pleasant, of 10 is a brisk breeze, of 20-25 very brisk, 30-45 very high, of 50 miles is a storm, 80 a hurricane, and 100 a cyclone, tearing up everything. The greatest pressure registered at Glasgow was 55 lbs. per square foot.

Anemomet'rograph. ('Ανεμος'; μέτρον; γράφω.) An instrument arranged so as to produce upon paper a drawing that indicates the

duration and rapidity of the wind.

('Avenos; Anemometrog'raphy. μέτρον; γράφω, to write.) A description of the anemometrograph; also, the operation of the Anemometrograph.

Anemometrum. See Anemometer.
Anemometry. (Ανεμος; μετρέω, to
measure. F. anemometrie; G. Windmessang.) The art of measuring the rapidity and ascertaining the direction of the wind; anemometry.

Anemone. ('Ανεμώνη; from ἄνεμος, wind; because it grows on exposed situations, or because its flower was supposed only to open in wind. F. anemone; I. anemone, anemolo; S. anemona; G. Windblume, Küchenschelle, Windroschen.) A Genus of the Nat. Order Ranunculacca. Annual plants, having an involuere of 3-divided leaves, more or less remote from the flower; calyx petaloid, 5-9 sepals; corolla 0; achamia soft, woolly, tailed or tailless. Properties acrid.

A. collina. (L. collinus, growing on a hill.) The A. pulsatilla.

A. corona'ria. (L. coronarius, belonging to a wreath.) A species which has acrid poisonous qualities, like the A. pulsatilla.

A. grœnlan'dica. A synonym of the

Coptis trifoliata.

A. hepatica. (F. hepatique; G. Leberkraut.) The Hepatica triloba. Herb trinity. The leaves of this plant were formerly used in the Austrian Ph. Said to be mildly astringent and corroborant, by infusion drank as tea, or powder of the dry leaves. The root is a vesicant, and was used as a detersive application to ulcers. When taken in large quantity an irritant poison.

A. horten'sis. (L. hortensis, belonging to a garden.) A species which has poisouous pro-

perties like the A. pulsatilla.

A. interme'dia. (L. intermedius, that which is between.) A synonym of A. pulsatilla.

A. Ludovicia'na. An American plant, the properties of which have been particularly studied by Dr. W. II. Miller, who speaks highly of its value in chronic ophtbalmic diseases, especially entaract, amancosis, and opacity of the cornea, and in cutaneous eruptions. It may be employed in the form of a tea of the dried flowers and herb, or the juice of the plant may be given, preserved by the addition of one fourth of its bulk of alcohol, or evaporated to the consistence of extract.

A. nemoro'sa. (L. nemorosus, full of woods, full of foliage. F. anemone des bois de sylvie; G. Waldanemone, weisse Windblume.) Wood anemone. Rhizome creeping; leaves ternate; leaflets three-lobed, cut; flowers solitary, erect, white; sepals generally six, glabrous, spreading; stamens all perfect; achenia with short styles. Quality acrid. Anemonin, a volatile camphor-like substance, convertible into anemonic acid by the action of alkalies, has been

obtained from it. Has been used successfully in tinea capitis, and is stated to produce hainaturia in cattle.

A. pa'tens. (L. patens, open, wide.) An erican species. Hab. Illinois and Rocky American species. Hab. I. Mountains. An aerid species.

A. praten'sis. (L. pratensis, growing in meadows. F. pulsatille noir, anemone des prés ; G. Wiesenanemone.) Meadow anemone. recommended by Storck in secondary syphilis and cutaneous affections; it has also been recommended in hooping-cough.

A. pulsatil'la. (F. coquelourde, passe-fleur, pulsatille; G. Küchenschellenkraut, Windkraut, Osterblume.) Pasque flower. Sepals six, erect, silky; outer stamens transformed into glands, aobenia with long feathery styles. Used in cutaneous diseases, in catarrhal affections of the mucous membranes generally, in amenorrhea, and in hooping-ough. Dose of the extract of the stem and leaves, one or two grains or more. This preparation and the tineture, given in large doses, produce nausea, vomiting, purging, and diuresis. See Pulsatilla.

A. ru'bra. (L. ruber, red.) The A. pra-

A. sylves'tris. (L. sylvestris, belonging

to a wood.) The A. pratensis.

Anemon'eæ. (F. anémonées.) A Family of the Nat. Order Ranunculaceae. Calyx usually coloured, with imbricate astivation; achenia candate, one-seeded; seed inverted.
Or, a Tribe of the Family Ranunculacea, with

monospermons indehiscent fruit and a simple

perianth.

Anemon'ic ac'id. An acid produced by

the action of alkalies on anemoniu.

Anemo'nin. (F. anemonine; G. Pulsa-tillenkampher.) C<sub>15</sub>H<sub>12</sub>O<sub>6</sub>. The active prin-ciple of the plants belonging to the Genns Anemone. It is volatile and crystallisable, of neutral reaction, soluble in hot water and hot alcohol, from which it is deposited on cooling in the form of colonrless, shining, orthorhombic prisms, heavier than water. These are insoluble in cold, but slightly soluble in warm other. They are more soluble in chloroform, and also in hot layender and olive oils. Anemonin is acrid, and the melted crystals applied to the tongue produce a pricking and stinging sensation, and leave after them white spots, like those caused by escharotics. Clarns found that doses of 0.5 to 0.6 gramme (about 7 or 8 grains) cause death in rabbits. It paralyses the medulla oblongata and spinal cord, and excites irritation of the digestive organs and kidneys. The dose is 1 mg. (1-65th grain).

Anem'ony. The Anemone hepatica. Some of the varieties of anemony were known and employed in medicine in very early times, as by Galen, A.D. 175, Paulus Ægineta, A.D. 675, and Avicenna, A.D. 1050. From their writings it appears that anemony was esteemed in diseases of the eye and skin, in derangements of the menstrual function, and as a galactagogue. After falling into disnse, Störck revived it at the close of the last century, recommending it in melancholy, amenorrhoa, severe forms of syphilis, and in certain diseases of the eyes. Hahnemann regarded it as a polychrest, and recommended it in many diseases.

A., mead'ow. The Anemone pratensis. A., rue-leav'ed. The Thalictrum anemonoides.

A., wood. The Anemone nemorosa

Anemoph ilous. ('Ανεμος, wind, φίλος, Term applied to plants that are chiefly loved.) fertilised by the wind and not by insects.

Anem'oscope. ('Ανεμος; σκοπέω, to examine.) An instrument which serves to make known the variations of the direction of the winds; a weathercock.

Anemy. See Anamia.
Anencepha'lia. ('Aν, neg.; ἐγκέφαλος, the brain. F. anencephale; I. anencefalo.) Name by Breschet for a genus of organic deviation, or partial agenesis, characterised by absence of the

Also, it has been made to include monstrosities

which have no head.

Also, a term for the condition of insane or im-

becile persons.

Anencephalic. ('Aν, neg.; ἐγκέφαλος, the brain.) Having no brain; applied to a monster-fætus, horn without the brain.

Anencephalohæ mia. ('Δν: ἐγκέφαλος; αίμα, blood.) Imperfect supply of blood to the brain; syncope.

Anenceph aloid. ('Aν, neg.; ἐγκέφα-λος, the brain; είδος, form.) Term applied to a feetus with partial defect of the brain.

('Αν; ἐγκέ-Anencephaloneu'ria. φαλος; νεύρου, a nerve.) Defective nervous action in the brain. (Dunglison.)

**Anencephalotrophy.** ('Aν; εγκεφαλος, τροφή, nourishment.) Defective nutrition of the brain. (Dunglison.)

Anenceph'alous. ('Av, neg.;  $\epsilon \gamma \kappa \epsilon - \phi \alpha \lambda os$ , that which is in the head.) A monsterfœtus, born without a hrain; having no hraiu. This condition is due to the gradual increase of the fluid occupying the cerebral vesicles at a certain period of fœtal life. Hydramnios is usually also present.

Applied by Galen, l. iii, de Hipp. et Pl. Decr. c. 4. to those who are foolish or mad.

**Anenerge sia.** ('Ανενεργησία, inefficacy. G. unthätigkeit.) Debility.

Anener'gia. ('Aν, neg.; ἐνέργεια, energy. G. Kraftmangel, Kraftlosigkeit.) Want or loss

of strength or vigour. **Anen'tera.** ('Aν, neg.; ἔντερον, an intestine.) Having no intestinal canal. Applied by C. G. Ehrenberg to a Section of Polygastrica without intestinal canal.

Anenterelmin'tha. ('Aν, neg.; ἕντε-ρον, intestine; ἕλμινς, a worm.) Intestinal worms without an intestinal canal.

Anenteroneu'ria saturni'na. 'Aν, neg. ; ἔντερον, an intestine ; νεῦρον, a nerve. F. anentéronervie saturnine.) Saturnine or lead poisoning when it affects the intestines.

Anen'terous. ('Aν, neg.; ἔντερον, intes-

tine.) Destitute of an intestine.

Anepiplo'ic. (An, neg.; epiploicus.) Having no epiplöon.

Anepis'chesis. ('Αν, neg.; ἐπίσχεσις, a stoppage. G. Unvermögen.) Incontinence, as of the urine.

Anepithym'ia. ('Aν, neg.; ἐπιθυμία, desire.) Loss of any one or more of the natural appetites, as hunger or thirst.

A. chlorosis. A synonym of Chlorosis.

Anerethis'ia. ('Αν. neg.; ἐρεθίζω, to excite. G. Reizlosigkeit.) Want of incitement or incentive.

Aner'gia. Similar to Anenergia.
Aneric. Old name for sulphur vivum.

Anerit. Same as Aneric.

Anero'bia. See Anaerobia.

An'eroid barom'eter. ('A, neg; v<sub>1</sub>, pós, moist; ilôos, form.) Name given to an apparatus recently constructed to answer the purposes of the barometer. It consists of a flat circular metal box, having the top corrugated in concentric circles, and so thin and elastic as to vield to alterations in the atmospheric pressure. This box being exhausted of air, through a short tube, which is subsequently made airtight by soldering, constitutes a spring, which is affected by every variation of pressure in the atmosphere, the corrugations on its surface giving it greater elasticity. When atmospheric pressure increases, the top is pressed inwards, when the pressure decreases, it rises; these changes are indicated by an index on a graduated dial, which is

moved by a series of multiplying levers. **Anerpon'tes.** ('Aνέρπω, to creep up.) Applied by Vicillot and Ranzani to a Family of Passeres having sharp claws that give the faculty of clinging to bodies, and of climbing along walls

and trunks of trees

Anerythroblep sy. ('Aν, neg; ἐρνθρός, red; βλέπω, to see.) Inability to distinguish the various shades of red. This affection is usually congenital, but may be acquired. Its discovery is of great importance in engine drivers, railway guards, and others who have to act by coloured signals.

Anerythrop'sia. ('Aν, ueg ; ἐρνθρός, red; δψις, sight. G. Rothblindheit.) The same

us Anerythroblepsy.

Anerythrop'sy. ('Aν, neg.'; ἐρυθρός, red.) Inability to see red colours.

Anesipo ma. ('Aνεσις, a letting loose;  $\pi \tilde{\omega} \mu a$ , a lid.) Applied by Latreille to a Trihe of

Siluroides having a mobile operculet.

An esis. (Aneous; from awingu, to slacken.
G. Nachlass, Aussetzen.) Term used by Galen, de
Temp. Tot. Morb. c. S, for the remission or diminution of the symptoms of a disease.

Also, relaxation or remission generally.

Dill, Anethum ( Ανησον.) Ane'son. graveolens.

Anesorrhi'za. A Genus of the Nat. Order Umbelliferæ.

A. capen'sis. Hab. Cape of Good Hope. An esculent plant.

Anesthet'ic. See Anæsthetic. Ane'sum. Anise, Pimpinella anisum. An'et. Dill, Anethum graveolens.

An'ethated. (Anethum, dill.) Prepared or mixed with dill.

Ane'thene. C<sub>10</sub>H<sub>16</sub>. The most volatile part of the essential oil of fennel; it boils at 190° C. (374° F.). It is isomerons with terebinthene.

Ane'thi fruc'tus, B. P. (L. fructus, fruit. F. fruits d'aneth; G. Dillsamen.) Dill fruit. The fruit of Anethum graveolens. They are oval and flat, about 1—5" long, with a pale membranons margin; odour aromatic, taste warm and somewhat bitter. Stomachic, carminative, and diuretic.

Ane'thol. C10H12O. A constituent of the oils of anise, star anise, tarragon, and fennel. It is deposited from them, at a low temperature, in the form of brilliant colonrless laminæ, fusible at 21° C. (69°8° F.), and boiling at 232° C. (449°6° F.)

Anethox'ylon. ("Ανηθον, dill; ξύλον, wood.) The woody root of dill.

Ane'thum. (Ανηθον. G. Dill.) A Genus of

the Nat. Order Umbellifera. Umbels compound; involucres 0; calyx obsolete; fruit compressed from the back, with a broad dilated edge; ridges three; dorsal filiform, equidistant; lateral lost in the margin; vitte one to each furrow; albumen thin, lenticular.

A. foenic'ulum. (G. Fenchel.) The sweetfennel, Faniculum dulce, and probably also the

F. vulgare.

A. fcenic'ulum fruc'tibus ova'libus. (L. fructus, fruit.) A synonym of Fæniculum

vulgare.

A. grave'olens, Linn. (L. graveolens, strong smelling. F. aneth; G. Garten-dill.) Common dill. Hab. South of Europe, near the An annual, with an erect, striated, branching stem; flowers yellow, in large, flat, terminal umbels, without an involuere; leaves bi- or tripinnate; glaucous leaflets linear and pointed. The fruit is aromatic, stimulant, carminative. It is used as a condiment to relieve tlatulence and griping in infauts.

Also, a synonym of Peucedaneum.

A. pastina'ca. (L. pastinaca, the thing dug up; a parsnip.) The Pastinaca sativa.

A. piperi'tum. (L. piperitis, pepper-wort.) A synonym of Faniculum dulce.

A. sege'tum. (L. seges, the growing eorn.) A synonym of Carum Ridolfia.

A. sowa, Roxb. Dill or Bishop's weed. Hab. India. Umbels terminal, without involucels; thowers yellow; petals roundish, entire; leaves decompound, alternate; leaflets filiform. fruit differs in no essential respect from that of the A. graveolens, and it is used for the same purposes. Probably only a variety of A. grareolens.

An'eti. ('Avetos, from avinus, to remit, or relax.) Relaxed; remittent; applied as a generic name for intermittent fevers, by Dr. Mason Good.

**Anet'ic.** ('Ανετικός, relaxing; from ἀνίημι, to slacken.) Having power to assuage, or relax severity. Applied to soothing medicines.

Ane ton. ( Ανητον.) Dill, Anethum graveolens.

Anetu'ræ. ('Ανετος, relaxed; ουρε, a tail.) A Family of Suborder Platyrrhini, Order Primates. Monkeys with long but not prehensile tails, which are fully hair clad, the vertebrae tapering to the end. It includes Pithecia, Nyctipithecus, Callithrix, and Chrysothrix.

An'etus. (Same etymon. as Aneti.) A

term for intermittent fever.

A. quarta'nus. (L. quartanus, belonging to the fourth.) Quartan ague.

A. quotidia nus. (L. quotidianus, daily.) Quotidian ague.

A. tertia'nus. (L. tertianus, belonging to

the third.) Tertian ague.

Aneural gicon. ('A, neg.; νεῦρον, a nerve; άλγοs, pain.) Name given by Dr. Downing to an apparatus for applying warmth and sedative vapours to any part of the surface of the body, to reduce excess of obstinate neuralgia.

Aneur'eæ. See Aneuridæ. Aneu'ria. ('A, neg.; νεῦρον, a nerve.)

Paralysis.

Aneu'ridæ. (Same etymon.) A Family of the Nat. Order Jungermanniae.æ. Thallus leatless, without a midrib; monœcious or diœcious; the antheridia embedded in the thallus; archegonia surrounded by a sheath; numerous trichomata; no perianth; capsule stalked, oval.

An'eurism. See Anarysm.

Aneuris'mal. See Aneurysmal. Aneuro'sis. ('A, neg.; νεῦρον, a nerve.) A term used to indicate absence of nerves; and, also, absence of tendons.

**Aneurysis.** Same as Aneurysmus. **An'eurysm.** ('Ανεύρυσμα, an aneurysm; from ἀνευρύνω, to widen. F. aneurysme; G. Pulsadergeschwulst.) A dilatation of, or a springing from, an artery, varying in size from a poppy seed or less to that of the head, and affecting the whole or part of its circumference. ancurysms may be fusiform, sacciform, or sacculated. In true ancurysm the walls are always formed in the early stages by the diseased arterial coats, whilst in false or traumatic aneurysm the walls are formed by the adjoining The alterations in the walls of the tissues. vessel in true aneurysm are essentially the results of chronic inflammation, or other morbid change, of the tunica iutima, producing thickening, hyperplasia of the connective tissue, atrophy, fatty degeneration, ulceration, and calcification of this coat with more or less complete absorption of the tunica media.

The contents of an aneurysm are usually a column of fluid blood, surrounded by a laminated coagulum, the inner layers of which are soft and reddish, the outer progressively denser and more yellow, and in old aneurysms becoming converted into fibrous tissue. By the increase of the coagulum the tube of the artery may become obliterated, suppuration of the contents of the sac may occur, or, by the detachment of fragments, embolism on the distal side may be produced, leading to arrest of the flow of blood through the sac and the cure of the disease, or to serious results, according to the part supplied normally by the ancurysmal vessel.

The symptoms consist, in the early stage, of the presence of a tumour occupying the position of an artery, with expansive pulsation, accompanied by a peculiar thrill and a foud systolic sound at each beat. On arresting the flow of blood through the aneurysm, by pressure on the artery above it, the pulsation ceases, and the swelling lessens in size. The pain is usually slight. In the later stages the swelling is much harder and larger, does not pulsate so distinctly, is not emptied by pressure, and produces secondary troubles by pressure on veins, nerves, duets of glands.

Aneurysms are most common in middle and advanced life, occur most frequently in men, and especially in those engaged in laborious occupations, and in those accustomed to drink in excess.

In the treatment, the following measures amongst others have been more or less successfully practised :- Rest, simple and scanty diet, and strict regimen, bloodletting (Albertini and Valsalva); ligature of the artery immediately above the aneurysm (Anel and Desault); at a distance from the seat of disease (Humber); below the disease (Brasdor); above and below, with opening of the sac (Antyllus); without opening the sac (Pasquier); ligature applied to one of the branches into which the artery naturally divides (Wardrop); pressure, either digital or mechanical, after opening the sae (Guattani); on the ancurysm (Duhois, Dupuytren); on the vessel (Bellingham, Signorini); by bending the joint if near one (E. Hart); by torsion; by kneading the tumour (Fergusson); hy passing a thread or needle through the sac (Velpeau); by galvano- or electro-puncture (Pravaz); by the injection of coagulating liquids, as solution of perchloride of iron (Monteggia, Leroy d'Etiolles, Bouchut); by

the actual cautery (Severin) and by caustics; by complete temporary arrest of circulation, with exsanguination of the limb, by means of Esmarch's bandage; hypodermic injection of ergot, and the internal use of iodide of potassium, have been recommended.

A. a bosselu'res. (F. bosselure, a hump.)

Cirsoid aneurysm.

A., arte'rio-ve'nous. An aneurysm which opens into a vein. It is called an urysmal varix when the communication is immediate; varicose aneurysm when there is a saccular tumour interposed between the arterial and venous openings.

A. by anastomo'sis. A tumour of a bluish colour and soft spongy feel, consisting of dilated, irregular, tortuous, thin-walled arteries, pulsating and communicating a thrill to the finger. They occur chiefly in the superficial connective tissue, and also in the tongue and in-ternal organs. When it can be reached it may be removed by ligature or excision; if too deeply scated the arterial branches, or the main trunk supplying it, may be tied.

 $\dot{\mathbf{A}}$ . by dilata'tion. The same as A., fusi-

form.

A., car'diac. (F. anévrysme du cœur.) Aneurysm of the heart may be a simple general bulging of a part of the cardiac wall, or a sacculus protruding from the organ, and communicating with its interior by a more or less distinct opening. It usually occurs in the left side, and most frequently in the ventricle. Death may occur from rupture, or from the progress of disease in other organs, consequent on cardiac disturbance.

Also, a synonym of dilatation affecting one or

all of the cavities of the heart.

A., car'diac, ac'tive. A term for hyper-

trophy of the heart.

A., car'diac, false consec'utive. A term applied to anenrysm of the left veutricle of the heart, especially when originating in rupture or ulceration of the endocardium and part of the adjacent muscular wall, with protrusion of the remainder, and of the pericardium.

A., car'diac, pas'sive. A term for dila-

tation of the heart.

A., cir'soid. (Κιρσός, enlargement of a vein; είδος, likeness.) When the saccular form of an aneurysm is combined with the cylindrical, in the shape of numerous sinuous hulgings, so that irregular tumours result.

A., cu'puliform. (L. cupula, a little tub; forma, shape.) A synonym of A., cystogenic.
A., cylin'droid. The same as A., fasiform.

A., cystogen'ic. ( $K\dot{\nu}\sigma\tau\iota s$ , a small bladder; γένεσις, production.) Small aneurysms, communicating with the artery by a sharp border and having a hemispherical sac, most frequently seen at the origin of the aorta, and appearing to have been formed in an atheromatous patch.

A., diffu'sed. An aneurysm which has resulted from rupture of all the coats of the vessel, and in which the infiltrated surrounding tissues have become the boundary of the cavity.

It is also used to describe cases of ruptured artery, in which the blood is more or less closely confined to the neighbourhood of the rent, and in which there has been no time for a false wall to be formed.

A., dissecting. (F. anévrysme disséquant.) This form occurs when the internal and middle tunics have given way, and the blood forces its way between the layers of the middle tissue, or between the media and adventitia; a further rupture may take place from the cavity of the aneurysm through the inner coat into the vessel again, or through the outer coat.

A., dissect'ing, of cap'illaries. Applied to that distension and infiltration of the outer investment of the capillaries of the brain which is seen in certain cases of capillary homorrhage.

A., endog'enous. ("Ενδον, within; γεννάω, to produce.) An aneurysm which has originated in lesion of the inner coat of the artery.

**A.**, exog'enous. (Έξω, from without; γεννάω, to produce.) A synonym of A., trau-

A., exter'nal. Affecting one of the arteries, neck, or outside of the head.

(G. pulsirende Blutbenle.) A., false. Aneurysm originating in rupture of one or more of the arterial coats.

Originally, the term was used in an opposite sense.

A., false consec'utive. An ancurysm consequent of rupture or ulceration of the inner and middle coats of an artery.

A., false prim'itive. An anenrysm produced by division of all the coats of an artery.

A., fu'siform. (G. spindelformiyes Anen-rysma.) An aneurysm which consists of a more or less regular dilatation of the whole calibre of

an artery for a limited part of its course.

A., her'nial. (F. anivrysme hernicux.)
The same as A., mixed internal; the inner cont protruding through the other ruptured coats, as a

A., inter'nal. Aneurysm affecting one of the arteries contained in the cavities of the body. A., mil'iary. (F. anerrysme miliare.

This term is applied to the minute dilatations of the smaller arteries, the bursting of which is a frequent cause of cerebral hamorrhage.

A., mix'ed. When the sac consists of one

or two only of the three arterial coats, with rup-

ture of the remainder.

A., mix'ed exter'nal. An aneurysm in which the middle and inner coats are ruptured, the outer alone remaining.

A., mix'ed internal. One in which the outer and middle coats are ruptured, the iuner

alone remaining.

A. of car'diac valves. Sacculi or pouches occurring in the mitral and aortic valves, usually projecting into the left auricle; the wall of the sac sometimes gives way, and a perforation results.

A. of the heart. See A., cardiac.
A. of the heart, acu'te. A term applied to a condition which occasionally occurs in carditis, when purulent softening of some part of the cardiac wall results, and rupture takes place into one of the cavities, usually a ventricle.

A. of the heart, lat'eral. A synonym of

A., cardiac. A. of the heart, par'tial. A synonym of

A., cardiac. A. of valves of heart. See A. of cardiac

A., rac'emose. (L. racemosus, in clusters.) A synonym of A., cirsoid.

A., sac'ciform. (L. saceus, a bag ; forma, shape.) An aneurysm with a distinct opening from the artery, involving one side only of the

wall of the vessel, and with a definite sac.

A., sacculated. The same as A., sacci-

A., sponta'neous. Arising without known or apparent lesion.

A., spu'rious. The same as A., fulse.

A., traumat'ic. An ancurysm consequent on lesion of the arterial coats. If the injury have caused an extravasation of blood, which continues to be connected with the blood within the artery, and is surrounded by a kind of sac formed by the adjoining tissues, it is termed a primitive traumatic ancurysm. If, however, the original lesion have cicatrised, and the cicatrix yields after a longer or shorter period, it is termed a consecutive traumatic aneurysm.

A., true. (G. wahres Ancurysma.) That form in which there is no rupture, only dilatation

of the arterial coats.

Formerly, the term was used in an opposite sense

A., tu'bular. A term for A., fusiform.
A., varicose. (F. anévrysme variqueux.) An aneurysm lying between an artery and a vein and opening into both; it may be the result of disease or of injury. See Ancurysmal varix.

Aneurys ma. See Ancurysm.
A. cirsoi des. See Ancurysm, cirsoid.

A. cor'dis acti'vum. A synonym of Hypertrophy of the heart.

A. disse'cans. (L. disseco, to ent asunder.) See Ancurysm, dissecting.

A. ex vul'nere. (L. vulnus, a wound.) A

term for Aneurysm, traumatic. A. her'niam arte'riæ sis'tens. A sy-

nonym of Ancurysm, mixed internal.

A. precordio'rum. Aneurysm of the aorta close to the heart.

A. spu'rium. (L. spurius, false.) Ancurysm, false.

A. varico'sum. Varieose ancurysm. See .1neurysmal varix.

A. vermino'sum. (L. verminosus, full of worms.) An aneurysm containing hæmatozoa. Cases of this kind have been observed in the horse, ass, and mule; it usually occurs in the mesenteric artery or one of its branches. It is a fusiform or irregular dilatation of the vessel with much thickening of its walls. The hæmatozoa noticed have belonged to the Genus Sclerostoma.

This form of aneurysm has also been noticed in

the frog.

A. ve'rum. (L. verus, true.) See Aneurysm, true.

Aneurys'mal. (Same etymon.) Of, or pertaining to, an ancurysm.

A. can'cer. Cancerous deposit in, or in

eonnection with, a vascular tumonr.

A. nee'dle. A slender instrument, flattened and curved for about an inch near its point, at which there is a small hole, or eye; used for passing a ligature under an artery, for the purpose of tying it; and so named, because this is frequently done for the cure of ancurysm.

The containing structure of an A. sac. aneurysm.

(F. varix anévrysmale; G. A. va'rix. das anerrysmalische Venengeschwulst.) A tumour resulting from perforation of a contiguous artery and vein, and subsequent union of the two. If bloodletting at the bend of the arm be earelessly performed, the lancet may transfix the yein, the fascia of the biceps muscle, and enter the artery; in this case the blood from the artery accumulates under the aponeurosis, and forms a circumscribed false ancurysm, or a varicose ancurysm; but if the openings of the vein, fascia, and artery are united by adhesive inflammation into one, through which the blood passes from the artery into the vein, which becomes more or less dilated above and below the seat of injury and pulsates like an artery, this is called aneurysmal varix; the passage of the blood from the artery into the vein is accompanied with a whizzing noise like the bellows sound heard in certain diseases of the heart. The wearing of an elastic bandage is the only treatment advised, unless the tumour appears to be increasing, when the artery may be tied above and below the seat of damage.

Aneurysmatic. (Same etymon.) Of, or pertaining to, an aneurysm.

Aneurys'mus. See Aneurysm.

An'eys. Anise.

Anfaka. Arabie for a coagulum. Anfian. Arabie for opium. (Quiney.)

 $\overline{\Lambda}$ lso, a synonym of Maslach. An-fir-filius. Arabic for hydrargyrum,

or mercury. (Quincy.) Anfrac'tuose. Same etymology and

meaning as Anfractuous.

Anfractuos'ities. (Same etymology

as Anfractuosity.) Furrows.

A., cer'ebral. (L. cerebrum, the brain. F. anfractuosités cerebrales; G. Windungen des Gehirns.) The furrows or sulci between the con-volutions of the brain; (hoy have an average depth of 5" to 1". See Fissures.

A., ethmoid'al. A term for the Ethmoidal

Anfractuos'ity. (L. anfractus, a turning, or bending round, from the obsolete anfringo. F. anfractuosité; G. Furche, Krümmung.) A winding or turning. Applied to the furrows, or sulci between the convolutions of the brain.

Anfrac'tuous. (Anfractus, a turning. G. krunmgängig, gekrümmt, gebogen.) Having or full of sinnosities.

Anfrac'tus. (L. anfractus.) See Anfractuosity.

A. cer'ebri. (L. cerebrum, the brain.) The cerebral fissures.

Angaria'ria. A tree of Congo, reputed to be efficacious in removing the pain occasioned by the passage of calculi. (Waring.)

Angecta'sia. The same etymology and

meaning as Angelectasis.

Angei'a. ('Αγγεῖον, a vessel, a blood-vessel.) A vessel.

A. pneumatica. (L. pneumaticus, helonging to air.) An old term for the arteries.

Angeiæ mia. ('Λγγεῖον'; αΙμα, blood.)
Congestion or fulluss of the blood-vessels.

Angeiaeraphro'sia. ('Αγγεῖου; ἀήρ, air; ἀφρο΄ς, foam.) Asphyxia by means of bronchial foam; a condition that causes the fatal termination in many cases of capillary bronchitis and other pulmonary diseases.

Angei'al. ('Αγγεῖου, a blood-vessel.) Vascular.

Angelecta'sia. See Angelectasis.
A. veno'sa. (L. venosus, venous) varieose vein.

Angeiec'tasis. ('Αγγείον, a bressel; εκτασις, dilatation. G. Gefassau nung.) Dilatation of the blood-vessels. ('Αγγεῖον, a blood-on. G. Gefässausdchterm has been added to many words to denote dilatation, as cardicetasis, artericctasis, phlebeetasis, lymphangeicetasis, and teleungeicetasis.

A., capilla'ris. Capillary angelectasis. A synonym of Teleangeiectasis.

Angelectoma. Same as Angelectasis. Angeien'chyma. See Angienchyma. Angeiccardi'tis. (('Ayyelov; car-

Inflammation of the heart and neighditis) bouring large blood-vessels.

Angeiocar pous. See Angiocarpous.
Angeioelephanti'asis. ('Αγγείον; elephantiasis.) A synonym of Elephantiasis teleanaeiectodes.

iog'eny. ('Αγγεῖου; γεννάω, to The formation or development of Angeiog'eny. vessels.

Angeiog'raphy. ('Αγγίον; γράφω. write. G. Gefasslehre.) A description of to write. the blood-vessels.

Angeiohæ'mia. ('Ablood.) Sauguineous congestion. ('Αγγεῖου; αἶμα,

Angeichydrog raphy. ('Αγγεῖον; υδωρ, water; γράφω, to write.) A description of the lymphatic vessels.

Angeiohydrol'ogy. ('Αγγεῖον; εδωρ; λόγος, an account.) A treatise on the lymphatic vessels.

Angeiohydrot'omy. ('Αγγεῖον; ὕδωρ; τομή, a cutting.) The dissection of the lymphatics.

Angeiola. (Αγγείον, a vessel. G. Balg, ülle.) The capsule of Cryptogams.
Angeioleuci'tis. (Αγγείον; λευκός,  $H\ddot{u}lle.)$ 

Angeioleuci tis. (Αγγείου; λευκός, white.) Indamnation of the lymphatic vessels.

See Lymphatics, inflammation of the symphatic vessels.

Angeioleucol'ogy. ('Αγγείον; λευκός; λόγος, treatise.) The study of the lymphatic and lacteal vessels.

Angeiol'ogy. ('Αγγεῖου; λόγος, an account.) A description of the blood-vessels and the lymphatics.

It has also been used to express the selection of vessels for bloodletting

Angeiolymphitis. ('Aγγείον; lymph.) Inflammation of the lymphatic vessels.

Angeiolympho'ma. A tumour formed from lymphatic vessels. See Lymphangeioma.

Angeio'ma. ('Αγγεῖον, a blood-vessel. G. Gefassgesehwulst, Gefassneubildung.). A vas-

cular tumour, caused by an excessive formation of blood-vessels.

A., caver'nous. (F. angiome caverneux.) Vascular tumours in which, as well as the arteries, veins, and capillaries of a simple angeioma, there are connected with the vessels alveolar spaces, communicating freely with each other, and lined with an eodothelium consisting of flat scales; the intervening structure consists of connective tissue, with occasionally unstriped mus-cular fibre. These tumours are spongy to the feel, often bluish in colour, and oceasionally pulsate; they occur most commonly in the skin and subcutaneous connective tissue, especially near to an external mucous orifice; they also occur in the orbit, liver, spleen, kidney, and muscles. Varieties of these tumours have been named erectile tumours, venous vascular tumours, aneurysm by anastomosis.

A., fis'sured. (F. angioma fissuraux.)

Angeioma of the mucous orifices. A., lipog'enous. (Λίτος, fat; γεννάω, to produce. F. angioma lipogène.) An augeioma which has arisen from the adipose tissue.

**A., phlebog enous.** (Φλέψ, a veio; γεννάω, to produce. F. angioma phlebogene.) An angeioma arising in connection with the vasa vasorum of the veins.

A., plex'iform. A synonym of A. simple.
A., sim'ple. (F. angiome simple.) A vascular tumour in which the blood-vessels, usually capillary, are simply dilated and tortuous, and held together by connective and fatty tissue; they are often congenital, usually small, violet or red, slightly elevated masses, situate on the

skin of the face, neck, or other part of the body.

Angeiomala cia. ('Αγγείον; μαλακία, softness.) Softening of the blood-vessels. Angeiomonosper mous. ('Αγγεῖον,

a vessel, a capsule; μόνος, solitary; σπέρμα, seed.) Having one seed only in a capsule.

Angeiomy'ces. ('Αγγείου'; μύκης, a fuugus.) A synonym of the disease formerly known as Fungus hæmatodes.

Angei'on. ('Αγγείον.) A vessel.
Angeioneuro'sis. ('Αγγείον; neurosis.) A neurosis of the blood-vessels.

Angeionitis. ('Αγγεῖον.) Inflammation of the vessels.

Angeiono'ma. ('Aγγεῖου.) See Angionoma.

Angeiono'sus. ('Αγγεῖον; νόσος, disease.) Disease of the vessels.

Angeionu'sus. See Angionusus. Angeiopathia. See Angiopathia. Angeiopla'nia. See Angioplania. Angeioplero'sis. See Angioplerosis. Angeiopy'ra. See Angiopyra. Angeiorrha gia. See Angiorrhagia. Angeiorrhæ a. See Angiorrhæa. Angeioscope. (Αγγείον: σκοπίω, to look at.) An instrument for observing the capil-

laries.

Angeio'sis. See Angiosis.
Angeiosper'matous. ('Αγγείο σπέρμα, a seed.) Having seeds in a pericarp. ('Αγγείου;

Angeiosper'mious. (Same etymon.) Having seeds in a pericarp. (Same etymon.) Angeiosper mous.

Having seeds in a pericarp.

Angeiostegnosis. See Angiosteg. nosis.

Angeiosteno'sis. See Angiostenosis. Angeiosteo'sis. See Angiosteosis. Angeiostrophe. See Angiostrophe. Angeiotelecta'sia. See Angiotelec-

Angeiot'omist. ( Αγγείου: τομή, α cutting.) One skilled in the course of the bloodvessels.

Angelot'omy. See Angiotomy. Angel'tis. ('Αγγεῖον, a blood-vessel.) Inflammation of a vessel.

An'gel bread. A purgative cake made of spurge, ginger, flour, and oatmeal. (Dunglison.)

Angel'ic ac'id. (Angelica. G. Angelicasaure.) C<sub>5</sub>H<sub>5</sub>O<sub>2</sub>. An acid found in angelica root, and in sumbul; it is also present in croton oil. It may be produced by heating the essential

oil of chamomile with potassium hydroxide, and also by treating pencedanin with alcoholic potash. at to treatilises in long prisms and needles, melts at 45° C. (113° F.), and boils without decomposition at 190° C. (374° F.).

A. root. The Angelica lucida, or Ligusticum actaifolium.

Angelica. (L. angelus, an angel, from its virtues.) A Genus of the Nat. Order Umbellifera. Umbels compound, many-rayed; bracts few or none; bracteoles many; calyx 5-toothed or without teeth; petals with a short inflexed point; fruit compressed from the back; lateral primary ridges winged, dorsal and intermediate elevated; vittæ 1-2 in the furrows.

A. archangelica. (F. angelique, herbe du Saint-esprit; 1. and S. angelioa; G. Angelikawarzel, Engelwarz.) Garden angelica, is the only species used in medicine. It is a large, strongly aromatic plant, with smooth-furrowed stem, with bipinnate leaves. General involucre wanting; umbel large, many-rayed, spreading; umbellule dense, subhemispheric; involucel 8leaved; calyx 5-toothed; fruit compressed from the back; ridges 5, winged, the lateral short of the edge and broader than the dorsal; vittae numerous, covering the plano-convex albumen, which is loose. Grows in watery places in Europe. The root and fruit pungent, aromatic, stimulant, tonic. Dose 30 grains. It is made into a conserve, and employed in the manufacture of gin and of vespetro. The root contains a volatile oil, angelic acid, a crystallisable resin, angelicine, an amorphous resin, a bitter matter, tanuin, malates, pectic acid, gum, and starch.

A. atropurpu'rea. (L. ater, black; purpureus, purple.) Masterwort. Hab. United States. Leaves ternate; petioles large, inflated; leatlets ovate, acute, deeply serrate, somewhat lobed; flowers greenish-white; root purplish. The juice of the fresh root is acrid, and is said to be poisonous; drying removes this. Formerly in U.S. Ph., and used as the A. archangelica.

A. gra'na. (L. granum, a grain.) A term

applied to Anderson's pills.

A. levis'ticum. (L. levisticus, from Liguria.) A synonym of Ligusticum levisticum.

A. lu'cida. (L. lucidus, shining.) A synonym of Ligusticum actæifolium.

A. moscha'ta. (L. moschatus, smelling of musk.) The name given at one time to the plant from which sumbul was believed to be obtained.

A. nen'do. A synonym of Ligusticum actaifolium.

A. officina'rum. (L. The Imperatoria ostruthium. (L. officina, a shop.)

A. paludapifo'lia. A synonym of Ligus-

ticum levisticum.

A. praten'sis apiifo'lia. (L. pratensis, of the meadow; apium, parsley; folium, a leaf.) A synonym of Athamanta orcosclinum, and also of Peucedanium silaus.

A. sati'va. (L. sativus, that which is planted.) A synonym of A. archangelica.

A. sylvestris. (L. sylvestris, belonging to a wood. Princeps alexipharmacorum. F. angelique sauvage.) Wild angeliea. Ilab. angelique sauvage.) Wild angeliea. Hab. Arabia. Glabrous; leaflets oblong, ovate, serrate, petioled obliquely; umbels large, pubescent; bracts decidnous; bracteoles few, subulate, persistent. Aromatic and carminative. The powdered seeds are applied to the hair to destroy pediculi.

Angelica bal'sam. A black-brown

resinous matter found in angelica root.

A. oil. (G. Angelicaol.) An oil found in angelica root; it is colourless when fresh, but soon becomes brown; it is lighter than water, has a camphorous odour, and a burning spicy taste.

A. tree. The Aralia spinosa.
A. wax. (G. Angelicawach. A. wax. (G. Angelieawachs.) A waxy substance found in angeliea root.

\*\*Engelic'e\*\*. A Group of the Subfamily-Orthospermea, Family Umbellifera. Fruit compressed from the back; the three dorsal ridges winged or filiform; lateral ridges broadly winged, the wings of each mericarp withdrawing from each other; receptacle bi-partite.

Angelicic acid. A synonym of An-

getie acid.

Angel'icin. A crystallisable resinous sub-

stance obtained from Angelica. It is inederous, at first almost tasteless, then pungent; soluble in alcohol and ether, from which it crystallises.

Angelicus pul'vis. The angelic powder; a name given by Schröderus to the Marcurius vita, or the algaroth of old chemists.

An'gelin. C<sub>10</sub>lt<sub>13</sub>NO<sub>3</sub> A weak base found in the resin of the alburnum of Ferreira spectabilis. It occurs in slender, white, silky, tasteless, inodorous needles; very slightly soluble in alcohol and water. (Fehling.)

An'gelin. (G. angelimholz.) The bark of

the Andira inermis.

A. co'co. The fruit of the Andira stipulacea, which resembles that of the nut of certain Brazilian palms, as Diplothemium maritimum.

A. re'sin. The product of the Ferreira speciabilis, and used in Brazil as a specific in intermittent fevers.

Angeli'na. The Andira inermis. Angelinæ cor tex. The bark of the

Ardira inermis. Angellus. (L. angulus, an angle. G.

Winckelchen, Eckehen.) A small angle,
Angeloc'acos. A synonym of Myroba-

Angelo'nia. A Genus of the Nat. Order Scrophulariacea, several species of which are used as emollients in South America.

Angemphrax'is. See Angiemphraxis. An'gers. France; Dep. Maine et Loire; Arrond. d'Angers. Here are some ferruginous wells containing 0.017 of a gramme of iron sulphate, 0.317 of manganese sulphate, 0.250 of alum sulphate, and 0.233 of calcium bicarbonate, in one litre.

An'ghar. A plant of Seindia; the root is astringent, and is used in dysentery.

An'gi. Aucient term for buboes, or tumours in the groin,

Angiæ'mia. ('Αγγεῖον, a vessel; αἷμα, blood.) Term for plethora, or congestion of the blood-vessels.

Angica. The wood of this name is believed by v. Martius to form part of the Ecorce de jeunesse et de la virginité of the Brazilians. It is the product of the Acacia angico and allied trees. The bark is called Barbatimao.

Angidiecta sia. (Άγγείδιον, a small vessel; dim. of άγγείον; εκτασις, extension.) Dilatation of the eapillary vessels.

Angidiospon'gus. ('Αγγείδι σπογγιά, a sponge. G. Gefüssschwamm.) ('Αγγείδιον; synonym of the disease formerly known as Funque hæmatodes.

Angiec'tasis. ('Αγγεῖον, vessel; ἔκτασις, extension.) See Angelectasis.

Angiecto'pia. ('Αγγεῖου; ἔκτοπος; away from a place.) The state in which vessels are found out of their natural place.

Angielco'sis. ('Αγγεῖου; ελκος, an nlcer. G. Gefassverschwirung.) Ulceration of the vessels.

Angiel'cus. ('Αγγεῖον'; ελκος an ulcer. F. angialcère; G. Gefassegeschwür.) An ulcer of a vessel.

Angicmphrax'is. ('Αγγεῖου; ἔμφραξις, a stoppage.) An over-fulness and obstruction of the vessels.

Angien'chyma. ('Αγγεῖου, a vessel; εὐχυμα, an infusion; from εὐχεω, to pour in.) Vasenlar tissue. A term employed by C. Morren to designate a tissue or parenchyma composed exclusively of vessels.

**Angieurys'ma.** ('Αγγεῖον; εὐρύνω, to make wide. F. angieurysme.) Dilatation of a vessel.

Angiftis. ('Αγγείον. G. Gefassentzündung.) Term by Piorry for inflammation of the vessels, originally and specially of the eapillary vessels.

Angina. (L. angina, the quinsy; from ango or ἄγχω, to strangle; more or less of a suffocating sensation being experienced. F. angine; I. strozzatura; G. Braune.) A term for a sense of suffocation, and, so, applied to diseases in which this is a prominent symptom;

also, to those attended by sore throat.

The term angina is applied to inflammatory affections of the pharynx, and these have been divided into the following forms: -simple, erythematous, glandular, tonsillitic, uleerous, gan-grenous, and diphtheritie. In the simple form there is dryness of and pain in the pharynx, pain during deglutition. It is commonly caused by sudden exposure to cold air, in a person otherwise debilitated or exhausted, is not dangerous, requires rest, warmth, and in general a stimulant and tome plan of treatment. The tonsillar form, sometimes called Amygdalitis, is characterised by great swelling of those organs, and may be either acute, when it is accompanied by sharp febrile symptoms and considerable distress, or chronic, a state that is often seen in strumous children, in whom the swelling alters the voice, impedes the respiration, renders the breath offensive, and reacts on the general health. Acute cases require local depletion, hot poultiees applied externally, emollient and astringent gargles internally, and a general sustentative plan of treatment. Chronic cases are best treated by change of air, especially to the sea coast or high inland regions; the administration of iron and iodine; the injection of a few drops of a solution (1 to 3) of iodine tineture in water into the gland, or its excision.

A. accessoria. (L. accedo, to approach.)

A synonym of Abscess, retropharyngeal.

A. acu'ta. (L. acutus, severe.) An ordinary sore throat, A. simplex, in which the fever is somewhat intense and the local symptoms marked.

A. angino'sa. A synonym of Scarlatina anainasa.

A. aphtho'sa. (L. aphthæ, the thrush.) Aphthous inflammation of the mouth or throat. A. aquo'sa. (L. aquosus, watery.) Edema

of the glottis.

A. aquo'sa cedemato'sa. (L. aquosus; οίδημα, a swelling.) An old term for anasarca dependent on compression of a venous trunk.

A. bronchia'lis. (G. Luftrohrenentzündung.) A synonym of Bronchitis.

A. cani'na. (L. caninus, of, or belonging to, a dog.) A synonym of Croup.

A. cantato'rum. (L. cantator, a singer.) Singer's sore throat. A similar disorder to A. clericorum.

A. carbuncula'ris. (L. carbunculus, a small eoal. F. angine carboncheuse; I. angina carbonchiosa; G. Anthraxbraune, Kehlbrand.) Carbuncle in the throat.

A. catarrha'lis. (G. Halsbräune.) Ca-

tarrh of the throat. See A. simplex.

A. chron'ica. (Χρονικός, concerning time.) Chronic angina; it is usually dependent on some special cause, as in elergyman's sore throat, drunkard's sore throat.

A. clerico'rum. (L. clericus, a elergy-

man.) Clergyman's sore throat. A condition of relaxation of the faucial, laryngeal, and neighouring mucous membrane caused by excessive or forced use of the voice. It is best relieved by rest, tonics, and astringent applications, such as glycerin of tannin.

A. cor'dis. (L. cor, the heart.) A syno-

nym of A. pectoris.

A. croupo'sa. Croupose angina. A term applied to diphtheritie or membraneus croup.

A. cum tumo're. (L. cum, with; tumor,

a swelling.) A synonym of Quinsy.

A. diphtheritica. (Διφθέρα, a prepared hide.) Diphtheritic inflammation of the throat.

A. epidem'ica. (Επιδήμος, among the people.) A synonym of Scorlatina anginosa, and of S. maligna.

A. epiglottide'a. Epiglottidean angina. Term for an ædematous swelling of the glottis, consequent on chromic laryngitis.

A. erysipelato'sa. A synonym of Scarlatina anginosa.

Also, an erysipelatous inflammation of the fances accompanying crysipelas of the face.

A. erythemato'sa. ('Ερύθημα, a redness on the skin.) Erythematous angina. A synonym of A. simplex.

A. exanthematica. (Εξάνθημα, an cruption.) A synonym of Scarlatina anginosa.

A. exsudato'ria. (L. exsudatio, a sweating out.) A synonym of Croup.

A. exter'na. (L. externus, outward.) A term for the disease Parotitis, or the mumps.

A. fau'cium. (L. fauces, the fauces.) Inflammation of the fauces.

A. fau'cium exsudati'va. (L. fauces; exsudatio, a sweating out.) Diphtheria especially affecting the fauces

A. fau'cium malig'na. (L. fauces; malignus, of an evil nature.) A synonym of Cynanche maligna.

A. folliculo'sa pharynge'a. (L. folliculus, a small bag.) Follicular inflammation of the pharynx. See Pharyngitis, follicular.

A. gangrænosa. (Γάγγραινα, a gangrene. G. brandige Halsentzundung.) Gangrenous angina; a term applied to the sloughing which occurs in noma, and in some forms of searlatina.

A. glandulo'sa. (L. glandulosus, full of kernels or glands.) A synonym of Tharyngitis, follicular.

A. herpetica. ("E $\rho\pi\eta$ s.) Herpes of the fancial mucous membrane; a not uncommon form of sore throat.

A. hu'mida. (L. humidus, moist.) A synonym of Croup.

A. inflammato'ria. (L. inflammatio, an iuslammation.) A synonym of Croup.

A. inter'na. (L. internus, inward.) A

synonym of Croup.

A. larynge'a. (Λάρυγξ, the larynx.) Laryngeal angina. See Laryngitis.

A. larynge'a œdematc'sa. (Οἰδημα, a swelling.) Œdematons laryngeal angina. A synonym of Œdema of the glottis.

A. lingua'ria. (L. lingua, the tongue.) Inflammation of the tongue. See Glassitis.

A. Ludovi'ci. (G. Halszellgewebsentzündung.) Called after Ludwig, of Stuttgard, who first described it. A phlegmonous inflammation of the mueous membrane, and of the intermuscular and subcutaneous connective tissue of the sublingual and submaxillary regions, sometimes

terminating in gangrene. It is said to be at times epidemic.

A. Ludwig'ii. The same as A. Ludovici.
A. malig'na. (L. malignus, of an evil nature.) Same as Cynanche maligna.

A. maxilla ris. (L. maxillaris, belonging

to the jaw.) A synonym of Mumps.

A. membrana cea. (L. membranaccus, membranous.) Membraneus angina. A term for Croup.

A. mi'tis. (L. mitis, mild.) Catarrh of the fauces.

A. morbillo'sa. (L. morbilli, measles.) The sore throat accompanying measles, when the rash appears on the faucial mneeus mem-

A. muco'sa. (L. mucosus, mneens.) A

synonym of Scarlatina anginosa.

A. nasa'lis. (L. nasalis, belonging to the nose.) A synonym of Nasal catarrh, especially when attacking chiefly the posterior nares.

**A. œdemato'sa.** (Οἰδηματώδης, of the nature of a swelling.) **A** term for œdema of the glottis.

A. palati'na. (L. palatinus, of the palate.) Catarrhal inflammation of the volum pendulum

A. paralytica. (Παραλυτικός, affected with paralysis.) Paralysis of the pharynx or œsophagus.

A. parotidæ'a. Parotid angina. synouym of Mumps.

A. parotidæ'a exter'na. (L. externus,

outward.) A synonym of Mumps.

A. pec'toris. (L. pectus, the breast. F. angine de poitrine; 1. angoscia; G. Herzbraune.) A paroxysmal affection, characterised by severe pain amounting to anguish, and a sense of oppression in the region of the heart, with a feeling of impending death.

The pain is described as unbearable, and is usually felt about the left side of the lower end of the sternum; often it extends to both sides of the chest, strikes through to the shoulders and back, and while sometimes felt in the right arm. it generally shoots into the left arm, and often stops at the elbow; a certain degree of numbness and of pallor usually accompanies the pain.

During the attack the cardiac beats are modified in frequency, rhythm, and force, or are altogether arrested. The respiratory acts remain unaltered, or are slightly augmented in frequency. The attack is often brought on by such things as walking against the wind, or the presence of gas in the stomach. It lasts from a few minutes to an hour or two, and recurs at uncertain intervals, and not unfrequently ends in sudden death. It is most common in men, and in those of mature or advanced years.

Gout is a frequent accompaniment of angina

pectoris.

The symptoms are due, according to Eulenhurg, either to lesion of automatic excito-motor ganglia of the heart, whether within or outside of the heart; to excitation, direct or reflex, of the vagus nerve, eausing it to exert its inhibitory influence on the heart; or to lesion of the vaso-motor sympathetic nerves.

After death, calcification of the coronary arteries and fatty degeneration of the museular structure of the heart have been found, and called the eauso of the disease; but in a great proportion of cases no organic lesion has been discovered.

The treatment should consist in giving nar-

cotics and diffusible stimuli during the attack, and pursning a general tonic and sustentative plan in the intervals.

Of the many remedies recommended, the inhalation of amyl nitrite, in doses of three to ten minims, at present appears to be the most successful; opium aud ehloral hydrate have been used with some success; the inhalation of ehloroform or, better, of ether, has given relief.
Zine valerianate or sulphate, arsenic, quinine,

phosphorie acid, silver nitrate, potassium and calcium bromide, hydrocyanic acid, digitalis, the insertion of issues and setons over the cardiac region, cutaneous faradisation of the breast and nipple, have been recommended.

A. pellicula ris. (L. pellicula, a small skin.) Pellicular augina. Term for those inflammations of the fauces, pharyux, and larynx, in which false membranes form.

A. pemphigo'sa. (Πέμφιξ, a vesicle.) Pemphigus of the fauces.

A. pernicio'sa. (L. perniciosus, destructive.) A synonym of Croup.

A. pestilentia'lis. (L. pestilentia, an infectious disease.) A synonym of Diphtheria. A. pharynge'a. A synonym of Pharyngitis.

A., pharyngo-scrofulous. A form of ulcerative pharyngitis, characterised by crosions of the follicles at the back of the pharynx spreading to the neighbouring parts; they are yellow, rough, and covered with muco-purulent matter; in extreme cases yellow acuminated pustules are seen. Iodide of iron, tonics, cod-liver oil, and the local use of iodine, iodoform, and perchloride of iron, are recommended.

**A. phlegmono'sa.** (Φλέγμα, inflammation.) Phlegmonous angina. A term given to that form of A. simplex in which there is cedematous swelling of the mucous membrane with deep-seated inflammation, and, it may be, suppuration of the submucous tissue.

A. polypo'sa. (L. polyposus, having a polypus. G. häutige Bräune.) Polypous angina. Another term for croup, because it is attended by the fermation of a false membrane, somewhat like a polypus.

A. potato'rum. (L. potator, a drinker.) Drunkard's sore throat. A chronic inflammatory condition of the fancial and pharyngeal mucons membrane, produced by the excessive use of alcoholic stimulants, especially spirits.

A. pseu'do-membrana cea. false; L. membrana, a membrane.) A synonym of Diphtheria.

A. pulpo'sa. (L. pulposus, fleshy.) A

synonym of Croup. A. pu'tris. (L. putris, stinking, decaying.)

Sloughing sore throat. A. sanguin'ea. (L. sanguineus, bloody.)

A synonym of Quinsy.

A. scarlatino'sa. Scarlatinal sore throat. **A. scirrho'sa.** (Σκίρρος, hard.) Scirrhous angina. A term for difficulty of swallowing eaused by scirrhus of the pharynx or esophagus.

A. sic'ca. (L. siccus, dry. F. angine séche.) Dry augina. Term for chronic inflammation of the pharynx characterised by an uneasy sense of dryness and heat; it is symptomatic of chronic disease of the stomach or lungs.

A. sim'plex. (L. simplex, simple. mal de gorge; I. angina della fauci; G. Hals-weh, Gaumenkatarrh.) Sore throat; entarrhal inflammation of the fauces. There is heat and dryness of the throat, pain in swallowing, perhaps hoarseness, some cough; fever varies in amount; the mucous membrane of the pharynx is swollen and red, occasionally with white patches, or partly covered with tenacious mucus. Suppuration under the mucous membrane is rare. An aperient, alkaline salines, then chlorate of potash and bark, or quinine and iron, with an astringent gargle, is the treatment generally adopted.

A. si'ne dolo're. (L. sine, without; dolor, pain.) A term given by Dr. Gairdner to a specially indefinable and indescribable sensation, sometimes present in cardiac diseases, apart from cardiac asthma, dyspnea, or orthopnea, and not distinctly accompanied by local pain. It more distinctly accompanied by local pain. frequently accompanies insufficiency of the aortic valves than other lesions. Anxiety and oppression, sleeplessness, cerebral disturbance, and irregularly sighing respiration, are the chief accompaniments of the characteristic cardiac anguish or indefinable distress.

A. spasmod'ica. (L. spasmodicus, spasmodic.) A synonym of Laryngismus stridulus.

A. spas'tica. (L. spasticus, spasmodic.) A synonym of Laryngismus stridulus.

A. squirro'sa. See A. scirrhosa. A. strangulato'ria. (L. strangulator, a

choker.) A synonym of Croup.

A. strepito'sa. (L. strepito, to make a great noise.) A synonym of Croup.

A. strid'ula. (L. stridulus, creaking.) A synonym of Croup.

A. suffocati'va. (L. suffoco, to choke.) A synonym used by Bard, in 1789, for diphtheria. A. suffocoto ria. (L. suffoco, to choke.)

A synonym of Croup. A. superficialis. (L. superficialis, belonging to the surface.) Superficial sore throat. A synonym of A. simplex.

A.synocha'lis. (Synocha.) A synonym of Quinsy.

A. syphilitica. Syphilitic sore throat. This form may be acute or chronic, and may be a mere erythema of the mucous membrane, or may exhibit papules and gummata, or may result in great destruction of tissue from niceration and sloughing.

A. thyroï dea. thyroid body. Inflammation of the

A. tonsilla'ris. (L. tonsilla', the tonsils; G. Mandelentzündung.) A synonym of Quinsy.
A. trachea'lis. (L. trachea, the wind-

pipe.) A term for eroup.

Also, a variety of the malignant angina of old authors, described as an erysipelatous and not a phlegmonic inflammation, and probably allied

to diphtheria. A. ulcero'sa. (L. ulcerosus, ulcerous.) Ulcerous angina. A synonym of Cynanche ma-

A. uvula'ris. (Uvula. G. Zapfenbräune.) Inflammation of the nvula.

A. variolo'sa. (L. variola, smallpox.) The sore throat accompanying smallpox, when pustules appear on the mucous membrane of the throat.

A. ve'ra et legit'ima. (L. verum, trne: legitimus, pertaining to law.) A synonym of Quinsy.

A. vesiculo'sa. (L. vesiculosus, full of bladders.) A synonym of A. herpetica.

Angi'na, follic'ular. A synonym of Pharyngitis, follicular.

A., gan'grenous. See Angina gangrænosa.

A., glan'dular. A synonym of Pharyngitis, follicular.

A., hog'skin. A synonym of Diphtheria. A., cedem'atous. A synonym of Edema of the glottis.

A., ul'cerated. A term for ulcerated sore

A., ul'cerative. A term given to cases in which ulcerative stomatitis spreads to the fauces. Angina-li'ni. The name of the Cuscuta in the old formularies.

Anginal. (Same etymon as Angina.) Relating to angina.

Angi'non. The name of the herulock in

An'ginose. (L. angina, the throttling thing; quinsy.) Of, or pertaining to, angina.

Angino'sus. (Same etymon.) Of, or belonging to, angina; having, or accompanied by, angina.

Angiocarditis. See Angeio arditis. **An giocarp.** ('A $\gamma\gamma\varepsilon\bar{\iota}o\nu$ , a vessel;  $\kappa a\rho\pi\delta s$ , a fruit. G. angiokarp.)  $\Lambda$  fruit which is indu-

Angiocar peus. (Same etymon.) Same as Angiocarpous

Angiocar'pia. (Same etymon.) A plant bearing an Angiocarp.

Angiocar pium. (Same etymon. o. uttenfrucht.) Term applied by Kützing to the Huttenfrucht.) Term applied by Kützing to the conceptacle of Fucus, that is, to the swelling of their frond which contains the reproductive organs.

Angiocar'pous. (Same etymon. G. hlicesfrüchtig.) Term applied to a Group of schlivesfrüchtig.) Lichens, with globular or snb-globular apothecia, closed above by an epithecium, so that their ostiole is reduced to a punctiform perforation of the conceptacle.

Also to a Group of Fungi, in which the organs of fructification are enclosed in a common envelope, as in the Truffle, Lycoperdon, Gcastrum, and Mncor.

Angioceratodei'tis. ('Αγγεῖου; ccratodeitis, inflammation of the cornea.) Inflammation of the vessels of the cornea.

Angiochal'asis. (Αγγείου; χάλασις, a slackening. F. angiochalase; G. Gefasserweiterung.) Dilatation of the vessels.

Angio'des. ('Ayyeiov. F. angieux.) Having or full of vessels.

Angiodias tasis. ('Αγγεῖου, διάστασις, a separation.) A separating from each other of vessels normally together.

**Angiogas tres.** ('Λγγείον: γαστήρ, a stomach.) Term applied by Nees to Fungi, in which the reproductive organs are contained in special conceptacles, themselves enclosed in a common envelope.

Applied by Fries to Fungi (Gastromycetes), the spores of which are contained in thecæ.

**Angioge'nia.** ('Αγγείον; γευνάω, to produce. F. angiogenie; G. Gefussbildung.) The formation of vessels.

**An**'giograph. ('Αγγείον; γράφω, to engrave.) A form of sphygmograph, devised by ('Αγγείου; γράφω, to Landois, the advantages of which are said to be that the amount of pressure can be accurately varied at will, that the style is constantly in contact with the registering surface, and that the movement is vertical.

Angiographia. ('Δγγεῖον; γράφω, to

write. F. angiographie; G. Beschreibung der Gefasse.) A description of the vessels; angiography.

Angiohydrograph'ia. See Hydran-giographia.

Angiohydrologia. See Hydrangio-

Angiohydrotom'ia. See Hydrangio-tomia.

Angioi'tis. Kuhn's form for Angii-

Angiokeratodi'tis. See Angiocerato-

Angioleuci'tis. ('Λγγιῖον, a vessel; λευκόν, white. (F. angioleucite; G. Lymphyefus-scntzundung.) Inflammation of the lymphatic vessels.

**An**'giolith. ('Λγγεῖον; λίθος, a stone.) A synonym of *Phlebolith* 

Angiolithic sarco'ma. See Sarcoma,

angiolithic.

**Angiology.** (' $\Lambda\gamma\gamma\epsilon\bar{i}o\nu$ , a vessel containing liquor, or a vein;  $\lambda\delta\gamma\sigma$ s, a discourse. G. Gefässlehre.) Term for the doctrine of the blood-vessels and absorbents.

**Angiolymphitis.** ('Aγγεῖον; lymph.) Piorry's term for inflammation of the lymphatics.

**Angio'ma.** ('Αγγεῖον, a vessel.) A tumour produced by enlargement or new formation of blood-vessels. See Angeioma.

A. arteria'le racemo'sum. (L. racemosus, clustering. G. Rankenanyioma.) Λ synonym of Ancurism, cirsoid.

A. capilla're. (L. capillaris, hair-like.)
Angioma of the capillaries. See Teleangeiectasis.
A. caverno'sum. (L. cavernosus, full of hollows.) See Angeioma, cavernous.

A. circumscrip'tum. (L. circumscriptus, bounded.) A synonym of A. cavernosum.

A. lymphat'icum. See Lymphangioma. A. muco'sum prolif'erum. (L. mucosum, slimy; proles, offspring; fero, to bear.) Proliferating mucous angioma. A variety, perhaps, of cylindrical epithelioma, in which there is an active new formation of blood-vessels, with hyaline degeneration of the vascular sheath.

A. racemo'sum. (L. racemosus, full of clusters.) A term applied to cirsoid ancurism.
A. varico'sum. (L. varicosus, full of

dilated veins.) See Teleangeicctasis venosa.

A. veno'sum. (L. venosus, full of veins.)

A. veno'sum. (L. venosus, full of veins.) See Angetoma, cavernous.

Angiomala'cla. ('Αγγείον,: μαλακία, softness. F. augionalacie; G. Gefüsserweichung.) Softening of the vessels.

**Angiom'yees.** ('Αγγείον', μόκης, a fungus.) A term for the disease known as Fungus becautodes.

An gion. ('Λγγεῖον, a vessel.) A vessel. Angioneuro'sis. See Angeioneurosis. Angiono'ma. ('Λγγεῖον.) Term applied generically to ancurysm, varix, and erectile tumours

Also (ἀγγεῖον; νομαί, eating sores. F. anqiouæme.) Ulceration of the vessels.

Angionos'us. ('Αγγεῖον', νόσος, disease. F. angionose, maladie de vaisseau; G. Gefasskrankheit.) Disease of the vessels.

Angionu'sus. ('Αγγετον, a vessel; νούσος, a disease.) The pathology of the vessels.

Angioparal'ysis. ('Αγγετον, a vessel;

Angioparal'ysis. (Αγγείον, a vessel; παράλυσις, palsy.) Paralysis of the vaso-motor nerves.

Angioparalytic. (Same etymon.) Applied to diseases resulting from paralysis of the vaso-motor system, as, for example, to certain forms of hemicrania.

**Angiopath'ia.** ('Αγγεῖον; πάθος, affection. F. angiopathie; G. Gefassleiden.) An affection or disease of the vessels.

**Angioplania.** (Άγγεῖου; πλάνη, a wandering. F. angioplanie.) Aberration of a vessel from the normal structure and position; angioplany.

Angiopleg'mus. ('Λγγεῖον'; πλίκω, to twist. F. angiophlegmus.) The tying of a vessel. Similar to Angiophoce.

Angioplero'sis. (Ληγεῖου; πλήρωσις, a filling up. F. angioplerose; G. Gefässüberfüllung.) Engorgement of the vessels.

Angioplo ce. ('Αγγείου; πλοκή, a twining.) The tying or securing of a vessel; also, by B. Stilling, a mechanical expedient for stop-

ping the bleeding of large vessels.

Angiopterid'eæ. ('Αγγείον, a vessel; πτερίες, a fern.) A Family of the Order Marattiaecæ. Sporangia 5–20 in number, in two rows, forming a sorus, destitute of a velum, seated on a receptacle, occupying the dorsum of one of the nervures near its extremity; cach sporangium is oval or pyriform, sessile, single-chambered, with laminated wall, rests on a ring of thickwalled cells, and dehisces by a longitudinal slit on the ventral aspect.

Angiopy'ra. ('Αγγεῖον; πῦο, a fever. F. angiopyrie; G. Gefassfieber, entzündlich Fieber.) Inflammatory fever.

**Angiorrha**'gia. ('Αγγεῖον', ῥήγννμι, to burst forth. F. angiorrhagie; G. Gefässzerreizung.) A sudden discharge from the vessels, but by custom employed to express active hamorrhage.

**Angiorrhœ'a.** ('Αγγείου; ρέω, to flow. F. angiorrhee.) A flow or moderate discharge from the vessels, but by custom applied to passive harmorrhage.

**Angiosar'ci.** ('Λγγεῖον: σάρξ, flesh.) Term applied by Leveille to endothecal thecasporous Fungi, which have a fleshy and generally indehiscent receptacle, such as the Tuberaceæ, Onygene, and Erysipheæ.

Angiosialitis. ('Λγγείον; σίαλον, saliva. F. angiosialite.) Inflammation of the salivary duets.

Angio'sis. (Αγγεῖου, a vessel containing liquor, or a yeiu.) Term for all diseases of bloodvessels.

**Angioso'ri.** ('Λγγεῖου; σωρός, a heap.) Term applied to ferns, the sori of which are enclosed in a capsule, or under the fold of an indusium, in opposition to the gymnosorous ferns.

Angiosper meæ. ('Λγγεῖον; σπέρμα, a seed) Α group of Algæ in Kützing's classification, including the Fucaceæ, Cystosireæ, Sargasseæ, and Halochlocæ.

Angiospermia. ('Αγγείον'; σπέρμα, a seed. F. angiospermie; G. Bedecktsamige.) Term applied by Brown as a correlative to Gymnospermia; to plants having the seeds lodged in a pericarp.

A Group of Fungi, including Fucaceae, Cystosireae, Sargasseae, and Halochloeae.

Linnens' name for a Group of didynamous plants, as Rheinanthus, Melampyrum, which have their seeds clothed with a distinct pericarp. In modern Botanical Classifications, a Division of the Class Dicotyledones, Subkingdom Phanerogamia. Ovules enclosed in an overy, indirectly fertilised by the action of the pollen on the stigma.

An'giosperms. (Same etymon.) The same as Angiospermia.

**Angiospon'gus.** ('Αγγείον', σπόγγος, a sponge.) Same as *Angidiospongus*; also similar to *Angeicetasis*.

Angiospo ræ. ( Αγγεῖον; σπόρος, seed.) Term applied to Fungi, the spores of which are contained either in theea, or on the basidia, in the interior of the tissue of the receptacle.

**Angiosporous.** (Αγγείον; σπόφος, seed. F. angiospore; G. bedeektsporig.) Applied by Meyer to sporocarpia of lichens; when contained in the utricles they are termed asci or theces.

Angiostegno'sis. ('Αγγεῖον; στέγνωσε, a making close. F. angiostegnose.) A contraction of the vessels.

Angiostegnotile. (Same etymon. F. angiostegnotique.) Belonging to Angiostegnosis. Applied to medicines that astringe the vessels.

Angiosteno'sis. ('Αγγείου; στένωσις, a being straitened.) Similar to Angiostegnosis.

Angiosteogenia. (᾿Αγγεῖου; ὁστῖου, a bone; γευνάω, to produce. F. angiostrogénie; G. Gefussverknöcherung.) Ossification of the vessels; angiosteogenv.

the vessels; ingiosteogeny.

Angiosteosis. (Αγγείον; osteosis. F. angiosteose; G. Gefassverknocherung.) The progress of ossification of the vessels.

Angiosto'mata. A Suborder of the Order Ophidia, Class Reptilia. Gape small; quadrate fixed to the skull, as is the squamosal, when present. The post frontal is absent, and the teeth are never grooved. The skin covers the eyes and is thick, and a rudimental pelvic girdle is present. It includes Tortrix, Typhlops, and Uropeltis.

Angios'tomous. (Λγγεῖον; στόμα, a mouth. F. angiostome; G. gefassmundig.) Applied to univalve shells the opening of which is narrow, i.e. of equal diameter throughout, and of the length of the shell, as in Cypræa.

Angios'tomum. A Genus of sexuallymature Nematoid Entozoa, of which the following species have been recognised.

A. ascaroï des. (Ascaris; ɛidos, form.) Found in Limax cinercus.

A. entom'elas. (Ἐντός, within; μίλας, black.) Found in the lung of Anguis fragilis.
A. Linsto'vii. See A. macrostomum.

A. Linstovii. See A. macrostomum.
A. macros tomum. (Μακρόs, large; στόμα, a mouth.) Found in the plenral cavity of the Anguis fragilis.

Angios' trophe. ( Αγγείου; στροφή, a turning. F. angustrophe.) Torsion of the ends of divided vessels, as the arteries.

Angiosym'physis. ('Αγγείου; σύμφυσις, a growing together. G. Gefasserwachsung.) Adhesion to or union of vessels with each other.

Angiosynize'sis. ('Αγγεῖου, συνίζησις, collapse.) Collapse of the vascular canals.

Angiot'asis. ('Αγγεῖον; τάσις, a stretching.) Tension of the vessels.

Angiotat'ic. (Same etymon.) Belonging to Angiotasis.

Angiotelecta'sia. ('Αγγείον: τέλος, an extremity: ἐκτασις, extension. F. angiotelectasie.) Extension of vessels or the ends of vessels.

Angiotelec'tasis. Same as Angio-telectasia.

Angioten'ic. ('Αγγεῖον: τείνω, to stretch. F. angiotenique; 1. and S. angiotenico; G. Entzündungsfieber.) The term angiotenic fever was substituted by Pinel for the indammatory fever of Huxham, synocha of Cullen, and febris continua non putrida of Boerhaave, which Pinel thought was due to vascular irritation and tension.

**Angiothe cia.** ('Αγγείον ; θήκη, a box.) Term applied by Nees v. Esenbeek as synonymous with *Angiocarpiu*.

Also, applied to Fungi possessing theca, which are enclosed in the tissue of the receptacle, as in the truffles.

Angiothlip'sis. ('Αγγεῖου; θλῖψις, pressure.) Pressure on one or more vessels.

Angiotitis. ('Αγγεῖον; οὐs, the ear. G. Ohrgefassentzündung.) Inflammation of the vessels of the ear.

Angiot'omy. (Αγγείον, a vessel containing liquor, or a vein; τέμνω, to cut. F. augeiotomie, augiotomie; G. Gefasszergliederung.) Term for the dissection of the blood-vessels and absorbents.

Angle. (L. angulus; from ἀγκύλος, bent. F. angle; G. Winkel.) The space comprehended between the meeting of two lines at a point.

A., acro'mial. ('Λερωμία, the point of the shoulder.) Walshe's term for the angle formed by the elavicle and the head of the humerus.

A., auric'ular. (L. auricula, the external car. F. angle auriculaire.) This term is applied to several angles formed by lines having their vertex on the biauricular vertex and extending to various points of the eranium, as to the alveolar point, the nasal, suborbital, bregmatic, lambdoid, iniae, opisthic.

A., auric'ulo-era'nial. (L. aurienta, the onter ear; κρανίον, the skull. F. angle auriento-eranien.) A synonym of A., aurientar.

A., basifa'cial. (L. basis, the base; facies, the face.) The angle formed by a line drawn in the vertically divided skull from the basion to the middle of the anterior extremity of the cerebral surface of the sphenoid, i.e. the basi-cranial axis; and one drawn from the latter to the anterior margin of the alveolar border of the maxilla, the basifacial axis. The angle varies in man from 90° to 120°. In the higher mammals it is very obtuse, nearly 180°.

A., bas'ilar, of Bro'ca. (L. basis, the hase.) The apex is at the basion, and of the two sides one corresponds to the plane of the occipital foramen, and the other extends from the basion to the naso-frontal articulation. It varies from  $+14^{\circ}$  to  $-26^{\circ}$ .

A., bior'bital. (L. bis, twice; orbit.) This angle represents the angle of divergence of the two visual axes. It varies from 40° to 54° in man.

A., con'dylar, of Eck'er. (Kôuôuλos, a knob.) The obtuse angle, looking upwards and backwards, formed by the plane of the occipital foramen with the plane of the basilar groove or clivus. It varies from 100° to 125° in negroes, and from 117° to 140° in white men, the mean being 113·5° in the former, and 128·2° in the latter.

A., coronofa'cial, of Gra'tiolet. (L. corona, a crown; facies, the face.) This is formed at the point of innction of a plane passing through the coronal suture of the two sides, and the horizontal facial line of Camper.

A., cos'tal. (L. costa, a rib.) The angle formed by the middle line of the body, and a line drawn along the lower border of the false ribs to the middle line of the body. That of the left side is slightly the more acute.

A., cranial. (Kpaviov, the skull. F. angle cranien.) The cravial angles are obtained in the same manner as the auricular angles, except that the apex is the anterior border of the

occipital foramen.

A., critical. (Κριτικός, able to discern.) The angle beyond which a luminous ray, passing from a mere to a less refracting medium, cannot emerge; from water to air the critical angle is 48° 35°; from glass to air 41° 48′. It is dependent on the fact that the angle of incidence of a luminous ray in passing from a more to a less refracting medium is less than the angle of refraction.

A., ephip'pial, of Welcker. ('E $\phi$ i $\pi$ - $\pi$ cos, a saddle-cloth.) See A. sphenoidal.

A., eth'mo-cra'nial. (Ethmoid, bone; koaviov, the skull.) The angle formed by the basicrauial axis and the plane of the cribriform plate of the ethmoid bone. This angle is about 140° in skulls of Western European races; it diminishes in the higher forms and increases in the lower forms of animals, until the lines become almost continuous in oue plane.

A., fa'cial. (L. facies, the face. F. angle facial; I. angolo facial; G. Gesichtswinkel.) Camper took this angle by drawing a horizontal line from the external auditory foramen to the lower border of the nostrils, and a facial line passing upwards from the incisor teeth to the glabella; the angle is formed in front of the upper jaw at the jutersection of the two lines. It varies from 70° to 80°. Geoffrey St. Hilaire and Cuvier made the horizontal line of Camper oblique by commencing at the cutting edge of the incisor teeth. Cloquet made the apex of the angle at the alveolar border of the upper jaw. Jacquart made the apex of the angle at the nasal spine. Topinard and Broca, whose plan is probably the best, take Cloquet's apical point, i.e. the alveolar border of the upper jaw, and draw a nearly horizontal line through the external auditory meatus, and a facial or vertical one to the ophryon. It is usually from 75° to 80°.

A., fron'tal. (L. frons, the forehead.) The angle formed between a horizontal plane and a line representing the inclination of the fore-

head.

A., great, of eye. (F. grande angle de

l'ail.) A., iniofa'cial, of Des'champs. ('Iviov,

the back of the head; L. facies, the face. F. angle iniofacial.) The angle formed by a line drawn from the occiput to the most prominent point of the forehead and one drawn from the occiput to the symphysis of the chin. A line connecting these two in front completes the cephalie triangle.

A., lim'iting, of resis'tance. The same

as A. of repose.

A., mandib'ular, of Bro'ca. (L. mandibula, a jaw.) The angle formed by two lines, one drawn along the lower border of the body of the lower jaw, the other along the posterior border of its ascending ramus.

A., metafa'cial, of Ser'res. (Μετά,

behind; L. facies, a face. F. angle metafacial.) The augle that the pterygoid processes make with the base of the eranium.

A., na'si-ma'lar, of Flow'er. (L. nasus,

the nose; malu, the cheek hone.) A horizontal angle, the apex of which is at the root of the nose and the two sides on the outer margin of the orbits. It averages from 130° to 135° in European, and 140° to 145° in Mongolian races.

A., na'so-ba'sal, of Vir'chow and Welck'er. (L. nasus; basis, the base. F. angle nasal.) The angle that the naso-basilar line makes with the naso-subnasal line, the apex being at the subnasal point. It is about 665 in

the European, 71° in the negro.

A., occip'ital. (L. occiput, the back of the head.) The angle formed by the basicranial axis (a line drawn in the vertically divided skull from the anterior margin of the foramen magnum of the occipital bone) and the occipital plane; it is very obtuse in man, but is almost a right angle in the lower vertebrata.

A., occip'ital, of Bro'ca. (Same ety-i.) The apex of this angle is at the opisthion, one side is formed by a line extending from the opisthiou to the root of the nose and the other along the plane of the occipital foramen. In

man it varies from  $10^{\circ}$  to  $-20^{\circ}$ .

A., occip'ital, of Dauben'ton. (Same etymon. F. angle occipital.) The apex is at the opisthion; one side is the plane of the occipital foramen, and the other is a line extending from the opisthion to the suborbital point. In man it varies from  $-16^{\circ}$  to  $+19^{\circ}$ .

A. of crys'tals. (Κρύσταλλος, clear ice.) The angles or summits formed by the incidence of the faces of crystals; the three-faced, fourfaced, and so on, according to the number of faces

by which they are formed.

A. of devia tion. (L. devio, to go aside.)
The angle formed, in the passage of an incident luminous ray through a prism, by the production of the lines of incidence and emergence; it expresses the deviation of light caused by the

A. of divergence. (L. divergium, a point of separation. F. angle de divergence.) Term applied in Botany to the angle formed between two vertical planes, measured by the axis of the stem and by two consecutive leaves of the same spiral or verticil.

A. of eye. (F. angle de l'ail.) The angle formed by the junction of the upper and lower lids, either at their outer or at their inner extremity.

A. of in'cidence. (L. incido, to fall upon.)
The angle that a ray of light or sound falling upon a plane surface makes with a line drawn at right angles to this surface.

A. of lips. (F. angle des lèvres.) The point of junction, on each side of the mouth, of

the upper and lower lip.

(F. angle de la må-A. of low'er jaw. choire.) The angle formed between the horizontal and the ascending fami of the inferior maxillary bone. It amounts to 170° to 160° at birth, falls to 150° to 130° during the first dentition, and 115° at the second dentition, approaches a right angle in

A. of neck. (F. angle de la nuque.) The angle formed by the junction of the nape and the neck, lying between vertebra promineus and the

occiput.

A. of neck of fe'mur. The angle formed by the neck of the femur with the shaft. This equals 116° to 138°, with an average of 125°, in man, and is nearly a right angle in woman. In advanced age it is 110°. It is relatively smaller in persons of short stature.

A. of nose. (F. angle du nez.) The angle formed by the junction of the nose and the cheek.

A. of polarisa'tion. In polarisation of light by reflection, the angle of polarisation is the angle which the incident ray makes with the reflecting substance when the reflected ray and refracted ray are at right angles to each other. The angle of polarisation for glass is 54° 35', for water 52° 45', for diamond 68°.

**A.** of progna thism. (Πρό, forward; γνάθος, the jaw.) The angle which, according to Topinard, is formed at the alveolar point by the horizontal plane and the line of the profile.

It is nearly the same as A., naso-basal.

A. of pu'bis. (F. angle du pubis.) The point of junction of the anterior and inferior borders of the body of the pubis.

A. of reflection. (L. reflecto, to turn back.) The angle that a ray of light on reflection from any surface makes with a line drawn perpendicularly to this surface. The angle of incidence is always equal to the angle of reflection.

A. of refraction. (L. refractio, a breaking back. F. angle refringent.) The angle that a ray of light in passing from a rarer to a denser medium, or vice versa, makes with a line drawn at right angles to the plane of junction of the two surfaces.

A, of repo'se. (F. reposer, to rest.) In the case of a body urged over a rough surface, that angle formed by the line of mutual action and the common perpendicular at which arrest of motion occurs.

A. of rib. (F. angle de côte.) The roughened line on the onter surface of the rib, between the tubercle and the most convex part, and corresponding to the outer border of the erector spinæ muscle.

A. of Se'gond. The apex is at the basion; the plane of the occipital foramen forms one side, and a line extending to the suborbital point indicates the separation of the cranium from the face, whilst another line, extending to the lower border of the superior maxillary bone, gives the total facial angle. The cerebral angle is about 159°, the facial angle 47°.

A. of supina'tion of the hand. (L. supinus, lying on the back.) The extent to which the hand can be supinated after pronation, it

amounts to about 180

A. of the loc'uli of the o'vary. (L. loculus, a little place.) In Botany, the point of the ovarian cavity which corresponds to the line of adhesion of the borders of the carpellary leaf which forms each carpel. Whether the ovary is composed of one or of several carpels the angle of the single loculus, or of the several loculi, always looks to the centre of the flower. Hence its name of internal angle.

A. of the mouth. The point of junction

of the upper and lower hip on each side of the

mouth.

A. of tor'slon of fe'mur. (L. torqueo, to twist.) The angle which the axes of rotation of the joints at the ends of the bone form with each other. It varies from 7.2° to 26.7°; average 11.8°.

A. of tor'sion of hu'merus. (L. torqueo.) The degree to which the humerus is twisted in its lower part, as represented by the course of the musculo-spinal groove; it amounts to about 180°.

A. of tor'sion of tib'ia. (L. torqueo.) The angle which the axes of rotation of the joints at the ends of the bone form with each other. It

varies from 2° to 32°; average 19°.

A. of u'terus. (F. angle tubaire de A. of u'terus. (F. angle tubaire de l'utérus.) The point of union of the lateral and npper sides of the nterns, with which the Fallopian tubes are connected.

(L. olfacto, to smell.) A., olfac'tory.

Same as A., ethmo-cranial.

**A., op'tic.** ( $O\pi\tau\iota\kappa\dot{o}s$ , of sight.) The angle formed by the principal optic axes when the two eyes are directed to the same point; the nearer the object looked at the larger the angle, and vice

A., or bital. Same as A., biorbital. A., or'bito-occip'ital, of Bro'ca. angle formed by two lines, one in the biorbital plane, the other in that of the occipital foramen. See 'Revue d'Anthropologie,' 1877.

A., pari'etal, of Quat'refages. (F. angle varietal.) This angle is ascertained by drawing a line, which is more or less vertical, on each side of the head, through the extremities of the bizygomatic line, i.e. the horizontal line passing through the broadest part of the face, and the extremities of a line passing horizontally through the broadest part of the frontal bone. The lines usually meet above (forming the pyramidal angle of Prichard); sometimes the lines are parallel, and there is no angle, and occasionally the lines are divergent, and the angle is negative.

A., premaxillary, of Hux'ley. (L. pra, before; maxilla, the lower jaw.) Same as

A., basifacial.

A., pyram'idal, of Prich'ard. See A.,

parietal, of Quatrefages.

A., solid. A term applied to the angles of

crystals.

A., sphenoïd'al, of Welck'er. (Sphenoid bone. F. angle sphenoidal.) The apex is at the middle of the crest which separates the optic grooves from the pituitary fossa; one side extends from this point to the basion, and the other side is formed by a line extending from the above point to the naso-frontal suture. The angle looks downwards and forwards.

A., sternoclavic'ular. Walshe's term for the angle formed by the clavicle and sternum.

A., symphys ian. (Σύμφυσις, a growing together.) The angle which the symphysian line or profile of the lower jaw makes with the plane of the inferior border of the body of the bone.

A., vis'ual. (L. visualis, relating to sight.) The angle formed by the secondary optic axes, lines extending from the optic centre of the lens to the extremities of the object looked at. This angle is larger or smaller, according to the size of the object looked at; and decreases with increased distance if the same object be looked at. The smallest visual angle is about 30 seconds. The smallest perceptible object is calculated by Volkmann to be 0.00013 of a milli-

Angles, cephal'ic. ( $K\epsilon\phi a\lambda h$ , the head. F. angle cephalique.) The cephalic angles are measurements which have been adopted in Anthropology as bases of comparison of the skulls of different races. The different cephalic angles are described under the special headings, as Angle, auricular, A., facial.

Anglicus su'dor. (L. anglicus, Eng-

lish; sudor, sweat.) A name of the Sweating sickness.

Angogo. A tenifuge employed by the Abyssinians, the product of the Siline macrosolen. Angola seed. (G. Angolaerbse.) The

seed of the plant Abrus precutorius.

A. weed. A commercial term for the litmus, Roccella tinctoria, which is obtained from Angola.

An'golam. The Alangium devapetalum. An'gone. See Anchoné.

**Angophra'sia.** (Λγχω, to press tight the throat; φράσις, speech.) A term suggested by Küssmaul for hemming and hawing, i.e. halting in the speech, and introducing long-drawn or iterated vowels.

An'gor. (L. angor, a strangling.) A syn-

onym of Angina.

With some authors it differs from angina in its short duration, but expresses the same anxiety and oppression about the epigastrium.

A. fau'cium. (L. fauces, the upper part of the throat ) Catarrh of the fauces.

A. pec'toris. (L. pectus, the breast.) A

synonym of Angina pectoris.

Ango'ra. Turkey; Galatia. Here are mineral waters, some of which are cold and

ferruginous, and others, warm and sulphuretted. An'gos. ('Αγγος, vessel.) This generally, in medical writings, signifying a blood-vessel, was employed by Hippocrates, vi, Epid. s. 5, t. 17, as

a name for the uterus.

Angou'rion. ('Αγγούριον, a water melen.)

The cucumber, Cucumis satirus.

Angree cum. (F. angree, from Madagascar name Angurek.) A Genus of the Nat. Order Orchidoceæ. Hab. Madagascar, and Island of Bourbon.

A. carina'tum. (L. carinatus, keeled.) The leaves of this plant are purgative and unthelmintic.

A. fra'grans. (L. fragrans, sweet-scented. F. fahane; G. Thee von Bourbon.) The leaves of this plant are entire, coriaccous, and straightnerved; they are highly fragrant, and have been introduced into Paris as a substitute for Chinese tea, under the name of Thé de Bourbou, or Thé de Fahane; they contain Coumarin.

Anguici'dus. (L. anguis, a snake; cædo, to kill. G. schlangentodtend.) That which has, or seems to have, the property of killing serpeuts,

as Aristolochia anguicida.

Anguid'ei. Applied by J. E. Gray and Wagler to an Order of Reptilia having the Anguis for their type.

An guiform. (L. anguis, a snake; forma, likeness. G. schlangenformig.) Snakeshaped. Applied to a Family of Reptilia having the body like a serpent; also to a Family of Myriapoda having the body for the most part linear.

Anguilla. (Akin to ἔγχελυς, an cel.) The eel. A Genus of the Family Muranida, Suborder Physostomapodes. Scales not visible; nostrils anterior or lateral; tail rounded; tongue free; dorsal fin arising somewhat behind the skull; gill openings very narrow, in front of the pectoral fin.

A. anguil'la. A synonym of A. rulgaris. A. pekinen'sis. Hab. China, especially the river Ning Po. A species which supplies

some part of the China isinglass.

A. vutga'ris. (L. rulgari\*, common. \*Εγχε\νς. F. anguille; I. anguilla; S. anguilla; G. Aal.) llab. Europe. The common cel. Upper

jaw shorter than the lower; dorsal fin arising far behind the pectoral. In autumn the ecl leaves the fresh waters for the mouths of rivers or the sea, where it attains sexual maturity and breeds; but the process of reproduction is still obscure; the ovaries are riband-like; the testicles have not been demonstrated. In spring the young fish ascend the rivers. The flesh is of good flavour but fat, and in consequence is, with some persons, difficult of digestion.

Anguilla'ra. Italy, near Lake Sabatino. A mineral water springing from the basaltic lava at a temperature of 21°C. (69.8°F.) It contains sodium chloride 4 grains, calcium chloride 2.5, sodium sulphate 3, magnesium sulphate 2, calcium earbonate 7.5, magnesium carbonate 3.5, and silica 1 grain, in 15 ounces. Used in paralysis and nervous weakness, in chronic rheumatism, and in

urina- catarrbs from gravel.

(L. anguilla, an eel; Anguil'liform. forma, resemblance.) Resembling an cel.

Anguilloid. (L. anguilla, an cel; zlôcs, form. G. Aalahnlich.) Eel-like.

Anguillu'la, Ebrenb. (Dim. of L. anguilla, an cel.) A Genus of the Family Anguillulidæ. Buccal cavity small, œsophagus with a posterior bulh, and a chitinous masticatory apparatus.

A. ace'ti. (L. acetum, sour wine, vinegar.) No anal gland; month without lips; the two spicules strongly curved. Found in vinegar.

A. ag'llis. (L. agilis, active.) Found by Leidy in the intestine of Julus marginatus. A. appendicula ta. (L. appendicula, a

small appendage.) Found in the Blatta orientalis.

A. attenua'ta. (L. attenuatus, reduced, shortened.) Found by Leidy in the intestine of Julus marginatus.

A. bos'trychi typog'raphi. Found in the intestine of Bostrichus typographus.

A. brachyu'ra. (Βραχύς, short; the tail.) Found in the cacum of the larva of Rhizotragus aprilinus.

A. caloso matis. Found in the ventriculus of Calosoma sericeum. Found in the

A. car'abi clathra'ti.

ventriculus of Carabus clathratus. A. depres'sa. (L. depressus, pressed down.) Found in the excum of the larva of

Cetonia marmorata. A. grac'llis. (L. gracilis, slender.) Found in the large intestine of the larva of Polyphylla

fullo. A. intestina'lis.

(L. intestina, tho bowels.) A species often found accompanying the A. stereoralis. A synonym of Leptodera stercoralis.

A. labia'ta. (L. labia, a lip.) Found in the Polydesmus virginiensis.

A. laticollis. (L. latus, brond; collum, the neek.) Found in the Oxythyrea stictica.

A. lumbrici. (L. lumbrieus, an earthworm.) Found in the traches of the Lumbrious terrestris.

A. macron'ra. (Maκρός, long; οὐρά, the

tail.) Found in the Blatta orientalis.

A. moni'lis. (L. moniie, a necklace.) Found in the small intestine of Aphodius conspurcatus.

A. rig'ida. (L. rigidus, hard.) Found in the ventriculus of Passalus cornutus.

A. robus'ta. (L. robustus, firm.) Found in the intestine of Ligyrus relictus.

A. satur'niæ. Found in the abdomen of

the larva of Saturnia pyri. A. socia'lis. (L. socialis, companionable.)

Found in the large intestine of Acheta abbreviata. A. stercora'lis. (L. stercoro, to dung.) species found in the intestines of persons suffering from the diarrhoa of Cochin China. It is a millimètre long, with a cylindrical smooth body, rather narrowed in front and pointed behind. A synonym of Leptodera stercoralis.

A. trit'ici. (L. triticum, wheat.)

Tylenchus tritici.

Anguillu'lidæ. (G. Aalchen.) A Family of the Order Nematoda, Class Nemathelmintha. The great majority non-parasitic, of medium size, generally with a double esophageal enlargement, oecasionally with candal glands, never with a eaudal sucker. The males possess two equal spicules, with or without accessory pieces. The genital opening ventral. They possess pigment spots or rudimentary eyes. Some live on plants, others in the products of putrefaction or fermentation, and others, again, in the earth or fresh

Angui'na. (L. anguis, a serpent er snake.) Of er belonging to the Anguis or snake. Applied to a Family of Ophidian reptiles.

Anguin eous. (L'anguis, a snake. G. schlangenartig.) Resembling or belonging to a snake.

Anguin'idæ. (L. anguis, a serpent.) Name given to a Family of the Ophulia, having the Anguis for its type.

Anguinine. (Same etymon.) Similar

to or belonging to a snake.

Anguinoïd'æ. Applied by Fitzinger and Eichwald like Anguinida.

Anguinoid'ei. Same as Anguinoidæ.
Angui'num. (L. anguinus, belonging to a snake.) A snake's egg; it was believed to possess supernatural powers.

An'guish. (L. angustia, narrowness, distress. F. angoisse; I. angoscia.) Distress; anxiety; agony; the distressing oppression generally referred to the epigastrium which accompanies dyspnœa.

A., fe brile. The distress which often accompanies the outset of a fever.

An'guium senectæ. (L. anguis, a snake; senecta, old age.) The exnyine or cast skins of snakes, a decoction of which was said to cure deafness and pains in the ears.

Anguivi pera. Applied by Carus and Ficinus to a Tribe, by Latreille to a Family, of Reptilia, including venomous serpents that have

the body anguilliform.

Angular. (L. angulus, an angle. F. angulaire, angulé, anguleux; G. eckig, winkelig, kantig.) Of or belonging to an angle; formed like an angle.

A. ap'erture. The angle formed by the most divergent rays which can enter the object glass of a microscope; the apex of the angle

being the focal point.

A. ar'tery. (L. arteria angularis narium; F. artère angulaire; G. Winkelarterie.) The terminal branch of the facial artery. The part included under this term is given differently by different anatomists. Thus Henle considers it to be all that portion of the facial which runs up by the side of the nose, beyond the origin of the compressor nasi musele, and which, after sending numerous branches to the ala and dorsum of the nese, divides at the lower margin of the orbicularis oculi, and anastomeses with the nasal branch of the frontal emerging from the orbit, which sometimes takes its place. Some of the older anatomists apply the term to the trunk of the facial, because it passes over the angle of the lower jaw-bone; and others, again, limit it to that branch only which supplies the inner canthus of the eye, and anastomoses with the frontal.

A. bone. One of the constituents of the mandible or inferior maxillary bone in Sauropsida, Ganoids, and osseons fishes. It lies under and behind the angle of the jaw and the os arti-

culare.

A. convolu'tion. The same as Gyrus angularis.

A. cur'vature. See Spine, angular curvature of.

A. fore head. (F. front anguleux.) term applied to that form of cranial deformity in which the sides are flattened, and the forehead prominent and angular; according to Morel, such persons are wicked, crucl, and unmanageable.

A. gy'rus. (F. pli courbe; G. zweite, or

mittlere Scheitellappenwindung.) See Gyrus

angularis.

A. mo'tion. The movement of the bones of a joint by which they are placed at a greater or less angle with each other.

A. move'ment. The same as A. motion. A. nerve. (F. nerf angulaire; G. Nasen-winkelnerve.) A branch of the inferior maxillary nerve distributed to the inner canthus of the

A.pro'cess, exter'nal. (G. Jochfortsatz.) The onter termination of the orbital arch of the frontal bone; it articulates with the malar bone.

A. pro'cess, inter'nal. The inner termination of the orbital arch of the frontal bone; it articulates with the lachrymal bone.

A.pro'cesses. (F. apophyses angulaires.) The external and internal extremities of the orbi-

tal arch of the frontal bone.

A. vein. (F. reine angulaire; G. Nasen-winkelblutader.) This vein follows the course of the artery, and discharges its contents partly into the ophthalmic vein and partly into the facial It is formed by the junction of the snpraorbital and frontal veins, and receives the nasal and superior palpebral veins.

Angula'ris. (L. angularis, having angles. F. angulaire; G. eckig, winkelig.) That which

belongs or appertains to an angle.

A. scap'ulæ mus'cle. (F. angulaire de l'omoplate; G. Schulterheber.) A strong musele situated in front of the shoulder of solipeds. It arises from the transverse processes of the five last cervical vertebræ, and is inserted by a thick and fleshy attachment into the internal face of the scapula. The inferior border is fused with the serratus magnus. It is covered by the cervical trapezins, the mastoido-humeralis, and the small pectoral musele. It covers the splenius, the inferior brauch of the ilio-spinalis, and the common intercestal muscle. Its action is to draw forward the superior extremity of the scapula. It is the Levator anguli scapula of man.

Angulate. (L. angulatus, firmished with corners, or angles. F. angulé; S. angulado; G. eckig, winekelig.) Having many angles.

Angulicol'line. (L. angulus, an angle; collum, the neck. G. winkelhalsig.) Having the neek or corselet angulate, as Cneorhinus anguilicollis.

Angulif'eræ. (L. angulus, an angle; fero, to bear.) A Tribe of the Family Bacillariacea, having polygonal valves.

Anguliferous. (L. angulus; fero, to bear. G. winkeltragend.) Bearing or presenting

Anguliner'vious. (I. angulus; nervus, a sinew. G. winkelnervig.) Applied by Candolle to leaves in which the fibres that were joined together in the pedicle separate, forming, either with the base or its prolongation, an angle, as in Dicetyledones.

Anguliros'trate. (L. angulus; rostrum, a beak. G. winkelschnabelig.) Applied by Illiger, Goldfuss, and C. Bonaparte to a Family, by Savy to a Tribe, of Passeres, having the beak

angulate.

Angulose. (L. angulus, an angle. G. cekig.) Having angles.

An'gulus. (L. angulus; from ἀγκύλος, crooked, angular. F. angle; I. angolo; S. angulo; G. Ecke, Winkel.) An angle.

A. acu'tus tib'iæ. (L. acutus, sharp.) The crest of the tibia.

A. cos'tæ. (L. costa, a rib. F. angle de côte; G. Rippenwinkel.) The point where each rib is twisted so that the two extremities will not rest on the same plane. The outer surface of the rib is marked at this point by an oblique rough line, which corresponds to the outer border of the erector spinæ muscle. The first and last ribs have no angle, and it is only faintly marked on the eleventh.

A. Ludovi'ci. (L. Ludovicus, Louis. G. Louisschewinkel.) Louis' angle. An angle formed by the recession of the body of the sternum, and the tilting forward of the mannbrium; it may be eaused by contraction of the upper thoracic space; and also, in emphysema, by excessive expansive efforts which affect the lower and more movable portion of the sternum most.

A. mandib'ulæ. (L. mandibula, a jaw. F. angle de la mâchoire infirieure; G. Unterkieferwinkel.) The angle formed between the body of the lower jaw and the ramus. In the adult it varies from 110° to 120°; in infancy it is as great as 140°, or more; and in age it undergoes

increase.

**A. maxil'1æ inferio'ris.** (L. maxilla, the jaw-hone; inferior, lower.) The same as  $\Delta$ . mandibula.

A. ocula'ris. (L. ocularis, belonging to the eyes. F. angle de l'wil; G. Augenwinkel.) The angle of the cyclids.

A. oc'uli exter'nus. (L. oculus, the eye; externus, outward. G. äussere Augenwinkel.) The angle formed by the junction of the outer ends of the cyclids. The outer canthus of the

A. oc'uli inter'nus. (L. internus, inner. G. innere Augenwinkel.) The angle formed by the junction of the inner ends of the cyclids; the inner canthus of the eye. The internal is larger than the external angle.

A. op'ticus. The optic angle. See Angle, visual.

A. pu'bis. (Pubis, the bone of that name, F. angle du pubis; G. Schamwinkel.) The angle, which is nearly a right angle, formed between the anterior and superior borders of the body of the pubis.

A. subpu'bicus. (F. areade pubienne; G. Schambogen, Schamwinkel.) The subpubic arch. The angle formed by the inner borders of the descending rami of the ossa pubis. It is wide in the female than in the male.

A. vestibula'ris. The angle of the vestibule; a slight projection on the upper part of the lamina spiralis of the cochlea which gives attachment to Reissner's membrane.

A. viso'rius. (L. visor, one who sees.) See Angle, visual.

Angu'ria. ( Άγγούριου, a water melon. G. Wassermelone.) Α Genus of the Nat. Order Cucurbitacea. Herbaceous or frutescent plants; flowers directous; males collected at the extremity of a long peduncle, in capitula, corymbs, or umbels; receptacle, which is the tube of the calyx, elongated, cylindrical, ventricose; calyx terminating in five teeth, and corolla rotate; stamens two, short. Female flowers solitary or grouped, with two rudimentary stamens; ovary inferior, unilocular, with two parietal placenta; ovules numerous; fruit oblong or ovoid; seeds oblong, compressed.

Also, the Cueurbita citrullus, or water-melon plant, which is called Angurier in Denmark, and

Angurye in Bohemia.

The word Anguria is also used as the specific name of the Cucumis anguria.

A. peda'ta. The pedate anguria. Hab. West Indies. Fruit edible, with seeds; used for cataplasms and emollients.

A. trifolia'ta. (L. trifoliatus, three-leaved.) The fruit of this plant is eaten in St. Domingo, as a pickle or boiled.

A. triloba'ta. The three-lobed anguria. The fruit of this plant is eaten in the Antilles, preserved in vinegar or boiled.

An'gus. The same as Angos.

Angus'tate. (L. angusto, to make narrow. G. verengert, verschmalert.) Made narrow; applied to a leaf which gradually runs out into a point.

Angusta'tie. (L. angusto, to make straight, or narrow. F. angustation; G. Verengerung.) Term (Gr. στενοχωρία) used by Galen, l. de Diff. Morb. c. 7, for the morbid contraction of a vessel or canal; a straitening or narrowing; angustation.

A. cor'dis. (L. cor, the heart.) A term for the systole of the heart.

A. rec'ti. Stricture of the rectum. Angus'tia. Anxiety; constriction. A. abdomina'lis pel'vis. The abdominal

constriction or brim of the pelvis. A. perinæa'lis pel'vis. The perinæal constriction or outlet of the pelvis.

A. præcordio'rum. (L. præcordia, tho diaphragm, the heart. G. Engbrüstigkeit.) A

synonym of Asthma. Angusticol'line. (L. angustus, narrow; collum, the neck. G. schmalhalsig.) Having the neck or corselet narrow, as Nebria angusticollis.

Angustiden'tate. (L. angustus; dens, a tooth. G. engezahnig.) Having narrow teeth, as Mastodon angastidens.

Angustifo'lia planta'go. (L. angustus, narrow; folium, a leaf.) The Plantago

Angustifo'liate. (I. engustus; folium, a leaf. G. schmulblatterig.) Navrow-leafed.

Angustima'nous. (L. angustus; munus, a hand. G. engehandig.) Applied by A. II. Harvorth to Crustacea Macroura having narrow chela.

Angustipen nate. (L. angustus: penna, a wing. G. engeflugelicht.) Applied by Duméril to a Family of Coleoptera having elytra narrowed at their free extremity.

Angustire matous. (L. angustus; remus, an oar. G. engeflossfedert.) Applied by Harvorth to certain Crustacea having the hind feet terminating in narrow fins.

Angustiros'trate. (L. angustus; rostrum, a beak. G. engeschnabelig.) Having a

narrow beak.

Angustisep tate. The same as Angustiseptous.

Angustisep'tous. (L. angustus; septum, a partition. G. engetheilig, schnallwandig.)
Applied by Candolle to Crueferæ that have the partition of the fruit very narrow.

(L. angustus; Angustisil'iquous. (L. angustus; siliqua, a pod. G. engehulsig.) Having the fruit linear, compressed, and narrow, as Cassia siliqua. Angustistel'læ. A syuonym of Cida-

Angustu'ra. (From Angustura, a town of South America, where Humboldt first found this substance.) See 1. bark.

A. bark, false. (F. angusture fausse.) The bark, as at one time supposed, of the Brueia antidysenterica, but now believed to be that of

Strychnos nux vomica.

- A. bark, true. (F. angusture vraic. G. Angusturarunde.) Cusparia bark. This bark is the product of Galipea officinalis (Hancock) or febrifuga (Baillon), which is found on the banks of the Orinoco, South America. The bark is imported in slightly curved pieces of various lengths, covered externally with a yellowish-grey or whitish wrinkled epidermis, fragile, with peculiar odour, and slightly aromatic bitter taste. The inner surface, touched with nitric acid, does not become blood-red, which distinguishes it from false angustura bark, containing brucia. It contains volatile oil (C<sub>13</sub>II<sub>12</sub>O), boiling at the high point of 266·1 C. (511° F.), bitter extractive, resinous substances, caoutchoue gnm, lignin, and various salts; also, according to Saladiu, a crystallisable substance, Cusparin. It is a stimulant tonic, used in malignant bilious fevers, intermittent fevers, and dysentery. Dose, 10-40 grains. See Cuspariæ cortex.
- A. ferrugino'sa. (L. ferrugo, iron rust.) The Brucia antidysenterica.

A. spu'ria. (L. spurius, false.) See A. bark, false.

Angustu'rin. A synonym of Brucin. Also, the name of a bitter substance found in true augustura bark, which was at one time supposed to be an organie base.

The native name of Ferula Angu'za. The native name of Ferula alliacea, and of the Scorodosma factidum; plants,

Anhæ'mia. See Anænia.
Anhalti'na. (L. anhelo, to breathe with difficulty.) Medicines which facilitate respiration. (Parr.)

Anhalti'na a'qua. Anhalt water. See **E**au d' Anhalt

Anhaph'ia. ('Aν, neg.; ἀφή, touch. G. Gefühllosigkeit.) Diminution or loss of the sense of touch.

Anhe'lans. (L. anhelo, to breathe. F. anheleux.) Applied to Spongia anhelans, because the tubes which constitute it by their union continually appear to execute in water the movements of diastole and systole of the human chest in breathing.

Anhela'tion. (L. anhelatio, from anhelo, to pant. F. ankelation; I. anelazione; S. an-helacion; G. Keichen.) Shortness of breath, or difficulty of breathing; panting; dyspnæa;

**Anhe'litus.** (L. anhelo, to breathe with difficulty.) Irregular breathing; shortness of breath; anhelation.

Anhe'lous. (L. anhelosus, from anhelo. F. anheleux; I. anclante, affanoso; S. anheloso; G. keichend.) Breathing with difficulty.

A. respiration. (F. respiration anheleuse.) Quick and laborious breathing.

Anhema'sia. (' $\Lambda \nu$ , neg.;  $a \bar{\iota} \mu a$ , blood. F. anhemase)  $\Lambda$  deficiency of blood.

A. epizoot'ica. (F. anhemase epizootique.) A disease which has been noticed by Gelle, and which destroyed many mules a few days after hirth. It was characterised by great prostration, a weak and quick pulse, quick breathing, dry and hard fæces; it was generally fatal in six to twenty-four hours. The blood was found unclotted, pale rose colour, watery, and without

Anhemato'sia. Piorry's term for Anæmatosis.

Anhidro'sis. ('Aν, neg.; ιδρώς, sweat. F. anidrose; l. anidrosi; G. verminderte Schweisssecretion, Schweisslosigkeit.) Deficiency or absence of perspiration.

(L. localis, belonging to a A. loca'lis. place.) Partial anhidrosis, such as occurs in

ichthyosis.

A. universa'lis. (L. universalis, belonging to a whole.) General anhidrosis, such as occurs in diabetes.

('Av, neg.; iδρώs, per-Anhidrotics. spiration.) Agents which check profuse perspiration, by their direct or indirect action on the sudoriparous glands. They are—sponging the surface of the body with cold mineral or vegetable acids, or with water as hot as can be borne, or with tepid aromatic vinegar and water; the internal administration of dilute phosphoric and other mineral acids; astringents, mineral and vegetable, as sulphate of copper, acetate of lead, tannin, or gallic acid; oxides, as the oxide of silver or oxide of zinc; tonies, as quinine; and some solanaeeous plants, as belladonna and hyoscyamus.

Anhis'tous. ('Aν, neg.; ίστός, a web. F. anhiste.) Applied to tissues which are absolutely transparent, and present no structure recog-

nisable by the microscope.

A. mem'brane. (F. membrane anhiste.)
The membrana decidua of the uterus.

Anhomom'eri. ('Aν, neg.; ὁμός, like; μέρος, a part.) Applied by Blainville to an Order of Chetopoda, the bodies of which are formed of dissimilar articulations; anhomomerous.

Anhu'iba. The Sassafras officinale. Anhydræ'mia. See Anhydrohæmia. Anhy'dric. ('Aν, neg.; ελωρ, water. F. anhydre; G. wasserfrei.) Containing no water. Anhy'dride. (Same etymon.) A chemical compound containing no water.

Anhydrides of organic acids may be obtained by distilling the potassium salt of the acid with

the chloride of the radical of the acid.

**Anhy'drite.** ('Aν, neg.; νέωρ, water. G. wasserfreier Gyps, Wurfelspath.) Anhydrous calcium sulphate; a transparent mineral occurring in clays with rock salt and gypsum.

Anhydrohæ'mia. ('Δν, neg.; εδωρ,

water; aiua, blood.) Piorry's term for deficiency of serum in the blood.

Anhydromye'lia. ('Aν, neg.; ψέων, water; μυελός, marrow. F. anhydromyelie.) Defect or absence of the cerebrospinal fluid.

Anhydrotics. The same as Anhi-

Anhy drous. ('Av, neg.; νδωρ, water. F. anhydre; I. anidro; S. anhidro; G. wasserlos, wasserfrei.) Without any water; applied to various substances that contain no water in their constitution; without water of crystallisation.

A. al cohol. A synonym of Alcohol, ab-

Anhyste'ria. ('Aν, neg.; ὑστίρα, the womb.) Same as Ametra.

Ani'ba. A Genus of the Nat. Order Amyr-

A. guyanen'sis. A species some of the caranna resin of commerce. A species supplying

Anice ton. ('Ανίκητον, from ά, neg., and νικάω, to econquer.) Name of a plaster described by Galen, l. i, de C. M. sec. Loc. c. 8, composed of litharge, alum, cerussa, frankinceuse, and white pepper, held by the ancients to be an unfailing remedy in achores, or seald-head; it was also called mesianum.

Anice tum. Same as Aniceton. Anicillo. The Piper anisatum. Anidous. ('Δν, neg.: είδος, form. F.

anidien.) In Teratology, applied to monsters presenting general arrest of development. They are more or less globular in form, covered with normal skin, furnished with glands, and it may be hairs; they consist chiefly of adipose and connective tissue, of fragments of bones, and of rudiments of the vertebral column, and of blood-vessels in the neighbourhood of the insertiou of the umbilical cord. The heart is imperfect or absent. The head and neural eanal, if present, are rudimen-tary and malformed. The alimentary canal is always in an imperfect condition. Such monsters generally appear to be twins to perfect fœtuses.

Anidro'sis. ('Δν, neg.; ἰδρώς, sweat.) A deficiency or absence of perspiration. See

Anhidrosis.

Also, used (ἀνίζρωσις, from ἀνιδρόω, to get into a sweat) by Hippoerates for perspiration.

Anigozan'thus. A Genus of the Nat.

Order Hamadoraceæ.

A. flor'idus. (L. floridus, full of flower.)

Hab. N. America. A species the root of which, when roasted, is eaten by the natives of the Swan River, although it is aerid when fresh.

Ani'imum. An old term for animé resin. An'il. The Indigofera anil.

Also, a synonym of Indigo.

Anile in. A synonym of Anilin blue and Anilin riolet, obtained by the action of alcohol and heat on rosanilin with excess of anilin.

Anilei'ra. A synouym of Indigo. Anile ma. See Anilema.
Anile sis. See Aneilesis.
Anilia. A synonym of Anilin.
Anilia. A synonym of Anilin.
A. acid. A synonym of Nitro-salicylie

A group of chemical com-An ilides. pounds analogous to the amides, in which anilin plays the part of the ammonia of the amides; they may be regarded as amides which have their hydrogen more or less replaced by phenyl. They are formed by the action of acid chlorides on anilin. and by heating anilin salts with organic acids.

An'llin. C. H<sub>5</sub>. NH<sub>2</sub>. (Anil, the Pertuguese name of indigo.) An amidobeuzene. A colourless liquid, of burning taste and unpleasant odour, obtained from nitro-benzol by the action of reducing ugents, such as the alcoholic solution ammonium sulphide, zinc, and hydrochloric acid, or iron acetate, which last is that usually employed, or from the dry distillation of indigo, or by boiling indigo with potash ley. Anilin is insoluble in water and chloreform, but is freely soluble in alcohol, ether, and wood spirit. It produces a greasy stain if allowed to fall on paper, which, however, quickly vanishes. Exposed to air it absorbs oxygen, a resinoid mass being formed. The vapour is combustible, and burns with a smoky dame. It is a colourless oily liquid, with faint peculiar odour, density 1 036 at 0° C. (32° F.), boils at 182.0 (359.6° F.). It is a true base, combining, like ammonia, with ucids, but it does not change the colour of litmus. Nearly all its salts are colourless, crystallise readily, and are soluble in water. It is largely employed in the manufacture of colouring matters, and used as a staining agent in microscopical investigations. Anilin is a powerful nareotic poison, whether administered in vapour or in a liquid form. Given to eats and dogs it causes rapid loss of voluntary power, tonie and clonie convulsions, dilated pupils, difficult breathing, tumultuous cardiac action, terminating in coma and death in from half un hour to thirty-two hours after administration. In doses of half a grain, gradually increased, it has been given in chorea with benefit. The salts of anilin appear to be almost inert, though they have been tried in various affections.

The tests for anilin, given by Woodman and Tidy, are—that it has a peculiar tarry smell; that it burns with a smoky flame; turns purple, and then black, with chloride of lime; precipitates gold in a metallic form from a solution of the chloride; produces a rich crimson dye when heated with corrosive sublimate; forms a beautiful violet colour with an aqueous solution of an

alkuline hypochlorite.

A. dyes. When unilin is treated with solutions of chloride of lime or chromic acid, various colouring agents of a violet, red, yellow, green, or blue tint may be obtained; these have a special interest on account of the injurious effects that have been frequently observed from wearing articles of dress, as shirts, socks, waistcoats, and gloves, tinted by their means. In some instances arsenie, which is used in the manufacture of the dves, has been found in the woollen or calico stuff, occasioning the mischief. The effects are most marked in hot weather, when the acid perspiration tends to dissolve out tho dye. The symptoms consist in redness and staining of the part, followed by swelling, itching, and smarting, with the formation of little blisters or vesicles, which break and discharge their contents. There is usually well-marked constitu-tional disturbance, and the injurious effects persist for many months. Bad effects have also been seen from the use of magenta in colouring

Workpeople in manufactories, when there is an atmosphere charged with anilin, are said to suffer from bronchial cough and ulcerations of the

scrotum and extremities. **A. sul'phate.** (C<sub>6</sub>H<sub>7</sub>N)<sub>2</sub>.H<sub>2</sub>SO<sub>4</sub>. Colourless crystals, slightly soluble in water, less so in alcohol. When administered, it may eause a blue colour of the lips, perhaps from the production of a blue dye from oxidation of the anilin in the blood. Used in epilepsy, chorea, and other nervous disorders, in doses of 1 to 2 grains three times a day. Anili'num sulphu'ricum.

Anilin sulphate.

Anil'itas. (L. anus, an old woman.)

synonym of Dementia.

Aniloc'ra. A name given to certain Isopodous Crustacea that take up their abode on the surface of a fish, which they quit for another when external circumstances are not desirable; they frequently resemble their host in colour.

An'ima. (Akin to ἄνεμος, wind. G. Seele.) The soul, spirit, or vital principle. Applied anciently to any simple and volatile substance;

also, to the purest part of any substance.

Applied to any medicine believed to possess particular virtues or powers in curing the diseases of an organ, as if it were the soul of that organ; thus the hermodactyl was called the anima articulorum, or soul of the joints, because esteemed efficacious in arthritic affections.

Applied to the rational soul or intellectual principle of man; also to the vital principle, whether of animals or vegetables; also, to an intelligent principle behaved to preside over all the actions

of life. See Animus.

A. al'oes. Refined aloes.

A. articulo'rum. (L. articulus, a joint.) See Hermodactylus.

A. dul'eis vi'ni. (L. dulcis, sweet; vinum, wine. G. Weinbouquet.) The aroma of wine.
A. hep'atis. (L. hepar, the liver.) A term formerly applied to iron sulphate, because

it was believed to be efficacious in fiver-disease.

A. mun'di. (L. mundus, the world.) The supposed universal present and acting spirit of the universe.

A. pulmo'num. (L. pulmo, the lung.)

The soul of the lungs, saffron, from its use in asthma.

The soul of rhubarb, refined, or best that is, its purer qualities; refined, or best rhubarb.

A. rhe'i. Infusion of rhubarb.

A. satur'ni. (Saturnus, an old name for

lead.) Sugar of lead. A. Stahlia'na. The intelligent principle which Stahl supposed to be the supervising and presiding agent of life; the vital principle which caused all the normal phenomena of healthy life,

and also the abnormal manifestations of disease. A. vegetati'va. (L. regeto, to quieken.) Plastic force.

(Venus, an old name for A. ven'eris.

copper.) An ancient preparation of copper.

An'imæ. (L. anima, air.) The swimbladders of herrings, so called on account of their lightness. They were supposed to be diuretic.

A. deliquium. (L. anima, life, the mind; deliquium, defect.) Fainting.

An'imal. (Anima, the breath, spirit, or life. F. animal; I. animale; S. animal; G. Thier.) A living creature; an organised body, endowed with life and relustery motion. endowed with life and voluntary motion.

It was formerly thought that animals could be distinguished from plants by the complexity of their chemical composition, the intricacy and variety of their tissues, the possession of a stomach, the power of locomotion, and the presence of a nervous system, with the attributes of sensation and consciousness. These features are undoubtedly characteristic of the higher members of the animal kingdom, but recent

research has tended to show that in the lower forms of both animals and plants the distinctive features of each kingdom are softened down and the points of similarity so blended that it is impossible to draw any definite line of demarcation between them, and such forms have been collected into a common group or subkingdom, under the name of the "Protista," by Haeckel. The type and central figure of the Protista is the Amœba, and from it, as a starting-point, it is easy to pass through Algæ to the highest plants, and through sponges to the highest animals.

Putting aside these lowest forms, animals are found to contain a large proportion of compounds in their fluids and tissues, which, like albumen, are composed of carbon, hydrogen, oxygen, and nitrogen, frequently combined with sulphur and phosphorus. These compounds build up a great variety of tissues, as the connective, adipose, cartilaginous, osseous, glandular, muscular, and nervous each of which is destined to discharge special functions. To nourish the tissues food, consisting of organic compounds already elaborated by plants or animals, is ingested into a stomach and alimentary tract, where it undergoes division and solution, and from which it is absorbed into the circulating fluids. These undergo aeration, absorbing oxygen, and giving off carbonic acid gas, either at the surface of the body, or in more specialised organs, as the gills, tracheæ, or lungs. Motor power, usually required for locomotion, as well as for the internal movements of the body, is effected by means of mus-cular tissue, the force of which is under the guidance and control of the nervous system. Tactile and visual impressions are perceived by the nervous system in animals of very low organisation. The powers of hearing, taste, and smell, subsequently appear, and along with the increase in the number and variety of these means of communication with the external world, the mind is gradually developed. Reproduction is generally sexual, the young springing from an ovum produced by the female, and fecundated by the male; but generation by fission and asexual generation are occasionally observed.

An'imal. (F. animal; I. animale; G. animalisch, thierisch, belebt, lebend.) Having life; living; pertaining or belonging to life.

A. ac'ids. Acids existing free or combined in the animal body.

A. ac'tions. The functions and actions of

the animal body. A. arch. (F. arc animal.) The series of parts of an animal comprised between the two

extremities of the galvanic pile.

A. bath. See Bath, animal. A. char'coal. See Carbo animalis.

A. chem'lstry. (F. chimie animale.) The chemistry which concerns itself with animal bodies, the composition of their tissues, the nature of the changes, both developmental and retrograde, that they undergo, and the processes by which food is assimilated.

A.econ'omy. The doctrine of all matters relating to animal life; physiology.
A. electric'ity. See Electric organs and Electricity, animal.

A. heat. See Heat, animal.

A. jel'ly. See Gelatin.

A. king'dom. (F. regne animal; G. Thierreich.) This term embraces all those objects the study of which is called zoology. Attempts to classify the animal kingdom have been made from a very early period of history. Aristotle (350 n.c.) divided nnimals into those having red blood and those which in his view were either exsanguineous or possessed only white blood.

Linnaus (1750) also took the circulatory system as the basis of his classification, and divided animals into those with warm red blood and quadrilocular heart, as mammalia and birds; those with cold red blood and bilocular hearts, as he believed, reptiles and fishes; those with cold white sanies and a heart with a single cavity, as worms and insects.

Hunter (1760), still taking the circulatory system as his basis, arranged all animals into five groups. Those with quadrilocular hearts, manmalia and birds; those with trilocular hearts, reptiles and amphibia; those with bilocular hearts, fishes and most mollusca; those with unilocular hearts, articulata; lastly, creatures in which the functions both of stomach and heart are performed by the same organ, as the meduse.

Lamarck, considering the nervous system as a means of classification, proposed three divisions, the lowest of which comprised the animals he regarded as apathic or automatic, the next the sensitive, and the highest the intelligent.

Cuvier (1830), taking a wider and more general view of the structure and functions of animals, arranged them in four great divisions—Vertebrata, Mollusca, Articulata, and Radiata.

brata, Mollusca, Articulata, and Radiata. By Grant (1836) the following classification

was advanced :-

1. Subkingdom,—Cycloneura, or Radiata. Class 1.—Polygastrica. Class 3.—Polypifera. " 2.—Poritera. " 4.—Acalephæ. Class 5.—Echinoderma.

II. Subkingdom.—DIPLONEURA, or ARTICU-

Class 6.—Entozoa.
,, 7.—Rotifera.
.. 8.—Cirrhopoda.

Class 10.—Myriapoda.
" 11.—Insecta.
" 12.—Arachnida.
" 13.—Crustacea.

" 9.—Annelida. " 13.—Crustacea
III. Subkingdom.—Cycloganoliata, or
Mollusca.

Class 14.—Tunicata. Class 16.—Gasteropoda.
,, 15.—Conchifera. ,, 17.—Pteropoda.
Class 18.—Cephalopoda.

IV. Subkingdom.—Spinicerebrata, or Vertebrata.

Class 19.—Pisces, Class 21.—Reptilia. " 20.—Amphibia. " 22.—Aves. Class 23.—Mammalia.

Milne-Edwards' classification is as follows:

I. OSTEOZOARIA.
A. Allantoidea.

Class 1. Mammifera.

a. Monodelphia. β. Didelphia.

Class 2. Avos.

Class 3. Reptilia.

B. Anallantoïdea.

Class 4. Batrachia.
" 5. Pisces.

a. Ossei. β. Chondropterygii.

II. ENTOMOZOARIA.

Class 1. Insecta. Class 3. Arachnida. , 2. Myriapoda. \_ , 4. Crustacea.

Class 1. Annelida.

, 2. Helmintha.

, 3. Rotatoria.

B. Vermes.

Class 4. Turbellaria.

, 5. Trematoda.

, 6. Astoïda.

III. MALACOZOARIA.
A. Mollusca.

Class 1. Cephalopoda. Class 3. Gasteropoda. " 2. Pteropoda. " 4. Acephala. B. Molluscoida.

Class I. Tuuicata. Class 2. Bryozoa.

IV. ZOOPHYTA.
A. Radiaria.

Class I. Echinodermata. Class 3. Polypi.

" 2. Acalepha.

B. Sarcodaria. Class 1. Infusoria. Class 2. Spongia.

Huxley (1875) proposed the following:

## A. PROTOZOA.

 Monen.e.—Protamochidæ, Protomonadidæ, Myxastridæ, &c.

 Endoplastica.—Amœbidæ, Flagellata, Gregarinidæ, Acinetida, Ciliata, Radiolaria.

## B. METAZOA.

A. Gastrææ.

 Polystomata. Porifera or Spongida.

Monastomata,
 A. Archæostomata.

a. Scolecimorpha.
Rotifera. Nematoidea. Hirudinea.
Turbellaria. Oligochæta.

Turbellaria. Nematoda.

β. Cœlenterata. Hydrozoa. Actinozoa.

B. Deuterostomata.

a. Schizocœla.

Annelida (Polychæta). Gephyrea. Brachiopoda? Arthropoda. Mollusea. Polyzoa?

Enteropneusta. Chætogenatha. Echinodermata.

Tunicata. Vertebrata.
B. Aoastrææ (provisional).
Acanthocephala. Cestoidea.

The phylogenetic classification of Häckel, in which animals are grouped in the supposed order of their descent, is as follows:—

## I. Subkingdom.—Protozoaria.

 $Type \ or phyton.$   $Principal \ branches.$  Classes.  $\left\{ egin{array}{ll} 1. & Monera. \\ 2. & Ameebina. \\ 3. & Gregarina. \\ 4. & Aeinctæ. \\ 5. & Ciliatæ. \\ \end{array} 
ight.$ 

## II. Subkingdom .- METAZOARIA.

| Type or phylon.     |   | $m{P}$ rincipa $m{t}$ branches. | Classes.  |
|---------------------|---|---------------------------------|---|
| В.                  | 5 | III. Spongiæ                    | 6. Gastræada.<br>7. Porifera.   |

Prof. Ray Laukester's proposal is as follows: Grade I.—PLASTIDOZOA (Homoblastica).

Phylum I.—Protozoa.

Grade II.-ENTEROZOA. A .- CŒLENTERA (Diploblastica). Phylum 1.—Porifera.
" 2.—Nematophora.

B (of the Enterozoa).—ĈŒLOMATA (Triploblastica).

Phylum 1 .- Echinoderma.

2.—Platyelmia.

3.—Appendiculata (Parapoda).

,,

4.—Gephyræa. 5.—Mollusca (Mesopoda).

6.-Enteropneusta. "

7.—Vertebrata. 8.—Nematoidea. ,,

9.-Chætognatha.

A. lay'er. The serous layer of the hlastoderm; it consists of what is now known as the epiblast and part of the mesoblast.

A. mag'netism. (F. magnétisme animal.) Term for a theory propounded, or arranged into a kind of system, by Valentine Greatarick, in 1666; and revived by Anthony Mesmer, physician,

at Vienna, in 1776 or 1778.

The following is his account of the agent which He following is his accounted the algebraic her be supposed to exist, quoted from the 'Mémoire sur la Découverte du Magnétisme Animal,' par M. Mesmer, Paris, 1779, p. 74, et seq. Ibid. 'Avis au Lecteur,' p. 6, in the 'English Cyclopædia:'-" Animal magnetism is a fluid universally diffused; it is the medium of a mutual influence between the heavenly bodies, the earth, and animated bodies; it is continuous, so as to leave no void; its subtilty admits of no comparison; it is capable of receiving, propagating, communicating all the impressions of motion; it is susceptible of flux and of reflux. The animal body experiences the effects of this agent; by insinuating itself into the substance of the nerves it affects them immediately. There are observed, particularly in the human body, properties analogons to those of the magnet; and in it are discerned poles equally different and opposite. The action and the virtues of animal magnetism may be communicated from one body to other hodies, animate and inanimate. This action takes place at a remote distance, without the aid of any intermediate body; it is increased, reflected by mirrors; communicated, propagated, augmented by sound; its virtnes may be accumulated, con-centrated, transported. Although this fluid is universal, all animal bodies are not equally susceptible of it; there are even some, though a very small number, which have properties so opposite, that their very presence destroys all the effects of this fluid on other bodies. Animal magnetism is capable of healing diseases of the nerves immediately, and others mediately. It perfects the action of medicines; it excites and directs salutary crises in such a manner that the physician may render himself master of them;

by its means he knows the state of health of each individual, and judges with certainty of the origin, the nature, and the progress of the most complicated diseases; he prevents their increase, and succeeds in healing them, without at any time exposing his patient to dangerous effects or troublesome consequences, whatever he the age, the temperament, and the sex. In animal magnctism nature presents a universal method of healing and preserving mankind." See Mesmerism, Electro biology, and Hypnotism.
A. mus'cles. The voluntary muscles.

A. oil. An empyroumatic oil, obtained, along with bone spirit, from the destructive distillation

A. poi'sons. The poisons contained in animal bodies, whether natural products, as those of cantharides and the viper, or the result of decomposition, as in putrid meat.

A. quinoïd'ine. See Quinoïdine, animal.

A. starch. A synonym of Glycogen.
A. sug'ar. The sugar of diabetes.
A. tem'perature. The heat generated in an animal body.

A. vaccina'tion. Vaccination from the heifer.

Animal'cula. (Dim. of L. animal, a living being.) Animalcules.

A. semina'lia. (L. seminalis, of, or be-

longing to, seed.) The spermatozoa.

A. spermatica. (L. spermaticus, of, or relating to, seed.) The spermatozoa.

Animal'cule. (Dim. of L. animal. F. animalcule; I. animalculo; S. animalcilo; G. Thierchen.) A little animal; one whose true figure cannot be ascertained without the aid of the microscope. The word has been used very loosely; microscopic organisms of the vegetable, as well as the animal, kingdom being included.

A. cage. An apparatus fitted for the stage of the microscope for the purpose of confining and limiting the movement of small animals. It consists of a short piece of wide brass tubing, fixed perpendicularly to the margins of a similar sized hole in a flat brass plate, and having the other end closed by a piece of glass; a cap, consisting of a brass tube, closed at one end by a piece of thin glass, slips on to it in such a manner that a drop of fluid placed on the glass of the first tube may be compressed to any required extent by the glass of the cap, and so small objects may be kept still.

A., infu'sory. See Infusoria.
A., sem'inal. (L. seminalis, belonging to seed.) The spermatozoa.

A., spermatic. (F. animalcule spermatique.) The spermatozoa.

Animal'culism. The doctrine of the formation of the embryo from the spermatozoa. Animal'culist. A term applied to one who attributes various physiological processes to

the presence and activity of auimalculæ. Animalculo'vism. (L. animal, an animal; orum, an egg.) The doctrine that the embryo is formed by the union of the spermatozoa with the ovum.

Animal'culum. (Dim. of L. animal, a living being.) An animalcule.

Anima'lia. (L. animal.) The animal

kingdom.

Animaliferous. (L. animal; fero, to bear. G. thiertragend.) Bearing animals.
Animalis. (L. animalis, animate.) Of,

or belonging to, an animal.

A. facul'tas. (L. facultas, capability.)
The power of exercising sensation, motion, and the other faculties of the animal body.

A. mo'tus. (L. motus, motion.) A syn-

onyni of Muscular motion.

A. spiritus. (L. spiritus, a breathing, life.) The natural heat of living animals.

Animalisa'tus. (Same etymon.) Applied to inorganic or vegetable matter that has taken the character of animality; animalisate.

Animalised. Transformed into animal

substance; become part of the structure of an animal.

An'imalist. The same as Animalculist. Animal'ity. (Same etymon. F. animalité; I. animalité; S. animalidad; G. Thierheit.) The assemblage of attributes or faculties that distinguish animal organic matter; animal nature; vital activity of an animal body considered as unity.

Animaliza tion. (Same etymon. F. animalisation; 1. animalizzazione; S. animalizacion; G. Animalisirung.) A term for the process by which the nutritious portion of the vegetable food is assimilated to the various substances

composing the animal body.

Animate. (L. animo, to give life to. F. animer.) To vivify, refresh, or enliven.

Animatio. (Lat.) A quickening; ani-

mation.

A. foe'tus. (L. fwtus, an offspring.) The first consciousness by the mother of fwtal movements. See Quickening.

Anima'tion. (L. animo, to give being. F. animation; I. animazione; G. Bescelung, Belebung.) Term formerly employed for what was supposed to be the particular effect produced by the vis vita, by which life is begun and maintained, and by which the feetus begins to act as a true animal, after the female that bears it has quickened.

A. suspen'ded. Asphyxia.

An'ime gum. (Some have supposed that this word had its primitive form in ἐναιμον, a remedy used for arresting hæmorrhage. F. anime vraie; G. Animeharz, Kourbarilhurz.) A substance believed to be produced from Hymenæa courbaril, a leguminous tree of South America. It is in small irregular pieces of a pale lemonyellow or reddish colour, more or less transparent, covered with a whitish powder, brittle, with shining fracture, a feeble but agreeable odour, and a mild resinous taste. It consists of two resins, one soluble, the other insoluble, in cold alcohol, and a little volatile oil. Anime formerly entered into the composition of various continents and plasters. or dissolved in alcohol or oil was employed as an embrocation, but it is now only used as incense, or for a varnish. The Brazilians use it inter-nally in diseases of the lungs.

Another variety is obtained from the East Indies. and is supposed to be derived from Vateria indica.

A variety of copal gum is also known in commerce as a uimë; it is dug from the earth, and is the product of extinct forests. It has a finely pitted surface.

A. des Indes occidenta'les. The produce of Hymenæa martiana.

A. d'oc'cident. The produce of Hymenæu stilbocarpa.

A. du Brésil. The produce of Hymenæu stilbocarpa.

A. du Mexi'que. The produce of Hymenca stilbocarpa.

Animel'læ. (G. Ohrdrüsen.) Old name for the glands below the ears and lower jaw, according to Vesalius,  $\ell$ , vi. The parotid glauds.

An'imi. A synonym of Anime gum.
An'imi agita'tio. Agitation of the mind; anxiety.

A. ca'sus sub'itus. (L. casus, a falling down; subitus, sudden.) A term for fainting.

A. delig'uium. (L. deliquium, a want.)

Fainting.

A. pathe'mata. (Πάθημα, anything that hefalls one, impressions.) The passions of the

An'imin. Name by Unverdorhen for a salifiable base discovered in the animal oil of Dippel. It is probably impure Lutidin.

An'imism. (F. animisme; S. animismo; G. Animismus.) Formerly used to denote the Stahlian theory of the soul as the vital principle, the cause of the phenomena of healthy life and of disease.

Now generally used, as by Dr. Tylor, to express the general doctrine of spiritual agency in

the operations of nature.

An'imists. A term applied to those pbysiologists who believed that the anima, or soul, immediately actuated or influenced all the functions of the living body; also called Stahlians.

An'imus. (Akin to Anima. G. Geistmuth, Gemuth.) The soul or mind; applied both to the vital and the intellectual principle, but more frequently to the latter, denoting the mind or soul in the sense of a conscious and intelligent being, and so distinguished from anima, which usually indicates the soul in the sense of a living principle.

An'ion. ('Aνά, up; εἶμι, το go.) An electronegative body. A term employed in electro-chemical action for a body, when separated by electrolysis, which passes in the direction of the current of negative electricity to the positive pole,

or anode.

Anirid'ia. (An, neg.; iris. F. aniridie; G. Irismangel.) Want or defect of the iris.

An'is a'cre. The Cuminum cyminum.
A. aigre. The Cuminum cyminum.
A. bâtard. The Curum carui.

A. de France. The Anethum funicu-

A. de la Chine. The Illicium anisatum. A. de Paris. The Anethum faniculum.

A. doux. The Anethum funiculum.
A. eto'lé. The Illicium anisatum.
A. faux. The Cuminum cyminum.

A. faux. The Cuminum cyminum A. vert. The Pimpinella anisum.

An'isal. A synonym of Anisaldehyde. Anisal'dehyde.  $C_6H_4(OCH)_3$ .CHO. Formed, along with anisic acid, by the oxidation of anisic alcohol in contact with platinum black; and by the exidation of essential oils containing anethol by nitric acid. It is a colourless aromatic oil with a burning taste, insoluble in water, soluble in alcohol and ether. It hoils at 218° C. (478.4° F.) It forms crystalline compounds with alkaline bisulphates.

Anisanc'tus. Italy, sixty miles from Naples. A sulphuretted and carbonated water.

Anisan'thous. ("Aνισος, unequal; άνθος, a flower. G. ungleichblumenhüllig.) Applied by G. Allmann to plants having the perianths of different form.

An'isated. (G. anishaltig.) Mixed with or flavoured with anisecd.

Anisa'tum. Old name (rinum, heing

understood) for a wine made of the wine of Ascalon with honey and aniseed.

Aniscalp tor. (L. anus, the breech; scalpo, to scratch.) A term applied formerly to the latissimus dorsi muscle, because exerted in the act referred to, used by Bartholiu, Anat. iv, 2, p. 561.

Anischu'ria. (An, neg.; ischuria. F. anischurie.) Incontinence of urine; enuresis;

anischury.

An'ise. (F. anis; 1. anice; S. anis; G. gemeiner Anis; Port. herba doee; Dut. anys; Arab. anison.) The plant Pimpinella anisum. Umbels compound; involucres usually absent; ealyx obsolete; fruit contracted at the side, ovate; ridges 5, filiform, equal, the lateral on the edge; vittæ numerous; albumen concavo-convex; lower leaves are roundish, cordate, those of the stem pinnate, with wedge-shaped leaflets; fruit downy. Ilab. Egypt and Syria; cultivated in France, Italy, and Spain. It contains a volatile, but solid oil, stear optime of anise  $(C_{20}H_{12}O_2)$ , a fixed oil, and a resin. The oil in use is obtained from the P. anisum and the Illicium anisatum, which is imported from China. It concretes at 50° F. Sp. gr. 980. It is stimulant, aromatic, and carminative in doses of 1—4 drops on sugar. Said to be galactogogue. It is used by the Arabians in sciatica.

A.-cam'phor. A synonym of Anethol. A., star. (F. anis etoile; G. Sternanis.) The Illicium anisatum.

A. tree of Flor'ida. The Illicium Floridanum.

A., yel'low flow'ered, tree. The Illicium anisutum.

An'iseed. The seeds of Pimpinella anisum, or anise.

Aniset'te de Bor'deaux. (G. aniswasser.) Star anise 1000, coriander seeds 60, fennel seeds 60, alcohol 6000, water 4000, grammes. Bruise the seeds, mix with the spirit and the water; distil 10 litres, which keep three or four months; add a sufficiency of gelatin, 6000 grammes of sugar, and 6000 of water; filter. A stomachie and stimulating liquor.

Ani'si cam'phora. Camphor of anise; a term for a concrete substance, into which and a thin liquid, the volatile oil of anise separates when exposed to a low temperature. See Anethol.

A. fruc'tus. (L. fructus, fruit) Aniseed; the fruit of Pimpinella anisum. Fruit greenish grey, somewhat hairy, broadly ovate, didymous, the two carpels being nearly separated, crowned with the conical stylopodium and the short styles; each earpel has five low ridges with broad, shallow, intervening hollows; on transverse section 25 to 80 vittæ are seen; albumen grey, oily; odour aromatie; taste sweetish and aromatic. fruit yields 3 per cent. of fixed oil, which exists in the albumen, and an equal quantity of colourless volatile oil. See Anise and Oleum anisi.

A. sem'ina. (L. somun, a seed.) Anise seed. See Anisi fructus.

A. stella'ti se'men, Belg. Ph. The seed of the star anise, Illicium anisatum.

A. vulga'ris se'men, Belg. Ph. The seed

of the common anise, Fimpinella anisum.

Ani'sic acid. (F. acide anisique; G. Anissaure.) C<sub>6</sub>H<sub>4</sub>(OCH<sub>3</sub>).CO<sub>2</sub>H. Methyl-paracyybenzoie acid. Formed by the oxidation of anisaldehyde and anethol with nitrie acid. It crystallises from hot water in long needles, from alcohol in rhombic prisms. It melts at 183° C.

(361.4° F.), and sublimes without decomposition at 283°C. (541.4° F.) When anisic acid is taken into the body, it fixes the elements of glycocol,

nud appears in the nrine as anisuric acid.

Aniso briate. ('Ανισος, unequal; βρύω, to bud forth.) Applied by H. Cassini to monocotyledonous embryocs in which one of the sides is stronger in increase than the other.

Anisoceph'alous. ("Ανισος; κεφαλή, a head. G. ungleichkopfig.) Applied to Pinardia anisocephala, because its calathidia are very

**Anisochelis.** ("Ανισος; χηλή, a claw.) Applied to *Porcellana anisochelis* from the inequality of its claws.

Anisochi'lus. ('Aνισος; χείλος, a lip.)

A Genus of the Nat. Order Labiate

A. carno'sum. (L. carnosus, fleshy. Hind. and Duk. Panjiri.) Thick-leaved lavender. Stem erect, 4-sided; leaves petiolate, cordate at base, crenate, fleshy, villous; upper lips of calyx with ciliated edges, lower lip entire; upper lip of corolla 3-1 cleft, lower lip entire. A stimulant, diaphothe native doctors in Travaneure in entarrhal affections. The juice, mixed with oil of sesame and sugar, forms a refrigerant liniment; is also employed to cool the head.

Anisodac'tyli. ("Ανισος; δάκτυλος, a finger G. ungleichfingert.) Applied by Temminck to an Order, by Vicillot to a Tribe, of Birds,

having the toes of unequal length. Applied by Latreille to a Family of Rumi-

nantia.

Ani'sodont. ('Aνισος: ὁδούς, a tooth.) Unequal-toothed. Applied to Pristis anisodon, because its teeth are unequal.

Aniso'dus lu'ridus, Link. (L. luridus, sallow, wan.) A synonym of Scopolia lurida.

Anisodyn'amous. ('Ανισος, unequal; δύναμις, power.) Applied by H. Cassini to certain monocotyledonous embryoes to express that their sides have not the same power of increase.

Anisog ynous. (Av, neg.; ios, equal; with, woman.) Term applied to a flower in which the number of carpels is not equal to the number of sepals.

An'isol. C7 II80. Methyl phenate. Obtained with carbon dioxide by distilling anisic acid with haryta; it is a colonrless fluid, having an aromatic odour, of sp. gr. 991 at 15° C. (59 F.), and boiling without decomposition at 1523 C. (305.6 F.).

Anisomeles. A Genus of the Nat. Order Lamiacea.

(Tam. Péyamératti; A. malabar'ica. Tel. Mogabira; Mal. Karin-toomba.) Malabar cat mint. Leaves ovate-lanceolate, erenate towards apex; calyx 5-cleft, pubescent; apper lip of corolla entire, lower trifid, with the lateral divisions reflexed. An Indian shruh; the juice of the leaves in infusion, which is hitter and astringent, is given to children in colic, indigestion, and fevers arising from teething, and is also employed in stomachic complaints, dysentery, and intermittent fevers. Patients suffering from agne are made to inhale the vapour of the infusion till copious perspiration occurs. An oil distilled from the leaves is effectual as an external application in rheumatism.

A. ova'ta. (L. ovatus, egg-shaped.) The di-tilled oil is said to be used in Ceylon in uterine affections.

Anisomer'ic. ("Avisos; μέρυς, a part. F.

anisomérique; G. ungleichzählig, ungleichtheilig.) Applied by Martius to flowers, the parts of which

are unequal or irregular.

Anisom'erous. (Same etymon. F. anisomere.) Applied by Bonnard to an order of rocks formed in whole or in part by crystallisation, and where a dominant part, which serves for base, paste, or cement for the others, is contemporaneous with or anterior to the parts that contain it.

In Botany, applied to flowers in which the number of the parts of each whorl is unequal.

Anisomet'ric. ('Ανισος'; μέτρον, n measure. F. anisométrique.) Applied by Neumann to a system or union of crystalline forms in which the co-ordinate planes are perpendicular, and seem to relate to a system of axes to the number of three all unequal.

Anisometro'pia. ('Av, neg.; loos, equal; μέτρου, a measure; ώψ, the eye.) An inequality in the refractive power of the two eyes, so that one eye is myopic whilst the other is emmetropic or hypermetropic, or astigmatic, or both eyes being myopic, one is more highly myopic than the other. The treatment consists in the adaptation of glasses, but when the difference is great little improvement can be obtained from them. Lately it has been suggested that this term should be restricted to those cases of ametropia in which the abnormal refraction is the same in kind though different in degree. See Antimetropia.

Anisometropic. (Same etymon.) Of or pertaining to anisometropia.

**Anisone'ma multiflo'ra.** Asynonym of Phyllanthus multiflorus.

Anisoneu'rous. (Άνισος, unequal; νεῦρον, a nerve.) Term applied to plants in which the nervures are unequal.

Anisopet'alous. ( Ανισος; πέταλον, a petal. F. anisopetale; G. ungleichblumenblüttrig.) Term applied to a corolla in which the petals are unequal in number to the divisions of the calvx.

Anisophyllous. (Ανισος; φύλλον, a leaf. F. anisophylle; G. ungleichblattrig.) Term applied to plants the leaves of which are nnsymmetrical or unequal.

Anisophyl'lum ipecacuan'ha. ('Aνισος; φύλλον, a leaf.)
ipecacuanha. The Euphorbia

Anisop'oda. ('Aνισος', πούς, a foot.) Tribe of the Suborder Isop da, Order Edriophthalma. Abdomen with two-oared feet, which are not branchiated; sexual dimorphism slightly pronounced.

Anisopo'gon. ('Ανισος'; πώγων, the beard. F. anisopogone; G. ungleichbartig.) Applied by Illiger to a feather the sides of the heard of which differ from each other as to their length.

Anisop'terous. ( Ανισος; πτερόν, a wing.) A term applied in Botany to organs, ( Ανισος; πτερόν, a especially to fruits, which have unequal wings.

Anisosper'ma. ('Λνισος', σπέρμα, a seed.) A Genus of the Nat. Order Cucurbitacea.

A. passiflora. (L. passio, a suffering; flos, a flower.) The seeds contain n bitter oil; nsed in Brazil, where they are named Castanha do Jobota and Faba de San Ignatio, as valuable

stomachies. In large doses they purge.

Anisostam'inous. The same as Anisostemonous.

Anisoste mones. ( Ανισος; στήμων, the warp, a thread, and so, a stamen. F. anisostemone; G. ungleichstaubfadig.) Applied by Wachendorff to flowers in which the number of stamens has no relation with that of the free or adherent petals, as in many Dipsaceæ.

Anisoste monous. (Αυτος; στήμων. F. anisostémone.) Term applied to a flower in which the number of stameus is different from

that of the petals.

Anisostemopet'alous. ('Aνισος; στήμων; πέταλου, a petal. F. anisostémopétale.)
Applied by Wachendorff to plants, the stamens which are unequal in number to that of the divisions of the corol.

Anisosthenic. ('Avisos, unequal; σθένος, strength.) Of unequal strength; as inequality in the contractile powers of muscles, or

of sets of muscles

Anisot'achys. ('Ανισοταχής, unequally rapid; from ἄνισος, unequal, ταχύς, quiek.) An old epithet applied to the pulse when characterised by inequality with quickness.

Anisotom'idæ. (Ανισος; τομή, a section.) A Family of the Group Pentamera, Order

Coleoptera.

Anisot'omous. ('Ανισος ; τομή, section. F. anisotome.) Term applied to a leaf, corolla, or ealyx, the divisions of which are unequal; oblique.

Anisot'ropal. ('Avisos, unequal;  $\tau \rho i - \pi \omega$ , to turn. F. anisotrope.) Term applied to substances physically homogeneous, which have the power of doubly refracting a ray of light, like Iceland spar

Anisotropous. Same as Anisotropal. Anistioph orous. (Aν, neg.; ίστιον, a sail; φέρω, to bear.) Applied by J. E. Gray and Spix to a Family of Chauve-souris (bald mice)

which have no appendage on the nose.

Ani'sum. ('Aurou, anise. F. anis; I. anice; S. anis; G. anis.) The plant anise; also

called aniseed.

The officinal name, U.S. Ph., of aniseed.

A. Africa'num frutes'cens. (L. frutescens; from frutex, a shrub.) A synonym of Bubon galbanum.

A. frutico'sum galbanif'erum. (L. fruticosus, bushy; galbaniferus, galbanum-bearing.) A synonym of Bubon galbanum. bearing.)

A. in'dicum. (L. indicus, Indian.) synonym of star anise, Illicium anisatum.

A. in'dicum stella'tum. (L. stellatus, starry.) A synonym of star anise, Illicium stellatum.

A. officina'le. (L. officina, a shop.) The Pimpinella anisum.

A. sinen'se. (L. sinensis, from China.) A synonym of the Illicium anisotum.

A. stella'tum. (L. stellatus, starry.) A synonym of the Illicium anisatum.

A. vulgare. (L. vulgaris, common ) A synonym of the Pimpinella anisum.

Anisu'ric ac'id. C10H11NO4. A substance formed during the passage of anisic acid through the body. It dissolves easily in alcohol, the solution yielding prismatic needles on evaporation, and in hot water, from which it may be obtained in leafy crystals. When heated it decomposes into anisic acid and glycocol.

An'isyl. The hypothetical radical of anisic

A. al'cohol.  $C_8H_{10}O_2$ . Obtained from anisaldehyde by the action of nascent hydrogen, or by heating with alcoholic potash. It forms shining colourless prisms; has a faint odour and pungent taste; melts at 25° C. (77° F.), and distils without decomposition at 258.80 C. (497.84° F.)

(L. anus, the fundament; Aniter sor. tergo, to wipe.) The latissimus dorsi muscle.

Anjudan. The fruit of the assufactida plant, Ferula assafactida, which is imported into India from Persia and Afghanistan, and is used by the native physicians as a sudorific.

An'kle. (Possibly from ἀγκών, the elbow, which also means any similar curvature; or Saz. ancleow. F. cheville du pied ; G. Knöchel.) That portion of the lower extremity where the leg and foot are united, distinguished by a well-known prominence, the malleolus, on each side.

A., amputation at. An operation specially recommended by Syme. The foot being held at a right angle, an incision is commenced immediately below the outer malleolus, and carried across the sole to a point exactly opposite, below the inner malleolus; the extremities of this incision are then joined by another running across the joint; the flap is dissected off the os calcis, the joint opened in front, the lateral ligaments and then the tendo Achillis divided, and the removal of the foot completed; the malleoli are then sawn off, sometimes with a thin slice of the tibia. Several modifications of this operation have been devised. The flaps have been formed from the sides, the hinder portion of the os calcis has been retained, as in Pirogoff's operation, and other minor alterations have been proposed.

A., disloca tion of. This displacement seldom occurs without fracture of the fibula, or of the inner malleolus. It may occur outwards,

inwards, backwards, or forwards.

In dislocation outwards, the fibula is fractured, and the internal lateral ligament is ruptured, or the inner malleolus fractured; a hollow exists at the seat of fracture, the tibia projects inwards, and the outer edge of foot is raised.

In dislocation inwards, a rare and somewhat severe accident, there is no fracture of the fibula. but the tibia is broken through the malleolus. There is great prominence of the outer malleolus, and the inner edge of the foot is raised.

In dislocation backwards, the capsular and deltoid ligaments are ruptured, the fibula is generally fractured above the malleolus, and the tibia pushed on to the navicular and cuneiform bones. The foot is shortened, the heel lengthened, and the toes point downwards.

In dislocation forwards, the tibia is displaced backwards on to the os caleis, and the inner malleolus may be fractured; the foot is lengthened and the heel shortened; it is a very rare acci-

dent.

Reduction is effected by flexing the knee and pulling the foot in a proper direction; leg splints with lateral pieces are then to be applied.

An'kle-joint. A ginglymus between the tibia and fibula above and on the sides, and the astragalus below with its two lateral facettes, of which the external is much the larger. ligaments are three in number, an anterior, an external, and an internal. The auterior is thin and membranous, attached above to the tibia, below to the astragalus. The internal or deltoid is composed of a superficial layer, the anterior fibres of which pass forwards from the inner malleolus to the seaphoid, the middle fibres descending vertically to the os calcis, and the posterior passing backwards to the astragalus. The deep layer consists of strong fibres passing between the inner malleolus and the astragalus.

The external lateral ligament consists of three fasciculi extending from the external mallcolus to the astragalus in front, to the outer side of the os calcis in the middle, and to the astragalus behind. The transverse ligament of the inferior tibio-fibular articulation takes the place of a posterior ligament. The synevial membrane sends a process upwards between the tibia and fibula. The joint is supplied by the malleolar branches of the anterior tibial and peroneal arteries, and by the branches of the anterior tibial nerves. The parts in relation with the joint from without inwards are the tibialis anticus, extensor proprius pollicis, anterior tibial vessels, anterior tibial nerve, extensor com-munis digitorum, and peroneus tertius. Behind from within outwards are tibialis posticus, flexor longus digitorum, posterior tibial vessels, posterior tibial nerve, flexor longus pollicis, and in the groove behind the external malleolus, the tendons of the peroneus longus and brevis. (Gray.)

An'kulē. (ἸΑγκύλη, the bend of the arm.) A contracted joint, especially the knee.

An'kuroïd. (<sup>3</sup>Αγκυρα, an anchor; είδος, likeness.) Hook-like or anchor-like.

A. cav'ity. A synonym of the middle or descending cornu of the lateral ventricle of the

An'kus. See Ancus.

eyelids to each other.

An'kyla. ('Αγκύλη.) Term used by Galen, l. vii, de C.M. per Gen. c. 6, for the contraction or stiffening of a joint.

An kyle. Same as Ankylo.

**Ankylente'ria.** ( Αγκύλη, a loop; εντερον, the intestine. F. ankylenterie.) Ac-

cidental adhesions between pieces of intestine. **Ankylobleph'aron.** ('Αγκύλη, athong, or loop; βλέφαρον, the eyelid. **F.** ankyloblepharon; G. Ankyloblepharon, die Verwachsung der Augenleider.) A term for adhesion of the

('Αγκύλη, a noose; Ankylochei'lia.

χείλος, a lip.) Adhesion of the lips.

Ankylochi'lia. See Ancylocheilia. **Ankylocol'pus.** ('Αγκύλη; κόλπος, the womb. F. ancylocolpe; G. die Verwachsung der Mutterscheide.) Adhesion of the vulva, or walls of the vagina. Imperforate vagina.

Ankyloc'ore. ('Αγκύλη; κόρη, the pupil of the eye. F. aneylocore.) Adhesion of the

pupil.

Ankylodei re. ( Αγκύλος, crooked; δειρή,

the neek.) Crooked neek; torticollis. **Ankylod'ere.** ('Αγκύλος; δέρη, the neek.) Twisted neck, torticollis.

Ankylod'eris. The same as Ankylo-

**Ankylodon'tia.** ('Αγκύλος, curved; οδούς, a tooth. F. ancylodontie.) A series of teeth irregularly attached to the jaw, bent inwards, or adherent to each other.

Ankyloglos'sia. ('Αγκύλη, a noose; γλῶσσα, the tongue.) Adhesion of the margins of the tongue to the gums.

Also, the condition of tongue-tie from a short

franum.

Ankyloglos'sotome. (Ankyloglossum; τέμνω, to cut. F. ancyloglossotome; G. Ankyloglossotom.) An instrument used in the operation for ankyloglossum.

**Ankyloglos sum.** ('Αγκύλη, a noose; γλώσσα, the tongue. F. ankyloglosse; I. anchyloglosso; S. anguiloglosso; G. Ankyloglosson.) A term for the condition of one that is tonguetied.

Ankylom'ele. ('Αγκόλη, a bent joint; μέλος, a limb. F. ancylomèle; G. Gliederverwachsung.) Adhesion of the limbs, as fingers, or toes with each other.

**Ankylome'le.** ('Αγκύλος, crooked or curved; μήλη, a probe.) Name used by Galen

for a curved probe.

Ankylomeris mus. ('Αγκύλη, a noose ; μίρισμα, a part. F. ancylomérisme.) Adhesion of parts naturally free, particularsy the viscera.

**Ankylopod'ia.** ('Αγκύλη, a noose; ποῦς, a foot. F. ankylopodie.) Ankylosis of the in-

Ankyloproc'tia. ('Αγκύλος, crooked; πρωκτός, the anus. F. ankyloproctie.) Stricture or narrowing of the anus.

An'kylops. See Anchilops. Ankylorrhin'ia. ('Αγκύλη, a noose; ρίν, the nostril. F. ancylorrhinic; G. verwack-sene Naselocher.) Term for Nares coalitie, or adhesion of the nostrils.

An'kylosed. (Same etymon as Anky-

losis.) Stiff from adhesion.

**Ankylosis.** (Άγκὐλωσιε, from ἀγκύλως, curved; or ἀγκύλη, the bend of the arm, a joint bent and stiffened by disease. F. ankylose; G. Gelenksteifigkeit.) The morbid consolidation of the articulating extremities of two or more bones, which previously formed a natural joint; a stiff

A. capsula'ris. Capsular ankylosis. Stiffening of a joint from contraction or shrivel-

ling of the capsular ligament.

A. extracapsula'ris. Extracapsular ankylosis. Stiffening of a joint from disease of the tissues outside the proper joint structures. Intracapsular

A. intracapsula ris. ankylosis. Stiffening of a joint from affection of bone, cartilage, or ligament.

A. muscula ris. Muscular ankylosis. A form which is caused by contraction of muscles.

A. spu'ria. (L. spurius, false.) Anehylosis due to rigidity of the soft parts around a joint.

Ankylo'sis, bo'ny. The form in which the connecting medium is bone, following the complete destruction of the eartilaginous structures of the joint. It is commonly the result of traumatic or pyaemic arthritis. If the distortion of the limb or the stiffness renders it useless, the joint may be excised; or the bony structures may be broken through after partially sawing or boring them, or a wedge-shaped piece of bone may be sawn out, and the limb placed in the least inconvenient position.

A., comple'te. Ankylosis of a joint so extensive as to hinder motion altogether; the

result of bony adhesion. See A., bony.

A., false. (F. ankylose fausse; G. falsche Ankylose.) Ankylosis due to rigidity of the soft parts around the joint.

A., fibrocel lular. A synonym of A., incomplete.

The form in which A., incomple'te. there is some motion of the joint, in consequence of the connecting medium not being bony. It may be caused by capsular thickening, by fibrous adhesion of greater or less extent between the joint ends of the bones, or by contraction of ligaments and muscle. It is commonly caused by arthritis, but may be the result of lengthened disuse. The treatment advised is passive motion,

alternate hot and cold douches, and, if these do not succeed, the foreible bending of the joint, and the eonsequent rupture of the adhesions, under ether.

A., ligamen'tous. The form in which

the connecting medium is fibrous.

A., os'seous. (L. osseus, made of bone.) See A., bony.

A., spu'rious. Ankylosis due to rigidity of the soft parts around the joint.

A., true. (F. ankylose vraie; G. wahre Ankylose.) The form in which the connecting material is of bone.

**Ankylos tomum.** (Αγκύλος, curved; στόμα, a mouth.) A species of Nematoid worm discovered by Dubini in the duodenum of man, hence called A. duodenale. He found it in five per cent, of the subjects examined at Milan, and it has also been seen in Egypt and Ireland. It is one eighth or one sixth of an inch in length, cylindrical, a little curved, transparent in the anterior fourth, reddish, yellowish, or brownish posteriorly, with a black spot opposite the com-nuencement of the intestine; month dorsal, circular when open, 4 hooklets at the bottom of the month on the abdominal side. A number are attached to the mucous membrane of the intestine in the centre of a lenticular eechymosis which they make. There is one male, with double penis, to about three females. (Littré.) Also

called Anchylostomum, which see.

Ankylotia. (Αγκόλη, a noose; οὖs, the ear. F. ancylotie; G. eine Verwachsung einer Ohröffnung.) Atresia auris, or imperforation of the meatus auditorius.

Ankylot'ic. (Ankylosis. F. ankylotique.)

Belonging to ankylosis.

**An'kylotome.** ('Αγκύλη, a clasp; τέμνω, to ent. F. ancylotome.) An instrument for operation in adhesions or contractions, especially of

Or ('Αγκύλος, erooked or curved; τέμνω, to cut),

a curved knife or bistoury.

Ankylure thria. ('Αγκύλη, a noose; ουρήθρα, the urethra. F. ancylurethre.) Adhesion of the walls of the nrethra.

Anky'ra. ('Αγκυρα, an anchor, a hook.) A hook.

An'kyrism. ('Αγκυρίζω, to hook. ankyrisme.) A form of suture of the skull in which one bone is hooked on to another, as the palatine to the maxillary bone.

Ankyroï'des. ('λγκυρα, an ancher; είδος, form.) Resembling an anchor; anchor-shaped; ankyroïd. Applied to the coracoïd process of the scapula, from its resemblance to the beak of an anchor.

Ankyrome'le. See Ankylomele. An'naberg. Germany; Saxony, ahout eight miles from Wolkenstein. Here are mineral waters, the chief constituents of which are sodium, magnesium andealeium carbonate, sodium chloride and sulphate, and a moderate quantity of free carbonic acid gas.

Annale The name in India of the fruit

of the Emblica officinalis.

Annatto. See Arnatto.

Annealing. (Sax. anælan; from ælan, to kindle, to heat, to bake.) The process by which substances naturally hard and brittle are rendered tough. Glass and iron are annealed by gradual cooling; brass and copper by heating and then

suddenly plunging in cold water.

An'neau. (Fr.) A ring. See Annulus.

An'nee. Hindustani name of a tree said to

increase the appetite, relax the bowels, and remove flatulence. Described as effectual in jaundice and rheumatism. (Waring.)

Annela ta. (L. annellus, a little ring.) A Suborder of the Order Sauria. Skin hard, non-scaly; body long, serpentiform, divided into rings, which are subdivided by longitudinal furrows; sternum wanting; scapular arch generally rudimentary, as is also the pelvis; limbs usually absent; eyelids and tympanic membrane absent; facial bones united to each other. Inoffensive animals, living on insects and worms,

Annel'ida. (L. annellus. F. annellides, vers à sang rouge; G. Rundwürmer, Ringwürmer.) A Class of the Subkingdom Annulosa, or Vermes, possessing a cylindrical, more or less elongated body, sometimes unsegmented, but usually presenting a considerable number of rings. The dorsal and ventral surfaces are very similar. The anterior extremity of the body is provided with sensory organs, tactile papillæ, eyes, and feelers, or with suctorial apparatus, which is usually of a chitinous character. Processes of chitine forming bristles play an important part in the lower forms. The bristles are arranged on lateral and symmetrical elevations of the body. Beneath the chitinous investment is a layer of longitudinally arranged muscular fibres, by which the undulating movements of the body are produced. The sexes are usually separate. In development there is more or less complete metamorphosis. Genmation and alternation of generation occur. There is a bilobed supra-æsophageal or cerebral ganglien, from which a filament passes down on either side of the esophagus, the esophageal collar, to join a large subasophageal mass, and from this a double gangliated cord extends beneath the intestine to the extremity of the body, giving off branches to the segments. The same gauglien gives off a long, slender stomatogastrie branch distributed to the intestine. The leech and lobworm are examples.

Annelida ria. (L. annellus, a little ring.) Applied by Blainville to a class of animals with the body divided into rings, which he regarded as intermediate between Articulata and Radiata.

Annelid eous. (Same etymon.) Ringed

like the earth-worm.

Annelides. A synonym of Annelida. Annesle'a spino'sa. A synonym of Euryale ferox.

Annex'us. (L. adnexus; G. verbunden.) Attached to; fixed against.

An'ni climacter'ici. (L. annus, a year: κλιμακτερικός, from κλιμακτήρ, the round of a ladder; a dangerous point in a man's life.) The Climacteric years.

A. crit'ici. (L. criticus, decisive.) The Climacterie years.

A. decreto'rii. (L. decretorius, decisive.) The Climacteric years.

A. fata'les. (L. fatalis, destined.) The Climacteric years.

**A. genethli'aci.** (Γενεθλιακός, belonging to a birthday.) The Climacteric years.

A. grada'rii. (L. gradarius, going step step.) The Climacterie years. by step.)

( Εβέσμαδικός, he-A. hebdomadici.

Inging to seven.) The Climacteric years.

A. hero'ici. (Έρωϊκός, heroic.) Climaeterie years.

A. natalit'ii. (L. natalitius, belonging to one's birth.) The Climacteric years.

A. scala'res. (L. scalaris, belonging to a

A. scansiles. (L. scansilis, that which may be climbed.) The Climacteric years.

may be climbed.) The Climacteric years.

Ann'janc. The same as Andjanc.

An'non. The name in Egypt of the Linum usitatissimum.

French name for a variety of Anno'ne. the red wheat.

Anno'ra. Arabic term for ealeined eggshells or quicklime. (Ruland and Johnson.)

Anno'sus. (L. annosus, full of years.)

A term in Botany applied to plants that have lived many years.

Annota'tio. (L. annotatio, a noting down in writing. Έπισημασία.) Old term for the symptoms preceding an attack of ague, or the beginning itself of a febrile paroxysm, as shivering, chilliness, trembling, yawning, drowsiness, &c., according to Galen. (Castellus.)

Annotinous. (L. annotinus, a year old.)

The last year's shoot rendered visible by an interruption at the point of junction with the previous

growth. (Cooke.)

Annot'to. A dye, obtained from the reddish pulp surrounding the seeds of the Bixa orellana, or Orleana. It is obtained by bruising the fruit, mixing it with water, straining, and allowing the liquid to stand to deposit a sediment; this is dried and made into cakes or rolls. French annotto, called also flag annotto, is obtained from French Guiana; Spanish or Brazilian from Brazil. It is non-crystallisable, brownish-red in colour, with a dull fracture, a sweetish smell, and a rough, bitterish taste; it colours water yellow. Chevreul has shown that it contains two colouring principles, orelline or bixine, or bixéine, a white or colourless crystallisable substance, becoming yellow on exposure to the air; and orelleine, which is perhaps only a product of the decomposition of orelline by air and ammonia. The Terra Orleana of the shops. Used for colouring cheese and plasters. It has been used in medicine.

An'nual. (L. annus, a year. F. annucl; I. annuale; S. anual; G. einjahrig; Gr. ένιαύσιος. Applied to diseases that occur at the same time each year; and also to a plant that continues but a year, for the summer season, or only for a few

A. rings. The concentric rings seen in a section of the wood of a dicotyledonous plant, and which indicate the successive annual additions to the stem.

An'nuens. (L. annuo, to nod.) Nodding; applied to the rectus anticus capitis, because it is employed in nodding or bending the head forward.

Annuen'tes mus'culi. (L. annuo, to nod.) The recti antici capitis mnscles, from their action.

Annuit'io. (L. annuo, to nod.) Nodding, as in assent; and in dozing in the sitting postnre. Nodding is also an epileptoid condition.

An'nular. (L. annulus, a ring. F. annulaire; G. ringformig.) Pertaining to, or shaped like, a ring; ring-like.

A. bone. The ring of bone into which

the membrana tympani is inserted. A. calcifica'tion. The form of ealeification of arteries, in which the deposit is more or less disposed in lines like rings around the vessel.

A. car'tilage. A term for the cricoid eartilage.

A. cells. (F. cellules annulaires ; G. Ringfaserzellen.) Cells of plants, of the variety called fibrous, in which the fibre assumes the form of rings on the inner surface of the cell-wall.

A. deformity of skull. A deformity of the skull produced by the pressure of a band pnt round the head in infancy; a custom adopted by

some races of man.

A. em'bryo. An embryo that is curved like a ring around the albumen, as in Mirabilis jaluna.

A.fing'er. (G. Goldfinger.) The ring finger. A. gan'glion. The outer part of the ciliary mnsele, formerly called the ciliary ligament.

A. lig'ament of at'las. The transverse

ligament of the atlas.

A.lig'ament of ra'dius. A band of fibrons tissue attached to the anterior and posterior edges of the lesser sigmoid cavity of the ulna. It surrounds the head of the radius, a synovial membrane continuous with that of the elbow-joint intervening. The upper border is wider than tho lower.

A. lig'aments of an'kle. Three in number, viz. an auterior, an internal, and an

external one.

The anterior presents two parts, an upper and lower; the upper attached laterally to the tibia and fibula, and having one sheath, with synovial membrane, for the tibialis antiens; the lower attached externally to the os calcis, and internally to the plantar fa-cia and inner malleolus, having three sheaths, with separate synovial membranes, an inner one for the tibialis antieus, the next for the extensor pollicis, and an outer one for the extensor longus digitornm and peroneus tertius.

The internal is attached to the inner malleolus above and in front, and to the inner surface of the os calcis below. It has separate sheaths for the tibialis posticus, the flexor longus digitorum, and the flexor longus pollicis. Between the tendons of the two flexors are placed the tibial

vessels and nerve.

The external is placed below the fibula and attached on the one side to the outer malleolus, and on the inside to the outer surface of the os calcis. It has one sheath, lined by synovial membrane, for the two peronei muscles.

A. lig'aments of car'pus. ligaments of wrist.

A. lig'aments of tar'sus. See A. ligaments of ankle.

A.lig'aments of wrist. Two in number, an anterior and a posterior.

The anterior is attached externally to the front of the scaphoid bone, the anterior and internal parts, and ridge of the trapezinm; and internally to the unciform and pisiform bones. Above, it is continuous with the fascia of the forearm, and below, with the aponeurosis of the forearm. On the cutaneous surface lie the palmaris longus and the ulnar artery and nerve. The flexor carpi rathe ulnar artery and nerve. dialis tendon runs in a special sheath close to the ridge of the trapezium, and beneath the chief arch of the ligament pass the four tendons of the flexor sublimis digitorum, the four of the flexor profundus digitorum, the tendon of the flexor longus pollicis, and the median nerve.

The posterior consists of some transverse fibres thickening the general aponeurotic fascia investing the muscles of the back of the forcarm. Externally it is connected to the outer part of the radius, and internally to the eunciform and pisiform bones. It presents six compartments, each lined by a synovial membrane, viz. from without iuwards, one for the first two extensors of the thumb, one for the two radial extensors of the wrist, one for extensor scenndi internodii pollicis, one for the common extensors of the fingers and for the extensor indicis, one for the extensor minimi digiti, and, lastly, one for the extensor carpi ulnaris.

A. mus'cle of Mul'ler. The circular

fibres of the ciliary muscle.

A. pro'cess. A synonym of the Pons Varolii; also called tuber annulare, and corpus annulare.

A. protu'berance. A synonym of the Pons Varolii.

A. reflec'tor. A synonym of Lieberkühn's reflector.

A. ves'sels. (F. vaisseaux annulaires; G. Ringgefüsse.) A variety of the vasenlar tissue of plants, in which the fibre is arranged in the form of rings on the inner surface of the

vessel. Annula'ris. (L. annularis, relating to a signet ring.) The cricoid cartilage.

A. a'ni. The sphineter aoi muscle.

A. cartila'go. The cricoid cartilage; so called from its shape.

A. dig'itus. (L. digitus, a finger.) The

riog or fourth finger. A. mus'culus. A synonym of the sphincter

ani mnscle. A. proces'sus. The annular process; a synonym of the *Pons Varolii*.

A. ve'na. The annular vein, the vein be-

tween the little and the ring finger.

Annula'ta. (L. annulatus, furnished with rings.) A synonym of Annelida. They were divided into Turbellaria, Suctoria, or Apoda, and Chætopoda, or Setigera.

Annulate. (L. annulatus, from annulus, a ring. F. annele; G. geringelt, ringformig.) Having rings; ringed. Applied to a class of the Arthropoda, in which the body is divided into numerous rings.

In Botany, applied to Ferns in which the spore

case is surrounded by a ring or Annulus.

An nulated. (Same etymon.) Ringed; applied to roots which have ring-like expansions on the roots, as the ipecacuanha.

A. ipecacuan'ha. The root of the Cephaelis ipecacuanha.

An'nuli. (L. annulus, a ring.) Term applied in Botany to a circular thickening presented by cells and vessels.

A. cartilagin'ei. A term applied to the incomplete cartilaginous rings of the trachea.

A. cartilagino'si trache'æ. The cartilaginous rings of the trachea.

Tendinous rings A. fibrocartilagin'ei. surrounding the orifices of the ventricles of the heart

A. of Bött'cher. Ring-like structures in the lamina reticularis of the ductus cochlearis.

A. superstitio'si. Superstitions rings according to Heuchenius, in not. ad Scren., p. 66 Term for rings against colic and epilepsy, formed of various substances, some having gems engraved with mysterious figures and characters, to which marvellons magical and medicinal effects were attributed.

A .- tendinophalange'a. A name of the lumbricales muscle

Annulicau'dus. (L. annulus ; cauda, a

tail. F. annulicaudé; G. ringschwanzig.) Applied to Histrionella annulicanda, the tail of which seems formed of rings when it is contracted; annulicaudous.

Annulicornis. (L. annulus; cornu, a horn. F. annulicorne; G. ringhornig.) Having annulated horns. Applied to Pandulus annulicornis, which has the lateral and inferior antennæ annulated with red; annulicornate.

Annuliferous. (L. annulus; fero, to bear. F. annulifere; G. ringtragend.) Having

or bearing rings.

An'nulipes. (L. annulus ; pes, a foot. F. annulipede; G. ringfussig.) Having the thighs surrounded by coloured rings, as Myopa annulipes; annulipede.

Annuloid'a. (Annulosa; eldos, form.) A Subkingdom of animals according to Huxley; according to others, a section of the Subkingdom Annulosa. They have a distinct nervons system in the oral region, and an alimentary canal shut off from the general cavity of the body; a water-

vascular system of ducts communicating with the exterior of the body is found in all, and in some there is a true blood-vascular system; the body is not segmented, neither are there bilaterally disposed successive pairs of appendages. Subkingdom is divided into two Classes, Echino-dermata and Scolecida.

Annulo'sa. (L. annulus, a ring.) A Subkingdom of animals. Body segmented on a longitudinal axis; nervous system consisting of a double series of ganglia connected by filaments, penetrated anteriorly by the œsophagus, and lying along the ventral side of the body; himbs, when present, turned towards the neural aspect of the body. This Subkingdom consists of two Divisions,

Anarthropoda and Arthropoda.

An'nulose. (L. annulus, a ring.) Ringed.

An'nulus. (L. annus, a circle.) A ring; a circular opening, or part resembling a ring.

In Botany (F. unneau; G. Ring), a special organ connected with the sporangia of ferns. The marginal cells of the sporangium hypertrophy, their walls become thick and brown, and form a zone or ring. This annulus may be complete or incomplete, horizontal or vertical, in regard to the axis to which the sporangia are attached; its walls may be parallel or oblique in relation to the axis of the sporangium, median or apiculate, according as it is placed at the base or at the summit of the sporangium. It is complete and horizontal in the Gleicheniaceae and Hymenophylleæ, complete and in the form of a band in Loxsoma, incomplete and clastic in the Polypodiacese, apiculate and formed of radiate cells in the Acrogyrateæ, rudimentary in the Osmundeæ, absent in the Angiopterideæ, Marattiaceæ, Daneaceæ, and the Ophioglossineæ. The dehiscence of the sporanginm in the Polypodiaceæ is due to the elasticity of the annulus.

The term annulus (F. anneau; G. Ring) is also applied by mycologists to a kind of membrane or filamentous veil which is inserted around the pediele or foot of the receptacle of a mushroom, and is also attached to the margin of the pileus. It may almost entirely wither up, or disappear, or remain fixed, variously altered into a thin, or rigid, or fenestrated membrane, or, lastly, it may become detached, as in some species of Lepiota, and be freely movable up and down the stem.

A synonym of Dactylius, and also of the Vulva.

A. abdomina'lis exter'nus. (L. abdominalis, belonging to the belly; externus, outer. G. vordere, or aussere Leisten- or Bauchring.) The external abdominal ring.

A. abdomina'lis internus. (L. abdominalis; internus, inner. G. innere or tufe Leistenring.) The internal abdominal ring.

A. abdomina'lis profun'dus. (L. profundus, deep. G. tiefe Leistenring.) The internal abdominal ring.

A. abdomina'lis superficia'lis. superficialis, belonging to the surface. G. aussere Leistenring.) The external abdominal ring

A. abdom'inis. (L. ahdomen, the belly.)
The inguinal ring. See Abdominal ring.
A. al'bidus. (L. albidus, white.) The

outer part of the ciliary muscle, formerly called the ciliary ligament.

A. cellulo'sus. (L. cellulosus, full of cells.) The part of the ciliary muscle, formerly called the eiliary ligament.

A. chirur'gicus. (L. chirurgicus, surgi-The chicurgical ring; a name for a metal cal.) ring or similar instrument for fixing the eyeball in operations.

A. cilta'ris. (L. cilium, an eyelash. F. muscle ciliaire; G. Strahlenring, Strahlenband.) The part of the ciliary muscle, formerly called the ciliary ligament.

A. conjuncti'væ. (G. Bindehautring.) A slight elevation of the conjunctiva surrounding the cornea, especially observed in old people.

A. crura'lts. (F. anneau crurale; G. Schenkelring.) The crural ring.

A. crura'lis exter'nus. (G. äusserer Schenkelring.) The external crural ring; the saphenous opening.

A. fi'bro-cartilagin'eus. The same as Annulus fibrosus.

(F. lame annulaire; G. A. fibro sus. Faserring.) The fibrous ring. The external laminar part of the intervertebral dises, which forms more than one half of each disc, and consists of concentric laminæ of fibro-eartilage and fibrous tissue alternately one with another. Some of the lamina are composed essentially of elastic tissue.

In the tail of the bird the annulus fibrosus replaces the intervertebral disc; it fills up the whole space between the vertebræ, and is pierced by the nucleus pulposus, a structure corresponding to the ligamentum suspensorium.

A. fibro'sus atrioventricula'ris. (L. atrium, the fore-court of a house; ventriculus, a ventricle. F. anneau or zone fibreuse du cour; G. Faserringen der Atrioventrikularoffnungen.) The fibrous or tendinons ring of the auriculoventricular opening on each side of the heart. It is composed of connective-tissue fibres, which run from the endocardium of the auricle and from the fascia-like subpericardial investment of the heart, near the coronal groove, into the auriculoventricular valves.

A. fos'sæ ova'lis. The prominent border, deficient below, of the fossa ovalis of the heart.

A. ganglifor mis. (L. ganglion, a swelling; forma, figure.) The outer surface of that part of the ciliary musclo formerly called the eiliary ligament.

A. ganglifor mis tu'nicæ choroï deæ.

The same as A. gangliformis.

A. inguina'lis ante'rior. (L. inguinalis, belonging to the groin; anterior, foremost. F. auneau inquinal inférieur; G. vordere Leisten-ring.) The external or anterior abdominal or inguinal ring or opening in the external oblique muscle of the abdomen, from which the intercolumnar fascia is given off.

A. inguina'lis exter'nus. (L. inguinalis; externus, outside.) The same as A. inquinalis anterior.

A. inguina'lis inter'nus. (L. inguinalis; internus, inward. F. orifice abdominale, or anneau inguinal supérieur ; G. innere Leistenring.) The internal abdominal or inguinal ring.

A. inguina'lis poste'rior. (L. inguinalis; posterior, hinder. G. hintere Leistenring.)

The internal abdominal ring.

A. inguina'lis profun'dus. (L. inguinalis; profundus, deep. F. orifice abdominal du canal inguinal; G. tiefe Leistenring.) The deep or internal ingninal or abdominal ring.

A. inguina'lis superficia'lis. (L. inguinalis; superficialis, belonging to the snrfuce. G. oberflächliche Leistenring.) The superficial or external inguinal or abdominal ring.

A.interauricula'ris. The interauricular ring. The thickened border of the fossa ovalis of

the heart.

A. i'ridis cilia'ris. (F. grand cercle, or anneau coloré externe de l'iris; G. ausserer Kreis.) The ciliary ring of the iris; the external zone of the iris.

A. l'ridis exter'nus. (F. grand cercle, or annian coloré externe de l'iris; G. äusserer Kreis der Regenbogenhaut.) The external ring or zone of the iris.

A. i'ridis inter'nus. (F. petit cercle, or anneau colore interne de l'iris; G. innerer Kreis der Regenbogenhaut.) The internal ring or zone of the iris.

A. i'ridis ma'jor. (F. grand cercle, or anneau colore externe de l'iris; G. ausserer Kreis der Regenbogenhaut.) The larger outer or peripheral ring or zone of the iris.

A. i ridis mi'nor. (F. petit cerele, or anneau colore interne de l'iris; G. innerer Kreis der Regenbogenhaut.) The smaller inner or pu-pillary ring or zone of the iris.

A. i'ridis pupilla'ris. (F. petit cerele, or anneau colore interne de l'iris; G. innerer Kreis der Regenbogenhaut.) The inuer or pupillary ring or zone of the iris.

A. ltgamento'sns. The ligamentous ring; a term for the part of the ciliary muscle formerly called the ciliary ligament.

A. membra'næ tym'pani. The ring of the tympanic membrane. See A. tympanicus.

A. ovalis. (L. ovalis, egg-shaped. F. anneau de Vieussens.) The oval ring; a prominent edge or border, deficient in the lower part, which bounds the upper part and sides of the fossa ovalis of the heart. The Enstachian valve is continuous with the anterior inferior extremity of the annulus ovalis.

A. purgato'rius. (L. purgatorius, purgative.) A ring made of glass of antimony, supposed to have the power of purging.

A. re'pens. (L. repens, ereeping.) synonym of Herpes circinatus.

A. sentlis. (L. senilis, belonging to old

people.) A synonym of Arcus senilis.

A. tendin'eus. (F. anneau fibro-cartilagineux de la membrane du tympan; G. Schnenring, Ringwulst.) The tendinous ring; the thick ring or border which forms the periphery of the membrana tympani.

A. tympan'icus. (G. Trommelfellring.) The tympanic ring; the osscous ring to which the membrana tympani is attached.

A. umbilica'lis. (F. anneau ombilical.) The umbilical ring; a circular aperture in the median line and near the centre of the abdomen, which is bounded by two semicircular fasciculi of fibres, through which, in fætal life, passed the pedicle of the umbilical vesicle or the narrow canal of communication between the umbilical vesicle and the intestine; the omphalomesenteric vessels; the urachus or canal of communication between the allantois and the bladder; and, lastly, the numbilical veins and arteries.

A. ventric'uli. (L. ventriculus, the belly.)

The pyloric aperture of the stomach.

A. Vieusse'nii. Vieussens' ring. thickened border of the fossa ovalis of the heart. It is composed of muscular fibre, and is most prominent above and to the inner side of the

An'nulus of the leg. A fibro-cellular, annular thickening, two or three inches wide, round the lower part of the leg, most common in

An'nus climactericus. (L. annus, a year; climactericus, belonging to the critical epoch.) The climacteric year; applied to the 63rd, and also to the 81st year of man, because men were supposed more likely to die during these years; a notion, however, without founda-

Anocar'pous. ('Ανω, above; καρπός, fruit.) Term in Botany, applied to ferns that bear the fructification on the upper part of their

**Anocathartic.** (Άνω, upwards; κα-θαίρω, to purge.) Having power to purge upwards, or cause vomiting; emetic.

Ano-caverno'sus. (L. anus, the fundament; cavernosus, full of holes.) A synonym of the Accelerator urina, so called because of its relation to the corpus cavernosum of the penis.

Anocchiatu'ra. (G. bosen Blick.) The evil eye. A supposed malign or baneful influence exerted by one person on another through

Anochei'lon.
alip. G. Oberlippe.) The upper lip. Also, a man with thick upper lip. Hoffmannus, Ideæ Machin. Human. s. 28, § 1.

Anocheilos'chisis. ('Δνω; χείλος; σχίσις, a cleaving.) Fissure of the upper lip;

harelip.

Anocheilum. The same as Anocheilon. Anocheilus. The same as Anocheilon. Anochilus. The same as Anocheilon. Anochilus. The same as Anocheilon. Anochus. ('Avoxý, a holding back, com avixw, to hold up.) A stoppage of the

An'ochus. ('Aνοχ from ἀνέχω, to hold up.) intestinal action.

Anococcyge'al. Pertaining to, or in the neighbourhood of, the anus and eoceyx.

A. raph'e. ('Puφή, a seam.) A band of connective tissue extending from the posterior border of the anns to the coccyx, into which the fibres of the sphincter ani externus and those of the levator ani muscles are inserted.

AnocœTia. ('Aνω, upwards; κοιλία, the belly. L. venter superior; F. anocælie; G. Oberleib.) The upper portion of the belly. Also,

the chest.

**Anocœliadel'phous.** ('Δνω, above; κοιλία, belly; ἀδελφός, hrother.) In Teratology, monsters in which the upper parts of the two trunks are united.

An'ode. ('Avá, np; ôôós, a way.

Sauerstoffpol.) The positive pole of a Voltaic or galvanic battery, so called because from its sur-

face the electric current enters the electrolyte. **Anoder'mei.** ('Ανά, without; δέρμα, a skin.) A Group of sessile *Polypora*, in which the pileus does not possess a hard woody surface.

Anoder meous. ('Aνά, without; δέρμα, skin.) Term employed in Botany to designate the receptacles of certain Fungi, of which the external surface does not present the aspect of an enidermis

("Avados, not singing, from du, Ano'dia. neg.; ωδή, a song.) A dissonant and unempha-

sised tone of speech.

Anod'ic. ('Avá, upwards; ôôás, a way.) Proceeding upwards, or ascending; applied by Dr. Marshall Hall to the ascending action of the nervous influence.

Anodin'ia. ('Aν, neg.; &δίς, the pain of childbirth. F. anodinie; G. Wehenmangel.)

Absence of pains in childbirth.

Anodinous. (Same etymon. F. anodine; G. ohne Geburtswehen.) Having no labour

**Anod'mia.** (' $A\nu$ , neg.;  $\dot{\phi}\dot{c}\mu\dot{\eta}$ , smell. G. Geruchlosigkert.) Absence of the sense of smell.

Anod mous. (Same etymon.) Having no smell.

An'odont. See Anodontous.
Anodon'tia. ('Λν, neg.; ἀδούς, a tooth.)
An anomaly occasionally observed in man, in which no teeth are developed.

Anodon'tidæ. (Same etymon. F. anodontudes.) Name by A. Smith for a Family of serpents having the Anodon for their type; and by Raffinesque for a Tribe of Pedifere having the Anodonta for their type.

Anodontid'ia. Same as Anodontida. Anodontoph ora. (An, neg.; adontophore.) Having no odontophore or tooth-bearing structure; a term applied to some Mollusca.

Anodon'tous. ('Aν. neg.; ὁδούς, a tooth. F. anodonté; G. zahnlos.) Having no teeth.

An'odous. Same as Anodoutous.
An'odous. (Anocos, a way up; from ava, up, ocos, a way.) That which is separated from the nutriment by the kidneys; the urine. (Dor-

An'odyne. ('Λν, neg.; ὁδύνη, pain. F. anodyn; G. schmerzstillend.) Driving away pain; applied to medicines which, by their

soothing qualities, assuage pain.

A., Hoff'man's. The Spiritus etheris sul-

phurici compositus.

A. neck'lace. (G. schmerzstillendes Halsband.) A necklace made of the roots of henbane, of the seeds of the Coix lachryma, or Job's tears, of allspice steeped in brandy, and other substances, and supposed to induce sleep, lessen the sufferings of dentition, and such like.

An'odynes. (Same etymon. F. anodins; G. schmerzstillende Arznei.) Medicines which relieve pain. Such are opinm, alcohol, chloro-form, chloral, Indian hemp.

Anodyn'ia. ('Avwõvvla; from av, neg.; οδόνη, pain. F. anodynie; G. Gefühllosigkeit, Schmerzlosigkeit.) A term used by Galen, Com. 2, in l. i. Epid. t. 46, for want or absence of pain; applied especially to such exemption in childbearing, partial or total, and thus synonymous with anæsthesia.

Anod'ynum martia'le. ('Ανώδυνος, allaying pain; L. Martialis, belonging to Mars, an old name of iron.) Old term for the precipitite form d by adding potash to a solution of the Ferrum ammoniatum in water.

A. minera le. (Mineral.) Old term for Sal prunella; also, for Nitrum stibiatum.

Anodynus. See Anodyne.

Ance'a. ('Avora, want of understanding. L. imbecillitas, dementia; F. anoie; G. Blodsinn, Verstandeschwäche, Verstandeslosigkeit.) Amen-

tia, or idiotism; also, delirium.

Idiotism; according to Dr. Mason Good, a variety of Moria demens, consisting in general obliteration of the mental powers and affections; paneity or destitution of ideas, obtuse sensibility, vaeant countenance, imperfect or broken articulation, with occasionally transient and unmeauing gusts of passion.

Anoe'sia. ('Avanoia, want of understanding. F. anoe'sie; G. Sinnlosigkeit, Gedankenlosigkeit.) Want of sense.

Ano'ia. Same as Anæa. An'ol. C<sub>9</sub>II<sub>10</sub>O. Also called allyl-phenol. It is furnished along with paraoxybenzoic acid by heating anethol with potash at 200° C. to 230° C. (392° F. to 446° F.) It crystallises in brilliant white shining plates, melting at 92.5° C. (198.5° F.)

Ano'lena. ('Aν, neg.; ωλένη, the forearm. F. anoline.) Applied by Ranzani to a division of acephalous malformations, having no arms.

Ano'lis. A Genus of the Family Iguanida. Pleurodont lizards, having the toes widened and united at the base; jugular sac very dilat-

A. bulla'ris. (L. bulla, a bubble. F. roquet.) A species used in the Antilles as a sudorific and antisyphilitic when eaten raw. West Indian species is esteemed for its anticancerous properties.

Ano'ma morun'ga, Lour. A synonym

of Moringa pterygosperma, Gærtn.

Anomæ'os. ('Ανόμοιος, dissimilar.) Λ term employed by llippocrates to designate viscid or unnatural humours.

Anomala cia. See Anomalacia.
Anomalia. ('Ανωμαλία, irregularity.
G. Unglevohmassigkeit, Regelwidrigkeit.) Term applied to exceptional or unusual phenomena or conditions.

A. nervo'rum. (L. nervus, a nerve.) The

nervous diathesis.

Anomaliflorous. (L. anomalos, irregular; flos, a flower. F. anomaliflore; G. angliichblümig.) Applied by H. Cassini in Synantherese to the calathidium of the discustand corona when composed of flowers with anomalous earals.

Anom'alipede. (L. anomalos; pes, a foot. F. anomalipedes; G. angleichfüssig.) Having different feet, as Oxyurus anomalipes, because its feet are different coloured.

Anom'alis. (F. anomaux.) Same as Anomalous.

Anomaloceph'alus. ('Ανώμαλος, irregular; κεφαλή, the head.) One whose head is deformed.

Anomalœ'cia. ('Ανώμαλος: οἰκία, a habitation. F. anomalæcie; G. anomalokie.) Name by Richard for a Class having hermaphrodite and unisexual flowers on the same stem, or on different individuals.

Anomalogona'ti. ('Ανώμαλος; γονά-τον, the hip-joint.) A Group of Carinate τιον, the hip-joint.) A Group of Carinate Birds, founded by Prof. Garrod, to include woodpeckers, passerines, and swifts, characterised by the absence of the rectus femoris muscle, which he calls the ambiens musele.

Anomalolog'ia. ('Ανώμαλος, irregular; λόγος, an account.) A discourse or treatise upon anomalies.

Anomalonom'ia. ('Ανώμαλος: νόμος, a law. F. and G. anomalonomie.) The doctrine of the laws according to which irregularities or apparent anomalies occur.

Anomalon'omy. (Same etymon.) The rules in accordance with which teratological de-

viations occur.

Anomalope'des. (L. anomalos, irregular; pes, a foot. F. anomalopède; G. ungleichfüssig.) Applied by Klein to a Family of Mammiferæ having the toes united by a membrane.

Anomalop'orous. ('Ανώμαλος, irregular; πόρος, a pore. F. anomalopore; G. angleichlochig.) Having cellules or pores of different size.

Anomalotes. ('Ανώμαλότης, irregularity.) An anomaly.

Anom'alous. ('Λνώμαλος; from ἀν, neg.; ὁμαλός, equal. F. anomal; G. anomalisch, abweichend, regelwidrig, ungleichmässig.) Not according to rule, or regular course; irregular; out of rule. Applied to diseases, or to symptoms of disease, which do not appear in the usual form or in regular course.

Anomalu'ridæ. ('Ανώμαλος; οὐρά, the tail.) An African Family of Order Rodentia, with a single premolar in each side of the upper and lower jaw; molars not tuberculate, but with transverse enamel ridges; no postorbital processes; large, subovate, suborbital fossæ and palate deeply notehed behind. There is a lateral patagium or flying membrane stretching from carpus to thigh, supported on a eartilaginous process attached to olecranon; ribs sixteen pairs; tail long and hairy.

Anom'alus mus'culus. (L. anomalos, irregular; musculus, a muscle.) The anomalons muscle. A slender musele, described by Albinus, of an inch in length, lying upon the superior maxillary bene beneath the levator labii superioris alaque nasi; it is connected by its lower end with the origin of the compressor naris, and by the other is attached to the nasal process of the superior maxillary hone. It is

supplied by the facial nerve.

Anomaly. ('Aνώμαλος, irregular; from av, neg.; ὁμαλός, even, consistent. F. anomalie; G. Abweichung, Unreachmussigkiet, Regelwidsigkeit.) An exception to the ordinary course of rule; deviation from specific type. Applied to a monster. An anomaly may occur from variation, as where a walnut presents three earpels instead of two; from duplicity, as where a single culm of wheat, dividing, bears two ears; from hypergenesis, or excess of growth, which may either be in point of number, as where an extra digit is developed on the hand, or in point of size, as in a giant; from agenesis, or arrest of growth, as in a dwarf; from arrest of development, as where the eye is not completely formed; from excess of development, as where the mamma is developed in a man; or from displacement.

Anom'ia. ('A, neg.; vouos, a law. F. anomie; G. Gesetzlosigkeit, Gesetzwidrigkeit.) Lawlessness; abnormality.

Anom'ia. A Genus of the Family Ostreidæ. Shell suborbicular; right valve sessile, perforated for the passage of a delicate byssus; left valve with four distinct depressions for muscles.

A. ephip'pium. (' $E\phi i\pi\pi \iota os$ , for putting on a horse, as a saddle-cloth. F. pelure d'oignon.) A species found on the shores of the Mediterranean Sea, and which is eaten.

Anomi'des. (Ανομος, without law; είδος, resemblance. F. anomides.) Applied by Duméril to a Family of Orthoptera having an odd appear-

Anom'matous. ('Aν, neg.; ὅμμα, an eye.) In Teratology, a mouster destitute of an eye

(Avonos, without Anomocar pous. law;  $\kappa a \rho \pi \delta s$ , fruit. F. anomalocarpe; G. angleichfruchtig.) Having anomalous fruit.

Anomoceph'ala. ('A, neg.; νόμος, law; κεφαλή, head.) All animals presenting some deformity of the head.

Anomocephalia. ('Ανομος, without law; κεφαλή, the head. F. anomociphalie.) The state of one that is anomocephalous.

Anomoceph'alous. (Same etymon. F. anomocephale.) Applied by Geoffroy-Saint-Hilaire to animals, the head of which accidentally

presents some deformity.

Anomodon'ta. (Avoµos, without law, irregular; ô∂oûs, a tooth.) An Order of extinct reptiles having the mouth beak-like, as in the turtle; jaws toothless, or bearing two tusk-like teeth; vertebræ biconcave; anterior trunk-ribs with bifurcate heads; pectoral and pelvic arches strong; limbs specially fitted for walking; no exoskeleton. Chiefly found in Triassic deposits.

Anomœmer'ia. (Ανομοιομερής, consisting of unlike parts. F. anomæmerie.) A com-

bination or conjunction of anomalous parts. **Anome ous.** ('Ανόμοιος, unequal.) A term formerly applied to fluids of the body abnormally viscid or irregular in character.

Anomoiodiperian'thus. ('Ανόμοιος, unlike; &s, two; \(\pi\_{\varepsilon}i\), about; \(\alpha\varepsilon\sigma\), a flower.)
Applied by Wachendorff to plants having the number of divisions of the calyx different from that of the segments of the corolla.

Anomophyllous. ('A, neg.; νόμος, law; φύλλον, a leaf.) Term applied in Botany to plants the leaves of which are irregularly disposed.

Anomop'teris. ('Aνομος, without law; πτίρις, fern. F. anomopteris.) A species of fern found in the new red sandstone, which differs from all other recent and fossil ferns.

Anomou'ra. The same as Anomura.
Ano'mous. (Ανωμος, without shoulders.
L. anomus.) Without shoulders, or destitute of a humerus.

Anom'phalous. ('Aν, neg.; ὁμφαλός, navel. F. onomphale; G. ohne Nabel.) Having no navel; "quales fuerunt Adam et Eva, utpote creati non per vasa umbilicalia nutriti;" as gravely recorded by P. Ammannus, Irenic. p. 102.

Applied erroneously to children born with extroversion of the bladder, as if they had no umbilicus or navel, it not being distinctly seen in

the confusion of parts.

Anomura. (Ανομος, without law; οὐοά, the tail.) A Tribe of the Order Decapoda, differing in the termination of the abdomen from the other Tribes, Macrura and Brachyura, being neither so large as that of the former nor so im-perfect as that of the latter. The Hermit-crab is the type.

An'omus. ('A, neg.; vouós, custom. G. gesetzlos, gesetzwidrig.) Lawless, not according to rule.

Ano'na. (A native Banda word.) A Genus of the Nat. Order Anonaceæ.

A. cherimo'lia, Mill. The cherimolier of Peru : esculent.

A. murica'ta. (L. muricatus, pointed like nurex shell. F. anone herissee, cuchiman, a murey shell. pomme cannelle.) Sour sop. A plant growing in French Guiana; the leaves are used as an antispasmodic, and the seeds as an emetic.

A. odoratis sima. (L. odoratis simus, very fragrant.) Ylang-ylang. A species yielding a very fragrant essential oil.

A. palus'tris. (L. paluster, marshy.) Hab. West Indies. The fruit is called the alligator pear, but as it contains a narcotic principle it is not eaten. The wood, called West Indian corkwood, is very light.

A. reticula'ta. (L. reticulatus, net-like.) Custard apple, sweet sop, or bullock's heart. Used

as A. squamosa.

A. squamo'sa. (L. squamosus, scaly. F. anone écailleuse; Mal. Atta marum; Duk. Sec-taphut; Hind. Ata; Beng. Loona Meba; Tam. Sita-pullum.) Custard apple. A small Indian tree; leaves oblong, glabrous, with pellucid dots; sepals three; petals six in a double row. The leaves, gently bruised and mixed with salt, are applied to malignant tumours. The bark is a applied to malignant tumours. The bark is a powerful astringent and tonic. The seeds contain a highly acrid principle fatal to insects; hence in India, mixed with grain and used as a powder for the hair. The fruit is succulent and delicious.

A. trilo'ba. (Τρίς, thrice; λοβός, a lobe.) The three-lobed anona. A synonym of Carica рарауа.

A. tripet'ala. (Τρίς; πέταλον, a leaf.)

A synonym of A. cherimolia.

Anona'ceæ. An Order of the Thalamifloral Dicotyledons allied to the Ranunculacia, with distinct carpels, no stipules, a valvate corolla, and ruminate albumen. The custard apples of the E. and W. Indies and the cheri-moyer fruit of Peru belong to it.

Anona ceous. (F. anonace.) Having the characters of the Anonacea.

Ano'neous. Same as Anonaccous.
Ano'nis. ('Avwvis, or ovwvis.) The root
was employed by the ancients as a calefacient, and the bark macerated in wine as a diuretic and

lithontriptic. It is the *Ononis antiquorum*. **Anonych'ia.** ('Av, neg.; övvɛɛ, the nail.

F. anonychie.) Defect of the nails of the fingers

Anon'ymos. ('Aν, neg.; ὄνομα, a name.) A plant of Scythia, anciently in request as a vulnerary, probably the Ajuga pyramidalis, or A. iva. (Waring.)

Also, applied to a species of wild madder. Also, applied to a species of Polygula.

Also, applied to a species of Spiraca. Also, applied to the cricoid cartilage.

Anon'ymous. (Same etymen. G. namen-

los, unbenannt.) Nameless.

Anopet'alus. ('Ανώ, upwards; πίταλον, a leaf. F. anopetale.) Having erect petals, as Sedum anopetalum.

Anophre'sia. The same as Anosphrasia. Anophthal'mia. ('Aν, neg.; ὀφθαλμός, the eye. F. anophthalmie; G. Augenlosiekert.) Want or absence of eyes.

Anophthal'mus. (Same etymon.) One who has no eyes.

**Anophyta.** ('Aνώ, upwards; φύω, to grow.) In Endlicher's system, a cohort of the Section Acrobrya, Region Cormophyta. Possessing no spiral vessels; both sexes are perfect; spores free in spore-cases. Hepatica and Musci are included under this term.

Ano'pia. ('Aν, neg.; ωψ, the eye.) In Teratology, defect or arrest of development of the cranio-facial axis; the trabecular arch is entirely wanting, and the eyes are rudimentary or

absent, although the orbit remains.

**Anopis'thia.** ('Aν, neg.; οπίσθιος, hehind. F. anopisthe.) Applied by C. G. Ehrenberg to two Families of Polygastrica having the roouth and anns contiguous in the same fosset, and consequently deprived of an anal extremity, properly so called.

Anoploph ora. ('Aν, neg.; ὅπλου, a tool, arms; φορίω, to hear.) Stingless insects. **Anoplothe ridæ.** ( Άνοπλος, unarmed;

Onploy, an animal. F. anoptothérion.) A Group of extinct Artiodactylous Mammals, or a Family of the Section Bunodontia, Suborder Artiodactyla, forming a transition between swine and the runninants. They were slender-bodied animals with a long tail and feet with two hoofs; six incisor teeth and two canines in each jaw. and seven molars on each side, with no interval between them and the canines. They are confined to the Eocene and Miocene periods.

('Aν, neg.; ὅπλον, A fossil Pachyderm Anoplothe'rium. armour; θηρίον, a beast.)

found in the Paris tertiaries.

**Anoplu'ra.** ('Ανοπλος, unarmed ; οὐρά, a tail. G. Pelzfresser.) A Group of parasitic animals resembling lice, chiefly found on the feathers of birds, and synonymous with Mallophaga.

According to some, an Order of the Subclass Ametabola, Class Insecta, in which the mouth is formed for sucking, and there are two simple eyes. They are parasitic, and are known as lice. They are now commonly regarded as constituting an aberrant Group of *Hemiptera*. **Anop'sia.** (Άνω, upwards; ὧψ, the eye.)

A synonym of npward Strabismus.

Also (dv, neg.; ővus, vision. L. cwcitas; F. anopsic; G. Blindheit), defect of sight; blind-

**Anop'tos.** ('Λνοπτος, unseen. G. ungeschen, unsiehtbar.) Invisible.

An'ora. An old term for quicklime. Also, a term for calcined egg-shells.

Anor chides. ('Aν, neg.; δρχις, the tes-de. F. anorchide; G. ohne Hoden.) Term for those born without testicles.

Anorchid'ia. (Same etymou.) Imperfect development, or entire absence, of the testieles.

Anor'chis. The same as Anorchus. Anor'chism. (Same etymon; G. Hodenmangel.) The condition of absence of the testicles.

Anor'chous. ('Λν, neg.; ὅρχις, the tes-ele.) Wanting or having no testicles; applied to a child whose testicles have not yet descended into the scrotum.

Anor'chus. Anor'chus. ('Ανορχος. G. Hodenloser, Verschnittener.) A man without testes. Anorec'ti. ('Ανόρεκτος, without appetite.)

Those who have no appetite. (Quincy.) **Anorec'tous.** ('Ανάρεκτος, without appe-

tite.) Destitute of appetite; without hunger;

with no desire for food, and an indisposition to take the food ordered.

Anorex ia. ('Aν, neg.; δρεξιε, an appetite. F. anorexie; G. Appetitlosigkeit, Appetitmangel, Essunlust.) Want of, or diminished, appetite. A. aton'ica. ('Ανονία, relaxation.) A form of the disease described by Cullen dependent

on debility.

A. humora'lis. (L. humor, a liquid.) A form of the disease described by Cullen and supposed by him to be dependent on disorder of the humours.

A. mirab'ilis. (L. mirabilis, marvellous.) A term for fasting.

Anorgan'ic. ('Aν, neg.; ὅργανον, an organ. F. anorganique; G. anorganisch.) Without organs; not organised; inorganic.

Anorganochem'ia. ('Λν; ὄργανον; χημεία, chemistry. F. and G. αποτηαποκhέπια.) Term hy Zenneck for the chemical examination of inorganic bodies.

Anorganochem'istry. The same ctymon and meaning as Anorganochemia.

Anorganog'eny. ('Aν, neg.; ὄργανον; εννάω, to produce. F. and G. anorganogénic.) That branch which treats of the origin of inorganie hodies.

Anorganognos'tics. ('Aν; ὄργανον; γνῶσις, knowledge. F. anorganognostique; G. anorganognostik.) The doctrine or knowledge of inorganic natural bodies; likewise mineralogy.

Anorganog'nosy. (Same etymon. F. and G. anorganognosie.) Same as mineralogy; the knowledge of inorganic hodies.

Anorganog raphy. ('Αν; δργανον; γραφή, a description. F. and G. anorgano-

graphie.) A description of inorganie natural

Anorganol'ogy. ('Αν; ὅργανον; λογός, a discourse. F. and G. anorganologie.) A treatise on inorganic bodies.

Anor'gic. Contraction of Anorganic. Anorgism. ('Aν, priv.; ὄργανον, an organ. F. anorgisme.) The whole bodies and powers of nature which do not pertain to the organie kingdom.

Anoria. ('Ανωρία, untimeliness.) Immaturity

Anoricous. The same as Anorous. Anormal. The same as Abnormal.

Anorophous. ('Ανώροφος, without roof.) Destitute of brain cavity; destitute of brain.

Ano'rous. ('Λνωρος. G. unzeitig unreif.) Untimely, immature.

Anorrhorhœa. ('Av, neg.; δρρός, sernm; ρέω, to flow.) Defective secretion of serous fluids.

Anor thic. ('Λν, neg.; ὀρθός, straight.) Not symmetrical.

A. sys'tem. A group of crystals the faces of which are not arranged symmetrically to any plane.

Anor'thite. ('Λν, neg.; ὁρθός, straight. F. anorthite.) Having no angles.

Also, applied to a mineral containing silicie aeid in combination with aluminium and calcium, and small quantities of iron, magnesium, sodium, and potassium.

Anortho'pia. ('Λν, ueg. ; ὀρθός, straight; ὄψις, vision.) Defective vision, in which parallel lines appear broken or bent.

Anortho'sis. ('Λνά, upwards; ὀρθόω, to

straighten. F. anorthose; G. Infrichtung.) Term for erection.

Also (ἀν, neg.; ὀρθόω. G. mangelade Aufrichtung.) Dencient ereculity; want of erection.

Anosia. ('A, neg.; νόσος, disease. F. anosie; G. Krankheitslosigkeit.) Absence of disease, therefore the condition of health, the end and aim of medicine.

Anos mia. ('Aν, neg.; οσμή, smell. F. anosmie; G. Geruchlosigkeit, Geruchsmangel.)

Loss of the sense of smell.

A. aton'ica. ('Ατονία, relaxation, from à, neg.; τείνω, to stretch.) Loss of smell from

defective nerve power.

A. organica. (Οργανον, an instrument.)
Organic anosmia. Loss of smell from apparent physical change in the parts subservient to that sense.

Anosmo'sia. The same as Anosmia. Anos'mous. ( Άνοσμος.) Having defect of smell.

Anosphra'sia. (' $\Lambda \nu$ , neg.;  $\delta \sigma \phi \rho a \sigma i a$ , smell.) The absence or loss of smell.

Anosphre'sia. ('Aν, priv.; ὅσφοησις, the sense of smell. F. anosphresie.) The absence or loss of the sense of smell.

Anosteoph ora. ('Δν, neg.; οστέου, a bone; φορέω, to bear. F. anostéophore.) Applied by J. E. Gray to an Order of Antliobrachiophoru having no hard mass in the body.

Anosteozo'a. Same as Anosteozoaria. Anosteozoa ria. (Αν; δστέον; ζωάριον, dim. ot ζωον, an animal. F. anosteozoaire.) Applied by Blainville to animals which have no bone, properly so called, as Crustacea and Insecta.

Anos'tomous. (Ανω, above; στόμα, a mouth. G. aufmundig.) Having the mouth

above the snont, as Salmo anostomus.

Anosto'sis. ('Δν, neg.; ὀστέον, a bone. G. Knochenatrophie.) Want of development or atrophy of bone.

A. interstitia'lis. (L. interstitium, a space hetween.) Term applied by Bruns to senile atrophy of bone.

Anotasier. (Arab.) Name for Sal ammoniacum.

Ano'tous. ('Av, neg.; ovs, the ear.) Without an ear.

Anoura. ('Av, neg.; oipá, a tail.) An Order of the Class Amphibia, including the frogs and toads. Skin naked; body thick set, having neither tail nor gills in the adult state; two pairs of limbs well developed; dorsal vertebræ procœlious, having long transverse processes, which take the place of the rudimentary ribs; bones of forearm and leg united into one bone; hind limbs usually fitted for swimming. This Order is also called Batrachia.

**Anou'rous.** ('Aν, neg.; οὐρά, a tail. G. Schwanzlos.) Tailless. Having the characters

of the Anoura.

Anoxæ'mia. ('Λν, neg.; ¿ξύς, acid; or ox, for oxygen; aἰμα, bloöd. F. anoxyhemie.) A term introduced by Jourdanet to indicate the diminished quantity of oxygen contained in the blood of those living in high altitudes, where the tension of the oxygen in the surrounding air is considerably decreased.

**Anoxidic.** ('A $\nu$ , neg.; axide.) One of a series of terms devised to describe the condition of the mineral constituents of organic substances, and signifying unoxidised; it is a condition of the mineral material which has not yet been observed. See Meroxidic and Teleoxidic.

**Anoxol'uin.** (' $A\nu$ ; &\( \xi\) & s. acid:  $\lambda \delta \omega$ , to dissolve.) A term applied by Leconte to that portion of any proteid which is insoluble in glacial acetic acid.

Anoxycau'sis. ('Av, neg.; ox, for oxygen; καῦσις, a burning.) Combustion without

oxygen, as, for example, by the alkalies. **Anoxydic.** ('Aν, neg.; ὁξψs, acid; or oxide.) Incapable of undergoing oxidation.

Anoxyhæ'mia, Same as Inoxæmia.

An-pater. Sulphur. (Quincy.) An'sa. (L. ansa, a handle, a loop on the edge of a sandal through which the shoe-tie was drawn. F. anse; I. ansa; G. Griff, Henkel, Handhabe.) A loop. Also, in Botany (G. Schnittstiel) the stalk of

one of the segments of a divided leaf.

A. atlan'tis. (Atlas, the first cervical vertebra.) A loop formed between the anterior branch of the first and second cervical nerve in front of the transverse process of the atlas. The branch of the first nerve receives a small branch from the sympathetic nerve.

A. cap'itis. (L. caput, the bead; I. ansa del capo.) A synonym of the Zygomatic arch.

A. dello sterno. (It.) The same as fourchette of the sternum.

A. galvano-caus'tica. (Galvani caustiens, burning; I. ansa tagliente.) A loop of wire which can be rendered white hot by electricity; used in surgery for the division or removal of parts, which it accomplishes with

little or no pain or hæmorrhage. A. intestina lis. (L. intestina, the entrails.) A loop of intestine supported in a curve

by its portion of mesentery.

A. memorab'ilis Wrisberg'ii. (I memorabilis, remarkable.) See A. Wrisbergii.

A. ner'vi hypoglos'si. The loop formed in the neck between the descending branch of the hypoglossal nerve and one, or sometimes two, branches from the anterior branch of the second, or second and third, cervical nerves.

A. of Hen'le. The looped tubes of Henle. The loops formed by the urinary tubes in the pyramid, immediately below the first convolutions which are found just after their origin in the Malpighian tuft. The epithelial liniug becomes in them thin and flattened, and the nuclei prominent.

A. of Reil. The internal fibres of the superior peduncle of the cerebellum which are directed inwards across the middle line beneath the corpora quadrigemina, and through the fasciculus prolonged upwards from the fasciculus teres.

The pedunculated A. peduncula'ris. loop; a synonym of the Substantia innominata.

A. Wrisbergii. A loop formed by the junction of the right great splanchnic nerve with the right pneumogastric; the concavity embraces the larger part of the right pillar of the dia-

An'sæ cervicales. (L. cervic, the neck. G. Halsschlingen.) The communicating branches connecting the anterior branches of the

cervical nerves.

A. lumba'res. (L. lumbaris, pertaining to the loins.) The branches of communication between the anterior branches of the lumbar nerves.

A. sacra'les. (Sacrum, the bone of that name.) The loops formed between the anterior branches of the sacral nerves.

A. subclavia'les. The subclavian loops. One or two branches of the sympathetic nerve which run before and behind the subclavian artery, passing from the inferior cervical to the

first dorsal ganglion.

A. Vieuse'nii. Vieussens' loops. Two or three branches given off from the lower convex border of the inferior cervical ganglion, which pass down in front of the subclavian artery, and, surrounding it in the form of loops, joins one the superior cervical gauglion, and another the recurrent larvugeal nerve.

Ansa'tus. (L. ansatus, having a handle;

G. gestielt.) Having a pedicle.

An'ser. (L. anser, a goose; akin to Sansk. Ransa; F. oie; I. oca; G. Gans.) The goose or gander; a Genus of the Order Anseres. Beak as long as the head, high at its origin, narrow in front, and terminated by a horny plate; transverse lamellæ incomplete; feet moderately long, placed somewhat back. The domestic goose is much used as food; its fat is emetic, and was used in hydrophobia; its flesh also had a reputation for the same purpose, and was said to be

aphrodisiae and to promote longevity.

An'seres. (L. anser, a goose. F. anserides.) An Order of the Class Aves, with short legs, placed behind the centre of gravity; anterior toes webbed; bill some imes flat, sometimes laterally compressed, sometimes provided with a

pouch.

Anser'idæ. (L. anser.) A Family of the Order Chenomorpha, Subclass Carinata, Class Aves. The geese. Beak higher at the base, smaller towards the tip, which is horny;

Anser'ides. Same as Anseres.

Anserifor'mes. (L. anser, a goose; forma, shape.) An Order of the Subclass Homalogonati, Class Aves, according to Garrod, including the geese, ducks, penguins.

Anseri'na. (L. anser, a goose.) Silver weed, or wild tansy. The Potentilla anserina.

Anseri'na. (Same etymon.) A Group of

the Family Landlirostres, Order Natatores, Class Ares. The geese. They differ from the Anatidee or ducks in that they have shorter wings, and longer and stronger legs.

An'serine disea'se. (F. maladie ansé-

rine.) A peculiar emaciating of the extremities observed in old cases of pellagra, producing such great projection of the tendons of hand in particular as to cause it to resemble the foot of the goose.

Anseri'nus. (L. anser, a goose. F. ancerine.) Of or belonging to a goose.

Applied to the skin (F. chair de poule; G. Ganzhaut; I. pelle d'oca) when contracted and rough from cold. See Catis anserina.

A. pes. See Pes anscrinus.

An-sir arto-spiritus. Sal. (Ruland.)

An-sir filius. Mereury. An'sjuden. A synonym of Assafætidæ. An'sula. (L. dim. of ansa; G. Henkelchen.)

A little handle, ear, or loop.

Ant. (Sax. Emet. F. fourmi; I. formicola, formica; G. Ameise.) The Formica and other Genera of the Order Formicida; the emmet or

Antachates. Name for Succinum, or a bituminous stone of another colour, which, when

burned, gives the odour of myrrh.

Antac'id. ('Αντί, against; acidus, neid. F. antacude, anti-acide; G. sauretilgend, saurewidrig.) Λ medicine which chemically destroys

or counteracts acidity, or sourness, by combining with the acid, and so neutralising it; as soda, ammonia, magnesia.

('Avri, against; L. acer, Antac'rid. sharp, acrid.) Medicines which have power to correct an acrid condition of the secretions.

Antaeneas mus. The same as Ante-

Antaëroph'thora. The same as Antacrophthoron.

**Antaeroph'thoron.** ('Αντί, against; αήρ, air; φθορά, corruption. G. Luftverbesserungsmittel.) A means of purifying the air.

Antag'onism. ('Αντί, against; άγωνίζω, to contend. G. Wechselkampf, Gegenwirkung.) A term for actions which are opposed to each other in their office. Thus, the flexor muscles are the antagonists of, or antagonistic to, the extensors; and antagonism of disease is said to exist when the prevalence of certain diseases seems to exclude the occurrence of others. The word antagouism when applied to the action of drugs is usually confined to their physiological action on the body, and does not include the unutually destructive chemical action on each other; and drugs are said to be in antagonism when, as in the ease of atropin and muscarin, one accelerates and the other slows the heart, or appear otherwise to have an opposite influence on the system.

Antag onist. (Ανταγωνιστής; from ανταγωνίζομαι, to repel, or tight back. F. antagoniste; G. Gegenkampfer, Widerstreber.) Applied by Bartholin to muscles whose function is opposed to that of others, as the abduetors and

adductors, the extensors and flexors.

Antagonistopathicus. ('Δνταγώνιστος, contending as an adversary; πάθος, disease.) Term employed by Ploucquet to indicate the condition of a person suffering from too much or too little antagonism, or from disturbances of the natural autagonising forces in the body. (Kraus.)

Antagonopath'icus. The same as Antagonistopathicus.

Antal. Arabic for a pure lotion. (Ruland and Johnson.)

Antale. A synonym of Antalium. Antal'gic. ('Αντί, against; ἄλγος, pain.

F. antalgique, anti-algique; G. schmerzstillend.)
Term applied to that which can assuage pain. Anta'lium. ('Αντα, over agaiost; ἄλε,

the sea.) An old term for the calcareous tubes or shells of some animal living in sand on the sea shore; probably one of the Tubicola. Formerly used as a substitute for oyster shells.

Antal'kaline. ('Αντί, ngainst; alkali.) Having the power of neutralising alkalies; such

are all the acids.

Antambula'cral. (L. anti, opposite; ambulacrum.) Applied to the surface, in the star-fishes, opposite to that which bears the ambulaera.

The Hindu name of the Antam'ul. Tylophora asthmatica.

Antanac lasis. ('Αντανάκλασις, reflection. G. Zuruckwerfen.) Term applied to the reflection of a ray of light or a wave of sound to the point from which it emanated; sometimes applied to simple reflection at any angle.

Antanaclas mus. ('Αντανακλασμός, reflection.) The same as Antanaclasis.

Antanaclastic. ('Λνταναλλαστικός, belonging to reflection. G. zuruckwerfend, zuruckbiegend.) Reflecting.

**Antaphrodis'iac.** ('Αντί, against; ἀφροδισιακός, sexual; or ἀφροδισιακ veuereal desire. F. antaphrodisiaque.) Opposed to what is venereal; anti-venereal; the Latin analogue applied by Wedelins, Amæn. Med. ii, 2, c. 18, 455 sees towardisine which the content of the content o p. 455 seqq., to medicines which subdue the venereal appetite; also, to those employed against syphilis. .

Antaphroditic. Same as Antaphrodistac.

Antapod'osis. ('Ανταπόδοσις; from άνταποδίδωμι, to render again, or restore. G. Zuruckgabe, Ruckkehr, Wiederkehr.) A term, applied by Hippocrates, Dieter. n. 68, to the recurrence or succession of the paroxysms in fever.

Antapodotic. (Same etymon.) A remedy occasioning or inducing a recurrence of a

paroxysm.

Antapoplec'tic. ('Αντί, against; ἀπο-πληξία, striking down. F. antapoplectique.)

Opposed to or relieving apoplexy.

**Antarctic.** ('Αντί, against; ἀρκτικός, north pole.) Southern; opposed to, or opposite to, the north.

Antaris. Arabic for mercury.

Antarthritic. (Αντί, against; αρθρίτις, the gout. F. antarthritique; G. gichtheilend, Gichtmittel.) Term applied to medicines employed for the relief of gout

Antasphyc'tic. ('Avrí; asphyxia. F. antasphyctique.) Opposed to, or overcoming,

asphyxia.

Antasthen'ic. ('Αντι, against; ἀσθένεια, eakness. F. antasthénique.) Term applied to weakness. remedies that increase the tone and strength of the body.

**Antasthmatic.** ('Aντί, against ἀσθμα, short-drawn breath. F. antasthmatique.' Term applied to remedies employed for the relief

of asthma.

**Antatroph'ic.** ('Αντί, against; άτροφία, a defect of aliment, an atrophy; F. antatrophique.) Applied to medicines opposed to, or overcoming, a state of atrophy or wasting.

Antelix. See Antihelix.

An'te par'tum. (L. ante, before; partus,

birth.) Before delivery; as of homorrhage.

Antebra chial. The same as Antibrachial.

(L. ante, before; Antebra'chium.

Antecæ'na. (L. antecæna. G. Vormahl, Vesperbrod.) A meal before supper.

Antece'dent. (L. antecedo, to go before. G. vorhergehend, übertreffend.) Preceding; that which goes before or precedes.

Applied to the exciting cause (causa antecedens), or that which actually produces the disease; also, to the signs (signa antecedentia) or precursory symptoms of a disease. See Causa and Signa.

In Logic, the first or basic categorical proposi-

tion in a conditional proposition is called the

antecedent.

Ante cius. ('Aντί, against; οἰκέω, to inhabit. F. antécien; G. gegenuberbewohnend.) Applied to people placed under the same meridian and at the same distance from the equator, but in two opposite hemispheres; antipodean.

Antecur'vature. (L. ante, before; curro, to bend.) A bending forward.

A. of u'terus. A bending forward of the body of the uterus on itself, or on the eervix, in less degree than occurs in anteflexion.

Antedilu'vian. (L. ante, before; dilu-

vium, the deluge. F. antédiluvien; G. vorsündfluthlich.) Applied by Brongmart to the soils of trass and alluvium anterior to the animal period; applied also to some fossil shells, as Conus antediluvianus, the living analogues of which are not

Ante'don rosa'cea. Comatula rosacea. One of the Crinoid Echinodermata.

Antefix'us. (L. ante, before; figo, to fix. G. angenagelt.) Attached in front.

Anteflex'ion. (L. ante, before; flecto, to bend, or bow.) A bending or bowing forward.

A. of the u'terus. (L. inflexio uteri an-or; F. antéflexion de l'uterus; I. anteflesterior: sione dell' utero; G. vordere Knickung, or Vorbiegung des uterus.) A bending forwards of the uterus, or cervix, the fundus sinking down between the cervix and the neck of the bladder.

Anteflexion in its lesser degrees may produce no symptoms; when extreme, there may be pain in the back or groins, increased by exercise or sexual intercourse, dysmenorrhœa, and, it may be, sterility, menorrhagia, leucorrhea, irritable bladder. The organ may sometimes be replaced in its proper position by the sound and retained there by a suitable pessary, the recumbent posi-tion, the bladder kept as full as possible of urine, and an abdominal belt. In more severe and chronic cases the use of an intra-uterine stem has been advised; the cervix has been jucised so as, by a new channel, to relieve the constriction at the point of flexion.

Antefur'ca. (L. ante, in front; furca, a rk.) The double or forked apodeme which fork.) projects from the sternal wall of the anterior somite of the thorax, in the cockroach, into its eavity, and so helps to support the nervous cord.

The forked projections on the ventral surface of each somite in some Arthropoda are also so

Antela'bium. (L. ante, before; labium, a lip.) The extremity of the lip.

Antelmin tic. The same as Anthelmintic.

An'telope. See Antilopus. Antemballom'enum. ('Αντεμβάλλω, to put in instead.) A succedaneum. (Duugh-

Antem basis. ('Αντέμβασις; from ἀντεμβαίνω, to enter reciprocally.) Used by Galen, l. de Ossib. in prown., for the introduction or insertion of hones into each other; mutual in-

Anteme'diary. (L. ante, before; medium, the middle. F. antémédiaire.) Applied by Mirbel to petals opposite the sepals of the

Antemeridia lis. (L. ante; meridies, midday; from medius, middle; dies, day. G. vormittägig.) Before neon.

Antemerid'ian. (Same etymon.) Before noon.

Antemetic. ('Αντί, against; ἐμετικός, provoking sickness; from ἐμέω, to vomit.) Applied by Wıllis, *Pharm. Rat.* i, 2, c 3, temedicines used to allay sickness or prevent vo-

Antendeix is. ('Αντένδειξις; from αντί, against; ενδειξις, a demonstration. G. Gegenanzeige.) A term synonymous with contra-indieation; according to Galen, Meth. Med. ix, 17.

Antendix'is. The same as Antendeixis. Anteneas mus. ('Αντιτείνω, to rise up, to resist.) Term used by P. Zacchias, Quast. Medico.-leg. l. ii, t. i, q. 18, n. 31, seqq., for a disease characterised by the furious dancing of the patients, and a disposition to lay violent hands on themselves; also called *Enthusiasmus*, probably a species of the *Chorea Sancti Viti*.

Antener gia. (Arteripyeta, antagonism. G. Gegenterrkung, Wechselwirkung.) Resistance. Antenna. (L. antenna, a sail-yard; akin to avaraiva, to stretch up. F. antenne; G. Fühlhorn, Taster.) Applied to two or four articulated filaments, varying greatly in form, and often according to sex, inserted in the heads of the Crustaceae, Myriapoda, and Inserta, and appearing to be peculiarly devoted to a delicate sense of

touch or smell, or, as some have thought, another and as yet mnreeognised sense. The hasal joint is called the scapus; it is connected by means of a ball-and-soeket-joint with the tornlus, the part of the head on which the antenna moves; the second joint is the pedicella, generally small and spherical so as to allow of free motion, and the remainder is the clayula.

In the pupa form of Rhizopoda and Cirripedia, and in the Cladocera, the antennae are modified so as to form organs of adhesion; in the Arachnida the mandibles of falces are believed to be homologues of the antennæ.

The term is also applied by Quatrefages to the filiform or fleshy palpi attached to the cephalic segment, or prostomium of Chætopoda.

A., prehen'sile. (I. prehende, to lay hold of.) A term given to the foremost pair of limbs of the pupe of Rhizocephala and Cirripedia, inasmuch as they are medified for the purpose of attachment to rocks or other bodies.

Antennara'riei. In some arrangements a Tribe of Physomycetous Fungi, consisting of doceulent diffuse patches on leaves or bark; they appear to be stages of growth of other forms.

Antenna ria. (Antenna; so called from the resemblance of the male pappus to the antennæ of a butterfly. G. Halzenpfotchen.) A Genus of the Nat. Order Compositæ. Heads diœcious; flowers tubular; female filiform, 5-toothed; style slender, funnel-shaped; male tubular; anthers partly exserted; style undivided; fruit nearly terete; pappus of female filiform, of male thickened towards tip and serrate.

A. dioïca, Br. (F. pied-de-chat; G. Strohblume.) Diœcions antennaria; eat's foot. Hab. Europe, Northern Asia, and E. and N.-W. America. Stems densely tufted; leaves chiedy radical, spathulate, silky beneath; scapes slender, cottony, with linear bracts; male heads subglobose, small; stamens exserted; female heads much lenger than male; fruit papillose; pappus-hairs silky. A mild astringent and expectorant.

A.margaritte ea. (L. margarita, a pearl. F. immortelle blanche.) Life everlasting. An indigenens American plant. Perennial, stoloniferous; leaves beneath and corymb densely elothed with white or buff cottony tomentum; leaves lanceolate, acuminate, sessile, glabrous above. The flowers are of a pearly whiteness, and slightly fragrant. The leaves are said to be somewhat a stringent and expectorant.

A. plantaginifo'lia. (L. plantago, a plantain: folium, a leaf) Probably a variety of A diorca, and having similar properties.

Antennarie . (F. antennarie.) Applied by Lessing to a Section of the Tribe Sencioidæ, Nat. Order Compositæ, having the Antennaria for their type, with distinct multi-floral dioxious or monoccious capitula; receptacle without scales.

Antenna'ris. (Intenna: F. antennaire.)
Pertaining to the antenne; applied by RobineanDesvoidy, in the Myodaria, to two small pieces
adherent together, on which the antennæ are implanted.

Antenna ta. (Antenna.) An Order of Vermes, synonymous with Chatopoda.

Antenna'tæ-trachea'les. (F. antennies-tracheales.) Name by Lamarck for an Order of Arachnides having two antennæ, and respiring by tracheæ.

Anten'nate. (F. antenne; G. fühlhornartig, fühlkoldenartig.) Having antennæ.

Antenniferous. (Antenna; fero, to bear. F. antennifere; G. fuhlhorntragend.) Bearing or having autennae.

Anten'niform. (Antenna; forma, likeness. F. antenniforme; G. fuhlhornformig.)
Resembling antennæ.

Anten'nule. (Dim. of antenna. F. antennule; G. Fuhlhornchen.) A small antenna. Applied to the maxillary palpi, because of their likeness to small antenna.

Antepectoralis. (L. ante, before: pectus, the breast. F. antipectoral.) Applied by Kirby to the anterior fect of insects, or those fixed to the antepectus.

Antepectus. (L. ante, hefore; pectus, the breast.) The anterior area or segment of the pectus of certain insects, or superior surface of the trunk.

An'tepes. (L. ante, before; pes, foot. G. Vorderfusz.) The fore foot or paw.

Antephial'tic. ('Αντί, against; ἐφιάλτης, the nightmare.) Applied by F. Hoffmannus, in Meth. Med. Walkaana, i, 19, p. 288,
to medicines opposed to, or curative of, the affection ephialtes, or nightmare.

Antepilep'tic. ('Αντί, against; ἐπίληψις, epilepsy. F. antepileptique, anti-épileptique.) Opposed to, or curative of, epilepsy.

Antepo'nens. (L. ante, before; pono, to place.) Anticipating.
An'tera. See Anthera.

Antereis'is. ('Αντέρεισις.) The resistance or fulcrum, as in the setting of a bone.

**Anterethic.** ('Avrl, against;  $i\rho i\theta \omega$ , to excite. G. reizlindernd.) Having the power to quiet excitement or crethism.

Anterior. (L. anterior, feremost. F. anteriour; G. vorhergehend.) Applied to that which is situated before some other object of the same kind; it may mean towards the head, or towards the ventral surface.

A. au'ris. (L. auris, the ear. I. anteriore dell' orcechio.) A synonym of the Aurieularis anterior muscle.

A. mallei. (Malleus, the tympanie hone of that name. I. anteriore del martello.) A synonym of the Laxator tympani musele.

Anterio'res na'si. (L. anterior, front; nasus, the nose.) A synonym of the Pyramidales nasi.

An'terit. Arabic for mercury.
An'teros. The amethyst, according to Gorrous.

Anterotic. ('Αντί; έρως, desire. F. anterotique; G. Geschlechtstrichmindernd.) Remedies opposed to, or overcoming, desire or sexual passion.

Antes. (L. antes, rows. G. Rabatten.) Rows of flowers or of vines. The borders of a garden.

Antester num. (L. ante, before; ster-

num, the breast-bone.) The first or anterior division of the sternum.

Anteuphor'bium. ('Avi, against; euphorbium, a gum-resin.) See Cacalia unteuphorbium.

Antever'sion. (L. ante, before; verto, to turn. F. antéversion; G. Vorwürtsbeugung, Umbeugungnachvorn.) A turning forwards.

A. of the u'terus. (1. uterus, the womb. F. antiversion.) A falling forward of the body of the womb, so that the fundus is towards the symphysis pubis, with consequent tilting upwards and backwards of the cervix into the coneavity of the sacrum. It is not so common as anteflexion, and is usually accompanied by enlargement of the organ. Occasionally there are no symptoms; often there is dysmenorrhea, and not unfrequently irritation of the bladder, and sometimes of the rectum; the symptoms depend on the degree of anteversion. The organ is advised to be replaced by pressing upwards the fundus by two fingers in the vagina, and the abdominal viscera by the hand over the lower part of the abdomen at the end of a period of forced expiration; the retention of the organ in sitä may be attempted by lying on the back, by prolonged retention of urine, by an abdominal pad, or by a properly adjusted pessary. Many cases do not need treatment.

**Anthemopty'icus.** (' $\Lambda \nu \tau i$ , against; *Hæmoptyicus.* F. anthémoptyque.) Opposed to, or controlling, hæmoptysis, or spitting of blood.

Anthæmorrhag'icus. ('Arri, against; aluopayla, hemorrhage. F. anthemorrhagique.) Applied to medicines opposed to, or checking, hemorrhage.

Anthec'tic. ('Aντί; Hectic. F. anthectique.) Opposed to, or overcoming, phthisis or consumption.

Anthe La. (A $\nu\theta\eta\lambda\eta$ , a blossom, especially the downy plume of the reed. G. Spirre.) A cymose inflorescence in which the pedicels of the lower flowers are so long that they project above those of the npper ones; as in some species of Juneus.

Anthelitragicus. ('Αντί; καξ, the outer border of the external ear; τράγος, the tragus.) A synonym of the Antitragicus mussle.

Anthelitra'gus. (Same etymon. F. anthelitragien; 1. antelitrageo.) A synonym of the Antitragicus musele.

**Anthelix.** ('A $\nu\tau i$ , against, opposite; " $\lambda\iota\xi$ , the onter horder of the external ear.) See Antihelix.

Anthelmia. ('Aντl, against; ελμινς, a worm.) The Spigelia marylandica or worm grass, or the Spigelia anthelmia.

Anthelmin'thic. See Anthelmintic.
Anthelmin'tic. ('Αντί, against; Υλμυς, a worm. F. anthelmuntique; G. wurmabtreibend.)
Applied to a medicine which expels worms from the intestinal canal; vermifuge.

Anthelmin'tica. (Same etymon; G. Wurmmittel.) Worm expelling medicines.

**A.** cathar'tica. (Καθαρτικόs, cleausing.) Anthelminties which act by their purgative properties, as scammony, aloes.

A. lubrican'tia. (L. lubrico, to render slippery.) Anthelminties which act by their lubricating property, as olive oil.

A.ton'ica. (Tovos, tone.) Anthelmintics which have a supposed tonic action, as savin.

A. veneno'sa. (L. venenosus, very poison-

ous.) Anthelminties which act by destroying the worm, as powdered tin, male fern.

Anthelmin'ties. (Same etymon.) Anthelminties have been divided into those which kill the entozoon and those which simply precure its expulsion. Anthelminties are usually best given on an empty stomach and, if the drug itself be not purgative, followed in a few hours by an aperient.

A., mechanical. Those which act hy means of their physical properties, as cowhage, powdered tin.

A., poi'sonous. Those which act by killing the worm, as male fern, santonin.

**Anthe ma.** (Λυθημα, probably only found in composition, as εξανθημα. G. Bluhen, Blüthe.) An exanthematous blush.

Anthematoscheticus. See Exanthematoscheticus.

Anthemic acid. An acid said to exist in Anthemis nobilis.

Anthemid'eæ. (F. anthémidé.) A Tribe of the Family Composite, having the capitula heterogamous or homogamons; receptacle naked or paleaceous; anthers without an appendage.

or paleaceous; anthers without an appendage.

Anthem'idis flo'res, B. Ph. (F. fleurs de camonule; G. Komische kumillen.) Chamomile flowers. The dried single and double heads of the Anthemis nobitis, wild and cultivated. The single variety consists of both yellow tubnlar and white strap-shaped florets; the double, of white strap-shaped florets only; all arising from a conical sealy receptacle. They have a fragrant odour and a warmish, bitter aromatic taste. They contain a terpene, a camphorone ethereal oil, a bitter principle, anthemin, and a small quantity of a doubtful acid, anthemic, similar to valerianic acid. A hot infusion of chamomile flowers given freely is a good emetic; in moderate doses, and especially when made with cold water, it is a stomachic in enfeebled conditions of stomach with flatulence.

An'themin. An alkaloid obtained from the flowers of the Anthemis mobilis, in the form of shining prismatic crystals, inodorons and tasteless, insoluble in ether and alcohol, slightly soluble in water.

An'themis. ('Aνθεμίε.) A Genus of the Nat. Order Compositæ. Leaves alternate, bipinnatifid; pappus none; florets of the ray seldom absent. ♀ in one row, of the disc ‡; bracts imbricated; receptacle conical, scaly; achænia obsenrely 4-cornered.

A. arven'sis. (L. arvensis, of the fields. G. Aekerkamille, wilde Kamille.) Corn chamomile. Annual; seales of receptacle uncronate; flowers of ray female, white; flowers of disc winged. A native of Europe and America, the flowers of which have an acrid bitter taste, and resemble in their qualities those of common chamomile.

Their quanties these or control anything hollow. F. camonille phante, maronte; I. antennids puzzotente; S. manzanilla loca; Port. contusa starda; G. Hundskamille, stinkende Kamille.) The plant May-weed, or stinking chamomile. Annual; creet; leaves alternate, sessile, flat, doubly pinnate; scales of receptacle setaceous; flowers of ray generally neuter, white; flowers of disc winged. It is officinal in the U.S. Ph. See Cotala.

A. foe'tida. (L. fatidus, stinking.) A synonym of A. cotula.

A. nob'lls. (L. nobilis, celebrated. F. camomille romaine; 1. camomilla romana; S.

manzanilla romana; G. Römische Kamilla, or R. camulle.) The chamomile. Perennial; prostrate; leaves pinnate, downy; the lobes pinnatifid; receptacle long, conical; scales of receptacle lanecolate, obtuse; flowers of ray female, white; flowers of disc cylindrical. Hab. Pastures or gravel. Arematic, bitter, tonie, and emetic. Is used in intermittents, dyspepsia, flatulence, colic, and cructation. See Inthemidis flores.

A. noreboracen'cis. A synonym of A.

cotula.

A. odora'ta. (L. odoratus, fragrant.) A synonym of A. nobilis.

A. parthenoïdes. A synonym of Py-

rethrum parthenium.

A. pyre'thrum. The pellitory of Spain. Hab. Barbary, Spain, Levant. It is a powerful local irritant and sialogogue. A synonym of Anacyclus pyrethrum.

A. tincto'ria. (L. tinctorius, belonging to a dyer. F. eamomille des teinturiers, wil de baufs; G. Farber-Kamille.) Dyers' chamomile. Hab Europe. A plant occasionally employed as a tonic and vermifuge in Europe.

A. vulga'ris. (L. vulgaris, common.) A

synenym of Matricaria chamomilla.

Anthem'ium. ('Λνθέμιον. G. gehäufter Bluthenstand, Bluste.) A term applied to the inflorescence of Compositæ.

Anthemorrhag'ic. ('Αντί, against; αἰμορραγικός, liable to hamorrhage. F. anthemorrhagique.) Applied to remedies against

hæmorrhage.

**An'ther.** (' $A\nu\theta\eta\rho\delta s$ , in full bloom. F. anthere; G. Staubbeutel.) The anther is the essential of the control of the contro tial part of the stamen, and is formed by the union of a variable number of small sacs, which contain the pollen. The stamen, as a whole, represents a modified leaf, and the two lobes—the anther usually present—are formed by the two labial halves of the lamina, united by the midrib, which is here named the connective. The part of the midrib below the anther is named the filament. The anther is the first part of the stamen to appear in the development of the flower, immediately following the growth of the divisions of the calyx and corolla. They form in the first instance small bud-like processes, which grow rapidly, become flattened from without inwards, and then present a longitudinal groove on their two faces, the lateral parts swelling to form the lobes of the anther, the pedicle or filament in the meanwhile gradually developing. The lobes at this time gradually developing. The lobes at this time constitute two solid cellular cylinders, united by the connective, but soon they also present a lon-gitudinal fissure on one of their faces, and the whole anther is divided into four semicylindrical columns. A process of differentiation now takes place in each of the lobes, the central cells enlarging and dividing, and ultimately forming the mother-eells of the pollen or male ovules. The grains of pollen are formed by the genesis of nuclei, and then by the endogenous segmentation of the protoplasm of the male ovules. The mothereells of the pollen grains are irregularly polyhedric, and have at first a thin investing membrane homologons with the vitelline membrane, but this subsequently thickens and presents con-centric lamination. The contents consist of protoplasm homologous with the vitellus of the female ovum, and a large strongly refracting nucleus homologous with the germinal vesicle. Whilst the pollen grains are maturing, the septum between the two halves of each lobe of the anther

breaks down, and the anther then presents two locali. Each localus is lined by delicate cells, forming an endothecal zone, external to which is one or many layers of fibrous cells, forming a kind of network-the mesothecal zone. The most external cells have thicker and more consistent walls, and form an epidermis. The young anther then is quadrilocular, a condition that is occa-sionally, as in the Lauraceae, persistent, but usually the adult is bilocular. Occasionally, however, as in Malva and Zostera, it is unilocular. At a certain period of their development the anthers dehisce and allow the pollen grains to escape. In most plants the debiscence takes place by a longitudinal slit running in the direction of the septum, which originally divided the young anther into four loculi. When this slit looks inwards or towards the axis, the anther is said to be introrse, when ontwards extrorse, when at the sides the dehiscence is said to be lateral. Sometimes the dehiscence takes place by a fissure or pore at the apex of each lobule, or by a single pore common to both loculi. Occasionally it is transverse, as in Garcinia, Morella, and Lavandula; and sometimes by one valve, as in Berberis, or by two valves, as in Lindera, or by four valves, as in Cinnamomum zeylanicum, and Nectandra. The anthers usually dehisee after the expansion of the flower, but sometimes it occurs in the bud. The movements that have been observed will be described under the word stamens. In form the anthers vary much, being oblong, lanceolate, elliptical, globular, ovate, sagittate, reniform, sinuate, or peltate. The bilocular anther is termed didymous when the two lobes are rounded and only attached to the connective by a single point, as in Euphorbia and Exceedaria. Anthers often have appendages either at their upper or their lower extremity. The connective is usually linear, but does not quite reach to the apex of the anther, which is then said to be bifid at the summit; but the anthers are sometimes attached at one point only, and are then said to be versatile (see Connective). The colour of anthers is usually yellow.

A. lobes. (F. loges de l'anthère; G. Antherenhülfte.) The parts, usually two, of the anther lying on each side of the insertion of tho

filament Anthera. (Ανθηρός, flowery, florid.) Applied by Galen, l. iv, v, de C.M. see. Loc., to a medicinal preparation, of a bright red colour, used in form of a powder, liniment, electuary, or collyrium, formed of myrrh, sandarach, alum, rose leaves, and saffron.

Also, a medicine extracted from the hvacinth. Also, a yellow fluid obtained from lilies. (Ruland.)

Also, an Anther.

A. adna'ta. (L. adnatus, for agnatus, from agnascor, to grow on.) Term applied to an anther the back of which is attached throughout its whole length to the filament, or to its continuation, the connective, as in the magnolia and water lily.

A. agglutina'ta. (L. agglutino, to fasten to.) Term applied when the anthers of adjoining stamens are firmly adherent to each other, as in

some of the Rutaceæ.

A. anti ca. (L. antieus, in front.) The same as A. introrsa.

A. a pice affix'a. (L. apex, the summit; affixus, from affigo, to fasten to.) Term applied to an anther which is attached to the connectivo by its summit only.

A. a'pice bicor'nis. (L. bicornis, twohorned.) Term applied to an anther which is

prolonged above into two horns.

A. a'pice bicuspida'ta. (L. bis, twice; cuspis, a point.) Term applied to an anther each of the upper extremities of which is prolonged into a point.

A. a'pice bif'ida. (L. bifidus, eleft.) Term applied to an anther in which the two lobes

are prolonged beyond the connective.

A. a pice biporo'sa. (L. bis, twice; porus, a passage.) An anther in which each of the two loculi opens at the upper extremity by a

A. a'pice biporo'sa dehis'cens. (L. dehisco, to split open. F. dehiscence poricide.) A term applied to an anther the two lobes of which open by separate pores at the apex, as in Pyrola rotundifolia.

A. a'pice biseto'sa. (L. bis, twice; seta, a thick hair.) Term applied to an anther which

is prolonged above into two bristles.

A. a'pice dehis'cens. (L. dehisco, to split open.) A term applied to an anther de-hiscing by a fissure heginning at the apex and extending to a variable point on one of its faces.

A. a'pice emargina'ta. (L. emargino, to deprive of its edge.) Term applied to an anther in which the connective does not quite

reach to the extremity of the lobes.

A. a'pice quadriporo'sa dehis'cens. (L. quadri, for quatuer, forn; porus, a passage; dehisco, to split open.) Term applied to an anther possessing four loculi, each of which opens by a pore at the apex, as in Poranthera.

A. a'pice uniporo'sa dehis'cens. (L. s. one: norus. a passage; dehiseo.) Term unus, one; porus, a passage; dehisco.) applied to an anther in which the upper ends of the cavities of the loculi fuse together to form a kind of funnel, which opens at the apex of the anther by a single pore, as in Tetratheca juncea.

A. apicinx'æ. (L. apex, the summit; cingo, to gird.) The same as A. apice affixa.

A. apicula'ta. (I. apiculum, a pointed piece of wood and wool worn on the cap by the flamens.) Term applied to an anther in which the connective is prolonged into a point beyond the lobes.

A. appendicula'ta. (L. appendicula, a small appendage.) Term applied to an anther in which the connective is prolonged beyond the lobes in various ways, forming spurs, as in heartsease, or a feather, as in oleander, or a knob, as in magnolia.

A. ba'si bicor'nis. (L. basis, the base; bicornis, two-horned.) Term applied to an anther the inferior extremity of each of the lobes of

which is prolonged into a horn.

A. ba'si bicuspida'ta. (L. bis, twice; cuspis, a point.) An anther in which the inferior extremity of each lobe is prolonged into a point.

A. basifix'a. (L. basis; fixus, fixed.) The same as A. innata.

A. bilocularis. (L. bis, twice; locularis, belonging to a box. G. Zweifachrig.) Term applied to an anther in which the four loculi, originally present, have united to form two.

A. calcara tum. (L. calcar, a spur. anthère éperonné.) Term applied to an anther in which the connective is prolonged into a spnr or other appendage, as in Viola odorata.

A. conni'vens. (L. conniveo, to shut together.) Term for the anthers of separate

stamens which are simply applied to one another, as in the anthers of Solanum.

A. contin'ua. (L. continuus, joining, un-

interrupted.) The same as A. adnata.

A. cordifor mis. (L. cor, the heart; forma, shape.) Term applied to an anther in which the lobes, taken together with the connective, present the form of a heart.

A. did'yma. (Δίδυμος, double) Term applied to an auther in which the two rounded or ovate lobes are only attached by their apex,

diverging to some extent below.

A. distrac'tilis. (L. distraho, to draw asunder.) Term applied to an anther in which the connective is prolonged into a kind of stalk, separating the lobes from one another.

A. dithecallis. (Δίε, twice; θήκη, a case.) Term applied to an anther in which the septum, originally present in each lobe, dividing it into two loculi, has been absorbed, so that the anther has only two cells.

A. diver'gens. (L. dis, apart; rergo, to bend, to turn.) Term applied to an anther in which the lobes separate from each other at their inferior extremity, as in many Scrofulariaceæ, Labiatæ, and Euphorbiaceæ.

A. dorsifix a. (L. dorsum, the back; fixus, fast.) The same as A. adnata.

**A.** ellip'tica. (Ελλειπτικός, elliptic.) Term applied to an anther in which the two lobes

together present an elliptical form.

A. extror'sa. (Perhaps analogous to introrsus; as extrorsus, from extraversus, turned ontwards.) Term applied to anthers in which the suture indicating the line of dehiscence looks outwards, or is turned away from the axis.

A. globo'sa. (L. globosus, round like a ball.) Term applied to an anther the lobes of which are of a rounded or spheroidal form.

A. immob'ilis. (L. immobilis, immovable.) The same as A. adnata.

A. inna'ta. (L. innatus, part. of innascor, to grow up in.) Term applied to an anther in which the filament runs directly, without interruption, into the base of the connective, like the stâlk of an ordinary leaf, as in Carex.

A. intror'sa. (L. introrsus, toward the inside.) Term applied to an anther when the suture indicating the line of dehiscence looks inwards, or is turned towards the axis of the flower.

A. lanceola'ta. (L. lanceolatus, armed with a little point.) Term applied to an anther in which the lobes, together with the connective, are of a lanccolate form.

A. latera'lis. (L. lateralis, belonging to the side.) Term applied to an anther in which the suture indicating the line of dehiscence is situated at the side of the lobe, or at right angles to the axis of the flower.

A. linea'ris. (L. linearis, linear.) Term applied to an anther the two lobes of which are

narrow and long.

A. luna'ta. (L. lunatus, halfmoon-shaped.) Term applied to an anther in which each lobe presents the form of a crescent.

A. meandrifor'mis. (L. mæandrius, a winding; from Μαίανδρος, a river rising in Phyrygia, remarkable for its windings; forma, shape.) Term applied to an anther the lobes of

which are tortnous or convoluted.

A. mob'ilis. (L. mobilis, easily moved.) The same as A. versatilis.

A. oblong'a. (L. oblongus, oblong.) Term

applied to an anther the lobes of which, together with the connective, are of an oblong shape

A. ova'ta. (L. oratus, egg-shaped.) Term applied to an anther the lobes of which present

the form of an egg.

A. pelta'ta. (L. peltatus, provided with a shield.) Term applied to an author in which the connective is expanded over the lobes which are concealed beneath it, as in Cupressus juniperus and Thuja.

A. pendulo'sa. (L. pendulus, hanging.) Term applied to an anther which is attached to

the connective by its summit only.

A. postica. (L. posticus, hinder.) The same as A. extrorsa.

A. quadrilocula'ris. (L. quadri, from quatuor, four; locularis, belonging to a box. G. vierfachrig.) The same as A. tetruthecalis.

A. renifor'mis. (L. ren, the kidney; forma, shape.) Term applied to an anther the lobes of which, either with or without the connective, present the form of a kidney.

A. ri'ma longitudina'li dehis'cens. (L. rima, a cleft; longitudo, length; dehisco, to split open.) A term applied to an anther de-

hiseing by a longitudinal fissure.

A. sagitta'ta. (L. sagittatus, provided with arrows; shaped like an arrow-head.) Term applied to an anther in which the base of each lobe is prolonged, giving it the aspect of an arrowhead.

A. scs'silis. (L. sessilis, belonging to sitting.) Term applied to an anther in which the filament is aborted.

A. sinuo'sa. (L. sinuosus, full of bendings.) Term applied to an anther in which each lobe is curved or twisted upon itself, as in the Cucurbi-

A. subgiobo'sa. (L. sub, under; globosus, round like a ball.) Term applied to an anther in which the lobes, with the connective, are nearly

round or spheroidal.

A. tetrathecalis. (Τετράς, four; θήκη, a case.) Term applied to an anther in which the septum, originally present and dividing each lobe into two loculi, is persistent in the mature state, so that the anther has four eavities, as in Butomns.

A. unilocula ris. (L. unus, one; locularis, belonging to a box.) Term applied to an anther in which not only the septum separating the two loculi of each lobe is absorbed, but also that separating the eavities of the two lobes, so that there is only one eavity in the auther, as in Malva, Polygala, and Alchemilla.

A. unilocula ris dimidia ta. one; locularis, belonging to a box; dimidiatus, halved. G. cinfachrig.) Term applied to anthers in which only one lobe is abortive or suppressed, whilst only one half of the remaining lobe is de-

veloped, as in Gomphrena and Salvia.

A. versat'ilis. (L. rersatilis, that which turns round, revolving.) Term applied to an anther in which the filament is attached by a slender apex to about the middle of its back, so that the anther swings upon it, as in grasses and Enothera.

An'thera lil'ii al'bi. (F. authères de lis blane; G. Liliiensaffran.) The anthers of the white lily, Lilium candidum. Used as saffron.

Anther'ea. The same as Anthora. **Anther'eon.** ( $\Lambda \nu \theta \epsilon \rho \epsilon \omega \nu$ .) The chin, or the place under the chin, which is covered by the beard, according to Hippocrates.

Antheriethrin. See Antherythrin. Antherice. (F. anthérieé.) Applied, by Bartling, to a Group of Asphodelew.

Also, a Group of the Nat. Order Liliacea, having a tubular periantle narrowing into a straight tube; episperm black, brittle.

Anthericos. ('Ανθέρικος.) The stalk and also the flower of Asphodel.

Anthericous. (Anthera. F. antherique; G. staubbeutelig.) Belonging to anthers.

Anthericum. ('Ανθέρικος, the asphodel. G. Zauntitie, Grastitie, Zauntitume.) A Genus of the Nat. Order Liliucca, differing from Asphodela in having thread-like filaments.

A. lilla'go. Leaves npright, with a linear furrow; style bent down. The plant, the flowers, and the seeds, were formerly used in medicine.

A. lilias'trum. A synonym of A. liliago. Formerly said to be alexipharmic and purgative. A. ramo'sum. (L. ramosus, branching.)
Used as a diaretic and emetic.

Antheridan gium. (Anthoridium; and λγγείου, a vessel, a capsule. G. Antheridienbeholter.) Λ capsule containing antheridia.

Antheridium. (Anther; eldos, likeness.) In Mycology, a cellular organ filled with protoplasm growing from a mycelial cell, or from the cell which serves as a pedicle to the oogonium or female organ. the time of feeundation it applies itself to the oogonium, and produces a tubular process, which traverses the wall of the oogonium, and discharges its contents, often in the form of very actively moving corpuscles. In other groups of Cryptogams the name is applied to the organ that produces antherozooids. (Baillon.)

Antheriferous. (Anthera; fero, to bear. F. anthérifère; G. staubbeuteltragend.) Bearing anthers; applied to the tube or body produced by the union of filaments of stamens in monodelphons and diadelphous plants.

An'theriform. (Anthera; forma, likeness. F. untheriforme; G. staubbeutelformig.) Having the form of an anther.

Antherog'enous. (Anther; γευνάω, to produce. F. antherogène; G. Antherenzeugend.) Forming or producing anthers.

Also, applied by Candolle to organs developed from anthers, or to double flowers resulting from the transformation of anthers into corniculated petals.

An'theroid. (Anther; Moos, form.) Resembling an auther.

('Ανθηρός, blossoming.) Antheros. Blossoming; belonging to the process of blooming.

Antherosym'phyia. Same as Symphysandria.

Antherotes. ('Ανθηρότης, blossoming.)

The state of blossoming. Antherozoids. (Anther; Çwo, a living being; élèos, form.) A term applied to the male reproductive cells of Cryptogams. These usually possess the power of spontaneous movement, which is due to the presence of one or two vibratile cilia. They resemble, therefore, the sperma-tozoa of animals. Many antherozooids are developed in the interior of a single cell; just as many blastodermic cells result from the seg mentation of the contents of the ovum. In Fungi, well-marked antherozooids are only found in the Saproleguiæ; in the Monoblepharis, the protoplasm of certain cells of the growing filament divides at a certain period into five or six small ovoid masses, each of which, representing an antherozoid, presents a large granular extremity, attached to which is a long vibratile cilium and a small hyaline and colourless portion named the rostrum. The cells, whose protoplasm thus

divides, are named Antheridia.

In the Algæ, antherozooids are only found in a small number of groups, and their development is usually simple. In Vaucheria, for instance, they are produced by the segmentation of the contents of a special cell termed the corniculum. They are here very small, and formed of a colourless, naked, elliptical mass of protoplasm, and possess a very delicate vibratile cilium at each extremity. After their escape they flow in great numbers towards the oogonium, into which they penetrate, and fuse with the superior hyaline part of the oosphere. In the Fuci large numbers of antherozoolds are also formed by the segmentation of an ovoid cell, termed the antheridium. On the rupture of the antheridium the antherozooids press towards and impregnate the oosphere. In Œdogonium, antheridia are represented by the cells of the growing filament, ordinarily shorter and less rich in chlorophyll than others. At a certain period the antheridian cell divides into two mother-cells; the protoplasm of each of these last is transformed into an ovoid antherozooid, the small extremity of which, named the rostrum, is byaline, and presents a complete crown of vibratile cilia. In Elogonium diplandrum two antherozooids are formed in each mother-cell.

In Characeæ there are antheridia producing numerous mother-cells, each of which develops into a single antherozooid. These are elongated and twisted into a spiral form. The anterior extremity, very slender, has two cilia; the posterior

is enlarged.

In Hepaticæ and Mosses there are well-developed antheridia, which contain numerous mother-cells, each of which produces one antherozooid. These have a spiral form, with two cilia in front and a protoplasmic mass behind, composed of from six to twelve granules, which present active Brownian movements.

In the Equisetaceæ the antherozooids are formed, as in the last group, in mother-cells contained in an antheridium. They are spirally coiled, the sides of the anterior part possessing many cilia, and the posterior part presenting a

protoplasmic mass.

In the Ferns the antherozooids are flattened and twisted, with numerous cilia, often arranged in groups, attached to its fore part, and ending in

a vesicle behind.

According to some, the ciliated portion of the antherozooids is only a locomotive organ, the true fecundating organ being the protoplasmic vesicle. Others, however, believe the actively moving ciliated part to be the real agent in feeundation, the other part being the unaltered and unused-up portion of the mother-cell.

Anther ythrin. ( Δνθος, flower; ἔρυθρός, d.) The red colouring matter of plants, of red.)

which little is at present known.

Anthe'sis. ('Arθησιs, the blossoming of a flower. G. die Blüthezeit, du Brüthenstand.) The blossoming of a flower. The act of dehiscence of an anther.

Anthi'arin. (H (F. anthiarine; G. An-

Anthicides. (F. anthicides.) Applied by Latrelle to a Tribe of Coleoptera trachelides, having the Anthieus for their type. They are now regarded as a Genus of the Family Pyro-

chroida, Order Coleoptera.

Anthidu'leæ. (F. anthidulé.) Applied by Robineau-Desvoidy to a Tribe of Myodariæ micromydes.

An'thine. (Avlos, a flower. F. anthin; G. blumig.) Belonging to a flower.
An'thines. (Avluos, of flowers.) A name given to certain medicated oils and wines, because of their red colour.

Anthoboth rium. ("Artos, a flower; βαθρίον, a groove.) A sexually mature form of Cestoid worm, of the Family Tetraphyllida.

A. auricula' tum. (L. auricula, an ear.) Found in the intestine of Prionodon glaucus.

A. cornuco'piæ. (L. cornu, a horn; copia, plenty.) Found in the intestine of Galeus

A. gigante'um. (L. giganteus, belonging to the giants.) Found in the intestine of Galeus canis.

Anthobranchia'ta. ("Aveos, a flower; βράγχια, the branchiæ. F. anthobranche; G. Afterkiemer.) A Family of Order Notobranchiata, Class Gastropoda. Gills dendritic, placed in a circle round the dorsally situated anus. mantle contains calcareous spiculæ.

Anthocar pous. (Ανθος, a flower; καρπός, fruit.) Term applied in Botany to some fruits formed by the coalescence of the floral organs, or part of these organs, with the true fruit, as in the case of the pine, fig, and others.

Anthocephalous. (Ανθος; κεφαλή, a head. F. anthocephale; G. blumenkopfig.) Having a head in the form of a flower. The Ternia anthocephala has a very large head with four obtuse lobes that are longer than it.

Anthoceph'alus. (Same etymon.) The Cysticercoid form of Tetrarhynens, which undergoes development in osseous fishes, and then migrates to Elasmobranehs.

A. elonga'tus. (L. elongo, to lengthen.)
Found encapsuled in the liver of Orthagoriscus

A. gigante'us. (L. giganteus, belonging to the giants.) Found in the frontal cavities of Chorinemos saliens.

A. hippoglos'si vulga'ris. Found in the abdomen of Hippoglossus maximus.

A. merlan'gi. (F. merlan, the whiting.) Found encapsuled in the abdomen of Gudus æglifinus.

A. paradox'us. (L. paradoxus, strange.) Found encapsuled in the ventriculus of Merlangus carbonarius.

A. rep'tans. (L. reptans, from repto, to creep.) Found encapsuled in the peritoneum, intestinal walls, and liver, and between the muscles of Pogonias chromis.

A. rudicor nis. (L. rudis, rough; cornu, a horn.) Found encapsuled in the walls of the in estine, and in the liver and intestine of Hippoglossus gigas.

A. triglæ. Found encapsuled in the ahdomen of Trigla guruardus.

Anthoc'eros. (Άνθος, flower: κέρας, horn.) Horntlower. A species of Alga. (Quincy.) Anthocero'teæ. (Ανθος, a flower; κέρας, horn. F. anthocero'es.) An Order of the Class Hepatica, Subkingdom Muscinea. Small mosses with a thallus having no median nervure; antheridium developed under the epidermis of the upper side of the thallus; archegonia sunk in the upper surface of the foliage. The sporangium solitary, elongated, with two upright valves, central columella and sporogonium furnished with claters projecting from the arche-

Anthochronolog'ium. flower; xpovos, time; λόγοs, a discourse. G. Blumenkalendar, Blumenuhr.) The determination of the time of day or the season of the year hy means of the blossoming or opening of flowers

Anthocoma. A synonym of An-

thrax.

**Anthocoryn'ium.** (Άνθος, a flower; κορύνη, n club. F. anthocorynion; G. Blitthenknospe.) Applied by Meyer to a kind of claviform, bifurcated bract, placed horizontally, and in some sort a cheral on the pedunele of Surubaa

**Anthocy'anin.** ('Δνθος, a flower; κυάν-os, blue. G. Anthocyan.) The colouring matter of red, pink, or blue flowers, according to whether the juice of the flowers is acid or neuter. It is solid, unerystallisable, soluble in water and alcohol, insoluble in ether; it is rendered green by alkalies. It exists in an isolated state in some red flowers, as the red poppy, which become blue by the action of alkalies.

Anthocy'anum. The same as Antho-

Antho'des. ('Λυθώδης, flowery. F. antheux; G. blumig, voll Blumen.) Having or full of flowers.

Antho'diate. (F. anthodié; G. mit blumenkorbehen versehen.) Having an Antho-

**Antho'dium.** ('Aνθος, a flower. F. anthode; G. Bluthenkorbehen.) In Botany, the capitulum of Compositæ.

An'thofles. (Fr.) A synonym in some Pharmacopoias for Cloves.

Anthog raphy. ("Aμθος; γράφω, to write. F. and G. anthographie.) A description or history of flowers.

An'thoïd. ('Λυθος; εἶδος, likeness. F. athorde: G. blumenahnlich.) Resembling a anthoide; G. blumenahnlich.)

**An'tholite.** ("A $\nu\theta$ os;  $\lambda$ í $\theta$ os, a stone. F. antholithe.) The fossil impression of the flowers in the shales of coal measures, and more frequently in tertiary strata.

Anthology. ('Aνθος, a flower; λόγος, a discourse. F. authologic; G. Blumenlese.) Term for a treatise on, or history of, flowers, their

nature, qualities, appearance.

**Antholysis.** ("Aνθος, a flower; λύω, to loose. G. Blüthenanflösungen.) Term applied in Botany to the regressive metamorphosis of floral organs, the carpels, for example, becoming converted into stamens, the stamens into petals, then into schals, and the sepals into leaves.

**Anthomy'des.** ('Aνθος; μοῖα, a fly. F. anthomydes.) Applied by Robineau-Desvoidy to a Tribe of Myodaria mesomydes living generally

on flowers.

Anthomy'ia. ('Aνθος'; μυΐα, a fly.) A Genus of Family Muscidæ, Suhorder Brachycera, Order Diptera, Class Insecta.

A. bras'steæ. (L. brassica, eabbage. G. Kohlmode.) A species the larvæ of which live

in the stalk of the cabbage.

(L. canicularis, per-A. canicula ris. taining to the dog star.) A species the larvæ of which are found in and cause certain boils. The larvæ have been seen by Cobbold to be discharged

by the bowels in man, the ova having been probably ingested with the food.

A. meteorica. (G. Gewitterfliege.) A species which bites horses and cattle, drawing

blood.

**Anthomy zee.** (Ανθος; μυζάω, to suck. F. anthomyze.) Applied by Vicillot, Ranzani, and C. Bonaparte, to a Family of Pusseres that suck the saccharine juice of flowers.

**Anthonec'tar.** ('Aνθος; νέκταρ, drink or tood of the gods.) Same as *Phytonectar*.

Anthon'omus. ('Aνθος, a flower; νομός, pasture. G. Apfelrusselkäfer.) A Genus of the Family Curculionide, Order Coleoptera. The species are very destructive to the huds, leaves, and fruits of apple and pear trees.

An'thonor. See Athanor. An'thony's fire, St. The popular term for erysipelas, because St. Anthony of Padua was supposed to care it by miracle; also, popularly called the rosc.

A.'s, St., nut. The Bunium flexuosum. The Ranunculus bul-A.'s, St., rape. bosus.

Anthoph'agous. ('Ανθος, a flower; φαγείν, to eat. F. anthophage; G. blumenfressend.) Eating flowers; living on flowers.

Anthoph'ila. (Ανθος, a flower; φίλος, a friend.) A synonym of Apidæ.

An'thophore. (Aνθοs, flower; φορέω, to carry. G. Bluthenträger.) A term applied in Botany to that part of the receptacle which in some flowers undergoes great elongation above and beyond the calyx, and supports the corolla and reproductive organs, which are thus, as in the Lychnis, much higher than the calyx.

-μιτορή orous. (Aνθος, a flower; φορίω, to bear, F. anthopore; G. blumentragend.) Bearing many flowers.

Anthophylai

leaf. F. meres de giroftes; G. Mutternelken.) Cloves. The fruit of the Caryophyllus aromaticus.

Anthophyl'lite. (Anthophyllus, clove; so-called from its likeness to a clove in colour. F. anthophyllite.) A kind of hornblende. It consists of silicic acid, in combination with varying proportions of calcium, magnesium, and iron.

(As if antithora, or antiph-An thora. thora, from ἀντί, against; φθορὰ, corruption. G. Giftheil.) A species of aconitum, erroneously supposed to be not poisonous, and recommended as alexipharmic and anthelmintic. See Aconitum anthora.

A. sylves'tris. (L. sylvestris, belonging to woods.) A synonym of Ledum pulustri.

A. vulgaris. (L. vulgaris, common.) The Aconitum anthora.

Anthoris'ma. ('Αντί; ὅρισμα, a bonndary. F. anthorisme.) A diffused swelling.

**Änthorrhi'za.** ('Aνθος; ρίζα, a root. F. anthorrize; G. Blumenwurzel.) Term applied in Betany to those plants in which the flower rises directly from an underground stem; formerly mistaken for a root, as in Convallaria and Pri-

An'thos. ('Arthos, a flower of any kind.) Applied particularly to the flower of resemany. The quintessence of gold, according to the aleliemists.

Also, a term for Flos aris.

A. philosopho'rum. Old term for a mode

of transmnting metals by means of vitriol, ac-

eording to Labavins, S. A. Ch. l. vii, s. 7. **Anthosa'tum.** ('Aνθος, a flower.) The flower of rosemary. See Anthos.

**An'thosperm.** ("Ανθος; σπέρμα, a seed. F. anthosperme; G. Blumensame.) Name by Gaillon for an agglomeration of small coloured globules which, in certain Thalassiophytes symphysistea, always precede the development of tubercles or conceptacles, because in those more simple organisms they present some analogy with the floral state of phanerogamous plants.

Anthosper meæ. (Same etymon. F. anthosperme; G. blumensamiq.) Applied by De Candolle and A. Richard to a Tribe of Rubiaeca, having the Anthospermum for their

**Anthosper'mic.** ('Aνθος'; σπ'ρμα, seed. F. anthospermique; G. blumensamıg.)

Having an Anthosperm.

**Anthos'tomous.** (Λυθος; στόμα, a mouth. F. anthostome; G. blumenmundig.) Applied to a Family of Helminthaprocta, having four proboscides, or four prominent suckers, auriculiform or petaloid, giving to their head the appearance of a flower.

**Anthotax'is.** ("Aνθος; τάξις, order.)
The manner of disposal of the parts of a flower.

Antho'us. ('Aνθος.) A term anciently applied to the plant rosemary, but afterwards transferred to metals, and then signifying the tifth essence or elixir of gold.

Anthoxan'theæ. (Aνθος; ξανθός, yellow. F. anthoxanthe.) Applied by Link to a Tribe of Graminea, having the Anthoxanthum

for their type.

Anthoxan'thein. ('Aveos; Eaveos, yellow.) One of the two colouring principles of yellow flowers, which have been separated by MM. Frémy and Cloéz. An amorphous mass, soluble in water, alcohol, and ether, and turned brown by alkalies.

Anthoxan'thin. (Avdos; Eavdos, yellow. F. anthoxanthine; G. Anthoxanthin.) A name given by MM. Frémy and Cloéz to one of two colonring matters found in yellow flowers. It abounds in certain fruits, especially those of the Cucurbitaceæ. It is an amorphous resinous substance, of a beantiful yellow colour, insoluble in water. According to M. Filhol, it is turned green by hydrochloric acid, becoming blue on the subsequent addition of nitric acid. Ether then separates a yellow matter soluble in this menstrnum, and a blue matter soluble in alcohol.

Anthoxan'thum. (Same etymon.) Spikelets in a spike-like panicle, one-flowered, with a large, bifd, awned glume on each side of the flowering one; empty glumes two, unequal, membranes lawar are membranous; lower one-nerved, upper threenerved; floral glume glabrous, awnless; paleze one-nerved; scales absent; stamens two; anthers linear, yellow; styles long, stigma feathery; fruit terete, enclosed in the brown shining floral glume and palea. It derives its name from its yellow anthers.

A. odora'tum. (L. odoratus, sweet smelling. G. Riechgras.) Nat. Order Graminacew. Sweet vernal grass. Perennial; panicle pubescent, interrupted below; awn short, scarcely exserted; anthers purple or yellow. It gives the characteristic odour to bay, and it is thought by some that the pollen of this plant is the cause of hay astlima.

Anthozo'a. ('Aνθος, a flower; ξώον, a

living being, an animal.) A Class of the Subkingdom Colenterata. Polypes provided with a gastric tube and mesenteric folds, and with internal sexual organs; frequently assembled in colonies which deposit coral. See Actinozoa.

Anthozu'sia. ('Ανθος: ὀζόσμαι, to branch it. F. anthozusue.) Name by Link for a kind out. F. unthozusie.) Name by Link for a kind of anamorphosis of leaves when they assume the

character of petals.

Anthracazothydrot'icum.  $\theta \rho \alpha \xi$ , coal, earbon; azotum, nitrogen;  $\tilde{v} \delta \omega \rho$ , water. G. Blausaure.) Old term for hydrocyanic

Anthra'cia. ('Ανθραξ, a coal.) A synonym of Carbuncle.

A Genus of Dr. Mason Good's Exanthematica, consisting of foul imperfectly sloughing tumours. A. pes'tis. (L. pestis, a plague.) Dr. Good's term for the Plaque.

A. ru'bula. (L. dim. of rubus, a bramble.)
Dr. Good's term for the yaws. See Frambasia.

Anthrac'idus. (Avetage, a coal. F. anthracide.) Applied by C. F. Naumann to a Class, by Beudant to a Family, that contains carbon, either pure or combined with other

**Anthraciferous.** ("Ανθραξ; fero, to bear. F. anthracifere; G. kohlentragend.) Containing carbon.

**Anthrac'iform.** ('Aνθραξ'; forma, likeness. F. anthraciforme.) Having the form or appearance of the Anthrax, as Sesia unthraciformis.

Anthra'cii. (F. anthracien.) Applied by Latreille to a Tribe of Diptera tanystoma, having the Anthrax for their type.

An'thracine. (Λνθραξ, coal.) A form of cancer characterised by blackness of the diseased part, or the presence of melanosis.

**Anthra**'eion. ('Ανθράκιον, dim. of άνθραξ, a carbunele.) A synonym of Malignant pustule.

Anthracite. ('Ανθραζ, coal or charcoal. G. Stevakohle.) A coal which contains very little bitumen, and is found in the oldest of the Carboniferous deposits. It has a more or less metallic lustre, a greyish-black or iron-black colour, and is frequently iridescent; its fracture is conchoidal; it is a good conductor of electricity, and burns with very little flame. It has been given nowdered in hearthurn, in scorbutic conditions, and for intestinal worms.

An'thracoid. (Δυθραξ; είδος, Ekeness. F. anthracoide; G. kohlenahnlich.) Resembling carbon, or the gem carbunele, or the disease car-

Anthracolith'us. ("Ανθραξ; λίθος, a stone.) Same as Anthrucite.

Anthracolæ'mus. ('Ανθραξ'; λοιμός, a pestilence. F. peste anthracique; G. die Schwarze Blatter; Milzbrand-Carbunkel.) The Festis

anthracia of Pinel, or black plague.

Anthracom'eter. (Αυθραξ; μέτρου, a measure. F. anthracomietre; G. Kohlensauremesser.) An instrument to determine the quantity of carbonic acid existing in a gaseous mixture; an anthracometer.

Anthracom'etry. ("Ανθραξ, earbon; μέτρον, a measure.) A means of testing the purity of air intended for respiration, by determining the amount of carbonie acid gas it contains. Pettenkofer has suggested two methods, one of which consists in ascertaining the amount of carbonic acid in a particular sample of the air,

and the other its average amount throughout the whole period of observation.

Anthraconecro'sis. ("Ανθραξ; νέκ-

ρωσις, deadness.) Senile gaugrene.

Anthraconite. ('Aνθραξ. F. anthraconite.) A variety of marble which has a coal black lustre when polished, as Kilkenny anthraconite.

Anthracophlyc'tis. ('Λυθραξ; φλυκs, a blister. F. anthracophlyctis; G. Brandblatter.) Carbuneulous or malignant pustule.

Anthracoporphyroty phus. (Anthrax; porphyrotyphus. F. anthracoporphyrotyphus.) Carbunculous porphyrotyphus.

Anthraco'sis. ('Ανθραξ, a coal.)

carbuneular disease

Also, a deposit of black material in the body. A. oc'uli. (L. oculus, the eye.) A term used by Paulus Ægineta for a red or livid, burning, sloughy and very painful tumour, occurring on the eyeball or eyelids.

A. pulmo num. (L. pulmo, a lung. F. fausse melanome du poumon, pseudo-melanose pulmonaire, matier noir des poumons, carbon pulmonaire; G. Kohlenstaubinhalationskrankheit.) Miners' or colliers' phthisis. A disease characterised by carbonaceous sputa and the deposit of carbon, in a finely granular condition, in the tissue of the lungs. It is common in those working in coal mines or other places where there is much carbon dust in the atmosphere, and is essentially a fibroid phthisis. The affected parts of the lungs are more or less consolidated, slate-coloured or black, and projecting; on section they present a smooth, firm surface; the bronchial tubes contain blackish mucopurulent matter; the interalveolar septa are thickened; black molecules are deposited along the course of the vessels, in the walls of the air cells, and amongst the connective tissue; and are also found in the mucus-corpuseles and in the ciliated epithelium. At a later stage, eavities form.

A deposit of carbon, recognised by its resistance to the action of acids and chlorine, is seen in man and in the dog as age advances. It produces no symptoms unless in great excess. The bronchial glands are frequently the seat of a similar deposit.

**Anthracothe** rium. ( 'Ανθραξ, coal; θηρίον, an animal. F. anthracotherion; G. Kahlenthier.) A fossil animal in coal, also in sandstone,

Anthracoty'phus. (L. anthrax; typhus. F. anthracotyphus; G. Typhus mit Curbunkelbildung.) Carbunculous typhus.

Anthrakoka'li sim'plex. ('Ανθουξ, a coal; kalı. G. Steinkohlenkalı.) Five parts of powdered anthracite mixed with seven parts of caustic potash are fused in an iron vessel. is black, bituminous-smelling, strongly alkaline, and not entirely soluble in water. It was introduced by Dr. Polya, of Pesth, and used in scrofula, chronic rheumatism, and chronic eezema. Dose 1-5 grains in water, or mixed with powdered liquorice; externally as an ointment, in the proportion of one part to twenty of lard.

A. sulfura'tum. (1. sulfuratus, impregnated with sulphur. F. anthracokali sulfureux; G. geschwefeltes Anthracocali.) A sulphuretted form made by mixing 16 parts of sulphur with 160 parts of pulverised anthracite, and adding these to 192 parts of a concentrated and boiling solution of caustie potash contained in an iron vessel; or by fusing together 7 parls of caustic potash, 5 of anthracite, and 4 of flowers of sulphur. It is used for the same purposes and in the same dose and manner as A. simplex.

An'thrax. ('Λνθραξ, a coal, or carbuncle. G. Kohle, bosartiges Geschwür, Milzbrand des Rindwich's.) Old term applied to the hydrargyri

sulphuretum rubrum.

The term has also been used to describe the earbuncular disease caused by infection from an animal suffering from splenic apoplexy, for which see Malignant pustule

Also, a synonym of Carbuncle.

Also, it has been applied to splenic apoplexy in domestic animals.

A. intestina'lis. (L. intestina, the bowels.) A term given to poisoning by eating (L. intestina, the the flesh of animals suffering from splenie apoplexy or anthrax; violent vomiting, diarrhæa, eyanosis, and collapse speedily set in. The gastrointestinal mucous membrane is found intensely injected, with edematous and hæmorrhagic projecting infiltrations, having discolored, acuminated centres. Bacteria are numerous.

A. malig'nus. (L. malignus, of an evil nature.) A synonym of Malignant pustule.

A. pulmo'num. (L. pulmo, the lung.)
A term for gangrene of the lung.

Anthraxif'erous. Same as Anthraci-

ferous. Anthrazothion'ic. ('Aνθραξ, eoal, azotum, nitrogen; θεῖον, sulphur. G. Schwefel-cyanwasserstoffsauere.) Same as Sulphocyanic.

Anthrazothion uret. (Same etymon.) Same as Sulphocyanuret.

**Anthrazo'thium.** ("Aνθραξ; azotum;  $\theta \in \tilde{\iota}o\nu$ , sulphur. F. anthrazothion.) Name by Grotthaus for sulphocyanogen, as expressing that it contains earbon, nitrogen, and sulphur.

Anthre'nus. (ἀνθρήνη, a hornet. F. anthrène.) A Genus of Coleoptera, the Byrrhus of Linnæus. Forehead with a simple ocellus; antenna cleven-jointed, ending in a three-jointed club; or eight-jointed, with a two-jointed club; or five-jointed, with a single terminal club; upper maxille erenulated; prothorax deeply channelled for the antennæ.

A. destruc'tor. (L. destructor, a déstroyer. F. anthrène destructeur, a. du boueuge.) A species the larvæ of which commit great depredatious on campher, cantharides, musk, and on other dried animal substances, as anatomical preparations.

A. pimpinel'læ. The same as A. destructor

Anthribides. (F. anthribides.) Name by Latreille for a Tribe of Rhyncophora, by Schænherr, a Group of Curculionides, baving the

Anthribus for their type.

Anthribus for their type.

Anthric'inæ. A Subfamily of the Family
Pyrochroidæ, having the thighs of the anterior and middle legs somewhat distant, leaving free

the mesotherax.

Anthris'cum. A plant, probably the A. odoratus, Linn., used by the ancients as a stimulant and cure for leucorrhea.

Anthris'cus. ('Ανθρίσκος. G. Kerbel, Klettenkerbel.) A Genus of Nat. Order Umbelliferæ. Beaked parsley. Annual or biennial hairy Leaves deltoid, pinnately or termitely decompound; umbels compound; bracts one, two, or none; bracteoles many, entire; ealyx obsolete; petals with an inflexed point; fruit ovoid, heaked, contracted at the side; ridges confined to the beak; vitta solitary or none; seed furrowed next the commissure.

A. cerefolium, Hoffm. (L.; or carefolium, Latinised by Pliny, from χαιρέφυλλον; from χαίρω, to rejoice; φύλλον, a leaf. F. cerfeiul cultivé, c. officinal; G. Gartenkerbel.) Chervil. Hab. Europe. Stem hairy above the joints; umbels sessile, lateral, opposite a leaf; fruit glabrous, twice as long as the beak. The plant has a pleasant aromatic odour, and is cultivated as a pot herb. It is said to be deobstruent, diuretic, and emmenagogue. It has been used in consumption, serofula, dropsy, cutaneous and seorbutic affections, and as an application to swollen breasts, bruises, and other local affections. The fresh juice is officinal in the Fr. Codex.

A. hu'milis. (L. humilis, low.) The A.

sylvestris.

A. pro'cerus. (L. procerus, tall.) The

A. sylvestris.

A. sylves'tris, Hoffm. (L. sylvestris, belonging to the woods. F. cerfeuil sauvage; G. wilder Kerbel.) Hab. Europe. Stem hairy helow; umbels peduncled, terminal; fruit glabrous. The plant has a strong disagreeable odour and a bitter taste. Has been used as an aromatic, and is said to be poisonous.

A.vulga'ris, Pers. (L. rulgaris, common.) Stem smooth; umbels peduncled, opposite a leaf; fruit ovate, hispid. An indigenous herbaceous plant; reputed to occasion stupor, delirium,

palsy, and asphyxia.

Anthro'pe. (' $\Lambda \nu \theta \rho \omega \pi \epsilon \eta$ , a man's skin.) Ancient term for the human eutis, or true skin; used by Herodotus, l. v, c. 25, where Julius Pollux appears to have read  $a\nu \omega \pi \eta \nu$  (see *Onomast*, l. ii, c. i,  $\delta$  5), but no good modern editions contain this reading.

Anthropendypocau'sis. ('Δνθρωπος, man; endypocausis. F. anthropendypocausis.) Internal heat, or burning of the human

body.

Anthropey iphyte. ('Aνθρωπος; εpiphyte. F. anthrop-iphyton; G. Huntgewaehs.) A parasite, or fungous growth on the human skin.

Anthropiat'rica. ( Λνθρωπος; Ιατρικός, belonging to medicine. F. anthropiatrique; G. Anthropiatrik, Menschenheilkunde.) The consideration of medicine in reference to man; the art of treating human diseases.

Anthro pic. ( Ανθρωπος.) Belonging,

or relating, to man. Anthro'pidæ. ("Aνθρωπος.) A Suborder of the Order Primates, of which man is the only genus and species. Lower limbs devoted to progression, anterior to prehension; sacrom as broad as long; hands prehensile, wide short; thumb opposable; ilia wide; ischiatic tuberosities everted; pelvic cavity and outlet broader than long; foot broad; hallux not opposable; teeth without a diastema; brain very large, convolu-

tions large and complex, sulci deep. **Anthropin'ic.** ("Ανθρωπος.) Belonging,

or relating, to man.

**An'thropism.** ('Aνθρωπισμός, humanity. F. anthropisme; G. Menschenthum.) The character or condition of a human being.

Anthropisto'ria. (κνθρωπος, man; ιστορία, information. F. anthropistorie; G. Menschenbeschreibung.) A description or history

**Anthropocen'tric.** ( $^{\prime}$ Λνθρωπος; κέντρον, any sharp point, the stationary leg of a

pair of compasses.) A term applied to that theory of the universe which regards man as centre or chief object of its existence.

Anthropochemia. (Λυθρωπος; χημεία, chemistry. F. anthropochimie; I. antropochimie; G. Anthropochemie, Menschaustoffkunde.) The chemical analysis of the human body.

Anthropochim'ia. Same as Anthropochimia.

**Anthropoc'tony.** ('Λνθρωποκτονία; ανθρωπος, man; κτείνω, to kill. F. anthropoctonie; G. Minschenmord.) Manslaughter; the destruction of man.

**Anthropodec'tus.** ('Ανθρωπόδηκτος ; ἄνθρωπος, man; δάκνω, to bite. F. anthropo-

decte.) Bitten by man.

**Anthro'poform.** ("Ανθρωπος; L. forma, shape.) Having the appearance or qualities of man.

Anthropogen'esis. Same as Anthro-

Anthropogen'ia. ( $\Lambda v\theta_{\rho\omega}\pi os$ , a man;  $\gamma \varepsilon v \nu a\omega$ , to produce. F. anthropogenie; G. Erzeugung des Menschen.) See Anthropogeny.

Anthropog'eny. ('Ανθρωπος, man; γένος, a race.) The doctrine of the descent of An endeavour to trace, on the theory of evolution, the successive stages by which the lowest forms of animal life have developed into the highest or human life. The evidence is deduced partly from geological considerations, necessarily very imperfect, since not only has the opportunity of examination by competent observers of large areas and numerous strata been wanting, but there can be little doubt that many groups of soft-bodied animals have died and left no recognisable trace behind them; partly from embryological considerations, for ontogenesis or the development of the individual represents, according to Haeckel, abbreviated phylogenesis, or the development of the race; partly from a comparison of the structure and functions of the various groups of living animals; partly from a study of atrophied organs, such, for example, as the Wolffian bodies, which in certain animals possess active functions, but which have fallen into disuse in man, being supplanted by organs of higher type; partly from the phenomena of Teratology, which often indicate reversion to lower types; and partly from pathological considerations.

The genealogical tree of the human race, as given by Haeckel, who is supported generally by Huxley, is as follows:—The lowest forms of animal life which represent the first formed creatures are the Monere. These, in the lapse of time, developed into solitary Amobae, and these again clustering together formed the Synamobae, these the Planeades, and these, through the Gastreada, Vermes, Archelminthe, Scolecidae, Chordonians, Acrania. Cyclostoma, Selachii, Dipneusti, Amphibia, Promammalia, Marsupials, Prosimian Apes, Anthropoid Apes, to Man. The doctrine is ably supported by Haeckel, Parwin, and a bost of writers. It has been combated by Agassiz, St. George Mivart, Bree, and others.

**Anthropog raphy.** (Άνθρωπος, a man;  $\gamma \rho \dot{\alpha} \phi \omega$ , to write.) A history of, or treatise on, the structure of man.

Also, that branch of Physical Geography which treats of the distribution, language, manners, and customs of man.

Anthropohistog'raphy. ('Λνθρω-

 $\pi \sigma s$ ;  $i\sigma \tau \dot{\sigma} s$ , a web;  $\gamma \rho \dot{\alpha} \phi \omega$ , to write.) A description of the tissues of the human body.

An thropoid. ('Aυτρωπος; είδος, form. F. anthropoide; G. Menschenahulich.) Resembling man.

A. apes. The higher or man-like apes. See Anthropomorpha.

**Anthropol des.** (Λυθρωπος, man. F. anthropoux; G. menschenartig.) Pertaining to, or resembling, man.

**Anthropolite.** ('Ανθρωπος; λίθος, a stone. F. anthropolite.) A human petrifaction; applied to the petrified human bones from Guadaloupe.

Also, a term for concretions in the human

body.

Anthropolithic. ( $\Lambda \nu \theta \rho \omega \pi \sigma s$ ;  $\lambda i \theta \sigma s$ .) Term applied by Haeckel to indicate the quaternary period or age when man, fully formed, appeared on the earth.

Anthropolog'ical. Pertaining to Anthropology.

**Anthropology.** ( $\Lambda \nu \theta \rho \omega \pi \sigma s$ ;  $\lambda \delta \gamma \sigma s$ , a discourse. G. Menschenkunde.) The study of man as a whole and in the widest sense of the term; both from a physical and a psychological point of view.

A., descrip'tive. One of Broca's divisions; being the study of the human group con-

sidered in its individual relations.

A., gen'eral. Oue of Broca's divisions; being the study of the human group considered

as a whole.

A., mor'bid. The study of man in relation to the diseases which affect him as a being that lives in a society.

**A.**, patholog'ical. The same as A., morbid.

A., zoolog'ical. One of Broca's divisions; being the study of the human group considered in its relations with the rest of organised nature.

**Anthropomag'netism.** ('Aνθρωπος'; magnetismus.) Term for Animal magnetism.

**Anthropoman'cy.** (Aνθρωπος; μαντεία, divination.) Divination by means of inspection of the entrails of a dead man.

Anthropomet'allism. (Ανθρωπος; metallum, a metal. F. anthropometallisme.) Term by Spindler for one of the principal forms of animal magnetism, that in which somnambulism and other phenomena are said to result from

looking at a metal plate or point.

Anthropom'etry. (Αρθρωπος; μίτρον, a measure. F. anthropométrie; G. Menschenmasslehre.) This term is applied to the determination of the physical proportions of the body and of its weight and strength. The iostruments required are a weighing machine, a dynamometer, handrule, measuring staff and measuring-tape, a pair of eallipers, and a chart. An anthropometric chart has been constructed by Charles Roberts, which consists of an outline figure of a man in a standing position, the heels in contact, and the arms hanging down, the forearm of one in the prone, the other in the supine position, and having lines drawn from a vertical median line horizontally to a line at the side, on which the length of the face, chest, abdomen, and other parts, can be written down. The chart contains other smaller tables, on which circular measurements can he made. Mr. Roberts gives minute rules and directions for taking and inserting the measurements.

The measurements of the different organs of

the body will be found under their appropriate headings. A few general observations on the bulk and stature of the hody may here be made. It is by no means easy to estimate the height exactly. It varies with the period of the day and the length of time that the standing or recumbent posture has been maintained, and with the action of the extensor muscles of the trunk, neck, and limbs. Trunk: The Americans, in their measurements made during the War of Secession upon a million individuals, chose as boundaries the spinous process of the seventh cervical vertebra and the perimeum, and found the length to be from 362-394 thousandths of the stature. Quételet took from the elavieles above to the perinæum below, and found a mean of 354 thousandths of the stature. In Seriziat's and Topinard's method the distance between the biaeromial and the biischiatic line was taken; the mean was 362 thousandths. The length of the trunk is, therefore, more than one third and less than two fifths of the stature.

The distance between the tips of the middle fingers, when the arms are as widely extended as possible, termed by the French the grande envergure, may be equal to the stature, or may exceed it by varying proportion up to 89 parts in a 1000. In a series of 10,876 American soldiers the mean

was 1.043 to 1.000.

Of the two extremities the upper, minus the hand, is shorter than the vertebral column from the atlas to the point of the sacrum in the proportion of 79 to 100; whilst the lower extremity, less the foot, is longer in the proportion of 113 to 100 (Huxley); or if the f-mur and tibia together be taken as 100, the humerus and radius together represent 68-1 (Humphry); or 68-9 (Topinard and Broca). The length of the radius is 75-1 (H.), 76-1 (T. and B.), if the femnr be taken as 100, the tibia 82-6 (H.), 80-6 (T. and B.), these observers excluding the internal malleolus. The relation of the hand to the stature is as 11-82:100, of foot as 16-96:100.

At birth man's height is 56 centimètres; at five years of age about I metre; at fifteen 1.50 m.; at niueteen he wants 15 mm. to complete his full height, which is reached generally at or about thirty years of age, though this varies. From fifty to sixty years the height always diminishes, and at ninety years is less by 7 centimètres.

The woman is shorter than the man by 12 centimetres, i.e. she is 7 per cent. less in height.
The average stature of adult Englishmen is stated by Dr. Beddoe to be between 5 ft. 6 in.

and 5 ft. 7 in. (1.676 and 1.702 mètres). Topinard gives it at 1.708 mètres. Of-

Anthropomor pha. (Aphpomor; upophi, form.) A Family of the Suborder Catarrhina, Order Primates. Arboreal, hair-covered animals, which babitually assume a semi-erect posture; tail rudimentary; anterior limbs long; dorsolumbar vertebrae seventeen or eighteen in number, the spines of which do not point towards a common centre; thorax broad; sternum wide; callosities and check pouches absent.

Anthropomor'phism. ('Ανθρωπόμορφος, of human shape. F. anthropomorphisme; G. Vermenschlichung.) Same as Anthropomorphosis.

The ferm is also used to express the conception of God as a being possessed of human properties and attributes.

**Anthropomor'phite.** ( $\Lambda \nu \theta \rho \omega \pi \sigma s$ , man;  $\mu \rho \rho \phi \dot{m}$ , form.) A plant, or part of a plant, resembling the human body.

**Anthropomorphol'ogy.** (Λνθρωπος; μορφή; λόγος, a discourse. F. and G. anthropomorphologic.) A treatise on the form of different parts of the human body. Synonymous with Descriptive Anatomy.

Anthropomor'phos. ('Ανθρωπόμορφοs, of human form.) A synonym of the Atropa mandragora.

**Anthropomorpho'sis.** (Άνθρωπος; μορφή. F. anthropomorphose; G. Menschengestattenbildung.) The formation of the human form.

Anthropomor'phous. (Ἄνθρωπος, man; μορφή, form.) Formed like man; resembling man's outward appearance; man-shaped. A name given by the old botanists to plants, or parts of plants, in which they saw some resemblance to the human body. The roots of Mandragora, certain Fungi, and the labellum of some Orchids, constitute examples.

**Anthropon'omy.** ( $\Lambda \nu \theta \rho \omega \pi \sigma s$ ;  $\nu \delta \mu \sigma s$ , a law. F. and G. anthroponomie.) The science which treats of the laws that regulate the formation of man, or that regulate the functions of his organs. Synonymous, in the latter sense, with Physiology.

**Anthroponosol'ogy.** ( $^{\Lambda}\nu\theta\rho\omega\pi\sigma\sigma$ ;  $^{\nu}\delta\sigma\sigma$ s, disease;  $^{\lambda}\delta\gamma\sigma$ s, a description. F. and G. anthroponosologie.) The doctrine of human diseases

Anthropop'athy. (Ἄνθρωποπάθεια, humanity. F. and G. anthropopathie.) Ilumanity. Anthropoph'agus. (Ἄνθρωπος; φαγείν, to eat. G. Menschenfresser.) Term for an eater of human flesb; a man-eater; a cannibal.

**Anthropoph'agy.** ('Λνθρωπος', φαγεῖν, to eat. F. anthropophagie', 1. antropoţagia'; G. Menschenfressen.) The act, or custom, of eating human flesh.

**Anthropopharmacol'ogy.** ("Aνθρωπος; φάρμακον, a drug; λόγος, an account; pharmacology. F. anthropopharmacologie; G. Anthropopharmakologie.) An account of the action of medicines on man.

**Anthropopho'bia.** ('Aνθρωπος ; φόβος, fear. F. anthrophobie; G. Menschenscheu.) A fear or dread of man.

**Anthropoph'orus.** ("Λνθρωπος; φέρω, to bear. F. anthropophore; G. menschentragend.) Applied to Loroglossum anthropophorum, hecause of a supposed resemblance between the labellum and a man suspended by the arm.

**Anthropoph thorous.** (' $\Lambda \nu \theta \rho \omega m \sigma - \phi \theta \delta \rho \sigma s$ ; from  $\tilde{a} \nu t \theta \rho \omega m \sigma s$ ;  $\phi \theta \epsilon (\rho \omega)$ , to destroy. F. anthropophthore; G. menschenverderbend.) Destroying men.

Anthropoplatrica. ('Ανθρωπος ; laτρικος, medical. G. Menschenheilkunde.) The medical art applied to man.

**Anthroposcat'ina.** ('Aνθρωπος; σκώρ, dung. F. anthroposcatine; G. Menschenkothstoff.) Human ordure.

**Anthropos' copy.** ('Λνθρωπος; σκοπέω, to explore, or observe.) The act of forming a judgment of a man's character and disposition, from an inspection of the lineaments of his body; physiognomy.

Anthroposco'rina. Same as Anthroposcatina.

**Anthroposomatol'ogy.** ( $^{\text{A}}\nu\theta\rho\omega$ - $^{\text{π}}\sigma s$ ;  $^{\text{σ}}\omega\mu\alpha$ , the body;  $^{\text{λ}}\dot{\sigma}\gamma\sigma s$ , a discourse. F. anthroposomatologie.) A treatise, dissertation, or description of the structure of the human body.

Anthropos'ophy. ('Λυθρωπος', σοφία, wisdom, or knowledge.) The knowledge of the nature and general character of man, according to Charlton, Œcon. Δnim. Exerc. iii, § 10.

Anthropother apy. (Ανθρωπος; θεραπεία, attendance, medical treatment. F. anthropothérapie; G. Menschenheilkunde.) The medical treatment of human beings.

**Anthropot'omist.** ("Αυθρωπος; τομή, a cutting. F. anthropotomiste; G. Anthropotom, Menschenzergliederer.) A dissector of man; a human anatomist.

Anthropot'omy. (Ανθρωπος; τομή. F. anthropotomie; G. Menschenzergliederungskunde.) Term for the cutting up, or dissecting, of man; human anatomy. At present it implies the ordinary dissection of the human body for the aequirement of medical knowledge, as opposed to the dissection of the comparative anatomist. The word in its strict etymological sense has long been represented by anatomist

simply; which, when the question was one of zootomy, became comparative anatomist.

Anthro'pous. ('Λνθρωπος.) te man.

**Anthropozo'ic.** ('Λνθρωπος, man; ξῷον, a living being.) Term applied by Hacckel to the age when man fully formed appeared on the earth. It is synonymous with the quaternary

An'thumon. ('Avri, one against another; θύμον, thyme.) A synonym of the dodder which

grows on thyme, Cuscuta epithymum.

Anthuride. A Family of the Tribe Anisopoda, Suborder Isopoda, Order Edviophthalma. Antennæ short; the first thoracic segment free and hearing a pair of prehensile limbs; abdomen with two-oared limbs and a strong swimming tail.

Anthu'rus. ("Aνθος, a flower; οὐρά, a tail. F. anthure; G. Blüthensehweif.) A term applied in Botany to the inflorescence of Chenopodiacew and Amarantacew. These consist of small contracted cymes, which in the Amarantus, for example, are very numerous, and situated in the axillæ of more or less modified females.

Name by Link for elongated peduncles that

bear flowers in bundles.

An'thus. ("Aνθος, a flower. G. Blume.)

A flower; especially that of rosemary.

Anthydri'asis. (' $\Lambda \nu \tau l$ , against; hy-driasis. F. anthydriase.) The opposite of Hydriasis, or hydropathy.

Anthydro'pic. ('Λντί; νδρωψ, dropsy. F. anthydrapique.) Opposed to, or relieving from, dropsy; applied to remedies of this cha-

Anthyllid'eæ. A Group of the Tribe Loteæ, Nat. Order Leguminosæ. Calyx 5-cleft, or 5-toothed, or 2-lipped; wings of flowers not folded or wrinkled; stamens coherent; pod

**Anthyllis.** ('Ανθυλλίε.) Under this name the ancients included two plants, one of which is now generally referred to Cressa cretica, though some regard it as the Anthyllis vulneraria; whilst the other was probably the Ajuga iva. It was employed in dysuria, epilepsy, affections of the uterus and spleen. Dioscorides, hii, c. 143; Paulus Ægineta, lvii,  $\S$  3; Pliny, lxxi, c. 104. (Waring.)

**Anthyllis.** ('Ανθολλίς.) A Genus of the Group Anthyllideæ, Tribe Loteæ, Nat. Order Leguminosæ. Herbs or shrubs; leaves pinnate, with a terminal leaflet; stipules small or none; calyx inflated, mouth oblique; petals with long claws; keel incurved; pod enclosed in the calyx, obliquely ovoid.

A. cre'tica. (L. creticus, belonging to Crete.) A plant believed to possess laxative virtues.

A. Herman'niæ. The root is said to be diuretic.

A. vulnera'ria, Linn. (L. vulnerarius, belonging to wounds. F. anthyllide, vulneraire, triolet janue; G. Wundklee.) Stem berbaccous, silky; radiele leaves pinnate, unequal; leaflets 2-6 pairs; heads in pairs, rarely solitary; flowers yellow. A plant common in England, France, &c., used as an application to wounds, burns, &c., by the peasantry.

Anthyl'lium. ('Ανθύλλιον, a floweret. G. Blumchen.) A little flower.

Anthypnot'ic. ('Aντί, against; ὕπνος, sleep. G. schlafvertreibend.) Medicines having power to hinder sleep, as strong coffee and tea taken before going to bed.

Anthypochon'driac. ('Αντί, against; ὑποχουδριακός, hypochondriae.) Mediemes having power to remove or to evercome hypochen-

Anthypocopho'sic. ('Αντι; ὑπόκωpos, rather deaf.) Having power to relieve deafness.

**Anthyster'ic.** ('Λντί, against; hysteria.) Applied to medicines having power to remove or overcome hysteria.

Antiac'id. See Antacid.
Anti'ades. ('Αντιάς, a tonsil.) A name for the tonsils. Also, inflamed tonsils; used by Nic. Piso de Morb. Cognose, et Curand. ii, 2.

Antiadi'tis. ('Αντιάs, a tonsil. F. an-

tiadite; G. Mandelnentzündung.) A term for tonsillitis, or inflammation of the tonsils.

Antiadon'cus. ('Aντιάς, a tonsil; ὄγκος, mass, an enlargement. F. antiadoneus; G. Mandelngeschwullst.) Term for a swelling of the tonsils.

A. inflammato'rius. (L. inflammatio, inflammation.) Inflammation of the toosils.

Antiaeroph'thora. See Antaeroph-

Antia'gra. ('Αντιάς, a tonsil; ἄγρα, a scizure.) Term for swelling of the tousils, Rio-

lanus, Enchrid. Anatom. iv, 7.

Antialbu'min. A body into which, in conjunction with *Hemialbumin*, Kühne describes albumen as being decomposed by the action of pepsin or, the pancreatic ferment, trypsin.

Antialbu'minose. The same as Anti-

Antial'kaline. See Antalkaline. Antiaphrodis'iac. See Antaphrodisiac.

Antiapoplec'tic. ('Αντί, against; άποπληξία, apoplexy.) A remedy for apoplexy.

An'tiar. See Upas antiar.

**An'tiar res'in.**  $C_{16}H_{24}O$ . Obtained from the dry juice of the *Upas autiar* by extraction with other or benzol. On evaporation of the ether it is deposited in feathery crystals of silky lustre. It is not poisonous.

Antia'rin.  $C_{14}\Pi_{20}O_5+2\Pi_2O$ . The poisonous principle of the *Upas antiar*. It is probably a glucoside. It appears in the form of silvery lamina, which dissolve in 254 parts of water, at 22° C. (71.6° F.), and in 27.4 parts of boiling water, in 70 parts of alcohol, and in 2800 of other; it melts at 220° (428° F.); reaction neutral; it dissolves in dilute acids and alkalies without combining with them. It reduces an ammoniacal solution of silver. It is highly poisonous, two milligrammes (less than 100th of a grain) proving rapidly fatal to a rabbit when subcutaneously injected; unlike curare, it diminishes in frogs the absorption of oxygen. The addition of a little sugar increases its solubility.

Antia'ris. (Antiar, or antschar, its native Javanese name. G. Upashaum, Pf dyift-baum.) A Genus of the Nat. Order Ulmacea, Series Artocarpea. Trees or shrubs inhabiting the warm regions of India and Australia. Leaves alternate, stipulate; flowers monœcious, irregular; corolla absent. Males, forming a capitulum, surrounded at their base by many bracts; perianth 4-partite, with four stamens; anthers extrorse. Female flower, receptacle concave, with a variable number of caducous sepals attached to its border; ovary unilocular, uniovulated; style with two

stigmata; ovule anatropal; fruit a drnpe; sceds exalbuminous.

A. saccido'ra, Dalz. (Σάκκος, a bag; δωρέω, to give. Tam. nettavil-marum; Mal. araya-angeli.) A large tree inhabiting Malabar, so called because its bark is used for making sacks. Leaves alternate, ovate, oblong, pointed, entire, glabrous above, slightly villons beneath; capitulum axillary; drupe with a purple down. The nuts are intensely bitter.

**A. toxica'ria.** (Τοξικον, poison for smearing arrows with.) Leaves oval-oblong, acute, hairy on both sides, specially along the chief veins, slightly serrated; male receptacles stalked. It yields the poison called Upas antiar, and which is named by the Javanese Antiar, or Antsjar; also called Ipo toxicaria, and Ipo,

Hypo, and Pohun upas.

Antiarthritic. See Antarthritic. An'tias. (Gr.) One of the tonsils. Antiasphyc'tic. See Antasphyctic. Antiasthen'ic. See Antasthenic. Antiasthmatic. See Antasthmatic. Antiatrophic. See Antatrophic.

Antiballom'enon. ('Αντιβάλλω, to throw against; or rather, ἀντεμβάλλω, to put in place of another, to substitute.) Coming in place of another. Applied to a medicine employed as a substitute for another, or a succedaneum.

Antiballom'enum. (Same etymon.)

A succedaneum.

Antibdel'la. ('Aντί, like; βδέλλα, a lecch. F. antibdelle.) An artificial or mechanical leech, an instrument by means of which incisions are made like the bites of leeches, and from these blood is extracted by a suction-pump.

**Antibe** chic. (' $\Delta \nu \tau i$ , against;  $\beta i \xi$ , a cough.) Expectorant.

Antibra'chial. (L. antibrachium, the forearm.) Of, or belonging to, the autibrachium or forearm.

A. aponeuro'sis. See Fascia of forearm.
Antibra'chium. ('Αντί, against; βμαχίων, the arm.) Α term for the forearm, because opposed to, when bent upon, the proper arm.

Antibro'mic. ('Αντί; βρωμος, a stench.)

Deodorant.

Anticachec'tic. ('Δντί, against; κα-χεξία, a bad habit of body. F. anticachectique; G. antikakektisch.) Applied to medicines opposed to what is cachectic.

Anticachec'ticum Ludovi'ci. See Ludovici, anticachieticum.

Anticacochym'ic. ('Αντί; κακός, bad;

χυμός, juice.) Anticachectic. (Dunglison.) **Antican cerous.** (L. anti, against; cancer. F. anticancereux; G. krebswidrig.) Remedies employed for the relief or cure of cancer.

Anticancro'sus. The same as Anticancerous.

An'ticar. (Arab.) Termforborax. (Ruland.) Anticarcino matous. ('Aντί; carcinoma. F. anticarcinomateue.) Opposed to, or palliating, carcinoma.

Anticar'diom. ('Δντί, against, or opposite to; καρδία, the heart. F. anticarde; G. Herzgrube.) The hollow below the sternum; the scrobiculus cordis, or pit of the stomach.

Anticar'dium. Same as Anticardiom. Anticarious. ('Avti; caries. F. anti-

carieux.) Opposed to, or acting against, caries. **Anticatar'rhal.** ('Αντί, against; κατάρροος, a catarrh.) Applied to medicines employed for the relief of catarrh.

Anticatarrho'ic. ('Δντί; κατάρρους.) Having power to relieve catarrh.

**Anticausot'ic.** ('Λυτί, against; καῦσος, an ardent fever.) Applied to a medicine used to remove or moderate an ardent fever.

Anticaus'tic. ('Αντί; κανστικός, capable of burning. F. anticaustique.) Opposed to, or relieving from the burning sensation produced by, caustic; applied to remedies of this quality.

Anticephalalgic. ('Λντί; κεφαλ-γία, headache.) Having power to relieve alyia, headache.)

An'tichamber. (F. antichambre) Vorkof.)A term applied in Botany, by H. v. Mohl, to that part of stomata which is outside the aperture or ostiole.

Anticheir. ( $A\nu\tau(\chi\epsilon\iota\rho)$ ; from  $a\nu\tau i$ , against;  $\chi\epsilon\iota\rho$ , the hand. F. antichir.) A term for the thumb, as being against or opposite the hand or fingers. (Galen.)

**Antichimet'lium.** ('Λυτί'; χίμετλου, a chilblain. F. antuchimetlium.) Λ m. dicine

against chilblains.

Antichirot'onous. ('Αντίχειρ, the thumb; τόνος, contraction.) Applied to epilepties in whom the forcible or spasmodic inflection of the thumb is one of the precursory or predominant symptoms of the attack.

An'tichlore. ('Avti, against; chlorine. F. antichlore.) A term applied to substances capable of nentralising or eliminating the excess of chlorine liberated in the act of bleaching; such are the alkaline sulphites, calcium sulphite, and dichloride of tin, or hydrated

stannous chloride.

Antichloris'tic. ('Avti; chloristic. F. antichloristique.) Applied to a hypothesis admitted into the creation of pneumatic chemistry, strongly nrged, in 1809, by Gay-Lassac and Thénard, and finally rejected, in 1810, by Sir Humphry Davy, according to which chlorine, in place of being a simple body, was held to result from a combination of oxygen and an unknown radical.

Antichlorot'ic. ('Δντί; chlorosis.) Having power to relieve chlorosis; applied to such remedies as iron.

**Antichœrad'ic.** ('Αντί; χοιράδες, scrofulous glands of the neck. F. antwhæradique.) Opposed to, or healing, suppurating or scrofulous glands; applied to remedies.

Antichol'eric. ('Δντί, against; cholera.)

Applied to medicinal plants which were believed

to cure cholera.

Antic'ipating. (L. anticipo, to anticipate, or take before. F. anticipant; G. vorgreifend.) Term applied to the occurrence of certain phenomena in the human body before their customary period; as the catamenia, or the paroxysm of ague

Anticipa'tion. (L. anticipo, to anticipate or take before.) Term for the occurrence of certain phenomena, morbid or natural, before

the customary period.

Anticlinal. ('Aντί, against; κλίνω, to bend, to slope.) Bending against or in opposite directions.

A. line. The ridge where anticlinal strata

A. stra'ta. (L. stratum, the thing spread, a layer.) A term applied to strata which slope in opposite directions downwards from a common meeting line.

Anticlinan'thus. ('Αντί; κλίνη, a bed;

åνθος, a flower. F. anticlinanthe.) Applied by H. Cassini to the inferior and squamiterous part of the clinanthium of Synanthereæ.

An'ticline. Same as Anticlinal line.

Anticne mion. (Λετικρήμιον; from αντί, against, or opposite; κινήμη, the leg.) Term, by Galen, for the anterior edge of the tibia; the shin.

**Anticnesmatic.** ('Αντί: κνησμός, an itching.) Having power to relieve itching or

the itch.

**Anticol'1c.** ('Aντί, against; κωλικός, suffering in the colon, and hence the colic. F. anticolique.) Opposed to the colic: applied to medicines having power to relieve from this complaint.

**Anticom ma.** ('Αντί; κόμμα, that which is struck.) Contre-coup. (Dunglison.)

Anticonta'gious. ('Arti', L. contagiosus; from contagio, a touching, infection.) Having power to arrest or destroy the material of contagion.

Antic'ope. ('Αντικοπή, a heating back.)

Contre-cour.

**Anticopom'eter.** ('Αντικοπή, a beating back; μέτρον, a measure.) Same as Anticopo-

scope.

Anticoposcope. (Δυτικοπή; σκοπίω, to examine. F. anticoposcope; G. Widerhall-forscher.) A synonym for the pleximeter; an instrument constructed for the purpose of percussion, the diagnosis being based on the characters of the sound returned.

**Anticop'toscope.** ( $\Lambda \nu \tau \iota \kappa \delta \pi \tau \omega$ , to beat back, to come into collision;  $\sigma \kappa \delta \pi \iota \omega$ , to examine.) The same as *Anticoposcope*.

Anticous. (L. anticus, that which is before.) Lying in front, as the lip of orchids.

Anticri'sis. ('Avti; spicis, a separating.)
Same as Apocrisis.

**Anticritical.** ('Δντί; κριτικός, enitical. F. anticritique.) Opposing or interrupting the crisis; applied to medicines.

Anticru'sis. ('Αντίκρουσις, a striking

against, a sudden stop.) Contre-coup.

Anticrus ma. (Αντικρούω, to strike

back or against.) Contre-coup.

Anticus. (L. anticus, that which is in front. F. antiricur; G. vorderer, vorn befindlich.)
Anterior, in front.
In Botany, applied to anthers as a synonym of

The Bottany

Anticyr'icon. An ancient plant, referred by Sprengel to Reseda mediterranea, and by Féc to Daphne tartouraira. It was conjoined with hellebore to aid its hydragogue effect in insanity, melancholy, epilepsy, and gont (Pfiny, l. xxii, c. 64). (Waring.)

Antidar trous. ('Αντί; δαρτός, flayed. F. antidartre; G. flechtenwidrig.) Applied to remedies for the cure of those skin diseases called

dartrous

Antideix'is. ('Apri, against; ètigis, proof, exhibition.) Counterindication. (Dunglison.)

Antidenu'tritive. ('Avri; denatrition.) Applied to remedies against denutrition. Antides ma. A Genus of East Indian plants of the Nat Order Stiloginae &.

**A. alexite ria.** ('Αλεξητήριον, a remedy ) A species believed to be useful in snake bites.

A. bu'nias. (Tam. Nolai tali.) Mediumsized tree inhabiting Coromandel. Leaves alternate, entire, lanceolate-oblong; spikes axillary. terminal; male flowers triandrous, with an abortive column in the centre; fruit red. A plant reckoned as a remedy against snake hites. The leaves are acid and diaphoretic, and are employed in syphilis.

**A. pubes'cens.** (L. pubescens, clothed with downy hairs, from pubesco.) A species the fruit of which is subacid and agreeable.

A. zeylan'ica. The leaves are used as an antidote for the bite of serpents.

Antides'meæ. A synonym of Stilagi-

Antidiarrhœ'ic. ('Αντί; διάρροια. F. antidiarrheique') Applied to remedies against diarrhea.

**Antidia**'stole. ('Λυτιδιαστολή; from ἀντιδιαστίλλω, to discriminate.) The distinguishing of one disease or symptom from another.

Antidi'nic. (Αντί, against; δίνος, giddiness, or vertigo.) Applied to medicines having power to relieve from giddiness, or vertigo.

Antido tal or Antidotal. (Αντίδοτος, a remedy. L. antidotion; F. antidotal; G. gegenecirkend, giftwidrig.) Having the property of an antidote.

Antidota rium. ('Aντίδοτος, antidote.)
Name formerly applied to a book of formulae for the preparation of medicines; a dispensatory.

Antidotary. Same etymon and meaning as Antidote.

An'tidote. ('Αντίδοτος, an antidote, a remedy: from ἀντί; δίδωμ, to give in return. F. antidote; I. antidote; G. Gegenmittel, Gegengift, Gegengabe.) A medicine which prevents or counteracts the effects of poison; formerly used to signify any remedy.

A., Bi'bron's. See Bibron's antidote.

A., chemical. One which changes the chemical properties of a poison, as chalk for the mineral acids, white of egg for corrosive sublimate. A chemical antidote should be harmless itself, and its action on the poison should result in a harmless or an insoluble compound.

A., mechanical. One which protects the stomach from the effects of poisons by procuring their mechanical suspension, or by covering the mucous surface and preventing absorption; such are oil and gum.

A., physiolog'ical. One which counteracts by its own action on the system the toxic

influence of a drug.

Antid'otum. (Same etymon.) Anantidote. A. arsen'ici. G. Ph. (G. Gegengift der arsenigensaure.) The directions for this preparation are—Dissolve hydrated sulphate of iron 60 parts, in water 120 parts; to this add hurnt magnesia 7 parts, and rob down to a thin paste. To be made when required, and administered freely in arsenical poisoning.

Russ. Ph. Magnesia usta 3 parts, distilled water 64 parts; to these add of solution of sul-

phate of iron 8 parts.

**A. Heraclidis.** (Ήρακλειδης, a male descendant of Heraules.) A synonym of one of the remedial compounds anciently used and called Euncapharmacos.

A. Mithrida'tium. A synonym of Mi-

A. universa'le. A mixture of one part of iron sulphate dissolved m water and two parts of magnesia water; it is used as an antidote in poisoning by arsenic, the cyanides, and metallic salts generally.

Antid'otus la'pis. (L. lapis, a stone.)

The antidotal stone, a term for the philosopher's

**Antid'romal.** ('Λντί, against; δρόμος, course.) A term in Botany, applied to a spiral which runs in the opposite direction to the antecedent spiral.

Antidynam'ica. ('Αντί; δυνάμις, power. F. antidynamique; G. schwüchend.)
Reducing, depressing, debilitating remedies

Antid'ynous.
Anodyne. (Dunglison.) ('Αντί; οδύνη, pain.)

('Αντί; δυσκρασία, Antidyscratics. bad temperament.) Medicines which are supposed to ameliorate or destroy the dyscratic conditions of the body. See Dyscrasia.

Antidysenteric. ('Aντί, against: δυσεντερία, a dysentery. G. ruhrwidrig.) Term applied to medicines having power to relieve

dysentery.

Antiemet'ic. See Antemetic.

Antienneahe'drus. ('Αντί; ἐννία, nine; ἔδρα, a base. F. anticnneaedre.) Applied by Hauy to a prism with 12 planes, terminated by 2 summits with 9 faces.

Antiephial tic. See Antephialtic.
Antiepid'osis. (Gr.) Term applied by
Hippocrates to the connection of successive febrile attacks, or to their concordance.

Antiepilep'tic. See Antepileptic. Antierot'ic. See Anterotic.

Antifar'cinous. ('Avti; farey.) A

term for remedies against farey.

Antife'brile. ('Avtí, against; L. febris, a fever. G. fiebervertreibend, fieberwidrig.) Having power to repel fever; applied to medicines against fevers; febrifuge.

Antifides. Old term for the calx of metals. Antigalactagogue. ('Arri; γάλα, milk; άγωγος, leading, from αγω, to lead, to convey.) Medicines which restrain the secretion

Antigalac'tica. ('Αντί, against; γάλα, milk. F. antigalactique; G. milchvertreibend.) Applied to medicines having power to lessen the secretion of milk.

Antig'oni collyr'ium ni'grum. Black collyrium of Antigonus, composed of eadmia, antimony, copper acetate, pepper, gum

arabic, and water. (Dunglison.)

Antig'ua. West Indies; one of the islands of the British Leeward group. The climate is fairly healthy and the soil fertile; but it suffers often from scarcity of water, and hurricanes have been severe. Residence here has been found nseful in threatened, but injurious in confirmed, phthisis.

**Antihæmop'tyca.** ('Aντί; αίμα, blood; πτύω, to spit.) Term applied to remedies arresting pulmonary hæmorrhage.

('Aντί; αἶμα, Term applied Antihæmorrhag'ic. blood; ρηγνυμι, to break forth.) to remedies arresting hæmorrhage.

Antihæmorrhoïd'al. ('Αντί; αίμορpoices, hæmorrhoids.) Term applied to remedies for piles.

Antihec'tic. ('Δντί, against; ἐκτικός, hectic.) Having power to remove, or assuage, hectic fever; applied to medicines used for this purpose.

Antihec'ticum Pote'rii. Pothier's antihectic; prepared as Antimonium diaphoreti-cum, with the addition of tin; it is probably a double salt, composed of potassium antimonate and stannate. It was formerly used in hæmorrhage, spermatorrhæa, and colliquative perspira-

Antihe'dricus. ('Αντί; "έρα, a base. F. anti-drique.) Applied by Hauy to a crystal composed of two rhomboids, each of which has its faces turned contrariwise to those of the other.

Antihe'lix. ('Avri, against; helix.) The inner curved ridge on the pinna; it begins below at the antitragus, curves round and forms the posterior margin of the concha, and divides above into two branches, one of which runs transversely forward, and the other continues upwards to the superior margin of the pinna.

Antihelmin'tic. See Anthelmintic. Antiherpetics. ('Aντί; ερπης, herpes. F. antiherpetique; G. gegenherpetisch.) Applied to remedies against herpetic diathesis.

These are sulphur, mercury, antimony, arsenic, cantharides, sarsaparilla, hydrocotyle, elm bark,

hop, taraxacum, and others.

Antihydri'asis. ('Αντί; ΰδωρ, water.) The doctrine which opposes the use of water in disease. (Littré and Robin.) disease.

Antinydrophob'ic. ('Avri; hydrophobia. F. antihydrophobique; G. gegenhydrophobique) phobisch.) Applied to remedies against hydrophobia.

Antihydro'pic. ('Αυτί, against; ὕδρωψ, dropsy.) Against, or curative of, dropsy; applied to medicines believed to be so qualified.

Antihy dropin. ('Aντί, against; εδωρ, water.) A crystalline compound, obtained by Bogomolow (1876) from the cockroach (Blattu Supposed to be the active principle which, when the powder of the bodies of these insects is administered in nephritis, causes increase of the renal and entaneous secretions, and disappearance of dropsy and of albumen in the urine; unlike cantharides, it has no stimulant action on the urinary organs.

Antihypnotic. See Anthypnotic. Antihypochon'driac. See Anthypo-

chondriae

Antihysteric. See Anthysteric.
Antiicteric. ('Αντί, against; ἴκτερος, the jaundice.) Against, or curative of, icterus, or jaundice; applied to medicines believed to possess such power.

A. spir'it. The product of the distillation of half an ounce of spirit of turpentine with half a pint of spirit of wine. It was proposed to be administered to dissolve gall-stones.

Antiimpetig'enes, So The Liquor hydrargyri perchloridi. Solomon's.

Antikar dium. See Inticardium. Antikonto sis. ( 'Αντί; κοντός, a pole.) The supporting of a weak or lame person by a erutch or staff.

Antila'bium. ('Avri; L. labium, a lip.) The same as Antelubium.

Antilactea. ('Apri; L. lac, milk.) Medicines which arrest the secretion of milk.

Antilactes'cent. ('Aeri, against: L. lactesco, to yield milk.) Having the power to arrest or diminish the secretion of milk.

Antilactics. ('Arri, against; L. lac, milk.) Remedies which diminish or arrest the secretion of milk; the chief of these is bella-

Antilam'bani. ('Δντιλαμβάνω, to seize. F. antilumbane.) Applied by Ranzani to a Family of Scansorcs, whose toes serve to seize their food and carry it to their beak.

Antilep'sis. ('Αντίληψις, a receiving in

turn. F. antilepsis.) The application of a remedy to a part away from that affected.

Derivative or revulsive treatment.

The application of a bandage or support to a diseased part by fixing it to a healthy part.

Antilep'tic. (Same etymon.) for a revulsive or derivative remedy.

Antilethargic. ('Αντί; ληθαργία, lethargy. F. antilethurgique; G. gegenlethurgisch.) Opposed to, or overcoming, lethargy; applied to remedies.

Antilith'ic. (' $A\nu\tau l$ , against;  $\lambda i\theta os$ , a stone. F. antilithique.) Having the power of preventing or impeding the formation of urinary concretions; such are large quantities of water, especially when containing potash, soda, or lithia, sodinm phosphate and bihorate, ammonium henzoate and other salts, mineral and vegetable acids, depending on the nature of the concretion.

Antil'les. A name given to the West Indian Islands, with the exception of the Bahamas. Many of the islands, which are of volcanic origin, possess sulphuretted saline springs, both hot and cold. See Cuba, Hayti, Jamaica, and others.

A. rhat'any. Two forms, black and

brown, of rhatany, identical with Para rhatany. Antilo bium. ('Αντιλόβιον; from ἀντί, against or opposite;  $\lambda \alpha \beta \delta s$ , the lobe of the ear. F. antilobe; I. antilobo; S. antilobo; G. Gegenlupchen.) Name for the tragus, or that part of the external ear opposite the lobe.

Antiloca prides. (L. antilopus, an antelope; caper, a goat.) A Family of Cavicornia, which has been proposed for the reception of the Antilope furcifer or Prong-buck, in that the outer sheath of the horn is deciduous.

Antilem'ic. See Antiloimie. Antilo'gia. (Άντιλογέω, or ἀντιλέγω, to speak against.) A contradiction in the symptoms of a disease so as to render its diagnosis difficult.

**Antil'ogous.** ('Αντίλογος, contradictory; from ἀντιλογέω or ἀντιλέγω, to speak against.) Contradictory; reverse.

A. pole. A term given to that end of a erystal in a pyroelectric condition, which is negative when heated, and becomes positive when cooled. See Pyroelectricity.

Antiloim ic. ('Αντί, against; λοιμός, the plague or pestilence. F. antilæmique; G. pestwidrig.) Against, or curative of, the plague or pestilence of any kind; applied to medicines so accounted.

Antilo'pë. ('Ανθόλοψ; from ανθος, a flower; who, the eye; that is, flower-eye, because of its soft expression, and great heanty, in this genus of animals.) The antelope. A Genus of the Ruminantia, the various species of which inhabit India and Africa; their horns and hoofs were formerly believed to possess antispasmodic properties, and were used in hysteria and epilepsy. Some of the species furnished varieties of Bezour.

Antilo'pidæ. A Subfamily of the Family wicornua. Body slim; legs long, slender; horns cylindrical, straight or enrved, annulated or twisted, sometimes seen only in the males; they possess lachrymal sinuses, or tear pits, beneath the eyes, which secrete a yellow waxy substance.

Antilys'sus. ('Arri, against; λύσσα, rabies. F. antilysse.) Applied to medicines supposed to be curative of hydrophobia.

Antimelancholic. ('Αντί, against; μελαγχολία, melancholia. F. antimelancholique.) Against, or capable of dispelling, melancholy; applied to medicines used with this view.

Antimephitic. (Auti; mephitic. F. antimephitique; G. laftreinigend, luftrerbesserndmittel.) Opposed to, or corrective of, foul exhalations.

**An'timere.** (' $\Delta \nu \tau i$ , against;  $\mu i \rho \sigma s$ , a part.) A term applied to those segments, or groups of organ systems, each built upon the same plan, which are placed radially round a centre. An example of antimeric segmentation is to be found in the starfish.

**Antimetro**'pia. ('Αντί; μέτρον, measure; ἄψ, the eye.) In Ophthalmic Surgery, a term applied to a condition in which the refraction of the two eyes is of an opposite kind, one, for example, being myopic, and the other hypermetropic.

Antimetro'pic. (Same etymon.) or pertaining to, antimetropia.

Antimiasmatic. ('Avti; miasm.) A remedy against malaria and malarial diseases.

An'timonate. Term for a combination of antimonic acid, or antimony pentoxide, with a base.

An'timonetted hy'drogen. synonym of Antimonious hydride.

Antimo'nial. (L. antimonium, antimony. G. antimonhaltig, spiessglanzhaltig.) Of, or belonging to, antimony. Applied to any compound medicine having antimony as its chief component.

A. caus'tic. A synonym of Antimonious chloride.

A. o'chre. A term for antimony found in the state of an oxide.

A. oint ment. A synonym of the Unguentum antimonii, U.S. Ph.

A. pow'der. A synonym of the Pulvis antimonialis, B. Ph. Also, of James's powder.

Antimonia le caus ticum. (Kavoτικος, capable of burning.) A synonym of Antimonious chloride.

Antimonia'les pil'ulæ Ward'ii. Ward's antimonial pills; they consisted of about a grain of glass of antimony.

Antimo'nialised. Prepared with, or containing, antimony.

Also, under the influence of antimony.

Antimo'nias potas'sæ, Belg. Ph. antimoine diaphoretique lavé.) Phre anti-(F. antimoine diaphoretique lave.) Pure antimony, 1 part; nitrate of potassium, 2 parts; mix, deflagrate, and keep at a red heat for an hour and a half; allow to cool, wash for some hours in water, dry, and reduce to a fine powder.

Antimo'niate. A salt of antimonic acid. A. of qui'nia. This salt has been recommended as a febrifuge, especially applicable to cases of doubtful periodicity. Dose, 2 or 3 grains, four times a day

Antimo'niated hydrogen. prepared at the time when it is required for inhalation, by acting on an alloy of a drachm of antimony, and two drachms of zine, and a drachm of tartrate or chloride of antimony, with hydro-chloric acid. The hydrochloric acid gas evolved simultaneonsly with the antimoniated hydrogen is arrested by a sponge dipped in an alkaline solution. The respiration of air impregnated with this gas for five minutes every hour, is said to be very useful in pnenmonia and capillary bronchitis with fever. The pulse diminishes in frequency and force, without the occurrence of nausea or vomiting, and expectoration is facili-

A synonym of Antimonious hydride.

Antimonia'tus. Prepared with, or containing, antimony.

(.Intimonium, antimony.) Antimon'ic.

Of, or belonging to, autimony.

A.acid. (F. acide antimonique.) Sb<sub>2</sub>O Hydrated antimonic oxide. A monobasic acid obtained by digesting metallic antimony in strong nitric acid; it produces normal salts of the form M<sub>2</sub>O.Sb<sub>2</sub>O<sub>5</sub> or MSbO<sub>3</sub>, and acid salts containing M<sub>2</sub>O.2Sb<sub>2</sub>O<sub>5</sub> or 2MSbO<sub>3</sub>.Sb<sub>2</sub>O<sub>5</sub>. It is a lemon-coloured powder, insoluble in water and acids.

A. chlo'ride. SbCl5. Antimony pentachloride. A mobile, colourless liquid, obtained by passing a stream of chlorine gas over antimonious chloride or slightly heated metallicantimony. It forms a crystalline compound with water when in small quantity; a large amount decomposes it into antimonic and hydrochloric acids.

A. ox'ide. Sb<sub>2</sub>O<sub>5</sub>. Antimony pentoxide. A pale, straw-coloured powder, obtained by acting on metallic antimony with strong nitric acid and heating the precipitated hydrate. It is monobasic. Before heating, when hydrated, is called

A. acid.

The hydrated oxide may be obtained also by decomposing autimonic chloride with water; this is called metantimonic acid. It is bibasic.

A. sul'phide. Sb<sub>2</sub>O<sub>5</sub>. Antimony penta-sulphide. Formed along with calcium carbonate, sodium antimonate, and sodium sulphide, by boiling for some hours in water 18 parts of powdered antimonious sulphide, 17 of dry sodium earbonate, 13 of lime, and 3½ of sulphur; it unites with the sodium sulphide to form sodium sulphantimonate, which crystallises on evaporation; this salt, when dissolved in water and treated with dilate sulphuric acid, deposits the pentasulphide as a golden-yellow flocculent precipitate. It forms salts with basic sulphides called sulphantimonates.

Antimon'ico-potas'sicus. (F. antimonico-potassique.) Applied by Berzelius to a double salt resulting from combination of an

antimonie with a potassic salt.

Antimonif erous. (Antimonium; fero, to bear. F. antimonifere; G. spiessglanztragend.) Applied to a substance that accidentally contains autimony.

Antimo'nii buty'rum. (L. butyrum. butter.) Butter of antimony; a synonym of Antimonious chloride.

A. calx. (L. calx, lime.) A synonym of Antimonium diaphoreticum.

Also, a term for Antimony, ash of.

A. calx lo'ta. (L. lotus, washed.) A synonym of Antimonium diaphoreticum ablu-

A. calx sulphura'ta. Salphuretted ealx of antimony. Calcined oyster-shells 10 Salphuretted parts, sulphur 4 parts, and crude autimony 3 Powder, mix, and calcine. Used as an emetic and alterative, in doses of 1-6 grains.

A. cerus'sa. (L. cerussa, white lead.)
A synonym of Antimonium diaphoreticum.

(L. solaris, be-A. cerus'sa sola'ris. longing to the sun.) A similar preparation to the Antimonium diaphoreticum, but made by heating in the sun by means of a lens.

A. chlori'dum. See Antimonious chlo-

A. cum sulphu're vitrifac'tum. (L. vitrum, glass; factus, made.) A synonym of Antimony, glass of.

A. diaphoret'icum elo tum. (L. elaro,

to wash clean.) A synonym of  $An^{i}monium$  diaphoreticum ablutum.

A. diaphoreticum vulgare. (L. vulgaris, common.) A synonym of Antimonium diaphoreticum ablutum.

A. et potas'sæ tar'tras. A synonym of Antimonium tartaratum, B. Ph.

U.S. Ph. Tartar emetic, prepared in the same way as the Antimonium tartarutum, B Ph.

A. et potas'sii tar'tras. A synonym of Antimonium tartaratum.

A. Helmon'tii flo'res. See Helmontii

flores antimonii.

**A. he'par.** (" $\Pi \pi a \rho$ , the liver.) Liver of antimony. Antimonious sulphide 1 part, dried sodium or potassium carbonate 2 parts; melt, heat till it is a proper colour, allow to cool, and powder. It consists of antimonious oxide and undecomposed sulphide and sodium, or potassium sulphide and carbonate. It is now chicity used in veterinary medicine as an alterative and purgative.

**A.** iodi'dum.  $SbI_2$ . A salt prepared by zently heating in a Florence thank meta-lic antimony and iodine. It is a crystalline foliated mass, which, when pulverised, yields a deep orange-red powder. It has been used as an alterative, in doses varying from a quarter of a grain to one grain, in form of pill.

A. mu'rias. A synonym of Antimonious

A. o'leum. (L. oleum, oil.) A synonym of Antimonious chloride.

A. oxid'ulum hydrosulphura'tum auranti'acum. Orange oxidulated hydrosulphuret of antimony; a synonym of Antimonium

sulphuratum, B. Ph. **A. oxi'dum**, B. Ph. Sb<sub>2</sub>O<sub>3</sub>. Oxide of antimony, or *Antimonious oxide*. The directious for preparing this substance are—Pour 16 fluid ounces of solution of chloride of antimony into 2 gallons of water, collect the precipitate, and wash it well with distilled water; then add to it 6 oz. of carbonate of soda, previously dissolved in 2 pints of distilled water, filter, collect the deposit, and wash with distilled water till the washings give no precipitate with a solution of silver nitrate acidulated with nitric acid; lastly, dry the product at a temperature below 100° C. (212° F.) It is a grevish-white powder, fusible at a low red heat, i asoluble in water, but soluble in hydrochloric acid. The solution dropped into distilled water gives a white deposit, at once changed to orange by H2S. It dissolves entirely when boiled with an excess of the acid tartrate of potash. It is somewhat irregular in its actions, which is that of tartar emetic, but probably milder. Dose, 1-4 grains.

A. oxi'dum aura'tum. (L. auratus, gold coloured.) A synonym of Antimonium

sulphuratum, B. Ph.

A. oxidum nitromuriat icum. synonym of Algaroth, powder of.

A. oxidum sulphure tum vitrifactum. (L. vitrum, glass; factus, made.)

synonym of Antimony, glass of.

A. oxysulphure tum. U.S. Ph. Kermes mineral. Sulphuret of antimony a troy cance, sodium carbonate 23 troy ounces, water 16 pints. Boil the water, dissolve the soda in it, add the antimony, and then boil for an hour. Filter, cool slowly, decant, drain the precipitate on a filter, wash it with boiled water, dry without heat, preserve in a well-stoppered bottle out of the light. It is an insipid, inodorous powder, of a

purplish-brown colour; on exposure to air and light it loses colour and becomes yellowish white. It is alterative, diaphoretic, and emetic. Dose, 4-2 grains.

Also, a synonym of Antimonium sulphuratum. A. potas'sio-tar'tras. A synonym of

Antimonium tartaratum, B. Ph.

A. regulus. See Antimony, regulus of. A. reg'ulus medicina'lis. (L. regulus, a ruler; medicinalis, medical.) A synonym of

Antemonium medicinale.

A. terchlori'dum. A synonym of Antimonious chloride.

A. teroxi'dum. See A. oxidum.

A. tersulphure'tum. A synonym of Antimonious sulphide.

A. vitrum. (L. vitrum, glass.) Antimony, glass of.

A. vit'rum cera'tum. (L. vitrum: ceratum, a wax salve.) Glass of antimony, in very fine powder, 1 oz., yellow wax, 1 drachm; melt in an iron ladle, and expose to a gentle heat until it is snuff-coloured; powder when cold. Formerly used in dysentery. Dose, 2-10 grains.

A. vit'rum hyacin'thinum. vitrum, glass; hyacinthinus, violet-coloured.) A synonym of Antimony, glass of.

Antimo'nious ac'id. (F. acide unti-

monueux.) A synonym of A. oxide.

A. chlo'ride. SbCl3. Butter of antimony. Obtained as a heavy buttery mass by passing chloring gas over metallic antimony, or by adding strong hydrochloric acid to antimonious sulphide; in the latter case the resulting liquid is distilled until each drop of the distillate on falling into water produces a copious white precipitate; afterwards the chloride comes over pure. and on cooling solidifies to a white crystalline mass. It is very deliquescent; dissolves in strong hydrochloric acid without decomposition. and the solution when poured into water throws down a white precipitate of powder of Algaroth. A caustic. See Liquor antimonii chloridi.

A. hy'dride. Sbll 3. Formed along with hydrogen when a salt of antimony or antimonious oxide is brought into contact with zine and sulphuric acid. The mixture burns with a bluish-green flame, and deposits metallic anti-

mony when a cold porcelain surface is put into the flame. See Antimoniated hydrogen.

A. ox'ide. Sb<sub>2</sub>O<sub>3</sub>. Obtained in a crystallino form by burning metallic antimony at the bottom of a large red-hot crneible; also by ponring solution of antimonions chloride into water, and digesting the resulting precipitate with a solution of sodium carbonate. It is dimorphous; occurring native in trimetric and in octohedral crystals. An impure trioxide has long been named glass of antimony, or vitrum antimonii. It occurs as a pale buff-coloured anhydrous powder, fusible at a red heat. It acts as a feeble acid.

A. oxychlo'ride. A synonym of Alga-

roth, powder of.

A. sul'phide. (F. sulphure d'antimoine ; G. schwarzes Schwefeluntimon.) Sb2S3. A leadgrey, crystalline substance occurring native. It may be prepared by melting antimony and sulphnr, or as an amorphous brick-red precipitate by treating a solution of potassio-tartrate of antimony with hydrogen sulphide; when heated the precipitate loses water, becomes crystalline, and is of a grey colour. It forms compounds with basic sulphides, which are called sulphantimonites. See Antimonium sulphuratum and Kermes min-

An'timonite. Term for a combination of antimonious acid and an alkaline base. Antimonites are very unstable salts. Also, applied to the salts of antimonoso-antimonic acid.

Antimo'nium. See Antimony.

A. al'bum. (L. albus, white.) A synonym of Bismuth.

A. al'bum calcina'tum. Calcined white antimony. A synonym of A. diaphoreticum.

A. al'bum præcipita'tum. (L. præci-

pito, to throw down.) See Algaroth, powder of.

(L. aureus, golden.) A A. au'reum. synonym of Antimonium sulphuratum.

A. bisulphura tum præcipita tum. Precipitated bisulphuret of antimony. A synonym of A. sulphuratum aurantiacum.

A. calcina'tum. Calcined antimony. A synonym of A. diaphoreticum.

A. ehlora'tum. A synonym of the Stibium chloratum, Aust. Ph.; and also of Chloruretum antimonii, Belg. Ph.

A. chlora'tum liq'uidum. of Liquor stibii chloruti, Helv. Ph.

A. chlo'rur. A synonym of the Stibium chloratum, Aust. Ph.

A. cru'dum. (L. crudus, raw, unprepared.

G. roher Spiessglanz.) A synonym of the Stibum sulphuratum nigrum, Aust, and Helv. Ph. Also, a synonym of the metal antimony. Also (G. Grauspiesylanzerz), a term for native antimonious sulphide.

Also, a synonym of Stibium sulfuratum crudum, G. Ph.

A. cru'dum alcoholisa'tum. A term applied to Stibium sulphuratum nigrum præparatum when alcohol has been used in the process of washing.

A. cru'dum præpara'tum. (L. erndus, raw; preparatus, prepared.) A synonym of Sulphuretum antimonii nigrum depuratum,

Belg. Ph. A. depura'tum, Belg. Ph. (L. depuro, to purify.) Purified antimony. Antimony of commerce 16 parts, antimonious sulphide 1 part, dried sodium carbonate 2 parts, ferrons sulphide 1.5 parts. Mix, fuse, separate the product from the scoriæ, powder and mix with dry sodium carbonate 1.5 parts; proceed as before, and also for

a third time.

A. diaphoret'icum. (G. schweisstriebende Spiessglanz.) Diaphoretic antimony; a term for an old preparation made by deflagrating in a crueible one part of grey antimony with three of nitre. It is a mixture of antimoniate, sulphate, and nitrate of potash. Esteemed formerly as gently diaphoretic and laxative, and called an antimoniate of potash; also called the Calx antimonii anglorum, and mineral diaphoretic. Dose, gr. 10-30.

In the Fr. Codex the proportion is I part of antimony to 2 of potassium nitrate; and the composition is given as antimony 79.99 parts, potash 10.70, and water 12.31 parts.

A. diaphoret'icum ablu'tum, Helv. Ph. (L. ablutus, from abluo, to wash off.) parts of pure metallic antimony, mixed with 100 parts of potassium nitrate, are put by degrees into a red-hot crucible, and kept at that temperature for half an hour; the resulting mass is powdered and washed with water until there is no taste.

Also, a synonym of Antimonius potassæ, Belg.

Ph.

A. diaphoret'icum al'bum. (L. albus, white.) A synonym of A. diaphoreticum ablutum.

A. diaphoret'icum dul'ce. (L. dulcis, sweet.) A synonym of A. diaphoreticum ablu-

A. diaphoret'icum edulcora'tum. (L. edulco, to sweeten.) A synonym of A. diaphoretreum ablutum.

A. diaphoret'icum jovia'le. (L. jovialis, belonging to Jupiter; a name given by the alchemists to tin.) A synonym of Antihecticum Poterii.

A. diaphoret'icum lo'tum. (L. lotum. part. of lavo, to wash.) The Antimoine diaphorétique lavé, Fr. Codex. See Antimonius po-

A. diaphoret'icum martia'le. martialis, belonging to Mars; a name given by the alchemists to iron.) An old medicine made by fusing together equal weights of powdered sulphuret of antimony and iron filings, reducing them when cool to powder, deflagrating them with three times their weight of nitre, and dissolving the product in water; the yellowish-brown precipitate thus produced is the martial diaphoretic antimony; also called Anticachecticum Ludovici.

A. diaphoret'icum nitra'tum.  $\Lambda$  term given to A. diaphoreticum, inasmuch as it contains potassium nitrate, which is removed by washing.

A. diaphoret'icum non ablu'tum. (L. ablutus, from abluo, to wash off.) A synonym of A. diaphoreticum.

A. diaphoret'icum reguli'num. (L. regulus, a ruler.) A synonym of A. diaphoreticum ablutum

A. diaphoret'icum ru'brum. (L. ruber, red.) A synonym of Regulus antimonii medicinalis.

A. diaphoret'icum sim'plex. (L. simplex, simple.) A synonym of A. diaphoreticum

A. emet'icum. (L. emeticus, provoking vomiting.) A synonym of A. tartaratum.

A. et cal'cium sulphura'tum. sulfure d'antimoine calcaire; G. spicssglanzhaltiger Schwefelkalk.) Sulphuret of antimony and calcium. Made by heating together antimonious salphide 12 parts, sulphur 15, and lime 60, the upper part being rejected. Formerly used as a resolvent, emetic, and antiarthritic.

A. fu'sum. (L. fusus, spread out.) A synonym of Sulphuretum antimonii nigrum de-

puratum.

A.grys'eum calcina'tum. (G. grauesspiessglanzoxyd.) Grey calcined antimony. A synonym of Antimonii oxidum.

A. hyacin'thinum. ('Yakivetwos, belonging to the hyacinth, of a violet-blu eolour.) A synonym of Intimony, glass of.

A. incinera'tum. (L. in, into; cinis, ashes.) A synonym of Antimonii oridum.

A. martia le cachec ticum. (L. martialis, belonging to Mars, an old term for iron; καχεκτικός, in a bad habit of hody.) A synonym of Ludovici anticachecticum.

A. medicina'le. (L. medicinalis, pertaining to medicine.) Sulphuret of antimony 5 parts, potassium carbonate 1 part, sodium chloride 4 pares; mix and melt. When cold remove the impurities from the top, powder the remainder, and wash. Used formerly as a diaphoretic and alterative.

A. murlat'icum. A synonym of Antimonious chloride.

A. muriat'icum oxida'tum. term for a solution of antimonious chloride.

A. muria'tum. A synonym of Antimonious chloride.

**A. ni grum.** B. Ph. Sb.S<sub>3</sub>. (F. antimoine sulfuré; I. solfuro d'antimonio; S. antimonio crudo; G. Schwefelspiessglauz.) Prepared sulphuret of antimony. Native sulphide of antimony, purified from siliceous matter by fusion, and afterwards reduced to fine powder. It is a greyish-black crystalline powder, which dissolves almost entirely in boiling hydrochloric acid, evolving hydrogen sulphide gas.

A. oxida tum. A synonym of A. dia-

phoreticum.

A. perfec'te oxida'tum. (L. perfecte, fully.) A synonym of A. diaphoreticum ablu-

A. precipita'tum al'bum. (L. præcipito, to throw down; albus, white.) A synonym of Algaroth, powder of.

A. reguli'num. (L. regulus, a ruler.) A synonym of pure antimony.

A. sali'tum. (L. salitus, salted.) A synonym of Antimonious chloride.

A. subchlora tum. A synonym of Algaroth, powder of.

A. sublima'tum. (L. sublimo, to lift on high.) Sublimed antimony. A synonym of Antimony, Argentine flowers of.

A. submuriat icum oxida tum. synonym of Algaroth, powder of.

A. succin eum. (L. succineus, of amber.)

A synonym of Antimony, glass of.

A. sulphura'tum. B. Ph. SbS<sub>3</sub> with SbO<sub>3</sub>. Kermes mineral. Sulphurated antimony. Sulphide of antimony, with a small and variable amount of oxide of antimony. It is thus madeten ounces of black antimony are boiled for two hours with 41 pints of solution of soda, the mixture being stirred frequently, and distilled water added to maintain the same volume. The liquid is then strained, and cilute sulphuric acid added to slight excess. The precipitate is collected on a calico filter, and washed with distilled water till the washings no longer precipitate with chloride of bariom; it is then dried at 100° C. (212° F.), or less. It is an orange-red powder, soluble in caustic soda, and also in hydrochloric acid, with evolution of sulphuretted hydrogen, and the separation of a little sulphur. Boiled in water, with acid tartrate of potash, the resulting solution is precipitated orange-red, with sulphuretted hydrogen. Sixty grains, dissolved in hydrochloric acid, and dropped into water, give a precipitate, which, when washed and dried, weighs about 53 grains. Dose, 1—5 grains.

A. sulphura'tum auranti'acum. (G. Goldschweftl, Fineffach-Schweftlantinon.) Orang-coloured sulphuret of antimony. A synonym of Intimonii sulphuretum precipitatum; and of Sulphur awratum antimonii, Belg Ph., and of Stibium sulfuratum aurantiacum, G. Ph.

A. sulphura'tum fus'cum. (I. fuscus, dark.) A synonym of Sulphuretum antimonii nigrum depuratum.

A. sulphura'tum ni'grum. (L. niger, black.) A synonym of Antimony sulphide.

A. sulphura tum præcipita tum. (L. præcipito, to throw down.) A synonym of A. sulphuratum aurantiacum, and also, of A. sulphuratum rubrum.

A. sulphura'tum præpara'tum. (L. præparatus, prepared.) A synonym of A. sulphura'um.

A. sulphura'tum ru'brum. (L. ruber, red.) A synonym of Kermes muneral.

A. tartara'tum, B. Ph. (F. tartrate de potasse et d'antimoine; G. Brechweinstein, Spiessglanzhaltiges weinsteinsaures Kali, Spiessglanzweinstein.) KO,SbO<sub>3</sub>,C<sub>8</sub>H<sub>4</sub>O<sub>10</sub>+2HO. Tartarated antimony. A tartrate of potash and antimony. The directions for making this are—mix 5 oz. of antimony oxide, with 6 oz. of finely powdered acid tartrate of potash, with a little distilled water, sufficient to form a paste; set aside for 24 hours; then add water to 2 pints, boil for 15 minutes, stirring frequently; filter, and set aside the filtrate to erystallise, dry the erystals at temperature of air. The salt forms colourless, transparent crystals, with triangular facets, soluble in water, less so in proof spirit. It decrepitates and blackens when heated. Its watery solution gives a white precipitate with hydrochloric acid, soluble in excess of the acid. but not formed if tartarie acid be previously added. Twenty graios dissolve, without residue, in fl. 5j at 60°, and the solution gives with SH3 an orange precipitate, which, when washed and dried at 100° C. (212° F.), weighs 9.91 grains.

Tartar emetic applied locally, in the form of oiotment, excites irritation, leading at first to a papular, then to a vesicular, and finally to a pustular eruption, hence it has been used as a powerful derivative and counter-irritant, but its action is capricious and painful. In small doses it excites a sensation of soreness in the stomach. In somewhat larger (1-6th to  $\frac{1}{2}$  gr.) it causes increased secretion of mucus in the intestinal canal, and diarrheea may be induced. It also excites secretion from the bronchial mucous membrane. In still larger doses (1-2 grains) it produces in the course of half an hour nausea and vomiting, accompanied by much straining. It acts in the same way if injected into the veins, and is hence thought by some to act on the centric, as well as on the peripheric extremities of the nerves. The toxic effects of antimony are indicated by considerable paralysis of both the sensory and motor nerves, with loss of reflex action. It weakens and paralyses the heart. It increases both the sensible and insensible transpiration through the skin, and the discharge of watery vapour by the lungs. It also increases the elimination of earbonic acid and of urea. It does not lower the temperature of the body. It has been largely used as an emetic, and as a depressant of arterial action, in the early stages of fever, in various forms of acute local inflammation, in catarrh, bronchitis, laryngitis and eroup, and pneumonia, in mania, and in strumous ophthalmia. It was formerly used as a depressant in delirium tremens, and as an aid in the reduction of dislocations and hernia. Dose, as a diaphoretic, I-16th to 1-6th of a grain; as an emetic, 1-2 grains.

In acute poisoning, the symptoms are that the patient complains of an intensely metallic taste, of thirst, severe pain in throat and helly, vomiting, and purging. The cardiae action is depressed, the skin cold and clammy, respiration laborious, there is dysuria, cramps affect the limbs, and death is often preceded by convulsions of a tetanic character. One and a half grains have proved fatal, but a much larger quantity may be got rid of by vomiting and purging, without serious results. In one case death occurred in 7 hours. The treatment consists in provoking vomiting, if this he not present, and in the administration of tannin, or the infusion of any astringent bark, afterwards strong coffee and opiates.

In cases of chronic poisoning, nausea and vomiting, with great depression, constipation or watery purging, and death resulting from exhaustion, have been observed.

A. tartariza'tum. A synonym of Antimonium tartaratum, B. Ph.

A. trichlora'tum. A synonym of Antimonious chloride.

A. us'tum. (L. ustus, part. of uro, to burn.) A synonym of grey oxide of antimony.

A. us'tum cum ni'tro. A synonym of A. diaphoreticum, inasmuch as it contained nitre.

A. us'tum median'te ni'tro confec'tum. (L. medians, being in the middle; confectus, part. of conficio, to prepare.) A synonym of A. diaphoreticum, in that it is prepared with nitre.

A. us'tum vitreum. (I. vitreus, of glass.) A synonym of Intimony, glass of.
A. vitrifac'tum. (L. vitrum, glass;

A. vitrifactum. (L. vitrum, glass; factus, made.) A synonym of Antimony, glass of.

A.vitrifica'tum. (L.vitrum, glass; factus, made.) See Antimony, glass of.

Antimon juret. (Antimony. F. antimonure.) Name by Beudant for an alloy of antimony with another metal.

Antimon'iuretted by'drogen. A synonym of Antimonious hydrole.

Antimono'so-antimon'ic ox'ide. Sb<sub>2</sub>O<sub>4</sub>, or Sb<sub>2</sub>O<sub>2</sub>, Sb<sub>2</sub>O<sub>3</sub>. It occurs native as antimony ochre; it is obtained by heating the metal or the pentoxide in the air. It is a greyish-white, infusible, and non-volatile powder, insoluble in water and acids. It is probably a compound of antimonious and antimonic oxides; but some believe it to be a distinct oxide forming salts, antimonites.

An'timony. ('Αντί, against: μοναχός, a monk. F. autimonio; I. and S. antimoine; G. Spiesglanzmetall; Dut. spiesglas; Dan. spids-

glands; Arab. Ismud, or Aitmat.) The story is told that Basil Valentine, a German monk, observed that when the sulphite was given to pigs, it first purged and then fattened them; on attempting to feed his brother monks in the same way he killed them all. Sh (Stibium). A metal, atomic weight 122. Chiefly found in the state of black sulphide, rarely native as a metal. Isolated by Basil Valentine at close of 15th century. It has a bluish white colour and strong lustre; it is extremely brittle. Sp. gr. 6.8; sp. heat 0 05077; it melts at 450°C. (842°F.), and boils and volatilises at a white heat. It has a properly like of the property of the strong and specific the strong and strong the stro erystalline structure, and can be obtained in rhombohedral crystals. It is reduced by heating the sulphide with half its weight of metallic iron. It undergoes no oxidation in the air at ordinary temperatures, but oxidises when melted in the air; and when heated more strongly it burns with a white flame, giving off white fumes of antimonious oxide. It forms two classes of compounds, the antimonious compounds, in which it is trivalent, and the antimonic compounds, in which it is quinquevalent. In combination with lead it forms type metal; with tin and a little copper, zine or bismuth, Britannia metal and pewter. Antimonious salts have the following reactions-Water renders their solutions milky, but hydrochloric acid redissolves the precipitate sulphuretted hydrogen gives an orange-red precipitate, or an orange-red tint if the solution is very dilute ; ammonium monosulphide gives an orange-red precipitate, soluble in excess of the reagent, especially if the reagent is impure and contains an excess of sulphur; potash gives a voluminous white precipitate of hydrate, soluble in great excess of the reagent; when boiled the precipitate becomes crystalline (oxide); ammonia and ammouium carbonate give a volumi-nous white precipitate, insoluble in excess of the reagent; potassium carbonate gives a voluminous white precipitate of hydrate, soluble when warmed, in great excess of the reagent; sodium phosphate gives a voluminous white precipitate; exalic acid gives a voluminous white precipitate, and, if sufficient time be allowed, causes complete precipitation; potassium ferrocyanide gives a white precipitate, insoluble in hydrochloric acid; potassium ferrieyanide clouds the solution in hydrochloric acid (due to the action of the water of the reagent); tannic acid gives a yellowish-white precipitate; metallic zinc gives a black precipitate of antimony, if in a platinum capsule a black spot; potassium permanganate is decolorised by it; the potassic solution of antimony oxide, after the lapse of some time, or by heat, precipitates the metallic silver of ammoniacal nitrate of silver. Antimonates have the following reactions-Hydrochloric acid gives a white precipitate, soluble in excess; nitric and sulphuric acids give a white precipitate, insoluble whilst cold, soluble by heat; sulphuretted hydrogen gives an orange-red precipitate if there be no free potash present; nitrate of silver gives a grey precipitate, but metallic silver is not deposited. See Reinsch's test and Marsh's test. Antimony colours flame a pale greenish-blue. Antimony, like arsenic, appears to be a protoplasmic poison.

Antimonium tartaratum, B. Ph. The

A. and potas'sium tar'trate. Antimonium tartaratum, B. Ph.

A., argentine flow'ers of. (L. argen-

tum, silver.) An old term for antimonious oxide when prepared by heating metallic antimony and providing a cool surface, on which the flowers, of silvery whiteness, are deposited.

A. arse niate of. A heavy white powder, containing 56 parts of antimony and 44 of arsenic acid in 100. It has been used in skin diseases and fever. Dose, 0012 grammes three

or four times a day

A.ash. Adull grey powder, resulting from the roasting in a reverberatory furnace of the antimony of commerce, antimonious sulphide. It consists of antimonious oxide, some antimouie oxide, and a portion of unburnt sulphide. It is emetic, and is used by some in the manufacture of tartarised antimony.

A. bases. A term given to certain compounds of antimony, such as stibethyl, analogous

to the antimonium salts.

A., black. The Antimonium nigrum, B. Ph.

A., black sulphuret of. A synonym of Antimonious sulphule.

A., but'ter of. Antimony chloride; a white, highly crystalline mass, very deliquescent, soluble in hydrochloric acid, the solution when added to water throwing down a white, subsequently becoming fawn-coloured, precipitate, composed of trichloride and trioxide of antimony—the old powder of Algaroth—which is soft, dissolves with a gentle heat, and crystallises on cooling. See Antimonious chloride.

A., ce'rated glass of. See Antimonii

vitrum ceratum

A., chlo'ride of. A synonym of Antimonious chloride.

A., chlor'uret of. A synonym of Antimonious chloride.

A., com'mon. A synonym of Antimonious

sulphide.

A., cro'cus of. A satfron-brown, insoluble powder; made by deflagrating equal parts of antimonious sulphide and potassium nitrate with a little hydrochloric acid, and then powdering the fused mass; sometimes sodium chloride was added. It is a variable mixture of sulphide and oxide of antimony, sulphate and antimonate of potassium and chloride of potassium. It was used for the same purposes as Antimonium diaphoreticum.

A., crude. A synonym of native Antimonious sulphide.

A., deutox'ide of. A synonym of Antimontum draphoreticum.

A., diaphoret'ic. See Antimonium diaphoretieum.

A., flow'ers of. A synonym of Algaroth, powder of.

A., glass of. Term for a preparation made by carefully roasting antimony sulphide in powder, and raising the heat at the end of the process so as to fuse the product into a clear glass, which should be transparent and of a brownish-red or hyacinthine colour. It is a mixture of antimonious oxide and sulphide with a little silica and iron. It is a violent emetic.

A., gol'den sul'phur of. A synonym of Antimonii sulphuretum precipitatum.

A., tersul'phuret. A synonym of the Antimonii nigrum, B. Ph., and of the Intimonii sulphuretum, U.S. Ph.

A., tetrox'ide of. A synonym of Antimonoso-antimonic oxide.

A., trichlo'ride of. A synonym of .Intimonious chloride.

A., triox'ide of. A synonym of Antimonions oxide.

A., trisul'phide of. A synonym of Antimonious sulphide

A., veg'etable. A synonym of the Eupatorium perfoliatum.

A., wine of. The Vinum antimoniale, B. P. Antim onyl.

A hypothetical radicle, SbO, supposed by some to be needed to explain the composition of the salts of antimony.

Antimoris. ('Aντί, against; μόρος, A medicine to prolong life.

Antimyce'tic. ('Aυτί; μόλης, a mushroom or fungus.) Having power to destroy the minute vegetable growths, such as Bacterium and Vibrio, which some believe to be the origin of certain diseases

('Αντί; νάρκωσις, α Antinarcot'ic. benumbing.) Applied to remedies for narcotic poisoning

**Antinephritic.** ('Αντί, against; νεφρῖτις, disease of the kidneys. F. antinephretique.) Applied to medicines believed to be curative of diseases of the kidneys.

**Antineural'gic.** ('Αντί, against; νεῦρον, a nerve; ἄλγος, pain ) Term applied to remedies which relieve pain, especially periodically recurring pain.

Antineuritic. ('Δντί; νεύρου, a nerve.) Term applied to remedies that prevent inflammation in nerves

Antineuropathic. ('Λυτί; υεῦρου, a A corroborant or nerve; πάθος, a disease.) nervine remedy.

('Avri, against; lviov, the Antin'iad. occiput.) A term used adverbially by Dr. Barclay, and meaning towards the Antinial aspect; also, termed Glabellad.

Antin'ial. (Same etymon.) Applied by Dr. Barclay, of Edinburgh, in his proposed nomen-

clature, to the aspect opposite the occiput. **Antiobe**'sic. (Λντί; L. obesus, corpulent. F. antiobisique.) Applied to agents pre-Applied to agents preventing or removing obesity.

( Autios, opposite; Antiochali'na. χαλινοί, fangs, F. antiochalin.) Applied by Muller to a Family of ophidian reptiles having the anterior teeth venomous.

Anti'ochi hi'era. (Ίερά, a name of many celebrated medicines or antidotes used by the Greeks.) The antidote of Antiochus. An ancient preparation, composed of germander, agaric, colocynth, Arabian stochas, opoponax, sagapenum, parsley, aristolochia, white pepper, cinnamon, lavender, myrrh, and honey. Used in melancholy, hydrophobia, and epilepsy. (Dunglison.)

A. theriaca. (Οηριακος, an antidote.)
The theriacum of Antiochus. An antidote to every kind of poison, consisting of thyme, opoponax, millet, trefoil, fennel, anisced, nigella sativa, and other herbs. (Dunglison) Antiodontal gic. See Autodontalgic.

**Antiorgas'tic.** ('Αντί, against; ὁργάω, to desire vehemently.) Term applied to medicines used for allaying excitement; and so, synonymous with the term selative.

**Antipalu'dean.** ('Aντί; L. palus, a swamp. F. antipaludeen.) Applied to remedies that are opposed to, preventive, or curative of,

the diseases of marshy districts.

Antiparalytic. ('Αντί, against; παράλυσιs, a loosening by the side, paralysis. F. antiparalytique; G. antiparalytisch.) Term applied to medicines, internally or externally employed, believed to be enrative of paralysis.

Antiparasit'ic. ('Λντί, against; παράσιτος, one who lives at another's expense, a parasite.) Remedies against parasites; insecti-

cide.

Antiparas'tata. ('Avri; L. parastata, the prostate gland.) An old term for the glands of Cowper.

Antiparastati'tis. ('Avrí; parastata, the prostate gland. F. antiparastatite.) Inflam-

mation of Cowper's glands.

Antipatha'ria. A Suborder of the Order Zonntharia, Class Anthozoa. Lowly-developed polypes in colonies, with a soft non-calcarcous skin, sometimes coutaining spicules, and covered with vibratile cihæ.

Antip'athes. ('Αντιπαθίς, a remedy for suffering.) The Corallium nigrum, which was

used as an astringent and refrigerant.

Antipathia. ('Αντιπάθεια, from ἀντί, against; πάθος, affection. F. antipathie; I. antipata; G. Wideveulle, Abneigung.) Antipathy. Term for any opposite properties or affections in matter.

Also, an old term for an aversion to particular objects or things, with great restlessness or

delirium.

A. insen'silis. (L. insensilis, insensible) Insensile antipathy; antipathy produced through some unknown medium, as in the case of a person experiencing a kind of horror in the presence of something, be it a cat or other object, when it is concealed and unknown, and not perceptible to any of the senses.

A. sen'silis. (L. sensilis, sensitive.) Sensile antipathy; antipathy produced through the medium of the external senses, as antipathy to the smell of certain flowers, fruits, or herbs, and to the sight of certain animals, as vermin, reptiles.

Antipath'ic. (Same etymon as Antipathia. F. antipathique; G. antipathiseh.) Having the quality of antipathy; opposed to.

Also, applied to palliative medicines.

Also, applied to the treatment of disease by medicines which are supposed to produce symptoms of an opposite character to those of the disease.

Antipath'idæ. A Family of the Suborder Antipatharia. Polypes with six short, non-retractile tentacles. Of the six radiating septæ, four are atrophied, the other two, which correspond to the commissures of the mouth, are fully developed, and furnished with mesenteries; axis horny.

Antipath'ion. ('Αντιπάθιον.) According to Dioscorides, v. I40, a species of black coral, said to be moderately astringent and refrigerant;

supposed to be black hæmatite.

Antip'athy. See Antipathia.
Antip'atri theri'aca. A composition used against snake-bites. (Dunglison.)

**Antipediculo'sa.** ('Av\ti', L. pediculus, a louse. F. antipediculeux.) Opposed to, or corrective of, pediculous disease; remedies which kill pediculi.

Antipedic'ulous. (Same etymon. F. antipediculeur.) Having power to destroy lice.

Antipep'on. A term applied by Kühne to a body which results from the continued action of pepsin upon albumin after antialbumin has been formed. It does not undergo conversion into peptone by the further action of the gastric or pancreatic ferment.

Antiperiod'ic. ('Αντί; περίοδος, a period.) Applied to remedies which destroy periodicity of diseases running a typical course.

Antiperistal'sis. ('Αντί; περισταλ-

**Antiperistal'sis.** ('Λυτί', περισταλτικός, clasping and compressing, from περιστέλλω, to clothe.) The inverted peristaltic or vermicular action of the intestines.

Antiperistal tic. (Same etymon.) Term applied to the inverted peristaltic motion of the bowels, by which their contents are forced

backwards or npwards to the stomach.

Antiperistattle action follows on obstruction, and is probably effected through the vagus nerve. Some have donbted the existence of a true antiperistaltic action, believing that the regurgitation of the contents of the intestine, which occurs in complete obstruction, is the result of the ordinary peristaltic action which, pressing downwards the outer part of the intestinal contents, forces upwards the central part

Antiperis'tasis. ('Αντιπιρίστιασις, reaction of the surrounding parts; from ἀντίς περάστημι, to stand round about.) Old term for the antagonism of those powers which are naturally opposed to each other, as light and darkness,

heat and cold.

Antipestilen'tial. ('Avri, against; L. pestilentia, pestilence F. antipestilential; G. wider die Pest.) Having remedial powers against the plague.

**Antiphar'macum.** (Λυτί; φάρμακου, a drug, a poison. F. antipharmaque; G. Gegen-

gift.) An antidote against poison.

Antiphar'mic. ('Aντί, against; φάρμακον, a drng, a poison. F. antipharmaque; G. gegen die Gift.) Having the powers of an antidote.

An'tiphate. Black coral; probably only a varied spelling of Antipathes, which see.

Antiphlogistic. ('Λυτί, against;

Antiphlogistic. (Λοτί, against; φλόγωσις, burning heat, as that of inflammation. F. antiphlogistique; G. antiphlogistisch, entzion-duageeidrige Mittel.) Opposed to inflammation. Applied to that medical treatment which is intended to subdue inflammation, or the excited state of the system in inflammatory complaints.

A. theory. (F. chimic antiphlogistique.) A term given to the chemical philosophy originated by Lavoisier, to denote its opposition to the phlogistic doctrines previously prevalent. It was essentially expressed in his proposition that all chemical change, including combustion, consists in a rearrangement of the elements of the bodies undergoing change; from this the doctrine of the indestructibility of matter followed, See Philogistic theory.

A. treatment. The antiphlogistic treatment of olden time consisted in low diet; blood-letting, general and local; alteratives, such as calonnel and tartar emetic; salines, such as nitrate of potash; diuretics, such as digitalis and acetate of potash; sudorities and continement to bed.

**Antiphlogo'sis.** ('Αντί, against; φλώ-γωσις. **F**. antiphlogose.) The action of antiphlogistics.

Antiphtheiri'aca. ('Avrí; plu lasis, louse disease. F. antiphthiriaque; 1. antif-terico.) Remedies which destroy lice.

Antiphthiri'aca. The same as An-

Antiphthisic. (Apri, against; \$\phi\theta i\sigma i\si consumption.

Antiphtho'ra. See Anthora.
Antiphysa ic. ('Αντί; φυσάω, to blow up.) Λ term for medicines which relieve flatnlence.

**Antiphysetic.** ('Δντί, against, φυσητικοs, for blowing up, flatulent.) Term applied to medicines used for dispelling flatulency.

Antiphys'ical. ('Δυτί, against; φύσις,

nature.) That which is contrary to nature. Also (ἀντί; φυσάω, to blow up), a term for medicines which relieve flatulence.

Antiph'yson. (Same etymon.) Old name

for the magnet or loadstone. (Quincy.)

Antiplas'tic. ('λντί, against; πλαστικός, fit for moulding; from πλάσσω, to form. F. antiplastique.) Unfavorable to the process of

healing, or of granulation; disorganising.

Also, applied to medicines which impoverish the blood.

**Antipleuritic.** ('Aντί, against; πλευ-ρῖτις, pleurisy. F. antipleuretique.) Term applied to medicines against, or curative of,

Antipneumon'ic. ('Αντί; πνευμονία, a disease of the lungs. F. antipneumonique.) Opposed to, or curative of, pneumonia.

**Antipodag**'ric. ('Αντί, against; πο-εάγρα, the gout. F. antipodagrique.) Term applied to medicines curative of gout.

Antip'odal. ('Αντί; πούς, a foot. G. gegenfusslerisch.) Having the feet opposite to each other.

A. cells. (G. gegenfüsslere Zellen.) One or more cells found at the lower part of the embryo sac of the ovule in plants. Their function is unknown.

**Antip**'odes. ('Aντί; πούs, a foot. F. antipodes, G. Gegenfüssler.) Applied to the people who live in parts diametrically opposed to each other; those who dwell on the parallels of the equator equally distant from the circle, the one on the south, the other on the north, having the same meridian, and separated by 180 degrees of longitude.

('Αντίπραξις, counter-Antipraxia. action; from ἀντί, against; πράσσω, to act or do.) Term for a contrariety of functions and temperaments existing at the same time in different parts; used by the ancients to express the variety of concurring yet often opposite symptoms, as spasms of the muscles of one limb, and paralysis of those of another.

Antipros'tatæ glan'dulæ. ('Αντί; prostate, the gland of that name.) The anti-

prostate glands; Cowper's glands.

Antiprostatic. ('Avtl, against; prostate, the gland of that name. F. antiprostatique.) Against, or opposite, the prostate gland.

Antiprurit'ic. ('Avri; L. pruritus, itching. F. untipruritique.) Term applied to remedies that relieve itching.

Antipso'ric. ('Avri, against; \$\psi\_{opa}\$, the

itch, F. antipsorique.) Term applied to medicines against, or curative of, the itch.

**Antipus.** ('Αντί; 'πούς, a foot.) An antipode. See Antipodes.

Antiputrod'inous. (Avrí; L. putredo, putrescence. F. antiputredineux; G. faulniss-widrig.) Opposed to, or corrective of, putrescence; applied to remedies.

Antipy'ic. ('Αντί, against; πύον, pus. F. antipyique; G. gegen Eiterung.) Term applied to medicines or other applications to prevent suppuration.

**Antipyrac'tic.** ('Λντί; πυρακτίω, to burn, to char. G. unverbrennlich.) Not able to

be burned.

Antipyretic. ('Λυτί, against; πυρετός, fever. F. antipyrètique; G. Fieberwidrig.)
Against, or curative of, fevers; applied to medicines as reputed; antifebrile; febrifuge.

A. treat ment. The treatment of fever by

means of cold baths.

Antipyrotic. ('Αντί, against; πύρωσις, a burning. F. antipyrotique; G. gegen Verbren-nungen.) Term applied to medicinal preparations used against, or curative of, burns.

Also (dvti; pyrosis), applied to medicines

which relieve water-brash or pyrosis.

Antiquartana rium. ('Avri, against; quartana febris, a quartan fever or ague.) Against, or curative of, quartan agne; applied to medicines so reputed.

Antiquar'tium. A synonym of Calomel.

Also, the same as Antiquartanarium.

A. Peruvia'num. Old name for Cinchona, or Peruvian bark, as mentioned by Wedelius, Ph. I. A. F. R. l. ii, s. 2, c. 8, from its powers in the cure of quartan ague.

Anti'qui mor'bi. (L. antiques, old; morbus, a disease.) Old term for chronic diseases.

Antirachit'ic. ('Avri, against; rachitis, rickets. F. antirachitique) Against, or corrective of, rachitis, applied to medicines exhibited with this view.

**Antirheumat'ic.** ('Λντί; rheumatism. F. antirheumatismal; G. antirheumatische.) Opposed to, or curative of, rheumatism.

Antirrhin'eæ. (F. antirrhiné.) Applied to a Family of Scrophularica; by Bartling to a Tribe of that Family represented by the Antir-

Also, a synonym of Scrophulariæ.

Antirrhin'ic. (Antirrhinum.) Of, or pertaining to, the Antirrhinum.

A. ac'id. A colourless, volatile, and nauseons acid, found in the leaves of the Digitalis purpurea; it resembles valerianic acid.

Antirrhin'idæ. A Tribe of the Nat. Order Scrophulariaceæ. Corolla with two lips, the posterior covering the anterior; inflorescence centripetal or composed of partial cymes.

Antirrhi'nin. A yellow colouring matter, obtained by Rigel from the flowers of some species of Linaria.

**Antirrhi'num.** ('Αντίρρινον, the snapdragon; from ἀντί, like; ρίς, the nose; so called from the resemblance of its flowers.) Snap-drigon, calves' snont, lion's snap. A Genus of the Nat. Order Scraphulariaceæ. Leaves entire, lower opposite, upper alternate; flowers solitary and axillary, or racemose and bracteate; calvx 5-partite; corolla personate; stamens 4, fertile; one rudimentary, or absent; capsule 2celled.

A. acutan'gulum. (L. acutus, pointed,

acute; angulus, an angle.) A synonym of A. linaria.

A. asarina. (L. asarum, the plant asarabacca; so-called from the similarity of the leaves.) A species the root of which, under the name racine d'asarine, is said by Guibourt to be substituted for asarabacca root.

A. auricula tum. (L. auricula, the outer ear) A synonym of A. elatine.

A. elatine. (Ελατίνη; perhaps from ελάτη, the pine.) Female speedwell. Formerly used in scurvy and chronic uleers.

A. hedera ceum. (L. hederaceus, like ivy.) A syuonym of Linaria vulgaris.

A. hederæfo'lium. (L. hedera, ivy; folium, a leaf.) A synonym of Linaria vul-

A. lina'ria. (L. linum, flax; from its resemblance in some respects.) A synonym of

Linaria vulgaris.

A. ma'jus. (L. major, greater. F. moufle de veau, queule de loup, q. de lion; G. Kalbnase, grosses-Lowenmaul.) Wild snapdragon. Tall, perennial; leaves lanceolate-oblong or linear; racemes dense-flowered; sepals short; flowers purplish, or white, or yellow; grows on old walls. It was used as an astringent and vulnerary, and from the seeds a bland oil was obtained.

A. oron'tium. (Orontes, a river of Syria. F. tête de mort.) A low annual or biennial; leaves linear, lanceolate, sessile, raceme leafy; flowers rosy purple; sepals narrow, spreading, longer than the corolla. It is said to be poi-

sonous.

Antirrhœ'a. A Genus of the Nat. Order Cinchonaceæ. A tree with opposite or verticillate stipulate leaves; flowers axillary, sessile, regular, and hermaphrodite, grouped in cymes; receptacle concave; calyx gamosepalous; corolla infundibuliform; anthers sessile; ovary inferior; style with two subulate branches; ovary bilocular; ovules anatropal; fruit a drupe, with two albuminous seeds.

A. borbon'ica. (Bourbon, a former name of the island now called Reunion.) Similar to,

if not identical with, A. verticilluta.

A.verticilla'ta. (L. verticillus, the whirl of a spindle.) Root and bark powerfully astringent; used in Réunion as a styptic to restrain hæmorrhage and mucous discharges.

Antirube olous. ('Avti; rubroli. F. antirubiolique.) That which is used against ru-

beola, or measles.

**Antisca'bious.** (' $A\nu\tau i$ ; L. scubies, itch.) Applied to remedies for the itch.

Antiscarlati'nal. ('Avtí; scarlatina. F. antiscarlatineux.) That which is used against

scarlatina.

Antis'cii. ('Αντί; σκιά, a shadow. F. antescuen; G. gegenschattler.) Same as antipodes, because the people thus geographically placed in relation to each other have their shadows in opposite directions.

Antiscir'rhous. ('Avti; scirrhus. F antiscirrheux; G. krebsheilend.) Opposed to, or relieving, scirrhus.

**Antiscoletic.** See Antiscolic. **Antiscolic.** ('Αντί, against; σκώληξ, a worm. F. antiscolique.) Term applied to medicines capable of expelling worms; vermifuge; anthelmintie.

Antiscorbu'tic. ('Avri, against; scorbutus, the disease scurvy. F. antiscorbutique; 1. antiscorbutico; S. antiscorbutico; G. antiscorbutico;

scorbutisch.) Against, preventive, or corrective of the disease scorbutus, or scurvy.

Antiscorbu'ticae. (Same etymon.) A synonym of the Uruerferæ.

Antiscorbu'tics. (Same etymon.) Remedies for scurvy; such are lime juice, horseradish, watercress, potatoes, onions.

Antiscrof ulous. ('Aντί, against; scrofulu. F. antiscrofuleux, antiscrophuleux; G. gegen die Scrofeln.) Against, or curative of, scrofula; applied to medicines believed to be efficient for this purpose. Such are the compounds of iodine, bromine, baryta, gold and sulphur, cod-liver oil, sodium chloride, hemlock, and, in popular repute, walnut leaves, buckbeau, watercress, horseradish, and others.

Antiseco'sis. (Gr.; from ἀντισηκόω, to counterpoise.) A reduction to a proper equili-

brium, as of the food.

Also, the re-establishment of strength.

Antisep tic. ('Αντί, against; σηπτικός, from σήπω, to make putrid. F. antiseptique; I. antisettico; S. antiseptico; G. antiseptisch, faulnisshindernd.) Having power to prevent putrefaction.

**A. cere'cloth.** A material of the same nature as, but thicker than, *A. gauze*.

A. gauze. A material used by Mr. Lister in the autiseptic treatment of wounds, consisting of muslin charged with a mixture of one part erystallised earbolic acid, five parts common resin, and seven parts paraffin.

A. lac plas'ter. A plaster made by spreading on cotton or other material a mixture of one part of carbolic acid and three of shell-

A. lig'ature. Catgut, or other suitable material, soaked in a solution of carbolic acid in olive oil.

A. plas'ter. A plaster made by dipping adhesive plaster into a hot solution of one part of carbolic acid in sixty of water.

A. treat'ment of wounds. See Wounds,

antiseptie treatment of.

Antisep'tics. (Same etymon.) The more important autiseptics are arsenious acid, creasote, and the acids of tar, thymol, salicyle, tannin, corrosive sublimate, animal charcoal, common salt, alcohol, zine-chloride, quinine, sulphurous acid, and the act of desiceation, boiling, and hermetically sealing to prevent access of air. The mode of action of these substances varies greatly, and is not in all instances known. The cause of putrefaction itself is indeed not thoroughly understood. As generally seen, it occurs in animal and vegetable tissues of complex chemical constitution, the proximate principles of which are reduced by oxidation to lower planes of composition, the change being accompanied by the appearance of bacteria and other low forms of life. By some it is thought that the agent is a kind of ferment acting by catalysis on extremely unstable compounds; whilst others attribute it directly to the growth and development of spores contained in the atmosphere which, in growing, effect the decomposition of the substances in question. It is certain that by the mere act of exposure to a boiling temperature, and closure of the vessel, so that on cooling a partial vacuum is produced, putrefactive changes are almost perfectly prevented, either from the absence of oxygen or the destruction of spores. Cold, again, seems to act simply by the absence of one of the necessary conditions. Other agents, as corrosive sublimate, and sulphur, and quinine, seem to be inimical to the growth of any of the lower organisms; whilst tannie acid appears to form chemical combinations that are less unstable, and therefore less likely to undergo putrefactive de-composition. According to Baierlacher, sulphurous acid is the hest yeast poison, a quantity not exceeding 0.33 per cent, sufficing to arrest germination; and next to this in efficacy stands salicylic acid; carbolic acid retards but does not altogether prevent germination; the action of chlorine is insignificant.

Antisial agogue.  $(\Lambda \nu \tau i;$ σίαλον. spittle; άγω, to lead.) Remedies which check

salivation.

Antisial'ic. ('Avti; σίαλον, spittle.) Having power to check the flow of saliva.

Antisi'alous. (' $\Lambda \nu \tau i$ ;  $\sigma i a \lambda \sigma \nu$ , spittle.) A remedy which checks the flow of saliva.

Antisideric. ('Αντί; σίδηρος, iron.) A term applied to medicines, like mercury and alkalies, and to such foods, as fat and mucilage, which were supposed to be antagonistic to iron; hence also autitonie.

Antis pasis. ('Αντίσπασιs; from ἀντί, against; σπάω, to draw. F. antispase; I. antispasis; S. antispasima; G. Gegenreizung, Ablitung.) Traction into a contrary part. Term used by Galen, l. de Hirund. Revuls. e. 3, and Winnerstee J. vi. Enid s. 2, t. 8, and Goyraus. Hippocrates, l. vi, Epid. s. 2, t. 8, and Gorræus p. 40, for a revulsion; the turning of the flowing humours into a different course.

Antispasmodic. ('Aντί, against; σπασμός, a convulsion or spasm; from σπάω, to draw. F. antispasmodique; G. krampfstillend.) Having power to allay spasmodic pains; applied to certain medicines of this character.

Antispasmod'ics. (Same etymon. F. antispasmodiques; G. krampfstillende Mittel.) An ill-defined section of medicines which includes remedies that are used to relieve noninflammatory pain or spasm; they partake of the nature of stimulants and narcoties. Such are ether, hydrocyanic acid, chloral, cbloroform, and the bromides, which have in some sort a sedative action; and the fetid gums, musk, castor, valerian, camphor, ammonia, and such like, which approach in action to the stimulants.

Antispas'tic. ('Λντί, against; σπασ-τικός, drawing away; from σπάω, to draw. F. antispastique.) Drawing against, or counteracting a state of, tension, or spasm, and so, synonymous with Antispasmodic; applied to medicines of this

character; also, derivative.

Antispas'ticon. A term used by Galen, l. xiii, Meth. Med. c. ii, for any medicine acting

by way of revulsion.

**Antispo'dium.** ('Αντισπόδιον. G. Pflan-zenasche.) A term applied by the ancients to the ashes of the fig, myrtle, olive, quince, privet, and other trees, which were considered as a substitute for spedes or spedium, which consisted of the ashes or residuum of metallic substances after combustion. Its uses were similar to those of the spodos (Dioscorides, l. v. c. 86, Pliny, l. xxx. c. 35.) (Waring.)

Antisqua mic. ('Avti; L. squamo, a scale.) A remedy for the cure of skin diseases. Antis'tasis. ('Aντίστασις, opposition ;

from ἀντί, against; στάω, to stand.) Opposition; antagonism.

Antistathme'sis. ('Αντιστάθμησις; from αντισταθμίζω, to counterpoise.) Λ reducing to an equilibrium,

Antistat'icus. ('Αντί; στάω, to stand. G. gegenstehend.) Antagonistic. Applied by Hauy to a crystal in which certain additional

facets have symmetrical figures, others, irregular.

Antisterig ma. ('Αντί; στήριγμα, a prop, a support.) A support for a weak part; a

fulcrum or crutch.

Antister non. Same as Antisternum. **Antister'num.** ('Αντί, against, or op-posite; στίρνον, the sternum. G. Oberrücken.) Old term for the dorsum or back, because it is

Antis'ticus. ('Αντί; στίξ, a row. F. antistique; G. gegenreihig.) Applied by Haüy to a crystal in which the facets of different rows are turned inversely one from the other.

Antistœ'chia. ('Λντί; στοῖχος, a series. L. commutatio literarum; G. Buchstabenweeksel.) The substitution of one letter for another of the same fundamental character, as in the p for k in the conversion of the Greek λύκος into the Latin

In Chemistry, the word was used to describe the conversion of one compound into others, as of ammonia into hydrogen and nitrogen.

Antistroph'æ. **Antistroph'æ.** ('Αντί; στρέφω, to turn.) An old term applied to the first two ribs, because they were regarded as acting in opposition to the other ribs.

Antistru'mous. ('Avti; L. struma, scrofula.) Term applied to remedies for the cure

of scrofula.

Antisu'doral. Same etymon and meaning as Antisudorific

Antisudorific. ('Avri; L. sudor, sweat. F. antisudoral.) Term applied to remedies diminishing perspiration; anhydrotic remedies.

Antisyphilitic. ('Avrl, against; L. syphilis, the venered disease. F. antisyphilitique; I. antisifilitico; G. antisyphilitisch.) Against, corrective, or curative of syphilis.

('Αντίτασις; from αντί, Antit'asis. against; τείνω, to extend. G. Gegendehnung.) A term used by Galen, l. vi, Meth. Med. c. 5, for counter-extension.

Antite'sion. A synonym in Dioseorides of one or several species of Xanthium.

Antith'enar. ('Λντί, against; θέναρ, the hollow of the hand or foot. I. antitenare; G. Gegenklopfer.) Opposing the palm or sole, as in the action of a muscle.

Also, opposite the thenar.

A. em'inence. The outer prominent border of the palm of the hand extending from the base of the little finger to the wrist.

A. mus'cle of great toe. (F. antithenar du gros orteil.) The adductor polheis pedis.

Winslow describes a muscle in the foot, which is evidently the muscle now called the flexor pollicis pedis.

A. mus'cle of thumb. (F. antithenar du pouce, demiinterosseux du pouce.) That portion of the flexor brevis pollicis manus, according to Winslow, which arises by the deep head; the whole of this musele, according to Riolanus.

Antither mics. ('Αντί; θερμός, hot.) Term applied to refrigerating remedies.

Antither'mum. (Same etymon. F. antithermon; G. Hitzmittel.) A medicine against heat; a refrigerating medicine.

**Antith esis.** ('Αντίθεσις, opposition; from ἀντιτίθημα, to set against. G. Gegensatz.) A term used in rhetoric to signify a form of words in which the opposition of meaning conveyed is marked by the contrast of the words

themselves.

Mr. Darwin has used this expression to denote one of the principles which explain the involuntary gestures and expressions used by man and other animals when under the influence of emotions; that tendency, namely, to effect movements, even though they be useless, of an exactly opposite nature to those prompted by an exactly opposite frame of mind, and which in that coudition are useful.

Antithetic. (Same etymon. G. gegensatzlich.) Opposite in words or meaning; in

contrast.

A. for'mula. A mode of writing the formulæ of chemical compounds in two lines, one of which contains the negative and the other the positive element.

Antith'ora. The Aconitum anthora. Antitimo'ria. ('Αντί; τῖμωρία, help.)
The sympathy between different organs, which is the foundation of the idea of Consensus as a medical term.

Antitox'ics. ('Αντί; τοξικόν, poison for smearing arrows with. F. antitoxique.) Anti-

dotes; remedies against poison.

Antitox'icum. (Same etymon. G. Ge-

gengift.) An antidote.

Antitrag'icus. (L. antitragus, an eminence of the external ear. F. antitragien.) A muscle arising from the outer part of the autitragus, and passing upwards to be inserted into the pointed extremity of the antihelix.

**Antitra**'gus. ('Αντί, against; τράγος, a he-goat; the cartilaginous prominence in front of the meatus auditorius. I. antitrago; G. Gegenbock.) Term for an eminence on the external ear. The thicker part of the antihelix, opposite the tragus, as described by Ruffus,

Antitris'mus. ('Auti, against; trismus.) A tetanic condition opposed to trismus, in which the mouth is open and cannot be closed.

Antitrochan'ter. ('Aντί, against; trochanter.) A process of the brim of the acetabulum in birds which articulates with the great trochanter.

Antit'ropal. Same etymon and meaning

as Antitropous.

**Antitropous.** ('Αντί, against; τρόπος, a turn, way, or manner. F. antitrope; G. verkehrtliegend.) Applied to the embryo when the radicle is distant from the hilum, the cotyledons being next to the latter; so that the embryo is inverted in relation to the seed.

Antityp'ia. ('Αντιτυπία, the resistance of a hard body.) Hardness; resistance to blows,

and also to the causes of disease.

Antityp'ical. ('Αντί; τυπικύς, conformable.) Antiperiodic in being opposed to the type of ague, namely, its periodicity.

Also, contrary to the typical form.

Antivari'olous. ('Avti; L. variola, smallpox. F. antivariolique.) Term for remedies

against smallpox.

Antivene'real. ('Avti, against; venereal disease; from Venus, the goddess of love. F. antivénérien.) Against, or curative of, the venereal disease; applied to certain medicines of this character; also, to such as had power to control or destroy the venereal appetite.

**Antivermic'ular.** (' $\Lambda \nu \tau i$ ; vermicular movements of the intestines.) Opposed to the peristaltic or vermicular action of the intestines.

Antiver'minous. ('Avrí: L. vermis, a worm. F. antivermineux.) Authelmintic.
Antivestib'ulum Boja'ni. The inner of the two chambers into which the tympanic cavity is divided in Chelonia by a process of the quadrate bone which forms part of the floor. The mastoid cells open into this chamber.

Antizootic. ('Λντί; ζώον, a living being. F. antizootique; G. theirtodtend.) Operating

against animal life.

**Antizym'ic.** ('Λντί, against; ζυμόω, to ferment. F. antizymique.) Against, or preven-

tive of, fermentation. Antizymot'ic. ('Aντί, against; ζυμωτικός, causing to ferment; from ζύμη, ferment.) Against, or preventive of, fermentation or zy-

mosis. Antizymot'ics. Remedies which oppose zymo-is; such are sulphurous acid, carbolic acid, and most disinfectants. The exact mode of action, whether it be purely chemical, or solely destruetive of the organisms which occur in or accompany the processes of fermentation and putrefaction, is yet unsettled.

Ant'jar. The name in Java of the Upas antiar.

Ant'ler. (F. andouiller.) The branches of the horns of a deer.

Antlia. (L. antlia, a pump. G. Schopf-

maschine, Pumpe.) A syringe, a pump. Also (F. trompe; G. Saugrussel), the proboseis of the Lepidoptera, which consists of the clongated, united, and spirally-rolled maxillæ.

**A.** gas'trica. (Γαστήρ, the belly.) stomach-pump.

A. lac'tea. (L. lacteus, relating to milk.) Same as A. mammaria.

A. mamma'ria. (L. mamma, mother, the breast, G. Milchpumpe.) Term for an instru-ment for drawing milk from the breast, a milk-

pump; a mammary-, or breast-pump. A. pneumatica. (L. pneumaticus, belonging to air. F. pompe pneumatique; G. Luft-

pumpe.) An air-pnmp.

A. sanguisu'ga. (L. sanguis, blood; sugo, to suck. G. Blutpumpe.) The exhausting syringe used in cupping.

Antlia'ta. (Same etymon. G. Schopfrusselmauler.) Applied by Fabricius to an Order of insects provided with an haustorium.

Also, a synonym of Diptera.

Antliobrachioph'ora. ('Aντλίον, a hucket; βραχίων, an arm; φορίω, to bear.) Applied by J. E. Gray to a Class of Mollusca, comprising Cephalopoda, because they have arms furnished with haustoria.

Antodontal gic. ('Aντί, against; F. antodontalgique.) όδουταλγία, toothache. Against, or curative of, odontalgia or toothache; applied to medicines of this kind.

An'todyne. ('Αντί; ὁδύνη, pain. F. antodyn; G. Schmerzstillend.) Subduing pain.

An'togast. Germany, in Baden, near Griesbach im Meissachthale. Three saline chalybeate springs, having the same composition, and having a temperature of 12° C. (53.6° F.) water contains calcium, magnesium, and sodium carbonate, sodium sulphate, some iron, traces of arsenic, and free carbonic acid. The climate is mild and the scenery beautiful; the bath is 1600 feet above sea level.

An'tonienthal. Switzerland; Canton Graubünden. In this valley, about 3000 feet above sea level, are found Badried and Scheri, iron carbonated springs; Aschuel, an alkaline spring; and Gailenbad, one containing sulphur.

Anto'nii, Ig'nis Sanc'ti. nthony's fire. A synonym of Erysipelas. Anthony's are.

Antophthal mic. (Άντί, against; φψελλιια, inflammation of the eye.) Applied to remedies against ophthalmia.

Antophyl'li. The same as Anthophylli.

Antophyllus. See Anthophylli.
Antor bital process. (L. ante, in front of; orbit.) A process also called the ethmopalatine process; it is the antero-external angle of the basilar plate in the dog-fish, which, during development, is loosely connected with the palatine cartilage of its own side.

Antorgas'tic. See Antiorgastic.

Antothe'sis. ('Αντώθησις, a thrusting against; from ἀντί; ἀθέω, to push.) A synonym of Endosmose.

**Antothis'mus.** ('Αντωθισμός, a thrusting against. G. Wechseldurchdringen.) Α synonym of Osmosis.

('Avti; ozana.) Applied Antozæ'nic.

to remedies against ozena.

An'tozone. ('Αντί, against; ozone.) A term given by Schönbein to a modification of oxygen, which, on combination with ozone, formed oxygen. It is now known to be hydrogen dioxide.

Anto zonides. A term given by Schönbein to the peroxides of barium, strontium, and calcium, because when treated with hydrochloric acid they give off no chlorine, but form a protochloride and hydrogen dioxide. See Ozonides.

Antozostomatic. ('Αντί; ὀζόστομος, with bad breath.) Having power to correct a bad breath, or a bad taste in the month.

An'tral. (L. antrum, a cave. F. antral.) Term applied to objects pertaining to cavities in bones, and especially to those of the antrum of the superior maxillary bone.

Antra'sia. An erroneous reading of

atrophia.

An'trax. Same as Anthrax.

**Antri'ades.** ('Αντριάς, belonging to a cavern. F. antriades.) Applied by Vieillot to a Family of Sylvicolæ that dwell in caverns.

Antri'tis. (L. antrum, a cave or hollow Term for inflammation of any eavity of place.) the body, or specially of the antrum Highmori-

An'tron. (Same etymon.) Term applied by Moench to fruits of which the apple is the

An'trope. Same as Anatrope.

Antrophlogo'sis. (L. antrum; phlogonin.) Same as Antritis.

Antrorrhon'cus. (L. antrum; rhonchus. F. gargouillement, râle caverneux; G. Gluckengerausch, Hohlengerassel.) Term for cavernous rhonehus.

Antrover'sion. (L. antrorsum, a modern manufacture, signifying forward; verto, to turn.) Same as Anterersion.

**An'trum.** (' $\Lambda \nu \tau \rho \sigma \nu$ , a den, cave, or lurking place. F. antre; I. and S. antro; G. Hohle.) A cavity or hollow place, especially in a bone, in which the opening is comparatively small.

A. au'ris. (L. auris, the ear.) The tym-

panum.

A. buccino'sum. (L. buccina, a crooked horn, or trumpet. F. antre buccineux.) The trumpet or horn-like cavity; a term used by

Bartholin, Anat. iv, 6, fin. for the cochlea of the

A. depta'le. (L. dentalis, belonging to the

teeth.) The pulp cavity of a tooth.

A. ethmoida'le. (Ethmoid, the bone of that name, F. antre ethmoidal.) The ethmoidal sinuses or cells.

A. ge'næ. (L. genæ, the checks.) The cavity of the cheek; a term for the antrum Highmorianum.

A. Highmo'ri. The same as A. Highmorianum.

A. Highmoria'num. (G. Kinnbackenhöhle.) The antrum of Highmore. A name applied to the cavity in the superior maxillary bone; it is lined by mncous membrane, and communicates with the middle meatus of the nose. It is also called the maxillary sinus.

A. mastoide'um. (F. antre mastoidien.) The cells of the mastoid process of the temporal bone.

A. maxil'læ. (L. maxilla, the jaw.) A term for the antrum Highmorianum, given to this cavity by Casserius, before Highmore discovered it, according to Quincy.

A. maxilla're. (L. maxillaris.) A syno-

nym of Antrum maxilla.

A. olfacti'vum. (L. olfacto, to smell at. F. antre olfactif.) The ethmoidal cells or sinuses.

**A. pylo'ri.** (Πυλωρός, a gatekeeper; the lower orifice of the stomach.) The cavity of the pylorus; a term for the bulging of the small extremity of the stomach near the pylorus.

A. pylor'icum. See A. pylori. Ants, ac'id of. A synonym of Formic acid.

A., artific'ial oil of. A synonym of Furfurol.

Ants jar. A synonym of Upas antiar. An'ty. Rumphius applies this name to an emollient herb.

Antyl'ion. ('Αντύλιον.) Old name used by Paulus Ægineta for an astringent malagma or cataplasm. (Gorraeus.)

Antyl'lus. An Italian surgeon, believed to have lived about the fourth century, as he is quoted by Oribasius. He wrote on phlebotomy and arteriotomy, ectropion, cataract, and tracheotomy.

A., meth'od of. A mode of treatment of aneurysm by extirpation, now disused. The artery above was compressed, the ancurysm was opened, the clots removed, the vessel tied above and below the aneurysm, and the cavity left to fill up by granulation.

Anu'bia. The Brazilian name of the Laurus sassafras.

An'ucar. Arabic name for borax. (Qniney.) Anu'dron. A term applied by the ancient Greek physicians to a plant that is believed to be stramonimu.

An'ulus. (Dim. of anus, the fundament.) A small depression.

Also, the anus itself.

Also, a term for a small deep uleer of the cornea.

Anu'ra. ('Aν, neg.; οὐρά, a tail.) An Order of Amphibia, including the Frog and Toad, so named because in the adult state the tail present in the larvæ or tadpole is atrophied. Anoura.

Also, a Division of Chiroptera, including Glossophaga and Monophyllus.

Also, a Group of the Podurida, Order Thys-

Anure'sis. ('Av, neg.; οὔρησις, a making water. G. Harnmangel.) Retention of urine.

Also, suppression of urine.

Anu'ria. ('Aν, neg.; οὐρον, urine. G. arnmangel.) Absence, or deficiency of, the Harnmangel.) nrine.

οὖρον, urine.) (' $\Lambda \nu$ , neg.; Anu'ric. Suffering from deticiency of urine

Also (ἀν, neg.; οὐρά, a tail), destitute of a tail. **Anurid idæ.** ('Aν, neg.; οὐρά, a tail.)

A Family of the Order Collembola, Class Insecta. Anu rous. ('Aν, neg.; οὐρά, a tail. F.

anure; G. Schwanzlos.) Wanting the tail.

A nus. (L. anus, the sitting thing, the fundament; akin to Sanscrit root as, to sit. F. anus, siege, fondement; G. After, Hintere.) Term for the extremity of the rectum; the lower opening of the alimentary canal; the funda-

It is an expansible aperture, covered externally by skin, which is here continuous with the intestinal mucous membrane. Its muscles are the internal and external sphineters, the levator ani, and the coccygeus.

Also, the auterior opening of the aqueduct of Sylvius in the brain.

In Botany, the inferior aperture of a monopetalous flower.

A., abnor'mal. See A. artificial.
A., artificial. The formation of a new outlet for the passage of fæeal matter from the intestine when the natural outlet is congenitally absent, or when obstruction of the intestinal canal occurs from disease. An artificial anus is sometimes the result of sloughing of the gut in operation for strangulated hernia, or as the result of wounds or ulceration. See Colotomy.

A., atre'sia of. ('Λ, neg.; τράω, to per-

forate.) Imperforation, which may be either complete or incomplete, ano-rectal, recto-urinary, or recto-vaginal. See A. imperforate.

A. cer'ebri. (L. cerebrum, the brain.)
The anterior opening of the aqueduct of Sylvius

in the third ventricle of the brain.

A., fis'sure of. One or more small cracks of the skin at the edge of the anus, generally due to constipation and passage of hardened fæees. Symptoms at first slight, but after some days each evacuation of the bowels is attended with severe eutting pain and bleeding, followed by distressing aching, which lasts several hours. The lesion is trifling, but it seriously interferes with either bodily or mental work. The treatment consists in injecting a pint of warm water an hour before going to stool, so that the faces may be softened the application of belladonna ointment, of solid nitrate of silver, forcible rupture. The most effective treatment consists in the division of the fibres of the sphincter ani.

A., fis'tula of. (L. fistula, a tubular sel.) A sinus which is the result of an abscess in the connective tissue around the lower part of the rectum, which has either burst into the intestine, or through the integument, or in both places. In the last and most common case it is termed complete, in the two former incomplete. The symptoms are, in the first instance, those of an ordinary abscess, which, bursting or being opened, discharges pus of a peculiarly disgusting odour. Brodie thought the abscess was always preceded by ulceration of the mucous membrane, but on this point there is a

difference of opinion. The cavity of the abscess contracts to a sinus, the internal opening of which is never more than an inch and a quarter from the anus (Ribes), whilst the external, when present, opens in the perineum, and discharges either continuously or at intervals a thin sero- or sunguino-puralent fluid and flatus, or even fæculent matter. Fistula in ano rarely heals without operation. In the treatment, the howel being cleared out with easter oil and an injection of salt and water, the forefinger of one hand should be introduced into the rectum, and a probe carefully passed into the external orifice of the fistula; as a rule, the internal orifice can be discovered. The probe may now be replaced by a grooved director, the point of which, having entered the eavity of the gut, may be brought down with the foreinger in contact with it, and the whole of the tissues, skin, connective tissue, sphineter muscle, and coats of the intestine divided at once with a curved sharp-pointed bistoury; the wound should be dressed with lint steeped in carbolised oil, and generally quickly heals by granulation. When great dread of cutting instruments exists, a ligature is sometimes employed to cut through the tissues between the two orifices. Severe hæmorrhage sometimes occurs after section, which must be checked by ice, turpentine, compresses, Ruspini's styptic, and manual pressure. The operation is contra-indicated in tubereulous patients.

A., fun'nel-sha'ped. An exaggeration of the natural depression of the anus in relation to the nates, with a smoothing out of the ruge, seen in those who have subjected themselves to sodomy.

A., imper'forate. (L.im, neg.; perforatus, from perfore, to pierce through.) The closure of the canal of the anus by a membranous septum, or the complete absence of more or less of the lower end of the rectum, its place being taken by a mass of deuse areolar tissue. Crucial division of the

septum is to be adopted in the first case; in the latter a deep, carefully made dissection in the perinæum, to reach the rectal cul de sac; or lumbar or inguinal colotomy will be necessary.

(Notos, spurious, counter-A. no thus. feit.) An artificial anus.

A., preternat'ural. (L. prater, beyond ; notura, nature.) A condition in which an opening, not the natural anus, into the intestine gives exit to the whole or part of the faces; it may be the result of a wound or of abscess.

A., pro'lapse of. See Prolapse of anus. A., pruri'tus of. (L. pruritus, an itching.) A distressing itching, which occurs in children as a result of threadworns (Oxyuris); in adults, from hæmorrhoids; in old age, as a special form of cutaneous disease. In the two former cases, the treatment will be found under their respective headings. In the latter, carbolised letions and ointments may be tried, also mercurial and zine ointments, lotions of hydrocyanic acid, tobacca, ebloroform, borax.

A., trum'pet-sha'ped. The same as A., funnel-shaped.

Hindustani name of a tree, An'wull. esteemed in asthma, affections of the chest, ophthalmia, leprous affections of the skin, and as a means of allaying bilious vomiting. (Waring.)

Anxietas. (L. anxietas, solicitude, fear. G. Angst, Beangstigung.) Anxiety.

A. præcordio rum. (L. præcordia, the parts before the heart.) A sense of oppression

and distress about the epigastrinm, with general restlessness.

A. tib'iæ. (L. tibia, the shin bone. F. agac ment des nerfs.) Restlessness and distressing sensations in the limbs, especially in the legs:

usually called fidgets.

Anxiety. (Λγχω, to grieve the mind. F. anxiete, adémonie; I. anxieta; S. ansiedad; G. Angstlichkeit, Soryfult.) A condition of agitation and depression, with a sensation of tightness and distress in the pracordial region. This feeling, or rather its marked expression in the features, forms a dangerous symptom in acute diseases.

**Anx is.** (Αγξις. G. Einklemmung, Beklemmung, Einschnürung.) Constriction.

A'ny. The common name in Amboyna of the Pangium edule.

**Anydræ** mia. ('Λν, neg.; κοιωρ, water; alμα, blood.) Defective amount of scrum in the blood.

Any'dria. ('Aν, neg.; ϋδωρ, water. G. Trockenheit, Wassermangel.) Want of moisture, dryness.

Any'dron. ('Aν, neg.; νόωρ, water.) Name for a species of nightshade, because when eaten it creates thirst; mad or raging nightshade. (Blaneardus.)

Any'drous. Same as Anhydrous. An'ylous. (Awolos, without wood. G. holzleer.) Immaterial; destitute of solid substance.

**Anymph'ious.** Applied by G. Allmann to plants deprived of the *Nymphium*.

Anyp'nia. ('Aν, neg.; ὕπνος, sleep.)

Sleeplessness.

An ysis. ("Aννσις, accomplishment; from ἀνύω, to complete. G. Vollendung, Mannbarwer-dan.) Adolescence.

**Anyste'ria.** ('Aν, neg.; ὑστέρα, the womb.) Absence of the womb.

**Aochle'sia.** ('Αοχλησία; from ά, neg.; δχλησις, disturbance. G. *Indolanz.*) Quiescence; eatalepsy.

Aoc'nia. ('Λοκνία, indefatigableness.)
Freedom from lassitude or weariness.

Aoi'nous. ('Aowos, without wine.) Absternious.

**Aon'con.** ("Ao $\gamma \kappa os$ , without swelling.) A bruise or sore in which there is no swelling.

**Aon'cos.** ('Λογκος, not bulky. G. dünn, mager.) Thin, lean, emaciated.

**Aonychoph'orous.** ('A, priv.; ἄρυξ, a nail; φορέω, to bear.) Applied by J. A. Ritgen to Ophidian reptiles without nail-like tubercles at the posterior part of the body.

**Aoonk.** An Indian plant. The stems are said to be bitter and tonic. (W.)

Aor'nous. (Λορνος, without birds; from a, neg.; ὅρνις, a bird.) Applied to a place so pestilential that birds will not live in it.

Aorta. ('Aoρτή: from ἀείρω, to lift; the word ἀορτή originally meant the lower extremities of the windpipe, what are now called the bronchi, and probably indicated the mode of suspension of the lungs; it subsequently eame to have the same signification as at present. Some have considered it as probably allied to ἀρτάω, to suspend; and others have, with little probability, derived it from ἀίρ, air; τηρίω, to guard. F. aorte; G. Aorta, grosse Palsader, Schlagader, Hooptschlagader.) The aorta is the main trunk of the vessels containing oxygenated blood. Springing from the left ventricle in front

of the left anriculo-ventricular orifice, it forms an arch over the root of the left ling, and then descends in front of the vertebral column nearly vertically, but with a slight inclination to the right, to the level and in front of the body of the fourth lumbar vertebra, where it divides into the right and left common iliae arteries. For convenience of description it is divided into three parts, the arch of the aurta, the thoracic aorta, and the abdominal aorta. Near the base of the heart the north presents three small bulgings, named the sinuses of Valsalva, corresponding in position with the segments of the semilunar valve, immediately above which they are placed. Two of these sinuses are situated anteriorly and one posteriorly, and in the two auterior sinuses are seen the orifices of the two coronary arteries of the heart, the first brauches given oil by the aorta. The sp. gr. of the walls of the aorta varies from 1.065 to 1.068.

A., abdom'inal. (L. abdominalis, of, or nging to, the belly. F. aorte abdominale; belonging to, the belly. G. Bauchaorta, Unterleibsnorta.) The abdominal norta commences at the nortic opening of the diaphragm in front of the body of the last dorsal vertebra, and terminates on the hody of the fourth lumbar vertebra, a little to the left of the median line, by dividing into the two common iliae arteries. It has in front the lesser omentum and stomach, the solar plexus surrounding the caliac axis, the splenic vein, panereas, left renal vein, transverse duodenum and mesentery, the aortic plexus of nerves, and numerous lymphatics; ou the right, the right crus of the disphragm, inferior vena cava, vena azygos, thoracic duct, and right semilunar ganglion; on the left, the sympathetic nerve and left semilunar gaughon; and behind, the left lumbar veins, receptaculum chyli, thoracic duct, and vertebral column. The branches are divided into two sets, parietal and visceral; the former are the phrenic, humbar, and sacra media; the latter the cocliac axis, superior and inferior mesenteric, suprarenal, renal, and spermatic.

A., an'eurysm of the abdom'inal. A dilatation, general or partial, of a part of the abdominal aorta, usually to be felt as a pulsattle tumour, with some thrill, and in which a rough bruit may be heard. The treatment advised is similar to that for thoracie ancurysm; pressure by means of a tourniquet for several hours, so as to arrest the circulation and procure the consolidation of the ancurysm, has latterly been in

several cases successfully applied.

A., an'eurysm of the thorac'ic. dilatation, either general or circumscribed, of the thoracie aorta. Ancurysm affecting that part of the vessel immediately above the sinuses is seldom to be recognised during life; it terminates fatally most usually by rupture into the pericardium or the right side of the heart, occasionally from the conditions accompanying valvular disease. symptoms of aneurysm of that part of the vessel beyond the valves vary considerably with the exact locality of the disease and with the size of the tumour; they consist, in varying degrees and combinations, of the results of impediment to the arterial or venous circulation and of pressure on nerves, air-tubes, or esophagus, such as pain, dyspnora, cough, change of tone or loss of voice, noisy breathing, hamoptysis, dysphagia, disturbances of special senses, headache, loss of power in, or paralysis of, lower limbs; often the disease proceeds until there is an unmistakable pulsating external tumour; on auscultation there is usually to be heard and felt an increased impulse, generally a rough systolic bruit, and sometimes a diastolie bruit, or an abrupt, smart shock may accompany the second sound. Death usually occurs from rupture, occasionally from exhaus-tion. The treatment advised is the recumbent posture, a nutritive diet fairly dry and in a small compass, anodynes for the relief of pain, the local use of ice, acetate of lead, iodide of potassium, ergot, galvano-puncture, ligature of one or more of the large vessels on the distal side of the aneurysm, the introduction of fine iron wire into the sac; but the disease is almost always fatal.

A., arch of. (L. arcus aorta. G. Aortenbogen.) That part of the aorta which extends from the left ventriele of the heart to the left side of the third dorsal vertebra. It is formed by the persistence of the fourth embryonic arterial or aortic arch of the left side. It is divided into three parts, an ascending, a transverse, and a descending portion. The length of the arch is

from 5-6.5 cm.

A., ascen'ding portion of arch of. (F. aorte ascendante; G. aufsteigende Aorta.) The intrapericardiac portion of the arch of the aorta: it extends from the base of the heart, opposite the lower horder of the third left costal cartilage, to the upper border of the s.cond costal cartilage of the right side, or, according to Henle, to the point where the innominate is given off. It is about two inches in length (5-6 cm.), and is situated about a quarter of an inch behind the posterior surface of the sternum. In front are the right pulmonary artery, the right appendix auriculæ, the pericardium, and the remains of the thymus gland. Behind are the right pulmonary vessels and the root of the right lung. On the right side are the superior cava and the right auricle, and on the left side the pulmonary artery. The length of this part of the arch is from 2.5—3 cm.

A., cross of. A synonym of A., arch of.

A., descending. That portion of the aorta which extends from the lower part of the hody of the third or fourth dorsal vertebra to the left side of the body of the fourth lumbar vertebra; it is divided into the thoracic and the abdominal

aorta.

A., descen'ding abdom'inal. The same

as A., abdominal.

A., descen'ding por'tion of arch of. This is nearly straight in direction, and lies on the left side of the bodies of the third, and sometimes of the fourth, dorsal vertebra, where it receives the name of thoracic aorta. In front receives the name of thoracic aorta. of it is the pleura and root of the left lung; on the right side, the esophagus and thoracic duct; on the left, the pleura; and behind, the vertebræ. A., descen'ding thorac'ic. A synouym

of A., thoracic.

A., dor'sal. (L. dorsum, the back.) The common trunk formed by the junction of the three pairs of aortic arches seen in the third day of development of the chick; it runs a short course along the back, under the notochord, and divides into two branches, which pass down on each side of the notochord.

A., great si'nus of. (L. sinus quartus, or maximus.) The enlargement observable in the upper part of the ascending portion of the arch of the aorta. It projects to the right, and is opposite the second costal cartilage of the right

side.

A., or'ifice of. See Antic orifice. A., pec'toral. (L. pectoralis, belonging to the breast.) A synonym of A., thoracic.

A., root of. The enlarged commencement of the aorta, including the orifice, valve, and sinuses.

(Θώραξ. a breast-plate, A., thorac'ic. the chest. F. aorte thoracique; G. Brustaorta.)
The upper division of the descending aorta; it extends from the lower margin of the third or fourth dorsal vertebra on the left side to the opening between the crura of the diaphragm in front of the last dorsal vertebra. in the posterior mediastinum; in front are the root of the left lung and the pericardium; behind, the vertebral column; on the right, the vena azvgos, the thoracic duct, and the esophagus; and on the left, the left pleura and lung.

A., trans'verse por'tion of arch of. Commences at the upper border of the second costal cartilage of the right side, and terminates on the left side of the body of the second or third (fourth, Wood) dorsal vertebra. It runs from the right side and in front, backwards and to the left. Its relations are above, the left innominate vein; in front, the left pleura and lung, the left vagus and phrenic nerves, and the cardiac nerves; behind, the trachea, deep cardiac plexus, esophagus, thoracic duet, and left recurrent nerve; below, the bifurcation of the pulmonary artery, the remains of the ductus arteriosus, the left recurrent nerve, and the left bronchus.

Aor'tæ, prim'itive. (L. primitivus, earliest of its kind.) Two vessels which, in the course of the second day in the development of vertebrates, proceed from the bifurcation of the single tube of the heart. Each primitive aorta lies in the mesoblast and bends round the front end of the foregut, passing from its lower to its upper surface, and then runs backwards on either side of the notochord immediately beneath the protovertebræ. The primitive aortæ coalesce for a short distance behind the head into a single trunk, the dorsal aorta, which again divides into two hranches, and these, after giving off at the close of the second day the omphalomesaraic arteries, are continued to the tail. From the fore part of the primitive aortae the aortic arches are successively given off.

A. ra'dix. (L. radix, a root. G. Aortenzwiebel.) The enlargement at the commencement of the aorta due to the projections of the sinuses

of Valsalva.

Aortarc'tia. ('Λορτή, the aorta; L. areto, to contract. F. aortarctie.) Contraction or narrowing of the norta.

Aortecta'sia. ('Αορτή, the aorta; ἔκτασις, extension. G. Aortenausdehnung.) Dilatation of the aorta.

Aortectasis. See Aortectasia.
Aorteurys'ma. ('Aopth', the aorta;
żpówa, to dilate. F. aorterysme; 6. Aortentecitung.) Term for an aneurysm of the aorta.

Aortic. (.lorta, the large artery of that name. F. aortique.) Of, or belonging to, the aorta.

A. ap'erture of the diaphragm. (F. ouverture aortique du diaphragme; G. Aortenschlitz des Zwerchfelles.) See A. foramen.

A. arch'es. In the development of the blood vascular system of Vertebrata, the part that subsequently becomes the heart is continu-ous with a single vessel, the aorta, or truncus

This almost immediately divides into two acrtic arches, and subsequently, as many arches are given off on each side as there are visceral arches, that is to say, five, but these are not all present together. The central part or keystone of the two highest soon disappears, the proximal portions remaining as the external carotid, the distal portions remaining as the internal carotid; the three remaining arches all curve upwards and backwards, and run along the side of the notochord, at first separately, but soon unite into a single aorta, which divides into the two common iliaes. The third arch on each side is continued at its proximal end as the external carotid, and at its distal end as the internal carotid, the connection with the fourth arch becoming obliterated. The fourth arch of the right side forms the commencement of the great dorsal aorta, and gives off the right subclavian just before it is joined by the fifth arch. The fourth arch of the left side becomes the left innominate in the chick, and gives off the left subclavian and the common carotid of the left side. The fifth arch of each side gives off branches to the lungs, which are at first small, so that the greater part of the blood flows into the dorsal aorta, but subsequently attain a large size and great importance.

A. car'tilage. A name given to the second right costal cartilage, inasmuch as the sounds of the aortic valves are best heard at this spot. Occasionally aortic sounds are conveyed along the pulmonary artery, and may then be best heard over the pulmonary or second left costal

eartilage. (Walsh.)

A. curve. (F. courbure aortique.) The arch of the aorta.

A. endarteri'tis. ( Ενδον, within ; άρτηplan, the arteries.) A synonym of Aortitis, chronie.

A. fora men. (L. foramen, an opening; from fora, to bore.) An opening through the diaphragm just in front of the vertebra, bounded on each side by the teudinous fibres of its crura; it transmits the aorta and thoracie duet, and usually also the vena azygos.

A. mur'mur. See Murmur, aortic.

A. notch. The point in the line of descent of a pulse-enrice as traced by the sphygmograph, at which the dicrotic wave commences; it is believed to coincide with the closure of the aortic valves.

A. obstruc'tion. A morbid condition of the aortic crifice or its valves, which, interfering with the free passage of the blood, produces a murmur which is systolic, and generally loudest over the second right intercostal space.

A. or'ifice. (G. Aortenmundung, Aortenoffining.) The communication between the left ventriele of the heart and the aorta. It is situated behind the sternum on the level of the second intercostal space, in front of and between the auriculo-ventricular openings, behind and about half an inch below the plane of the pulmonary opening. It is guarded by three semilunar valves, one of which is posterior and median. Behind it is the anterior division of the mitral valve. The circumference measures 3 inches in men, 2 inches 10 lines in women (Peacock); 70-4 mm, in men, 64-1 mm, in women (Bizot). It increases with age (Beneeke), being about 30 mm. in 1st year; 41 mm. at 7th year; 50 mm, at 15th year; 56-62 mm. in 21st year; 60-65 mm. from 30 to 40; 75 mm. from 50 to 60; and 75 to 81 mm. from 60 to 70 years of

age.

A. plex'us. (L. plexus aorticus abdominalis. G. Bauchaortengestecht.) The intercommunicating fibres of the sympathetic nerve sur-The intercomrounding the abdominal aorta. It is composed essentially of two lateral divisions connected with the semilunar gauglia and the renal plexuses. A few cross branches pass in front of the aorta, and join the lateral portions, which give off the mesenteric and spermatic plexus, and are continuous

below on each side with the hypogastric plexuses.

A. regurgita'tion. The reflux of blood from the aorta into the left ventricle from incompetence of the semilunar valves. It is characterised by a murmur replacing or immediately following the second sound, and heard loudest at the second right interspace and along the sternum. The murmur is often conducted to the apex and to the carotids and subclavians. If heard most distinctly over the second left interspace it indicates displacement.

A. si'nuses. (L. sinus, a hollow. F. sinus aortique.) The sinuses of Valsalva. Three bulgings of the wall of the aorta, one behind each

flap of the aortic valve.

**A. steno'sis.** (Στίνωσις, a being straightened.) Narrowing of the aortic orifice.

A. sys'tem. (F. système aortique.) The whole of the arteries which derive their origin from the aorta.

A.thrill. (F. frémissement vibratoire ; G. Schwirren.) A vibrating sensation felt in the sternal end of the second right intercostal space or just over the sternum, accompanying some forms of aortic obstruction or regurgitation.

A. valve. (F. valvule aortique.) This valve consists of three semilunar segments at the mouth or commencement of the aorta, as it rises from the left ventricle of the heart; two are anterior, one posterior and median. They are composed of fibrous structure, covered on each side by a reflection of the endocardium; the free edge is strengthened by a tendinous band, and has in its middle a fibro-cartilaginous nodule, the Corpus Arantii; tendinous libres run from this nodule to the attached edge of the flap, with the exception of a space on each side by the free edge, which contains none, and is called the lumble.

A. ven'tricle. (F. ventricule aortique.) A

term for the left ventricle of the heart in conse-

quence of its giving origin to the aorta.

A. ves'tibule. A short channel lying be-tween the cavity of the left ventricle and the aortic aperture above the mitral valve; its direction is forwards, upwards, and to the right; its walls being rigid and unyielding, retain the size of the cavity under every condition of action of the heart. It was originally described by Dr. Sibson as the intervalvular space of the left ventricle.

Aorti'tis. (Aorta, the great artery of that name. F. aortie; I. aortite; G. Hanptschlugaderentzündung.) Term for inflammation of the

aorta, acute or chronic.

A., acu'te. In its acute form acrtitis is a rare disease, with very obscure symptoms; tumultuons action of the heart, pulsation of the norta, aortic thrill and murmur along its course, have been observed; anxiety, tenderness of skin, general edema, and pain and heat along the course of the vessel, are also described. Cupping, counterirritation, opium, antimony, aconite, and salines constitute the usual recommendations for treat-

A., chron'ic. In its chronic form acrtitis does not appear to be recognisable, except, after death, in the shape of thickening of the coats and white patches of old exudation, with roughness and puckering of the inner coat, generally accompanied by dilatation of the vessel following some narrowing in the early stage. Salts may be deposited in the white patches.

Aor'tra. ('Αείρω, to raise or suspend.) Old term for the suspended portion of the lung on either side; consequently the lung itself.

Aoshba mugrabee. A root sold in the Indian bazaars, resembling sarsaparilla. (Waring.)

Aos mic. ('A, neg.; ὀσμή, a smell. G.

geruchlos.) Having no smell.

Ao'tus. ('A, neg.; ous, an ear.) In Teratology, a monster destitute of ears.

Aoua'ra. The same as Avoira.

Aoura'ra. The native name in French Guiana of the root of Astrocaryum vulgare, which is used as an antisyphilitic remedy.

Aourou'chi. The native name in Gmana of the fruit of the Virola or Myristica sebifera. Aoûté. (F. aoûter, to ripen; from Août, August.) Mature; ripe.

Aowaze. A spice employed in Abyssinia, eomposed of pimento, salt, ginger, zegakebia (a

kind of thyme), and cloves. It is used as a condiment with raw beef or brondo. (R. and L.) Apa Bad. One of the springs of Algyogy.

**Apac riton.** ( $A\pi a i \rho \omega$ , to drive away.) A name given by Apulcius to the chamomile. **Apag ma.** ( $A\pi a \gamma \mu a$ , a fracture at a joint.) According to Galen, this word signifies the superficial division of bone (fissure), or a fracture on the opposite side to the lesion (counter-fracture).

Also, simple fracture near a joint.

Also, abduction. **Apago'ge.** ('Απαγωγή, a leading away. G. Wegfuhren, Abfuhren.) Abduction; purga-

**Apag'ynæ.** ( Λπαξ, once only; γυνή, woman.) Denotes those plants that fructify once only in their life. A term proposed by Desvaux to replace that of monocarpic.

Apag'ynous. ('Απαξ, once; γυνή, a woman. G. einmahlfrauig.) Applied by Desvaux

to plants that fructify but once.

Apalach'ine. (F. the des apalaches, t. de la mer du sud; G. Apallachenthee.) A kind of ten obtained from the Ilex vomitoria. The Indians take it in infusion for the purpose of intoxica-

A. gal'lis. Another name for the plant

Ilex cassine, or I. romitoria.

**Apallage.** ('Απαλλαγή, deliverance. G. Befreiung.) A term used by Hippocrates for recovery from a serious disease, or in the case of an incurable disease applied to death. **Apallax'is.** ( $\lambda\pi\dot{a}\lambda\lambda\alpha\xi\iota s$ , deliverance.) The same as Apallage.

Apalotica. ('Aπαλότης, softness, tenderness.) Lesions or deformities affecting the soft parts

Apal'to sen'na. A synonym of Alexandrian senna.

**Apaly'tri.** ('Απαλός, soft ; ἔλυτρου, an ytrum. G. weichflugeldeckig.) Applied by Duméril to a Family of Colcoptiva having soft

Apa'ma. A Bragantia belonging to the

Nat. Order Aristolochiaccæ; said to be an antiparalytie.

Apanaste'ma. ('Απανίστημι, to rise and go away.) A nodulated excrescence of the conjunctival membrane of the eye.

Apanchom'enos. ( Λπαγχόμενος; from άπαγχω, to strangle.) Ancient term used by Hippocrates, Aph. ii, 43, for one who is strangled or suffocated by hanging. **Apante ma.** ('Απάντημα, a meeting.)

The same as Apantesis.

Apante'sis. ('Απάντησις, the act of going to meet.) Opposition, antagonism. An event or consequence of disease.

Apanthe'sis. ('Απάνθησις, a fading.)

The same meaning as Apanthismos.

Apanthis mos. ('Απανθίσμός, a plucking of flowers.) A term signifying the termination of the period of blooming; the period of withering; hence the withering or falling off, or closing up, of parts belonging to the child which are necessary to it before birth, as the closure of the ductus Botalli, the shrivelling of the umbilicus, the atrophy of the thymus.

Also, the act of plucking the bloom, hence the

act of defloration.

Also, an ancient term used by Galen, de, Ven. et Art. Dissect. c. viii, for an extremely minute blood vessel.

Apanthis'mus. Same as Hapanthismus. Apanthro'pia. ('Λπανθρωπία; άπό, away; ἄνθρωπος, a man. F. apanthropie; G. Trübsinn mit Menschenscheu.) Old term used by Hippocrates, Coac. Prænot. t. 482, for a kind of melancholia, characterised by a dislike of society. Also, inhumanity, cruelty.

Apanthropis'mus. The same as Apan-

Apanthro'pon. Ancient name of staphisagria.

The Mexican name of a Apanxalo'a. Species of *Lythrum*, employed as an astringent and vulnerary. (Waring.) **Apaphris mus.** (Απαφρίζω, to skim

off the froth.) Despumation.

Aparach'ytum. ('Απαράχυτος, olvos, being understood, pure wine.) Old name used by Galen, L. iv, de C. M. sec. Gen. c. 7, for the purest wine, unmixed with water.

Aparanym'phius. ('A. neg.; paranymphium.) Without a paranymphium.

Aparapetaloïd'eous. ('A.neg.; parapetalum.) Without a parapetalum.

Aparasceua'sia. ('Απαρασκευασία; from a, neg.; παρασκευάζω, to prepare.) A defect in the preparation of medicines or medical apparatus.

Aparine. ('Απαρίνη.) Old name for goose-grass, Galium aparine; for a Species of Xanthium; and for the woodruff, Asperula

Apar'tes. ('Απαρτής, fitted straight.) Pen-

sile, hanging downwards, as some of the muscles. **Aparthro'sis.** (' $\Lambda\pi\alpha\rho\theta\rho\delta\rho\mu\alpha$ , to be jointed. F. aparthrose; G. Abgliederung.) Dismemberment; disarticulation. The removal of a limb at a joint.

Also, a synonym of Diarthrosis. **Apar'tisis.** ('Λπάρτισιs, a fitting completely.) Entire connection.

Apar'ysis. ('Απαρύω, to draw off.) Exhaustion of impure humours.

Apas'tia. ('Απαστία. G. Nüchternheit.) Abstinence from food.

**Apas'tus.** (' $\Lambda \pi a \sigma \tau o s$ , from  $\vec{a}$ , neg.;  $\pi a \tau \epsilon o \mu a a$ , to feed.) Unfed, fasting.

Apatecphlogio'is. (' $\Lambda \pi \dot{a} \tau \eta$ , illusion; cephlogiois. G. trugerische varioloide.) False or deceptive variola.

Apath'es. ('A, neg.; millos, affection.) A sect of philosophers who pretended to have no affections

Apathetic. (Same ctymon as Apathy.) Having apathy; indifferent; wanting in feeling.

A. insanity. A form of insanity very similar to dementia, in which the memory is not really impaired, but the mind is torpid.

Apathicus. ('A, neg.; πάθος, a passion. F. apathique; G. getuhllos.) Pertaining to apathy; apathie. Without passion.

Applied by Lamarek to one of his three divisions, containing animals that have no special organ for their sensations, and which, he supposed, do not even feel their existence.

Ap'athy. ('A, priv.; πάθος, a passion. F. apathie; I. apatia; G. Gefuhllosiakeit, Un-empfudlichkeit.) Term for the absence or privation of all passion, emotion, or excitement.

**Ap'atite.** ('Λπατάω, to deceive; so called from its liability to be mistaken for other minerals. G. Trugstein, Trügling.) 3Ca(PO<sub>4</sub>)<sub>2</sub>+CaCl<sub>2</sub>. A mineral consisting chiefly of calcium phosphate, varying much in colour and in appearance.

Apeche ma. (Απήχημα, echo; from απηχέω, to sound back. F. apechème; G. Gegenspalt, Gegenbruck.) Old term for a fracture of the skull called Counter-fissure.

Apectoceph'alus. (L. a, neg.; pectus, the breast;  $\kappa \epsilon \phi a \lambda \dot{\eta}$ , the head.) A monstrosity having neither head nor thorax.

Apeiria. (G. Unerfa ungslosigkeit.) Inexperience. (G. Unerfahrenheit, Erfahr-

Apel. A plant of Guinea; the leaves are used in affections of the throat.

Apelain'ic ac'id. ('Δπό, from; ἔλαιον, oil.) A synonym of Elaidic acid.

Apel'la. (The proper name of a Jew-Judæus Apella, mentioned by Horace, and probably well known at Rome in his time. It has also been supposed to be derived from a, neg.; pellis, the skin, and so to have been used by Horace to indicate any Jew as being circumcised. This, again, has been set aside as incorrect, and the derivation above given, referring merely to this particular Jew's name, and his being circumcised, like all others, is held to be more just. F. apelle; G. Beschnittener.) This word has been applied to one whose prepare does not cover the glans penis, whether this be caused by eirenmeision, or is congenital, or aeeidental.

Apel'lous. (L. a, neg.; pellis, skin.) Having no skin.

Ap'elos. ('Λπελος; from à, neg.; πέλος, skin.) A wound not yet skinned over.

Apen'salus. A vessel with a narrow neck

to hold oil. Apep'sia. ('A, neg.; πέπτω, to digest. F. σpepsic; G. Nichtverdauung, Verdauungslosigkeit.) Old term for indigestion, now expressed

by the word dyspepsia. Apep'ta. (Same etymon.) Indigestible

Apep'tic. (Same etymon. F. apeptique; G. apoptisch, unverdaulich.) Having bad digestion; dyspeptic.

**Apep tous.** ('Απεπτος, nncooked; from a, neg.; πέπτω, to cook. G. ungekocht, unverdaut.) Uncooked, undigested, unripe, indigestible.

**A'per.** (Lat. akin to  $\kappa \acute{a}\pi \rho os$ , wild swine of both sexes. G. Eber.) The wild boar, or sow. **Aperception.** (F. apercevoir, to per-

ceive one's self. G. Anschauung.) That operation of the mind which consists in considering itself as the subject which perceives, or feels any impression. See also Apperception.

Ape'ria. The same as Apeiria.

Aperiantha ceous. (L. a, neg.; peri-F. aperianthace; G. ohne Blutendecke.) Without a perianth; applied by Mirbel to Cycadeae.

Aperian'thous. ('A, neg.; περί, around; autos, a flower.) A term applied to a flower having no perianth. An achlamydeous or naked flower.

Ape'riens palpebra'rum rec'tus. (L. aperio, to uncover, to open; palpebra, the eyelid; rectus, straight.) A synonym of the Levator palpebræ superioris.

Ape'rient. (L. aperio, to open. F. aperitif, G. abfuhrend, offnend, eroffnend.) Opening; applied to a medicine which gently opens, or effects a discharge from, the bowels; a laxative.

The term was anciently used to describe the power which certain remedies were supposed to possess of opening the natural pores or apertures of the different organs and blood-vessels.

Ape'rients. (Same etymon. G. Offnungs-mitte/.) Medicines which have a relaxing effect on the bowels, but which do not produce watery evacuations; such are easter oil, rhubarb, senna, and the like.

**Aperi'nous.** ('A, neg.; πηρίν, the scrotum.) Without scrotum or genitals; castrated.

Aperisper matous. (L. a, neg.; perisperm. F. apérispermé.) Applied to a seed or vegetable embryo without a perisperm, as that of Salsola tragus.

Aperisper'mic. (Same etymon.) Having no perisperm or albumen.

Aperisper'mous. ('A, neg.;  $\pi\epsilon\rho\dot{\iota}$ , around;  $\sigma\pi\dot{\epsilon}\rho\mu a$ , a seed. F. aperisperme.) An embryo or seed destitute of albumen. Same as Aperispermatous.

Aperis taten. ('Απερίστατος, solitary; from a, neg.; περιίστημι, to surround.) Term applied by Galen, l. ii, de C. M. sec. Gen. e. i, to a small uleer unattended by any serious mischief, and not surrounded by inflammation.

Aperis'tatum. Same as Aperistaton. Aperisto mati. (L. a, neg.; peristoma.)
Applied by Bridel to a Class of Musci, deprived of the peristome by absence of the opercule.

Aperiti'va reme'dia. (L. aperio, to open; remedium, a remedy.) Medicines relaxing the bowels; purgatives.

Aperitive. (L. aperio, to open. F. aperitif; G. offnend, abfahrend.) Term applied to purgative, laxative, or aperient remedies.

A. saf'fron of Mars. A synonym of Ferri subcarbonas, U.S. Ph.

Aper'itives. (Same etymon.) Medicines which produce relaxation of the bowels or tho biliary or urinary passages.

Some authors use the term as synonymous only with diureties.

Other authorities, as Fonssagrives, describe aperitives as stimulants of the appetite, and divide them into hygicnic and medicinal aperitives.

A., hygien ic. (F. apéritifs hygiéniques.) Under this title Fonssagrives includes the thorough cleansing of the mouth and teeth by a tongue-scraper, tooth-brush, or rough towel,

with or without dilute Eau de Cologne or tincture of pyrethrum, or simply cold water. Change of

air, exercise, and hydrotherapeutics.

A., medic inal. (F. apéritifs médicamenteux.) Under this term Fonssagrives ineludes condiments, and such drugs as quinine, gentian, centaury, chamomile, and the like.

A., ma'jor. (L. major, greater. F. apéri-tifs majeurs.) Some French authors class under this heading the roots of smallage, fennel, parsley,

asparagns, and butcher's broom.

A., mi'nor. (L. minor, less. F. apéritifs mineurs.) Some French anthors class under this heading the roots of maidenhair, dandelion, eryngium campestre, rest-harrow aud wild strawherry.

Aperit'ropal. ('A, neg.; περιτροπή, revolution. F. apéritrope.) That which does not undergo the usual successive changes in the normal evolution of the organs. (R. and L.)

**Aperitrope.** ('A, neg.; περιπροπή.) Defective metabolism; imperfect performance of the healthy actions of the system.

**Aperit'tos.** Same as Aperitus. **Aperit'tus.** ('Απέριττος, simple, plain ; from a, neg.; περιττός, rednndant.) Old term applied to those kinds of food which have the least excrementitious matter, as the flesh of wild animals, and those which feed in dry places.

Aper'tion. (L. apertio, an opening. Eroffnung.) The making of an opening, as the perforation of an imperforate ands or closed meatus auditorius, or the opening of an abscess.

Aper'tive. Same as Aperitive.
Aper'tor. (L. apertor, one who discloses; from aperio, to open.) An opener.

A. oc'uli. (L. oculus, the eye.) A synonym

of the Levator palpebræ superioris.

Aperto'rium. (L. aperio, to open ) Name of an instrument formerly used for dilating the os uteri dnring labour.

Apertu'ra. (L. apertura, an opening; from aperio, to open. F. ouverture; G. Offnung, Loch, Mündung.) An opening, either natural or made with an instrument; an aperture.

In Botany, Tode has given this name to the opening through which the spores are discharged

in Spheriaceous Fungi.

A. ante'rior ventric'uli ter'tli cer'e-(L. anterior, front ; ventriculus, a ventricle of the brain; tertius, third; cerebrum, the brain.) The foramen commune anterius, or channel of communication between the third and the two lateral ventricles of the brain.

A. cana'lis chor'dæ tym'pani. canalis, a channel; chorda, a string; tympanum, a drum.) The opening situated in the posterior part of the tympanum between the pyramid and the groove for the membrana tympani, by which the chorda tympani enters the tympanum.

A. cana'lis facia'lis spu'ria. (L. cana-lis; facies, the face; spurius, false.) The hiatus

Fallopii.

A. exte'rior cana'lis inguina'lis. (L. exterior, outer; canalis, a channel; inguinalis, belonging to the groin.) The external abdominal

A. infe'rior canalic'uli tympan'ici. (L. inferior, lower; canaliculus, a small pipe; tympanum.) A small foramen at the bottom of a depression situated between the jugnlar fossa and the carotid foramen in the petrous portion of the temporal bone.

A. interior cana'lis inguina'lis. (L.

interior, inner; canalis; inquinalis, belonging to the groin.) The internal abdominal ring.

A. na rium ante rior. (L. naris, a nostril; anterior, front. G. vorderen or ausseren Nasenlächer.) The anterior opening of the nares on each side.

A. na'rium exter'na. (L. naris; externus, ontward.) The same as A. narium anterior.

A. na'rium inter'na. (L. naris : internus, inner.) The same as A. narium posterior.

A. na'rium poste'rior. (L. naris; posterior, hinder. G. hinteren Nasenoffnung.) The posterior opening of the nares,

A. pel'vis infe'rior. (L. pelvis, a basin; inferior, lower. G. Beckenausgang.) The inferior opening of the pelvis.

A. pel'vis perinea'lis. (L. pelvis ; perinæum.) The inferior opening of the pelvis.

A.pel'vis supe'rior. (L. pelvis; superior, upper. G. Beckeneingang.) The upper opening of the pelvis.

A. pyriform'is. (L. pyrum, a pear; forma, shape.) The anterior opening of the nose in the skeleton, formed by the nasal bones above and the

superior maxillary bones laterally and below A.sca'læ vestib'uli. (L. scala, a ladder; vestibule.) The opening by which the scala vestibuli communicates with the scala tympani; it is situated at the lower and fore part of the

A. spu'ria cana'lis facia'lis. (L. spurius, false; canalis, a channel; facies, the face.) The hiatus Fallopii on the upper surface of the petrous portion of the temporal bone.

A. supe'rior canalic'uli tympan'ici. (L. superior, upper; canaliculus, a little channel; tympanum.) A small opening in the groove leading to the hiatus Fallopii in the upper part of the petrous portion of the temporal bone.

A. uteri'na. (L. uterinus, belonging to the womb.) The opening of the Fallopian tube

into the nterus.

A. uteri'na tu'bæ. (L. uterinus, belonging to the womh; tuba, a straight trumpet. G. Gebärmutteröffnung.) The opening by which the cavity of the uterus communicates with that of the Fallopian tube.

Ap'erture. (Same etymon.) An open-

A., ang'le of. See Angular aperture. Aper'tus. (L. aperio, to uncover, to open.) Open. Formerly used for cxulceratus, as cancer apertus, an open or ulcerated cancer; also, applied by Scribonius Largus, n. 81, to ulcers. Rhodius, in not. and Lex. Scribon.

In Betany (G. unbedeckt, offen, geöffnet), ap-

plied to an expanded flower.

Also, to a floral whorl which does not completely

embrace the receptacle.

Apet'alæ. (A, neg.; petal. F. apétales; G. Perigonbluthige.) One of the three groups into which A. de Jussieu divided Dicotyledons. It included all Dicotyledonous plants possessing only a single floral envelope, and was divided into three Sections-Epigyna, Perigyna, and Нуродупа.

In other classifications the Division Apetala is described as containing Dicotyledons having a perianth consisting of a single whorl of leaves, or it is ontirely absent; only occasionally is it composed of a double whorl of sepaloid leaves.

**Apeta lia-eleutherogyn'ia.** (A, neg.; petal; ἐλεύθερος, free; γυνή, the female.) Applied by Λ. Richard to a Class comprising

apetaleus Dicetyledons, the evary of which is

**A.-symphysogyn'ia.** (Σύμφνσις, a growing together; γυνή, the female.) Applied by A. Richard to a Class comprising apetalous Dicotyledous, the ovary of which is adherent.

Apetaliflo'rous. (L. a, neg.; petal; flos, a flower. F. apetaliyflore; G. blumenbluttlos-blumig.) Applied by H. Cassini to the calathidium and corona of Synanthereco when the flowers which form them are without a corolla.

Also, a term applied to plants destitute of a

corolla

Apeta'lius. Same as Apetalous.

Apetaloid. ('A, neg.; πίταλου, a leaf.) A term in Botany applied to flowers which have only one whorl of floral envelopes, which is considered to be the culvx.

**Apetaloste monous.** ('A, neg.;  $\pi \ell \tau$ - $a \lor ov$ , a leaf, a petal;  $\sigma \tau i \mu \iota ov$ , a thread.) Applied by G. Allmann to plants the stamens of which are free from all adherence to the petals.

Apet'alous. ('A, priv.'; πέταλον, a leaf, a petal. F. apetale; G. blamenblattlos.) Having no petals; without petals.

Apet'aly. (Same etymon) Absence of

Apeterebi-tupi. A name of Sassafras.
Apeth'isis. (Απεθίζω, to disuse, G.
Entwohnung.) The giving up of a habit.

Apethis'tic. (Same etymon.) Having relation to the giving up of a good or bad habit.

Apeuthysmenos. Same as Apeu-

**Apeuthys'menus.** ('Απευθυσμένου; from ἀπευθύνω, to make straight agaiu.) Name applied by the Greeks to the rectum, or straight gut. (Gorraus.)

A'pex. (L. apex, the extreme end of a thing. F. sommité, sommet; G. Ausserste, Spitze, Buckel, Scheitel, Wirbel, Schnebel.) The top, support of any holy or part

summit, or extremity of any body or part.

In Conchology, the limbs of a shell or the most projecting part of the valve near the upper or

lower border of the hinge.

In Botany, this term was applied by Tournefort to the male organ of the flower or stamen; it is now used exclusively to designate the summit of a plant or part of a plant most remote from its base.

Also, the opening at the summit of Spheriaceous

Fungi, by which the spores escape.

A. beat. The impulse of the contraction of the heart, felt and scen in the fifth intercostal space, about half way between the left edge of the sternum and a line drawn vertically downwards from the nipple. The point is lower when the heart is enlarged; higher when the heart's cavities are small, and when there is pericardial effusion. It is destroyed or much lessened in pericardial effusion and adhesion, and in cases where a piece of emphysematous lung protrudes in front of the heart; it is increased in force in hypertrophy of the heart; enlargement of other viscera, oreffusion into neighbouring cavities, may displace it.

**A., car'diac.** (Καρδία, the heart.) The lower end of the heart as felt in the Δ1. beat.

**A. catarrh'.** The same as A. congestion. **A. coch'leæ.** (Κοχλίας, a spiral.) The point or extremity of the cochlea of the ear; it is directed outwards, and a little downwards and forwards.

A. columel'ice. (L. columella, a small

column.) The upper narrowed extremity of the modiolus of the cochlea.

A. congestion. A term given to a condition of congestion of the apex of the lung, continuing for an indefinite period, giving rise to physical signs of consolidation, affecting the general health, as in tubercular deposit, and liable to take on disintegrating processes, so as to be one mode of origin of phthisis. This condition is not admitted by all observers.

A.cor'dis. (L.cor, the heart.) The point or inferior extremity of the heart: it is formed by the left ventricle, projects towards the left side and forwards, and lies between the fifth and

sixth ribs.

**A. geomet'ricus.** (Γεωμετρικός, relating to geometry, geometrical.) F. sommet geometrique.) A term applied in Botany to the uppermost point of a fruit when, in developing, one of the sides of the ovary has grown to a greater extent than the others, so that the style, instead of being terminal, is lateral, and more or less approximated to the base of the fruit. In this case a vertical raised on this base would not traverse the style or organic apex of the fruit, but would pass out at a higher point, which then receives the name of the geometrical apex, as in Anacardium occidentale.

A. lin'guæ. (L. lingua, the tongue. G. Zungenspitze.) The free extremity of the tongue

which is directed forwards.

A. mur'mur. A murmur heard over the act of the heart; when audible near the ensiform cartilage it is believed to depend on trienspid regurgitation; when at the cardiae apex and at the back also it indicates mitral regurgitation; a murmur indicating the latter condition, if slight, may not be heard at the back near the inferior angle of the left scapula; some observers teach that a systelic apex murmur may be caused by dilatation of the left ventriele.

A. na'si. (L. nasus, the nose. G. Nasen-

spitze.) The free extremity of the nose.

A. organ'teus. ('Οργανικός, organic. F. sommet organique.) A term applied in Botany to indicate in a fruit the point which corresponds to the insertion of the style, or, in a seed, to the extremity of the Cotyledons. In the greater number of fruits and seeds the organic apex is identical with the prolongation of the axis of the fruit or seed, and then corresponds to the geometrical apex, but in many growth is unequal, and the point of attachment of the style or the micropyle of the seed then becomes lateral, and the organic apex and the geometrical apex do not correspond.

A. patel'i.e. (L. patella, a small pan, the knee-pan.) The pointed inferior angle of the

patella.

A. pneumo'nia. The same as A. conges-

**A. pulmo'nis.** (L. pulmo, the lung.) The upper rounded extremity of the lung; it projects above the border of the first rib. It is grooved by the subclavian artery, from which it is separated by the pleura.

Aph'acc. ('Αφάκη.) A plant in use amongst the ancients as an astringent in diarrhom (Dioscorides, l. ii, c. 177; Galen, de simp, l. v; Paul. Egineta, l. vii, β iii; Pliny, l. xxvii, c. 21.) It has been referred to Vicia sepium by Fuchsius and Matthiolus, to V. angustifolia by Dalechamp, to V. craeca by Littré, and by Sprengel to either V. bithynica, V. lutea, or V. hybrida. (Waring.)

Apha'cia. Same as Aphakia. Aphær'esis. ('Αφαίρεσις', from ἀφαιρέω, to take away, to separate. F. aphérèse; G. Wegnahme.) Old term, used by Hippocrates, Conc. pranot. t. 360, for the amputation or removal of any diseased or preternatural part of

Also, formerly used for large and injurious extraction of blood.

Apha'gia. ('A, neg.; φαγεῖν, to eat. F. aphaŋe.) Inability to swallow.

Apha'kia. ('A, neg.; φακός, a lentil, anything shaped like a lentil, and so the crystalline lens. F. aphakie.) The condition of an eye when the crystalline lens is absent. The absence of the lens may be either congenital, or the result of accident, or of operation; it renders the eye highly hypermetropic, and abolishes the power of accommodation. In order to obtain good vision it is requisite to place a lens of from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  inches or lower power before the eye; a stronger power being required for near than for distant objects. The anterior chamber is usually very deep, and the iris funnel-shaped and tremulons.

Apha'kous. (Same etymon. F. aphake.) Deprived of the crystalline lens, whether congenitally, by displacement, or by operation.

Aphalangi'asis. ('A, neg.; φάλανξ, a line of battle, a bone of the finger.) The fourth stage of Oriental leprosy, in which gangrene of the fingers occurs.

**Aph'anes.** ('Αφανήs, unseen.) A Section of the Genus Alchemilla, characterised by the number of the stamens and carpels being reduced to one or two.

A. arven'sis. (F. percepierre, petit pied-de-lion des champs.) Leaves palmipartite, with three lobes, which are cuneiform, 3-5 fid, with leafy incised connivent stipules. A tincture is made from it which is recommended as an astringent and antilithie; now usually called Alchemilla arvensis.

**Aphanip'tera.** ('Λφανής: from ἀφανίζω, to remove from sight, to coneeal:  $\pi \pi \epsilon \rho \sigma \nu$ , a wing. F. puces; G. Flohe.) A Suborder of the Order Diptera, Class Insecta (Ametabolica). fleas; animal-sucking insects, having the body laterally compressed; thorax imperfectly distinguished from the abdomen; two scales, abortive wings, on each side of thorax; eyes simple, small, round; feelers short, in a groove; no upper lip; mandibles converted into long saws, between them is an azygous pricking organ; maxillæ short and broad; maxillary palpi elongated, with four seg-ments; lower hip split, segmented like a palpus; hind legs adapted for leaping; metamorphosis complete; larva destitute of feet, worm-like, hairy

Aphanip'terous. (Same etymon.)

Having no apparent wings. **Aphan'isis.** ('Λφάνισις, a getting rid of.)

Disappearance; extinction; fainting.

Aph'anite. ('Apawis, nusecu, obscure; from a, neg.; φαίνομαι, to be seen.) A species of rock, consisting of quartz, hornblende and felspar, so combined that they are severally indistingmishable, hence the name; also called cornean.

Aphanit'ic. (Same etymon.) Containing aphanite; applied to a rock of this nature.

**Aphanocnido** sis. ('Αφανίς, obscure; κνίδωσις, a stinging sensation.) Urticaria evanida; rapidly recurring and disappearing nettle

**Aphanocy'clicæ.** ('Aφανής, unscen;

κύκλος, a circle.) A Series of the Subclass Choripetalæ of angiospermous dicotyledonous plants. Spirally-built hemicyclic or acyclic flowers, with the segments mostly free, or only those of the gynecium coherent; perianth generally sepa-rable into calyx and corolla; the parts variable in number; stamens usually more numerons than the perianth leaves; carpels generally forming several monocarpous ovaries.

Aphanophle bious. ('Advavás, hidden ; φλέψ, veins.) A term in Botany applied to leaves in which the vems or nervures are indis-

**Aphanop terous.** ( 'Aφαφίς; πτέρου, a wing.) Wingless; applied to the fleas. **Aphar'ca.** ( 'Αφαρκη.) A plant, so named by Theophrastus, which has been variously identity. tified with Rhamnus aluternus, with Arbutus unedo, and also with Phillyrea angustifolia.

Apha'sia. ('Αφασία, speechlessness, from à, neg.; chaois, speech. G. Sprachlosigkeit.) Loss of the faculty of intelligent speech; not caused by any impairment of structure of the vocal organs, but by damage of the cerebral centre or centres for speech; it thus includes inability to speak depending on affection of the co-ordinating centre for the muscles producing articulate speech -uphemia; as well as that which depends on the loss of the memory of words-amnesia; it may or may not be attended by inability to write, not depending on paralysis of the limb—agraphia; and it excludes inability to speak from deafmutism, general paralysis, glosso-pharyngeal paralysis, ehorea, and such like. Aphasia is very commonly associated with right hemiplegia and lesion of some portion of the third frontal convolution, the island of Reil, and the subjacent part of the corpus striatum on the left side. A form of aphasia, which has been called func-tional, may be the result of fright or general disease.

Some authors include under this head defect

or loss of speech from whatever cause.

A. amnemon'ica. **A. amnemorica.** (Δμισιμονέω, to be unmindful.) Aphasia in which neither spoken nor written words can be remembered. The idea is present, but does not suggest the proper symbol, hence no word, or an incorrect expression, is employed. The appropriate word to express an idea cannot be recalled when required, though it is readily pronounced when heard.

A. amne'sica. ('Αμνησία, forgetfulness.)

The same as A, amnemonica.

A. amnes'tica. Same in ctymon and meaning as A. amnesica.

**A.**, aneu'ral. ('A, neg.; νεῦρον, a nerve.) A synonym of A. atactica.

A. associato'ria. (L. associo, to associate.) Same as A. atactica.

A. atac'tica. ('A, neg.; τάξις, order.) Aphasia is termed atactic when a word, though still retained as a sensory image and as a symbol of thought, can no longer be enunciated as a motor combination of articulate sounds, though the sounds themselves may still continue to be cor-

reetly formed when occurring in some other word.

A., atax'ic. The same as A. atactica. A., func'tional. A form of aphasia which may occur in hysterical persons as a result of great emotion, or of severe febrile or other disease, and as a congenital condition. It is not associated with hemiplegia, does not appear to be accompanied by manifest cerebral lesion, and may be recovered from.

**A., letholog'ical.** ( $\Lambda \eta \theta \eta$ , a forgetting; λόγος, a word.) A synonym of A. amnesica.

Apha'sic. (Same etymon. F. aphasique.) Term applied to one affected with aphasia.

Aphassom'enos. ('Aφάσσω, to feel.) Anciently used to denote the tactual examination of the female organs of generation as a means of diagnosing vaginal and uterine disease.

Apheb'riok. Arabic for sulphur. (Ruland.)

**Aph'edra**. ('Λφεδρών, a privy; from ἀπό, from; έδρα, a seat. G. Nachtstuhl.) A nightstool.

**Aphedri'a.** ('Αφεδρεία, a sitting apart.) The catamenia.

Aph'edron. ('Αφεδρών, a privy.) Λ

privy; a night stool; the anus.

Aphedro'nius. (Same etymon.) Pertaining to a night-stool, or a privy. Aph'edros. ('Αφεδρος, a sitting apart.)

The same as Aphedron.

Also, in the Septuagint, used as a term for menstruation, because the women amongst the Jews sat apart at that time.

Also, a synonym of Carthamus lanatus **Apheli'a.** (' $A\phi i \lambda \epsilon \iota a$ , simplicity.) The simple manners adopted by the sect of Methodists in teaching and practising medicine. (Dungli-

Aphelieis teros. ('Aπδ, away from; ηλικία, youth.) Past the flower of youth. Hippocrates, Epid. l, 7. (' $\Lambda\pi\delta$ , away from;

**Aphe'lion.** (' $\Lambda\pi\delta$ , from ;  $\eta\lambda\iota\sigma s$ , the sun.) Term for that point of a planet's orbit when it is at the farthest distance from the sun.

**Aphelx'ia.** ('Αφέλκω, to drawaway. G. Zerstreutheit.) A term for absence of mind;

A. inten'ta. (L. intentus, intense.) Abstraction of mind, in which the attention, at the instigation of the will, is riveted to some special subject, with consentient emotion of the general appearance.

A. otio'sa. (L. otiosus, unoccupied.) The condition called brown-study, in which the attention is voluntarily obedient to the imagination;

the muscles are quiescent.

A. so'cors. (L. socors, narrow-minded, thoughtless.) Absence of mind, in which the attention wanders, and does not readily yield obedience to the will.

Aphemet'ric. A wrong spelling of Ha-

Aphe'mia. ('Λ, neg.; φημί, to speak. F. aphémie.) Loss or defect of the faculty of speech. By some authors used synonymously with aphasia in its widest sense; by others, restricted to those eases in which the power of speaking is lost, although the vocal organs are in no degree paralysed, and although the mental faculty of speech, as evidenced by the understanding of words spoken and by the possession of the power of ex-

pressing thoughts by writing, is still retained. **Aphe mie.** (Same etymon. F. aphemique.)

Suffering from, or the subject of, Aphemia. **Aphepse ma.** (Αφέψημα; from ἀπό, coming from; ἔψω, to boil. F. aphepsene.) The term used for a decection by Dioseorides, i, 2. Aphep'sis. (Aperfes, a boiling off.) A

Apheresis. The same as Apharesis. Aphesis. (Λόμισες, a letting go; from ἀφινημ, to send forth. F. aphésic.) Old term, used by Hippoerates, Coac. Prænot. t. 575, for the

remission or resolution of a disease; also for eertain or all the members of the body.

Aph'ides. Same as Aphidida. Aphid'ian. (Aphis.) Relating to the

aphis, or plant-louse. Aphid'ida. (F. aphidiens, pucerons; G. Blattlause.) A Family of the Suborder Homoptera, of the Order Rhynchota, of the Class Insecta (Ametabolica) (Schmarda). By Latreille they are included under the Hemiptera. The antenna have from five to seven segments, and are often longer than the hody; the wings four, thin, membranous, but often absent; legs thin, with two tarsal segments; no salivary glands or Mal-pighian vessels. Many species have two horns at the posterior extremity of the abdomen (cornieula), from which a honey-like fluid is excreted, eagerly sought after by some kinds of ants. Some species propagate by parthenogenesis. The

Aphidiph'aga. (Aphis; φάγεῖν, to eat.) A Group of the Suborder Trimera, Order Coteoptera, having the last joint of the maxillary palpi seutiform, and the antennæ short, the three

Phylloxera vastatrix, so destructive to vines, be-

terminal joints forming a club.

longs to this Family.

Aphidivorous. (Aphis; L. voro, to de-bur. F. aphidivore.) Devouring or eating vour. F. aphidivore.) aphides.

Aphid'rus. Same as Aphedron.

**Aphilanthro** pia. (A, priv.; φιλαν-θρωπία, love of mankind. G. Menschenscheu.) Old term used by D. D. Wedelins, Pathol., Dogm. s. iii, c. 9, 596, for the first symptoms of melancholia, consisting in the shunning of society and amusements.

A'phis. (F. pueeron; G. Blattlaus.) A Genus of the Family Aphides, or Aphidida. Antennie longer than the body, nine-segmented; subcostal nervure trifid; abdomen with two honey

A. chinen'sis. (Chinensis, belonging to China.) The insect believed to produce Chinese galls, which are used as an astringent, by puncturing with its ovipositor the upper surface of the leaves of the Distylium racemosum or Rhus semialata.

A. pista'ciæ. (Πιστάκη, the pistaehio tree.) A Species of Aphis, the galls, Caroba judaica, produced by which in the Pistacia terebinthus, are employed as a masticatory, as an application in many diseases of the chest, and for the produc-tion of a red colour (Schmarda). The galls are clongated, pointed at the free end, with large internal eavity. There is also a smaller rounded variety known in commerce as Baisonges.

A. ul'mi. (L. ulmus, the elm tree.) The elm aphis. The fluid contained in the galls produced by this aphis is employed by the peasants in France and Italy as an astringent in ophthalmie disenses.

A. vasta'tor. (L. vastator, a desolator.) A destructive species of aphis. See Phylloxera. Aphiste'sis. ('Αφίστημι, to remove.)

An absecsa **Aphleb'ious.** ('Λ, neg.; φλέψ, a vessel.) A term in Betany, signifying destitute of veins or nerves.

**Aphlegman'tous.** ('A, neg.; φλεγ-μονή, inflammation. G. Entzundungswidrig.) Without inflammation; controlling inflammation, Also (ά, neg.; φλέγμα, phlegm), devoid of phlegm.

Aphloeid'exe. ('Aphloiós, without bark.)

Applied to an Order of Thalassiophytæ symphysistee, the endochromes of which are not covered by a continued tissue, cellulous or parenchymatous.

Aphlœ'ous. (Same etymon.) Applied to

plants without bark.

**Aphlogis'tic.** ('A, neg.; φλόξ, a flame.

F. aphlogistique.) Burning without flame.

A.lamp. Term applied to a lamp suggested by Davy, consisting simply of a thread of incandescent platina, so that it gives no dame.

Aphloia. A Genus of the Nat. Order Flacourtiaceæ or Bixaceæ. Trees or shrubs, with alternate, articulated, entire, dentate leaves, and axillary or solitary flowers; calyx strongly imbricated; ovary consisting of one carpel; placenta parietal; ovules horizontal and subcampylotropal; fruit a berry.

A. theæfor'mis. (Thea, the tea plant; forma, shape.) A shrub indigenous in the Isle of France, where it is named Bois sans écorce.

The bark is a good emetic.

Aphodeu'ma. ('Αφόδευμα. G. Koth, Stuhlgang.) Exerement.

Aphodeu'sis. ('Αφύδευσις.) The act of defacation.

Aphodi'inæ. A Subfamily of the Family Lamellicornæ of pentamerous beetles. Median femora approximate; two terminal spines on the posterior tibiæ.

Aph'odos. ('Aφοδοs; from ἀπό, from; δόδs, a way.) Used by llippocrates, ii. de R. V. in A. t. 24, and Galen, in. Comm. ad. h. l., for a secretion of the freces; the freees or exerement discharged from the intestines.

Apho'na. ('A, neg.; φωνή, a sound.) Explosives or mute consonants; divided into

Explosives or mute consonants; divided into hard—k, t, p; soft—q, d, b; and nasal—uq, n, m.

Aphonetic. ('A, neg.; φωνητικόκ, belonging to speaking.) Same as Aphonic.

Apho'ni. ('A, neg.; φωνή, the voice.) A term applied to comatose persons.

Apho'nia. ('A, neg.; φωνή, the voice. F. aphonie; I. and S. afonia; G. Stimmlosiykeit, Heistrkeit.) Term for dumbness; inability to speak; loss of voice; due to paralysis of the adductor of the vocal cords, and may be of funcductor of the vocal cords, and may be of functional or organic origin.

Also, a term for eatalepsy. A. albuminu'rica. A term given to a form of aphonia, which Fauvel first described as a white edema of the vestibule of the larynx,

preceding or following albuminuria. A. aton'ica. ('Λ, neg.; τόνος, tone.) Loss of voice depending on injury to, pressure on, or other disturbance of, the laryngeal nerves.

A. atonica oblæsa. (L. oblæsus, in-

A. aton'ica oblæ'sa. jured.) Speechlessness from injury to the lingual

or glottidean nerves.

A. aton'ica solu'ta. (L. solutus, loose.) Speechlessness produced suddenly, by emotion or shock, from total exhaustion of nervous power in the vocal organs, and without any recognisable

organic lesion.

A. clerico'rum. (Κληρικός, helonging to the elergy; from κλήρος, a lot, the elergy.) A form of chronic laryngitis occurring in those who have occasion to use the voice much, and especially in the elergy; it may arise from over-exertion or unwise use of the voice, and it may follow on catarrh. There is a feeling of dryness iu, and inclination to clear, the throat; hoarseness.

A. eling uium. (L. elinguis, without the tongue.) Dumbness from loss of the tongue.

A. eling'uium congen'ita. (L. elinguis; congenitus, born together.) Dumbness resulting from absence of the tongue from birth.

A. eling'uium oblæ'sa. (L. elinguis; oblæsus, injured.) Dumbness produced by loss of

the tengue from disease or injury.

A. guttura'lis. (L. guttur, the gullet, the throat.) Loss of voice depending upon inflammation or other disease of the fauces or glottis.

A., hysterical. Loss of voice, without any notable change of structure in the larynx, occurring in hysterical persons, and continuing for an indefinite period. Sudden recovery under strong excitement is not unusual.

A. paralytica. (Παραλυτικός, afflicted with paralysis.) Aphonia depending upon some lesion of the nerves or muscles of the vocal organs. A. surdo'rum. (L. surdus, deaf.)

dumbness of a deaf mute.

A. trachea'lis. (Trachea.) Loss of voice depending upon compression of the trachea.

Aphonic. (Same etymon. F. aphone; stimmlos.) Term applied to one who has lost G. stimmlos.) his voice.

(Same etymon.) Without Aph'onous.

Same as (Same etymon.) Aph'ony.

Aphora'ma. (Etymon uncertain.) Having projecting eyes, so that there is a wide field of vision.

**Apho'ria.** ('Αφορία, from ά, neg. ; φωρέω, for φέρω, to bear. F. aphorie ; G. Unfruchtbarkeit.) Barrenness or sterility in the female.

A. imperci'ta. (L. im, neg.; percito, to excite thoroughly.) Barrenness of irrespondence; steribty produced by personal aversion, or want of appetency. (Mason Good.)

A. im potens. (L. impotens, powerless.) The barrenness of impotency; it may be atonic or organic, cansed by intemperance of any kind, leucorrhea, and such like, or by structural defect, as imperforate hymen, or absence of ovaries.

A. incon'grua. (L. incongruus, nnsuitable.) Barrenness of incongruity; the conceptive power being inaccordant with the constituent principles of the seminal fluid received on the part of the male. (Mason Good.)

A. paramen'ica. (Παρά, amiss; μήν, a month, used here for the menses.) Barrenness from mismenstruction, according to Mason Good; the catamenial discharge morbidly retained, seereted with difficulty or in profusion.

Aph'orism. ('Αφορισμός; from άφορίζω, to define. F. aphorisme; I. and S. aforismo; G. Lehrspruch, Gedankenspäne.) A short proposition; a maxim or precept contracted into a short sentence; a terse and definite statement of a principle or doctrine in science or philosophy.

**Aphor'me.** ('Αφορμή, a starting point.)
The obvious cause of anything; the cause of a

Aph'orous. (Apopos, not bearing.) Barren; sterile. Aphræn'ous. ('Λφραίνω, to be silly.)

Insane; having lost reason. **Aphra'sia.** ('A, neg.; φράζω, to speak. F. aphrasie.) Broea's term for Aphrasia.

A. paranoi ca. (Παράνοια, madness.) A term applied to lunaties who, after remaining persistently dumb for a long period, nnexpectedly begin to speak.

A. superstitio'sa endem'ica. (L. su-

perstitiosus, full of superstition; iv, among; δήμος, a people.) The intentional avoidance of certain words, the use of which is held to be forbidden on religious grounds or for the sake of propriety.

Aphre'nia. ('Λ, neg.; φρών, the mind.)
Obliteration of the moral and intellectual acts;

dementia.

**Aph'rite.** ('Αφρός, foam. G. Schaumrode, Schuferspath.) A scaly variety of carbonate of lime, or calcareous spar, of a pearly lustre, and greasy to the touch.

**Aphrodes.** ('Αφρώδες, frothy; from άφρος, foam.) A name applied by the ancients to *Papaver glancium* and Euphorbium plants having a milky juice.

Also, applied to the blood and exercments.

**Aphrodis'ia.** ('Λφροδίσια, venery; from 'Αφροδίση, Venus. F. aphrodisie, veneric.) Venery. A term for the morbid, or immoderate, desire of venery.

Also, the generative act.

Formerly used for the age of puberty, or the venereal age.

A. phreni'tis. (G. Liebesmuth.) Phrensy or insanity from disappointment in love

Aphrodis iac. (Same etymon. F. aphrodisuque; I. and S. afrodisiaco; G. Geschlechtsreizend.) Of, or belonging to, venery. Applied to certain medicines which improve the functional condition of the generative organs.

Aphrodis'iacs. (Same etymen.) Medicines which stimulate sexual desire. A large number of aromatics and other substances have been credited with this faculty; such are musk, civet, canella oil, rocket seeds, fennel, opium, amber, phosphorus, cantharides, nux vomica, and many others

Aphrodis'iasm.  $('\Lambda φροδισιασμός,$ sexual intercourse. G. Liebesgenuss.) The immoderate desire of sexual intercourse; also, the

venereal act.

Aphrodisias'ticon clid'ion. Name of a troche which was formerly given in dysenteries, according to Galen. It was made of balaustines, opium, rhubarb, and other astrin-

Aphrodisias'ticus. Same etymon and

meaning as Aphrodisiae.

**Aphrodisiog aphy.** ('Λφροδίσια, venery; γράφω, to write.) An account of the pleasures of natural, and of the pains of inordinate, love.

Also, a description of syphilis.

Aphrodis'ius. Same etymon and mean-

ing as Aphrodisiae.

A., mor'bus. (L. morbus, a disease.) A former term for the venercal disease, or syphilis.

Aphrodita rium. ('Αφροδίτη, sexual love.) Name of a powder or dry medicine, consisting of scales of copper, incense, lesser pomegranate, cerusse, and starch, in equal portions, used by the ancients. The same name was likewise applied to a certain collyrium.

Aphroditic. (Same etymon.) Venereal. Aphrodit'idæ. A Family of the Suborder Nereida, or Errantia, Order Vermes. Back covered with membranous plates, and cirrli, for respiration; peritonenm lined with vibratile epithelium; pharyux capable of eversion, like a probescis.

Aphroditine. A Subfamily of the Family Aphroditide. Cephalic lobe rounded;

no lateral frontal tentacles.

**Aphrog'ala.** (' $\Lambda \phi \rho \delta s$ , foam;  $\gamma \delta \lambda a$ , milk. G. Schammulch.) Milk rendered frothy by agitation; used to relieve heartburn.

Aphroli'trum. The same as Aphronitrum.

**Aphrom'eter.** ('Αφρός, foam; μέτρου. G. Schaummesser.) Α kind of manometer for determining the pressure exerted by gases in artificial waters, champagne, and other sparkling wines.

**Aph'ron.** ('A, neg.;  $\phi \rho \hat{n} \nu$ , the mind. G. Sinnlos, unkhy, wahnsinnig.) A name given to the wild poppy, Papaver rhaas, in consequence of its intoxicating and narcotic properties.

Also, the name of a cephalic plaster prescribed

by Actins. (Parr.) **Aphro'nia.** ('A, neg.; φρήν, the miud.)

Apoplexy. (Dunglison.)

Aphroni trum. ('Αφρός, foam ; νίτρον, pitre. L. natrum murorum; G. Schaumnatron, Mauersalpeter.) The spume or foam of nitre; an ancient term for salts formed of sulphuric acid and various alkalies. It is the fungus-like growth that appears on recently built walls; and then consists of soda sulphate or carbonate, sometimes of magnesian sulphate, and occasionally, though rarely, of potash nitrate.

Also, a name for the natron, or nitre, of the

ancients.

Aphrosele'nos. ('Αφρός, foam; σελήνη, the moon.) Old term for a precious stone which represents the image of the moon as if in a mirror; otherwise called Selenite.

Aphrosyne. ('Αφοσόνη, folly. F. aphrosyne; G. Irrereden, Unvernanft, Wahnsinn.) Old term for the state now termed Amentia; also, delirium.

**Aph**'scious. ('A, neg. ; ψύσκη, a blister.) Without bladders.

Aph'tha. (Aφθα, mostly in plural, ἄφθαι; from ἄπτω, to set on fire. L. oscedo, ignis sacer; F. muguet, aphthe; I. afta; G. Fasch, Mehlhund, Mundschwammchen, Mundschross, Sandross, Kurvoss, Soor.) Aphthæ constitute the characteristic symptoms of the disease of infancy, popularly termed "thrush," and are also apt to occur in other diseases of the adult. They consist in small, roundish, white specks, resembling minute portious of curd scattered on the tongue, the lining membrane of the mouth and fauces, angles of the lips, palate, cheeks; they frequently coalesce to form patches of greater or less size, which often become detached, leaving a red exceriating surface, which sometimes ulcerates. In a large number of cases the patches consist in great measure of the spores and mycelium of the Oidium albicans. The relationship of the fungoid growth to the disease is not yet settled; some believe it to be an accidental condition, many that it is the canse of aphthæ. Similar spots occur in adults in feeble conditions of system, and towards the fatal termination of febrile and other exhausting diseases. The general health is to be attended to, the mouth kept serupulously clean, and glycerin of tannin, honey of borax, chlorate of pot-ash, or sulphurous acid, applied to the spots. A. adulto'rum. (L. adul'us, grown up.)

Stomatitis in the adult, accompanied by aphthie.

A. angino'sa. (L. angina, the quinsy.)

Aphthæ accompanied by angina.

A. epizoot'ica. (Επί, upon; ζωσν, an animal. G. Maul- und Klauenseuche.) Footand-month disease of cattle occurring in man. This disease, there seems no doubt, can be propagated to the human being by drinking the unboiled milk of a diseased animal, or by direct contact with its saliva or the serous discharge from the eruption; the eruption appears ebiefly about the lips and throat, spreads downwards, producing gastrie and intestinal disturbance, and occasionally appears on the hands and feet.

A. figura'ta. (L. figuratus, formed, shaped.) A form of disease of the tongue which is described as passing through three stages: first, as variously-shaped, white, opaque, slightly raised, red-edged patches; second, as a shallow, red, angry-looking, white-margined crosion; third, as a smooth, glassy depression. All sources of local irritation are to be removed, nitrate of silver or chlorinated soda solution to be applied to the patches, and iodide and chloride of potassium, or iodide of mercury, given internally.

A. lactan'tium. (L. lacto, to suckle, to suck.) A synonym of Thrush.

A. parasitica. (Παράσιτος, a parasite.)

A synonym of Thrush.

A. præpu'til. (L. præputium, the foreskin.) Herpes of the prepuce.
A. serpens. (L. serpens, part. of serpe,

to creep.) A synonym of Cancrum oris.

**Aph'thaphyte.** ( $\Lambda \phi \theta \alpha$ ;  $\phi v \tau \delta \nu$ , a plant.) The Oidium albicans.

('Αφθεγκτέω, to be Aphthenx'ia. speechless.) Loss of the faculty of speech from central nervous disturbance.

**Aphthenx**'is. Same etymon and meaning as Aphthenxia.

Aphtherythropy'ra. ("Αφθα; erythropyra.) Erythropyra with aphthe in the

Aphthocacosto'mia. ('Αφθα; κακός, bad; στόμα, the mouth. G. Schwümmchen, Mundfaule.) Gangrenous stomatitis, or cancrum

oris, accompanied by aphthie. **Aph'thoid**. ( $^{\prime}\Lambda\phi\theta u$ ;  $\epsilon\bar{i}\hat{c}os$ , form. F. aphthoide.) Aphthous-like. **Aphthong'ia**. ( $^{\prime}\Lambda$ , neg.;  $\phi\theta\delta\gamma\gamma\sigma s$ , any clear distinct sound, especially the voice of man.) A reflex aphasia, occurring but rarely, in which, at every attempt to speak, spasm of the muscles supplied by the hypoglossal nerve comes on, and speaking is rendered impossible.

Aphthophy'ton. See Aphthaphyte.
Aphthous. (Aphtha, the disease thrush.
F. aphtheux; G. aphthös.) Belonging to, or of the appearance or nature of, aphtha; having, or full of, aphthæ.

A. stomati'tis. See Stomatitis, aph-

**Aph'ya.** ('Αφύη.) An old term for the anchovy, Engraulis euchrasicolus. The original Greek word is by some supposed to mean, not the anchovy, but the sardine, Clupia sardinia; by Yarrell, the mackerel-midge, Motella glauca.

Aphyllan'theæ. Applied by Bartling to Tribe of the Nat. Order Liliacca, with the Aphyllanthes for its type, having a rush-like appearance and membranous imbricated bracts.

**Aphyl'lous.** ('A, neg.; φύλλον, a leaf. L. aphyllus; F. aphylle; G. blattlos.) In Botany, applied to plants, like Cactuses, destitute of leaves. Many plants appear to be destitute of leaves, because, like Cuscuta, these are reduced to scales; or because, like Opuntia Dillenii, they fall off early; or because, like Indigofera juncea and Lebeckia nuda, the petioles of the leaves have no lamina.

Aphylly. (Same etymon.) The condition of having no leaves.

**Aphyosto'mata.** ('Λφύσσω, to draw liquids; στόμα, a mouth. F. aphyostome.) Applied by Dumeril to a Family of Fishes having the snout very prolonged, presenting a small mouth at its extremity.

**Aphys'cious.** ('A, neg.; φύσκη, a sausage, a blister. G. blasenlos.) Without bladders. **Aphysi'idæ.** (Αφύσσω, to draw liquids) A Family of the Section *Pleurobranchiae*, Order *Opisthobranchiae*. Branchiæ situated on the right side of the back under a fold of the mantle; usually a thin internal shell, covered by two lobes of the foot; stomach with hard dentary plates; penis somewhat removed from the common genital aperture.

A'pi. Italy; near Rome. A mineral water, containing much carbonic acid gas and a very

small proportion of iron.

Apia'cas. A group of South American Indians, occupying territory between the rivers Paraguay and Parana.

Apia ceæ. (L. apium, parsley.) A synonym of Umbelliferæ.

According to Lindley, an Order of the Alliance Umbellates, distinguished by their didymous fruit and double epigynous disc.

Apia'ceous. (Same etymon.) Resem-

bling parsley.

Apia'ria. (L. apiarius, relating to bees.) Applied by Duméril to a Family, by Lamarck to a Division, by Goldfuss and Latreille to a Tribe, of Hymenoptera, having the Apis for their type. A'piary. (L. apiarium; from apis, a bee. G. Bienenstock.) A place for keeping bees.

Apias'trum (L. apiastrum; from apis, a bee.) Name for the Melittis melissophyllum, or mountain-balm, which bees light upon with evident preference; or, according to some, the Melissa

officinalis. Also, a poisonous plant of Sardinia (Pliny, l. xx, c. 45), probably Ranunculus sceleratus.

A'pical. (L. apicalis; from apex, the summit.) That which forms or occupies the summit.

A. cell. (G. Scheitelzelle.) The cell which remains at the summit in the growth of the higher flowerless plants, and which retains the functions of division which distinguish the mother-cell from which the plant sprung.

Apica tous. (L. apicatus, provided with an apex. F. apice; G. spitzig.) Terminated by

a conspicuous summit. A'pices. (L. plural of apex, a summit.) Summits, terminations.

A. cor'porum caverno'sum pe'nis. (L. corpus, a body; cavernosus, full of hollows; penis, the male organ.) The anterior terminations, covered by the glans, of the corpora cavernosa of the penis.

Apicicurv'ed. (L. apex; curvus, erooked, bent.) Curved at the summit.

**Apicifix'ed.** (L. apex, a summit: fixus, attached. F. apicifixe.) A term in Botany, applied to anthers when they are attached to the filament by a point near their summit.

Apiciflo rous. (L. apex; flos, a flower. G. spitzblumig.) Having flowers disposed in very

small terminal capitula.

Apic'iform. (L. apex; farma, shape. G. spitzformig.) Applied to crystals which, being very thin, resemble small tufts in the mode of their arrangement.

Apic'ilar. (L. apex, the summit. F.

apicilaire; G. spitzig.) Springing from, forming, or connected with, the summit of an organ.

A. dehis'cence. (L. dehisco, to split open.) Term applied in Botany to anthers which open at their summit to discharge the pollen, as in Solanum.

A.em'bryo. ("Εμβρνον, the embryo.) An embryo situated near the sumunit of the seed.

Apic'ula. (L. dim. of apex. G. Spitzehen.) In Botany, applied to a small, sharp and short point, the consistence of which is not very great. In Zoology, applied by C. G. Ehrenberg to pro-longations of the body of Infusoria when very small and pointed.

Apic'ulate. (L. apiculum, a pointed piece of wood worm on the top of the cap of the flamen; from apex, the summit. F. apicule; G. spitze-tragend, bespitzelt.) Term applied in Botany to organs ending in a short and sharp point. It is

employed in describing the connective of anthers when this is prolonged into a sharp point. A. fruit. A fruit in which the style still

remains as a point at the apex.

A'piculture. (L. apis, a bee; cultura, cultivation.) Bee breeding.

Apic'ulum. (Same etymon as Apiculate. G. Spitzchen.) Terminal point of an organ.

Apicur'vous. (L. apex ; curvus, bent. F. apicicourbe; G. Spitzgekrummt.) Bent at the summit or extremity.

A'pidæ. (L. apis, a bec.) A Family of the Group Alulifera, Order Hymenoptera. Bees. Tibie and tarsi enlarged throughout in the posterior limbs; first tarsal joint eiliated; anterior wings do not fold; lower lip and maxilla often very long, the latter forming a sort of sheath round the tongue.

Apif'erus. (L. apis, a bec; fero, to bear. G. bienetragend.) Applied to Ophrys apifera, from some resemblance of its flowers to bees.

A'piform. (L. apis; forma, shape. F. apiforme; G. bieneformig.) Formed like a bee, as Sesia apiformis.

Apig enin. C<sub>15</sub>H<sub>10</sub>O<sub>5</sub>. A substance, obtained from parsley, crystallising in iridescent lamine, which are soluble with difficulty in bot water, insoluble in ether, readily soluble in alcohol. Its solution does not gelatinise.

**A'piin.**  $C_{24}II_{14}O_{13}$ , or  $C_{27}II_{32}O_{16}$ . A delicate white powder, crystallising in silky needles, withont taste or smell, obtained from Apium graveolens and Carum petroselinum. It fuses at 180° C. (356° F.), dissolves readily in hot water, the solution gelatinising on cooling. It dissolves in 390 parts of cold alcohol. The aqueous solution gives a blood-red colour with protosulphate of iron. It yields sugar when boiled with dilute acids. It rotates a ray of polarised light to the right more powerfully than any other substance.

**Apilep'sis.** ('Απολαμβάνω, to cut off.) A seizure: apoplexy.

A'pillary. ('A, neg.; πίλος, a felt cap.) In Botany, applied to a flower which has no upper lip. **A'pinæ.** (L. apis, a bee.) A Subfamily of the Family Apidæ. Social bees. Tongue long; body heavy, villous; external border of posterior tible enlarged; posterior tarsi covered with thick

Ap'inages. An isolated tribe of South American Indians, living on the banks of the

lower Tocantin, Brazil.

A'pinel. A Mexican plant, the root of which is employed by the natives in cases of snake bite. It is believed to be the Aristolochia anyuicida.

Ap'inoid. ('Aπινής, free from dirt; ελδος, form.) A term applied to seirrhus, from the cleanness of its section.

Apin thion. (Gr.) Same as Absinthium. Api'nus, J. L. Born at Ochringen, in Franconia, Nov. 20, 1668. He wrote on epidemic

fever, syncope, and flatulence.

Apiocri'nidæ. A fossil Family of the Order Crinvidea, found in the chalk and colite. Pear-shaped animals, fixed to a support by a dilated base and a long, articulated column, which expands at the upper end, where it joins the base of the ealyx, which contains the soft parts of the animal, and is crowned by a circle of bifid pinnate arms.

Apiocri'nites. ( Απιου, a pear; κρίνου,

a lilv.) Pear-encrimites.

A'piol. (G. Petersilienöl.) Parsley camphor. A peculiar non-nitrogenous principle obtained from the seeds of common parsley by treating them with ether at about 71° C. (159.8° F.) It is a yellowish, oily, non-saponifiable, inflammable, non-volatile liquid, which also forms long, white, brittle needles, melting at 30° C. (86° F.), and boiling at 300° C. (572° F.); taste piquant and aerid; soluble in alcohol, ether, and chloroform, but insoluble in either hot or cold water. It was proposed in 1853 as an antiperiodic of great power. Taken in doses of from 7-15 drops it occasions slight cerebral excitement, with epigastric warmth and a sense of strength and comfort. In doses of 30-60 drops it causes vertigo, scintillations, noises in the ears, and head-ache. Occasionally its use is followed by nausea, colie, and bilious diarrhœa. Tonic and emmenagogue properties are also assigned to it. It has been used with advantage as a substitute for quinine in intermittent fevers, in doses of 15 drops; also, in intermittent neuralgia and in the night sweats of phthisis. It has been highly praised as a remedy in amenorrhœa and dysmenorrhœa.

Apio'lum. Same as Apiol. A'pion. ('Απιου, a pear.) The fruit of Pyrus

Apion. (Aπιου, a pear.) Increme to Tyrus communis, or pear (Dioscorides, l. i, c. 167; Paulus Egineta, l. viii, § 3). Used as a cataplasm.

Apionia. ('A, neg.; πίων, fat. G. Fettmangel.) Absence of fat; leanness.

Apionita. ('Απειμι, to go away. L. egesta, exercta; G. Ausscheidungen.) Term applied to the converting graverilly and else to the convertions graverilly. the excretions generally, and also to the semen.

**A'pios.** ('A $\pi\iota o\nu$ , a pear.) Name given by the Greeks to the Euphorbia apies, or spurge, the root of which is pear-shaped; also, to a Species of Glycine; and by the moderns to the Bunium bulbocastanum, and Lathyrus tuberosus. A Genus of the Nat. Order Leguminosa

A. tubero'sa. (L. tuberosus, full of lumps.) Hab, North America. A plant that the French have tried to acclimatise for the sake of its feculent tubers, which resemble those of the potato.

Api'ria. ('Απειρία, inexperience. L. imperitia; G. Uucrfahrenhvit, Erfahrungslosigkeit.) Want of skill; absence of experience.

Apirop'odous. (Amugos, without end; πούς, a foot.) In Entomology, having numerous

A'pis. (L. apis, the bec. F. abville; I. apv; G. Biene.) A Genus of the Subfamily Apinæ, Family Apidæ; or of the Family Authophilo, Order Hymenoptera, Class Inserta, Sub-kingdom Arthropoda. Mandibles spoon-shaped; maxillary palpi small; anterior wings with three cubital cellules; posterior tibia with no terminal spines.

A. acraeri'sis. A bee that, according to Fabricius, might be enltivated with greater advantage than even the A. mellifica.

A. Adanso'nii. A bee domesticated in

Senegal.

**A. amaithe'a.** ('Λμάλθεια, a nymph, daughter of Melissus, king of Crete, who fed pupites with goats' milk.) Λ bee which furnishes the greater part of the honey of Central Africa.

A. bic'olor. (L. bicolor, two-coloured.)

An Indian honey-supplying species.

A. cera'na. A species living in China. A. ceri'fera. (L. cera, wax; fero, to bear.)

A synonym of A. mellifica.

A. dorsa'ta. An Indian species of bee.
A. fascia'ta. (L. fascio, to envelope with bands.) A honey-producing bee which bas been long extensively cultivated in Egypt for its honey.

A. in'dica. A bee cultivated in India, at

Pondicherry and in Bengal.

A. laborio'sa. (L. laboriosus, laborious.) A bee that, according to Fabricius, might be cultivated with greater advantage even than the A. mellifica.

A. ligus'tica. (L. ligustieus, from Liguria, a country of Gallia Cisalpina.) A species of bee cultivated, for the sake of the honey it produces, in Italy, and probably also in the Morea and the

Isles of the Archipelago.

A.mellif'ica. (L. mellificus, honey making; mel, facio. F. abeille mellifique; I. ape pecchia; S. abja comun ótrabajador; G. Honigbiene; Russ. Pschela; Port. abetha.) The hive or boncy bee. An insect living either singly or in great colonies. The males, named drones, have atrophied oral apparatus and smooth hind legs, as they collect no-thing. The females have smooth hind legs and a long abdomen. In both the drones and the females the salivary glands are feebly developed. workers have divided eyes, a large hairy ligula, and single-jointed maxillary palp. The outside of the posterior dilated tibio is smooth, and hollowed into a shining plate for the reception and earrying of the pollen, which has been accumulated by means of the pollen brushes upon the basal joint of the metatarsus of this pair of legs. A colony or swarm consists of one queen bee or eompletely developed female, a few hundred drones, and from eight to twenty thousand workers.

The boney bee is common in the wild state in the forests of Russia and in different parts of India, but is rare in Britain. The bee is chiefly valued as being the source of honey and wax. In former times the hee itself was employed in medicine, the dried and powdered insect being used as a diurctic in dropsy and other diseases. Its use has lately been revived in America for cases of strangury consequent on inflammation of the bladder and the administration of cantharides. It has also been used with advantage in cases of retention of nrine. The infusion or "bee tea" is made by pouring a gill of boiling water on 40-60 bees. and after twenty minutes giving the whole of the finid as a draught. For the relief of the sting of the bec the application of Liq. Ammoniæ or of the Sp. Ammon. Aromaticus, after sucking

the wound, is usually successful.

A. nigripen'nis. (L. niger, black; penna, a feather, a wing.) An Indian species which supplies boney.

A. nigrita'rum. (L. Nigrita; the people living near the Niger.) An African species.

A. socia'iis. (L. socialis, companionable.) An Indian species which furnishes honey.

A. unic'olor. (L. unns, one; color, colour.) A black bee cultivated in Madagascar for the sake of the honey it produces.

A'pites vi'num. ('Aπίτης, perry; from

 $\check{a}\pi\iota\sigma\nu$ , a pear.) An old name for perry. **A'pium**. (Sanskrit *apya*, that which grows in the water; also,  $\check{a}\pi\iota\sigma\nu$ , a pear.) This word was anciently employed to designate aquatic plants, as the parsley and celery; also, mint, the Apium silvestre of Pliny. The various plants named Apium by the Latins are called Σέλινον by the

Argum. (F. ache; G. Eppich.) A Genus of the Nat. Order Umbelliferæ. Annual or perennial glabrous herbs. Leaves pinnate or ternately compound; umbels conformed with or without involueres and involueels; flowers white; calyx almost obsolete, forming a ring; petals oval, rounded, entire, or slightly marginate, incurved; fruit broadly ovate, laterally compressed; commissure constricted; carpophore simple; carpels 5-angled; primary ridges equal, prominent, obtuse; vittæ solitary in the vallceulæ; seed subterete.

A. am'mi, Crantz. The Ammi majus. A. ani'sum, Crantz. The Pimpinella anisum.

A. car'ui. The Carum carui.

A. dul'ce. (L. dulcis, sweet. F. ache cultivée, apleri ordinaire; G. Sellerie.) The cultivated variety of A. graveolens called Celery.

A. grave'olens, L. (L. gravis, heavy; oleo, to smell. F. ache, ache des marais; I. appio; S. apio; G. Eppich, Wassereppich; Dut. eppe; Turk. Kervis.) Smallage, celery. An annual or perennial glabrous herb. Leaves pinnate or ternately compound; umbels compound; bracts few or 0; bracteoles 0; flowers white; calyx teeth 0; petals entire, much incurved; fruit broadly ovoid, laterally compressed; commissure constricted; carpophore simple; carpels 5-angled; primary ridges equal, prominent, obtuse; vitta solitary in the interstices; seed subterete. Hab. Marshes all over Europe, the Caucasus, Mexico. Cultivated in India and elsewhere. When wild, growing in wet meadows and in ditches, it is aerid and poisonous; but when cultivated in dry ground and partially blanched, it is the celery used as a salad. In former times the whole plant was employed medicinally, the root as aperient, the seeds as carminative, the juice as sudorific and emmenagogue. The juice of the leaves, in doses of six ounces, taken at the commencement of the cold stage, is stated to be an excellent febrifuge, and to increase the efficacy of quinine.

A. horten'se. (L. hortensis, belonging to

a garden.) A name for the Apium petroselinum,

or A. graveolens, var. dulce.

A. inunda'tum, Reich. (L. part. of inundo, to overflow.) A decumbent or tloating plant. Submerged leaves; 2—3 pinnate leadets; eapillary rarely linear; floating leaves pinnate; heavillary acts leaves pinnate; lower leaflets deeply 3-cleft; bracts 0; bracteoles 4-6, lanceolate, 3-nerved.

A. involucra'tum. (Involuere.) A synonym of Carum Roxburghianum, and also of

Pimpinella involucratum.

A. macedo'nium. The Athamanta macedonica.

A. monta'num. (L. montanus, belonging to a mountain.) The Athamanta orcoselinum.

A. nodifio'rum, Reich. (L. nodus, a knot;

flos, a flower.) A prostrate or erceping plant. Leaves piunate, or 3-foliolate; leatlets slightly lobed, serrate; involuere 0; involueel composed of numerous oblong, searious bractcoles. Hab. Marshy places.

A. paluda'pium. (L. palus, a swamp;

apium, parsley.) The A. gravcolens.

A. palus'tre. (L. paluster, marsby.) The Sium angustifolium.

A. peregri'num. (L. peregrinus, foreign.)

A variety of A. petroselinum.

A. Petræ'um. (L. Petræa, from Petra, the name of a city in Arabia.) A name for the Bubon Macedonicum.

A. petroseli'num. (Πέτρος, a rock; σέλινον, parsley. F. ache persil; G. Petersilie.) Common parsley, Carum petroselinum.

(L. rapa, turnip. F. A. rapa'ceum. ecleri-rave.) A cultivated variety of the Apium graveolens, with a rapiform root.

A. rus'ticum. (L. rusticus, rural.) A synonym in Apuleius of the Ranunculus seelera-

A. sati'vum. (L. sativus, that which is sown or planted, in opposition to wild.) The cultivated or garden celery.

A. si'um. The Sium angust folium.

A. sylves'tre. (L. sylvestris, belonging to a wood.) The Anthriseus vulgaris.

A. sylves'tre lac'teo suc'co tur'gens. (L. sylvestris; lacteus, milky; succus, juice; lurgeo, to swell out.) A synonym of the Peucedanum palustre.

A. vulga're, Lam. (L. vulgaris, common.)

The A. graveolens, var. sativum.

Apiv'orous. (L. apis, a bee; voro, to devour. G. bienefressend.) Devouring or eating

Aplacenta'lia. (L. a, neg.; a cake, the placenta. F. aplacentaires.) (L. a, neg.; placenta, A Group of Mammals in Owen's classification, which includes the Didelphia and Ornithodelphia of Blainville's classification, the Monotremata and Marsupialia of Geoffroy St. Hilaire. They are characterised by the absence of a placenta.

Aplacenta'ria. Same etymon and meaning as Aplacentalia.

**Aplanat**ic. ('A, neg.; πλανάω, to wander.) Not wandering; not aberrant.

A. lens. (F. lentille aplanatique.) This term is applied to the combination of lenses by which aberration, both spherical and chromatic, is avoided. It is impossible to effect this completely; in the best arrangement of crown and flint glass, however, two points exist, in one of which the aberration of sphericity is neutralised, and in the other that of colour.

A. search'er. An apparatus devised by Dr. Royston-Piggot to correct the false images seen on each side of the best focal point when any well-defined structure is viewed by a good microscope. It consists of a pair of slightly corrected achromatic lenses, admitting of further correction by a separating adjustment, mounted midway between a low eyepiece and the objective, so as to admit of a traverse of two or three inches, by means of a milled head. These lenses are conveniently traversed within the draw-tube, and can be brought to bear at from four to ten inches from the objective; the focal length of the combination may vary from 1.5" to .75".

Aplan'atism. (Same etymon. F. aplanitume.) In Optics, the absence of spherical

aberration.

Apla'sia. ('Λ, neg.; πλάσις, a moulding.) Defective or arrested development of a tissue or an organ.

**Aplastic.** ('A, neg.;  $\pi\lambda d\sigma\sigma\omega$ , to form. F. aplastique.) Without form or regular structure; applied to morbid deposits that have no true organisation.

A. el'ement. A substance incapable of organisation.

A. lymph. See Lymph, aplastic.

Aples'tia. (Άπληστία, insatiate desire. F. aplestie; G. Unersättlichkeit.) Old term, used by Galen, l. de dign. et cur. an. morb. c. 9, for insatiability or greediness.

Apleuria. ('A, neg.; πλευρά, a rib. F. apleurie; G. rippenlos.) Term by Breschet for a kind of organic deviation, or partial agencsis, characterised by the absence of ribs.

Apleu'ros. (Same etymon.) Au ancient term applied by Galen to one wanting ribs.

Apleu rous. Same as Apleuros.

Aploc'erous. (Απλόος, simple; κέρας, a horn.) Term applied to insects the autenma of which do not bear lateral, isolated hairs.

Aplodon'tia. The same as Haplodon-

**Aplopap'pus.** ('A $\pi\lambda\delta ios$ , single; pappus.) See Haplopappus.

A. discol'deus. (L. discoides, in the form of a discus.) A Mexican species used in hys-

Aploperisto'matous. (' $A\pi\lambda\delta\sigma$ 's; pcristoma.) Applied by Bridel to mosses which have the peristome simple, or composed of only one row

Aploperis'tomous. Same etymon and

meaning as Aploperistomatous.

Aplospo'riæ. ('Απλόος, single, simple; σπόρος, seed.) A Suborder of the Order Alga. Spores green or brown, developed singly in the ntricles, not motile, but generally having filaments at the base. It contains the sea-weeds. The word is better spelt Haplosporea.

Aplosta chyous. ('Απλόσε; στάχυς, an car or spike. G. einfachöhrig.) Term applied in Botany to flowers arranged in simple spikes.

**Aplos'tega.** ('Απλώος; στίγη, a chamber. G. cinfachkammerig.) Applied by Orbigny to, a Section of Foraminifera, because they have only one cavity for habitation.

Aploste monous. ( Απλόος; στήμων, a thread.) A flower having one row only of stamens.

**Aplos'tomous.** ('Απλόος', στόμα, a mouth.) Ilaying the lip simple; applied to a Species of Helix.

**Aplotax'is.** ('Απλόος; τάξι Genus of the Nat. Order Compositæ. ('Aπλόος; τάξις, order.) A

A.auricula'ta. (L. auricula, the external car.) The root of this plant is a native Indian remedy for asthma, and is named Kut. It is the source of the Arabian costus, a cosmetic and reputed aphrodisiae. It is also smoked as a stimulant and narcotic.

A. cos tus. (Kóoros, a root used as a spice.) A Species supposed to be a source of the Costus.

Aplot'omy. ('Απλόος, simple; τομή, a cut.) A simple cut. (Dunglison.)
Aplu'da. (L.; from ab, from, and pluo, to flow away. G. Spreu, Kleie.) Bran, chaft.
Aplys'ia. ('Απλυσία, filthiness.) A Genus

of the Family Aplysiida, Order Opisthobranchia. Marine mollusea having a pointed posterior extremity, an oval shell, and lateral lobes serving for swimming

A. depilans. (L. depilo, to pluck out the hairs. F. livere de mer.) When disturbed this molluse emits from the inner face of the mantle a violet liquid, which has been supposed to be poisonous, but which in reality is inoffensive; the animal itself is in some places eaten.

Apneumatic. ('A, neg.; πνεῦμα, air.)

Having no air.

A. treat'ment. The treatment of wounds by means of an apparatus which excludes the

Apneumatocœ la. ('A. neg.: πνεῦμα, air; κοῖλος, hollow.) A Division of the Suhclass Amphirrhina, Subdivision Holocrania, Class Pisces, in Prof. Huxley's schematic arrangement of the Amphibia and Fishes; applied to those fishes which possess neither lung nor air-bladder.

**Apneumato'sis.** ('A. neg.; πνευμάτωσες, an inflating.) Defined by Graily Hewitt as that condition of lung-tissue characterised by the return of air-cells to a quasi-feetal state. portions of lung so affected having once been physiologically active have ceased to be so. Physically it is hardly to be distinguished from atelectasis, which is congenital apucumatosis; it consists of irregular polygonal depressions scattered over the surface of the lung, which, on being cut into, are found extending more or less deeply, and to be of a dark violet colour, tough, and empty of air; if there be no great amount of congestion they can be restored nearly to their natural appearance by inflation; there is often emphysema. The collapse of the air-cells depends on the blocking of a bronchial tubule by mucus or other material, so that, whilst they can be partially emptied by expiration, the plug prevents the return of air during inspiration. This condition occurs in bronchitis or similar affections of the lung, leading to blocking of the minute bronchial tubes; it is not uncommon in hoopingcough in weakly children. The symptoms induced by apneumatosis are great prostration, with shallowness of respiration and an increase of the interval following inspiration; there is an ineffectual cough and dyspnea. If the disease be extensive there is dulness on percussion and bronchial breathing, with coarse, rough rhonchi: there is also generally retraction of the lower half of the chest-walls, and in advanced cases bulging, it may be, of the upper part. The treatment recommended is restorative and stimulant. Good easily digested diet, dilute alcohol, ammonia, and ipecacuanha; when the patient is strong, emetics to remove mucus.

**Apneu'mia.** ('Λ, neg.; πνεύμων, the lung. F. and G. apnenmie.) In Teratology, partial agenesis, characterised by absence of

lungs.

Apneumo'na. (Same etymon.) An Order of the Class Holuthuroidea. Hermaphrodite Hermaphrodite Echinoderms having no special organ of respira-tion, and furnished with funnel-shaped ciliated organs, and simply-pennate or digitate teutacles.

Apneumoner'via. ('Λ, neg.; πνεύμων, lung; veupov, uerve.) Impaired power of performing the acts of respiration from want of nerve

**Apneus ta.** ('Απνευστος, breathless.) A synonym of Abranchia.

**Apneus tia.** (' $\Lambda \pi \nu \epsilon \nu \sigma \tau i a$ , a holding of the breath; from a, neg.;  $\pi \nu \epsilon \omega$ , to breathe, F.

apmustic; G. Athemlosigkeit.) Want of breath. Same as Apnad.

Apneus tous. (Λπνευστος, breathless, G. athembox.) Breathless; applied to one breathing so slowly and slightly as hardly to be perceived.

Apnœa. (A, neg.; πνοή, or πνοιά, a blowing; from πνέω, t) breathe. F. apnæ; G. Athemlosigkeit, Erstickung.) Term used by Galen for the partial privation or suspension of breath, which may arise from various causes, and is generally but improperly expressed by the word asphyxia.

In Physiology, the condition of an animal when the blood is saturated with oxygen, which leads to arrest of the movements of re-piration, the vago-phrenic nerve centres being no longer excited by the presence of carbonic acid in the blood

or in the air in the lungs.

In Medicine, the word is not infrequently used instead of asphyxia, as being more accurate, to denote the condition which exists in death by suffocation, as from drowning, choking, hanging, and such like, and from broughitis; in strychnia poisoning and tetanus, death often occurs from this cause by fixation of the respiratory muscles; the essential cause of death is retention of carbonic acid in the blood. At first, in acute apnæa, there is great struggling for breath, then vertigo, unconsciousness, generally convulsions, then relaxation of muscles, lastly, cessation of heart's action. After death the right heart, the pulmonary arteries, and the systemic veins, are gorged with dark blood, while the left heart and the pulmonary veins contain very little, this being a result of contraction of the minute arteries or the lungs. In chronic apnœa, as it occurs in brouchitis, the surface slowly becomes dusky, the yeins distended. the pulse rapid, the breathing quick and auxious. then drowsiness comes on, growing into coma, and ending in death.

A., car'diae. (Καρδιακός, belonging to the heart.) Walshe applies this term to forms of failure in the breathing act: first, where after a series of inspirations, gradually increasing in rapidity, the breathing becomes slower and slower until it quite ceases for a definite periodtwenty or thirty seconds—the pulse continuing; this form occurs in its most perfect devel opment in eases of fatty degeneration of heart, and is attributed by him to defect in the special nervous excitant of the respiratory act; the second form occurs in rare cases of eardiac disease-a tendency to complete stoppage of breathing on going to sleep, and may perhaps be to a cert in extent remedied by a gentle galvanic current passing from the nucha to the epigastrium.

A. infant'um. (L. infans, a little child.)
A term for spasm of the glottis in children.

A. neonatorum. (Neos, young, new; L. natus; from nascor, to be born.) Want of respiration in the new-born child. It occurs in feeble children, from compression of the umbilical cord, from long-continued and severe uterine contractiou, from pressure induced by pelvic deformity, from separation of the placenta before birth. Mucus should be removed from the mouth, the chest or buttocks slapped with a cold wet towel, a few drops of blood, when the child is not auæmic, may be allowed to run from the cord; if these measures are not speedily successful, artificial respiration should be resorted to.

A., ner'vous. A term for non-hysterical infrequency of respiration, sometimes amounting to as few as six in a minute, and accompanied by somewhat exaggerated, but in other respects, normal breath sounds. It would appear to de-

pend on deficient nerve force.

A., sec'ondary. A term applied to cases of sudden death after apparent recovery from drowning or other form of suffocation. patient may appear to be going on well for some hours or days, and then suddenly die without apparent cause.

Apnœasphyx'ia. (Apnwa, asphyxia. F. apnoesphyxie.) Apparent death, with cessation of breathing or of the pulse.

According to Swediaur, synonymous with Asphyxia.

Apnœolo'gia. (Apnæa; λόγος, a dis-A treatise on the various kinds of eourse.) apnœa.

**Apnoicus.** ( $A\pi\nu o i a$ , a want of breath.) Belonging to apnœa; breathless.

Ap'nous. Same as Apnoicus.

Ap'nous. (Λπνοός.) One whose respiration is so slow and slight that the breath seems to have altogether ceased.

Apobam'ma. ('Απόβαμμα, a tincture.) Old term, used by Cardanus, de Subtil. Rev. l. v, for water in which hot iron has been quenched.

**Apobio** sis. ('Αποβίωσις, departure from life. G. Tod, Ableben.) Death; cessation of life.

**Apoblaste** ma. (Λποβλάστημα, a germ or shoot. G. Seitentrieb, Nebenspross.) A shoot or scion.

or scion. **Apoble ma.** (' $\Lambda\pi\delta\beta\Lambda\eta\mu a$ , anything cast away; from  $\delta\pi\delta$ , from;  $\beta\delta\lambda\lambda\omega$ , to throw off. G. Weageworfene.) The product of abortion. **Apobole.** (' $\Lambda\pi\delta\beta\delta\lambda\eta$ , a throwing away. G. Wegwerfen, Fehlgebæren.) An abortion. **Apobras'ma.** (' $\Lambda\pi\delta\beta\rho\alpha\sigma\mu a$ , that which is thrown off, seum.) Bran; also, the foam of

the sea.

Apobreg'ma. ('Απόβρεγμα. G. Aufguss.) An infusion.

**Apobrochis mus.** ('Αποβροχίζω, to bind tight. L. subligatio; G. Unterbindung.) A binding or constriction of an organic part.

Apocal basum. A gum resin used to poison arrows, believed to be obtained from a species of Euphorbium. (Borey.)

Apocapnis mus. ( Αποκαπνίσμός. L. Fumigatio; F. apocapnisme; G. Raucherung.) Ancient term for a fumigation.

Ap'ocapouc. A poisonous tree of Madagasear. The natives extract an oil from the seed, which they use to anoint the hair.

Apocar pason. See Opocarpason. Apocarphol'ogy. Similar to Carpho-

logy. **Apocar'pous.** (' $A\pi\delta$ , separate;  $\kappa a \rho \pi \delta s$ , fruit.) Lindley includes under this name fruits that are composed of separate and free carpels, like those of the Ranunculacee, or which are formed of a single carpel, like those of the Legu-

**Apocartere'sis.** ('Αποκαφτέρησις. G. Selbstmord durch Hunger.) Suicide by hunger. Apocatas tasis. ('Αποκατάστασις, complete restoration: from αποκαθίστημι, to re-

establish.) The subsidence of a tumour, or the re-establishment of an exudation or sceretion. **Apocathar'sis.** ('Αποκάθαρσις, a thorough cleansing.) Term for a complete

purging, whether upwards or downwards. Apocathar'tic. ('Αποκαθαρτικός. cleansing; from aπό, from; καθαίρω, to purge.)

Having power to purge freely. **Apocaulisis.** ('Από, from; καυλός, a stem.) The snapping or breaking off of stems. Applied to the breaking across of bones.

Also, the abscission, tearing off, or amputation of the penis.

Apoceacaulis menon. (Από, asnnder; κεάζω, to split; καυλός, a stalk.) The snapping across of a bone near a joint, as if it were a stalk.

Apoceno'ses. ('Αποκενόω, to drain.)
An Order of the Class Locales, of Cullen's Nosology, being an unusual flux of blood, or other humours, without pyrexia or increased impetus of the fluids.

Apoceno'sis. (Same etymon. F. apocenose; G. Entleerung.) A term for an increased discharge, flux, or evacuation, attendant on disease, as of blood, or other fluid.

A. diabe'tes mel'litus. A synonym of Diabites.

A. ptyalis mus mel'litus. (L. mellitus, like honey.) A form of ptvalism in which the saliva is sweet.

A. vom'itus pyro'sis. A synonym of Pyrosis.

Apocenotic. (Same etymon.) Causing, or belonging to, increased evacuation or discharge from the vessels.

**Apoceryg'ma.** ('Αποκήρυγμα, a thing publicly proclaimed. G. das Vielbesprochene.) An old term for a declaration made to a patient as to his dangerous condition.

Also, used by Hippocrates to signify an unusual disease about which there is much discourse.

Apochin'amin.  $C_{19}H_{22}N_20$ . A white amorphous alkaloid, isomerous with homocinchonidin, obtained by the action of concentrated hydrochloric acid on chinamin and conchinamin through the abstraction of HoO. It is slightly soluble in ether, alcohol, and dilute hydrochloric acid.

Apochore'ma. Same as Apochoreon. Apocho'reon. (' $\Lambda\pi\alpha\chi\omega\rho i\omega$ , to pass off.) Old term for the faces or exerements; applied also by Hippocrates, Aph. vii, 69, to the urine.

Apochrem'ma. ('Απόχρεμμα; from αποχρεμπτομαι, to cough up.) Old term, used by Hippocrates, de R. V. in Acut. t. 27, for sputum, or expectoration

Apochremp'sis. ('Απόχρεμψις; from ἀποχρέμπτομαι, to spit out with retching.) Old term, used by Hippocrates, Coac. Pranot. c. 242, for the act of spitting or hawking up the sputum.

**Apochrœo'sis.** ('Αποχρωσιε, discoloration. L. decoloratio; G. Entfarbung.) Discoloration; etiolation.

('Αποχύλισμα; from Apochylis'ma. āποχυλίζω, to extract the juice.) Term for juice extracted from vegetables and inspissated, corresponding to the officinal term Rob; the same as what is now called an extract.

Apochylis'mus. (Same etymon.) The expressed juice of vegetables.

Apoch yma. ('Απόχυμα, that which is poured out. L. Zopissa; F. poix navale; G. Schiffpech.) Old name for the pitch obtained from ships' hottoms, being impregnated with sea-salt, and formerly esteemed in medicine.

**Apoch ysis.** ('Απόχυσις, a pouring out; from aποχέω, to pour ont.) An old term for cataract.

Apoclas ma. ( Απόκλασμα, a fracture

of the extremity.) A term formerly used, synonymous with Apagma.

Apoclei'sis. ('Απόκλεισιε; from aπο-κλείω, to shut out.) Absence of desire for, or disgust with, food.

Apocodei'a. The same as Apocodein.
Apoco'dein. C<sub>18</sub>H<sub>19</sub>NO<sub>2</sub>. A product of the action of chloride of zinc on codeine. It is amorphous, and has emetic properties.

**Apoc'ope**. (Αποκοπή; from ἀποκόπτω, to ent off. F. apocope; G. Ablosung, Wegschneiden.) A term for abscission, or amputation.

It has also been used to describe a wound with loss of substance, and a fracture with loss of

**Apoc'opous.** (' $\Lambda \pi \acute{o} κ ο \pi \tau ω$ , to cut off.) Castrated.

Apocre'nate. A combination of apocrenic

acid with a base.

**Apocre nic.** ('Aπό, from; κρήνη, a well. G. Quellsatzsäuere.)  $C_{24}\Pi_{12}O_{12}$ , a doubtful formula of Mulder. An organic, nitrogenous acid, contained in the mineral waters of Porla, in Sweden, and in the earth and ochreous deposits of chalybeate waters. It is obtained by boiling the ochreous mud with potash, filtering, neutralising by acetic acid, and then precipitating by cupric acetate; the precipitate, which is cupric apocrenate, is decomposed by hydrogen sulplide, which deposits a brown, somewhat astringeuttasting powder, slightly soluble in water, and soluble in alcohol. See *Humic acid*.

Apoc'risis. ('Απόκρισις; from ἀποκρίνω, to secrete, or separate. F. apocrisie; G. Ausleerung.) A term used for expulsion; also, for fæces or excrement, and whatever is east out from the body as redundant or superfluous; the same as

Ecerisis.

A. morbo'sa. (L. morbosus, diseased.) A term formerly used for contagious effluvia or miasmata.

**Apocrous'tic.** ('Αποκρουστικόs'; from ἀποκρούω, to repel. G. Austreibend.) Having the power of repelling and astringing. Used by the power of repelling and astringing. Used by Galen, Meth. Med. l. ii, 15, to a medicine which was much esteemed.

The same as Apocroustic. Apocrus'tic. The same as Apocroustic. Apocye'sis. ('Αποκύησις; from ἀποκυέω, to bring forth, or heget. F. apocyesie; G. Ge-baren.) Ancient term, used by Galen, de Caus. Morb. l. i, c. 7, for parturition or childbirth.

Apocyma. The same as Apochyma.

Apocyna'ceæ. ('Απόκυνου, the name of a plant in Dioscorides; from aπό, from; κύων, a dog, because thought to be poisonous to dogs.) Dog's-bane. A Natural Order of plants characterised by Lindley as Gentianal Exogens, with no stipules. The stigmas collected into a massive head, expanded at the base in the form of a ring or membrane, and contracted in the middle. They are trees or shrubs, usually milky. Leaves opposite, entire; calyx free, 5-partite, persistent; corolla monopetalous, hypogynous, 5-lobed, with contorted estivation, deciduous; stamens 5, arising from the corolla; filaments distinct; anthers adhering firmly to the stigma, 2-celled, opening length-wise; pollen globose or 3-lobed; ovaries 2 or 1-celled, polyspermous; ovules 00, amphitropal, or anatropal; fruit a folliele, capsule, drupe, or berry, double or single; seeds with fleshy or car-tilaginous albumen. The plants of this Order are often very poisonous. Amongst those are the Tanghinia venenifera, Cerbera manghas, Oleander, and Echites. It is only represented in

Britain by the Vinca major and minor, neither of which are undoubtedly native.

Apocyna'ceous. (Same etymon.) Resembling the Apocynum.

Apocyn'eæ. (Samo etymon.) A synonym of Apocynacea.

Apoc'ynin. A bitter substance, obtained from the Apocynum cannabinum, which is considered to be diaphoretic, diuretic, and antisyphilitic; it has been employed with success in

**Apoc'ynon.** ('A $\pi \phi$ , from;  $\kappa \psi \omega \nu$ , a dog.) A small bone in the left side of a frog, formerly worn round the neck to keep off surly dogs.

Apoc'ynum. (G. Hundstod.) A Genus of the Nat, Order Apocynaceae. Calvx small, 5cleft, persistent; corolla campanulate, half 5-cleft; lobes revolute, with five basal glands; anthers connivent, sagittate; style obsolete; follicles long, linear; seeds comose. A deleterious plant mentioned by ancient writers. It has been referred to Periploca Græca and to Cynanchium crectum, Dioscorides, l. iv, c. 81; P. Ægineta, l. vii, § 3; Pliny, l. iv, c. 58. (Waring.)

A. androsæmifo'lium, Linn. U.S. Ph. (Androsæma, the plant of that name; folium, a leaf. G. flugenfungenden Hundskohl.) Dog's bane. Hab. North America. Stem creet, smooth, abounding in a milky juice; leaves opposite, petiolate, ovate, acute, entire; flowers in loose eymes; fruit a pair of long, linear, acute follicles; seeds numerous, each with a long seeddown. This plant is an emetic, diaphoretic, and diuretic, and in small doses tonic. Dose, as emetic,

30 grains, as a tonic, 10 grains.

A. cannab'inum, Linn. U.S. Ph. (Kavváβwos, hempen. G. hanfartiger Hundskohl.) Called Indian hemp in America, but not to be confounded with the Cannabis sativa, var. indica. Leaves opposite, oblong-ovate, somewhat downy Leaves opposite, oriong-orace, solutions, beneath; eymes paniculate, many-flowered, publications, beaternally. The bescent; corolla small, greenish externally. root is officinal in the U.S. Ph.; it is 5-6 feet long, 3 inches thick, of a strong odour, and nanseous, acrid, bitter taste; it contains an active principle called apocynin; it is used in powder as an emetic, and in decoction, giv to Oj of water, as a hydragogue purgative, and as an antiperiodie in doses of a wine-glassful. Some observers speak highly of it as a diuretic, and advise that it should be so administered as not to produce vomiting or diarrhea.

A. foe'tidum, Burm. (L. fatidus, stinking.)

A synonym of Paderia fatida.
A. frutes'cens, Linn. (L. frutex, a fruit.) The Ichnocarpus fruteseens.

A. hypericifo'lium. (L. hypericum, the plant of that name; folium, a leaf.)  $\Lambda$  variety of the A. androsæmifolium. Its milky juice, when applied to the skin, produces an eruption much like flea-bites.

A. in'dicum. A species the young shoots of which are eaten.

A. juven'tas. (L. juventas, youth.) The systematic name for a plant given by the natives of India to old persons as a cordial.

A. marit'imum. (L. maritimus, of the sea.) The systematic name for the plant Venetian dog's-bane. The leaves are used in China to poison dogs.

A. no'væ an'gliæ hirsu'tum. (L. hir-The hairy apocynum of New sutus, hairy.) England; a synonym of Asclepias tuberosa.

A., or'ange. The Asclepias tuberosa.

A. scan'dens. (L. scando, to climb.) The Allamanda cathartica.

A. sibir'icum, Pall. A synonym of A. maritimum.

A. Syri'acum. (L. Syriacus, belonging to Syria.) A name for the Asclepius Syriaca, or Syrian dog's-bane, and also of Calotropis procera.

A. tiliæfo'lium. (L. tilia, the lime tree; folium, a leaf.) A synonym of Hoya viridiflora. A. Vene'tum, Linn. (L. Venetus, Vene-

tian.) Same as A. maritimum.

**Apocyrtu'mena.** ('Αποκυρτόσμαι, to rise to a convex shape.) A term applied to a suppurating tumour, when cone-shaped and ready to discharge

**Apoda.** ('A, neg.; πούs, a foot.) A Suborder of the Order Cirripedia. Carapace reduced to two separate threads, with antenniform organs serving for attachment; mouth suctorial; body without cirri; no thoracic or abdominal limbs; parasitie in the mantle of other Cirripedes,

Also, a synonym of Ophiomorpha.

Alse, a Division of Physostomous and of Anacanthinous fishes, in which the abdominal fins are absent.

Also, an Order of the Class Holothuroideæ having no ambulaeral tubes, with or without respiratory organs, and hermaphrodite.

Also, a footless Group of Amphibia, including

the Cacilia.

Apodacrytics. ('Αποδακρύω, to shed Substances which first excite, and then tears.) evacuate, the tears, as onions, hellebore. According to some, remedies which arrest the flow of tears.

Ap'odal. ('A, neg.; πούς, a foot.) Having

no feet, or the analogues of feet, as fins.

Apodanth'eæ. A Tribe of the Genus
Rafflesiaceæ, or a Tribe of Cytinaeeæ. Flowers solitary or aggregated, unisexual; perianth diehlamydeous; anthers disposed in one or several series below the summit of the column, sessile, nniloenlar, confluent; ovary inferior, unilocular; ovules anatropal or orthotropal; frnit superior or semi-superior. Parasites on various Dicotyledous.

**Ap'odeme.** (' $\Lambda\pi\delta$ , from;  $\delta\xi\mu\alpha$ s, the body; or  $\alpha\pi\delta$ ;  $\delta\xi\mu\alpha$ , a band.) Name, by Name, by Andonin, for the peculiar pieces that grow from some portions of the body of Articulata, which are fixed, and of which those (apodemæ insertionis) situated at the interior of the thorax often give attachment to muscles, whilst the others (apodemæ articulationis) frequently form a projection on the exterior of the thorax, and serve chiefly for articulation of some appendices of the hody, particularly wings.

Apodemial'gia. (᾿Αποδημία, a going abroad; ἄλγος, pain. G. Reiselust.) The longing to return home from fereign lands, according to some; according to others, and more probably, the

longing for foreign travel.

Ap'odes. ('A, neg.; πούς, a foot.) Without feet, or without the use of feet. Without ventrals, or those fins which correspond to the legs and feet in man.

Apo'dia. (A, neg.; πούς, a foot. F. apodie; G. Fusslosigkeit.) In Teratology, partial agenesis, characterised by the absence of feet.

Apodic'tic. ('Αποδεικτικός; from άποδείκνομι, to demonstrate. F. apadictique.) Axiomatic, evident beyond contradiction. Term employed by Kant, who borrowed it from Aristotle. The Greek philosopher established a distinction between propositions capable of being contradicted, or which might form the basis of a dialectic discussion, and those which are the base or result of demonstration. Kant, wishing to introduce an analogous distinction into our judgments, applied the term apodictie to those which are above and

beyond all contradiction. (Franck.) **Apodipo'sis.** ( $\Lambda\pi\phi$ , away; adeps, fat. G. Ferfetting.) A morbid conversion into fat, as of the flesh or bones.

**Ap'odous.** ('A, neg.; πούς, a foot. **F.** apode; G. fussloss.) Without feet.

**Apodyte** rium. ('Αποδυτήριον, from αποδύω, to strip one's self.) Ancient name for the ante-room in which the bathers stripped for the bath.

Also, the room where a patient is undressed before an operation.

Apogæ'ous. (' $\Lambda \pi o \gamma a \iota o s$ , from land.) Coming from the land.

Apogalactis mus. ('Απογαλακτίζω, to vean; from ἀπό, away; γάλα, milk. F. serraye; G. Entmilchung.) Old term for the weaning of a child.

Apogalac'tos. (Same etymon.) A child that has been weaned.

Apogalac'tus. Same etymon and meaning as Apogalactos.

**Apogas'tria.** ('Λ, neg.; πούς, a foot; αστήρ, the belly. F. apogastre.) Applied by Latreille to a Section of Mollusca, in which the belly is without feet, i.e. the Cephalopoda and Pteropoda, which he names also Pterygia.

**Apogeu'sis.** ('Λπογεύομαι, to take a taste.) A term formerly used for the loss, or the

various disorders, of taste.

Apogeus'tia. Same etymon and meaning as Apogeusis.

Apoglauco'sis. ('Απογλαύκωσις.) Old term, used by Dioscorides, i, 64, signifying the growing of a glaucoma.

Apogo nes. ('A, neg.; πώγων, a beard. G. bartlos.) Applied by Palisot-Beauvois to a Section of Musei, the urn of which is deprived of teeth at its orifice.

('Απόγονος, sprung from.) Apog'onus. Old term, used by Hippocrates, Epid. l. ii, s. 3, for a living feetus.

**Apohy'al.** (' $\Lambda\pi\delta$ , from; hyoid, the hone of that name.) Applied by Geoffroy Saint-Hilaire to the first pieces of the anterior or styloid cornua of the hyoid bone.

Apoi'ous. ("A  $\pi o \cos$ , without quality.) Having no sensible attribute of astringency or

acrimony, as water, starch.

Apokathar'sis. See Apocatharsis. **Apo'lar.** ('A, neg.;  $\pi \delta \lambda \sigma$ , the end of an axis.) Having no pole.

A. celis. Nerve cells that are spherical and have no processes.

Apolem'idæ. A Family of the Suborder Physophora, Order Siphonophora, Class Hydromedusæ. Stem very long; swimming bladders in two rows.

**Apolepis'mus.** ('Λπολέπισμα, a husk; from ἀπολεπίζω, to peel off. F. apolepesme; G. Abschulferung. Abschuppung.) Desquamation.

**Apolep sis.** (Απόληψις, a stopping; from aπολαμβάνω, to take back. G. Unterbrechung, Hemmung.) Old term, used by Hippoerates, Coac. Prænot. t. 603, for retention, interception, or suppression, of any of the natural evacuations

Apolex'is. ('Απόληξις, cessation.) Old

term, used by Hippocrates, in Præcept. xl. ii, for age receding from vigour, and advancing to the termination of life; declining old age.

**Apolino**'sis. ('Απολίνωσις; from ἀπο-λινόω, to tie up with a thread. F. apolinose.) Old term, used by Paulus Ægineta, for the cure of a fistula by the application of a ligature of raw thread, &c. Hippocrates, l. de Fist. ii, 13.

**Apolip'siŝ.** ('Απόλειψις, a failing; from απολείπω, to leave behind. G. Auslassen, Verlassen.) A failing or deficiency, as of the voice.

**Apollina ris alter cum.** ( $^{\prime}$  Απόλλυμι, to destroy; L. altercum, henbane.) Hyoscyamus niger. Pliny lxxv, c. 17.

Apollina'ris wa'ter. Obtained from the Apollinaris-brunnen, Neuenahr, Rhenish Prussia. Altitude 225 feet; temp. 21°C. (69°8°F.) Contains, in 16 oz., sodium earbonate 9°65 grains, magnesinm carbonate 3.39, calcinm carbonate .45, sodium chloride 3.57, sodium sulphate 2.30, oxides of iron and alumina 0·15, silica 0·6, earbonic acid 47·04. Scenery of neighbourhood picturesque. Employed in gont and rheumatism, scrofula, chronic bronchial catarrh, tendency to gall-stones, and uric acid diathesis. It is extensively used as a table water.

Apol'lo, Bag'ni d'. Italy; in the former States of the Church; it was called by the Romans Balnea clusina. A chalybeate spring, temp. 35° C. (95° F.), containing, in 16 ounces, sodium chloride 2 I grains, magnesium chloride 1, calcium chloride '5, calcium carbonate 8:5, and iron earbonate 26, with carbonic acid and some oxygen and nitrogen. It is used in liver affections, enlargement of spleen, and chronic gastric and intestinal eatarrh; in anæmia and chlorosis.

**Apol'ysis.** ('Απολύσις; from  $\dot{a}$ πολύω, to loose or free.) The term is used by Hippocrates, Epid. v, 6, 9, for expulsion of a feetus, or of the after-birth. Also, applied by Hippocrates, Coac. Pranot. t. 384, to the solution or termination of a disease; also, to a weak condition of the limbs. The loosening, or slacking, of a bandage, according to Erotianus.

**Apomag'ma.** ('Απόμαγμα, anything to wipe with; from ἀπομάσσω, to wipe oif.) Lint or a sponge used to clean an ulcer, or to wipe off sordes.

Apomathe'ma. ('Απομάθημα; from απομαθάνω, to unlearn.) Loss of memory.

**Apomatos toma.** ('A, priv.; πωμα, a lid; στόμα, a mouth. F. apomatostome.) Applied by Menke to a Suborder of Gasteropoda ctenobranchia, the shell of which has no operculum.

**Apom'eli.** ('Απόμελι; from  $\dot{a}π\dot{a}$ , from ;  $\mu\dot{\epsilon}\lambda\iota$ , honey.) Term used by Galen, *Meth. Med.* viii, 4, for a kind of decection of honey, or honeycomb, mixed with vinegar; said to have been something between sweet wine and oxymel; also, oxymel itself.

**Apomesos'tomi.** (' $\Lambda\pi\delta$ , away;  $\mu\epsilon\sigma\sigma$ s, the middle;  $\sigma\tau\delta\mu\alpha$ , a mouth.) Applied by Klein to a Section of Echini, not having a central mouth.

Apomor'phia.  $(\Lambda\pi\delta;$ morphia.) C<sub>17</sub>H<sub>17</sub>O<sub>2</sub>N, or morphia, minus H<sub>2</sub>O; it is formed when morphia is heated in a sealed tube with strong hydrochloric acid, or when it is treated with a solution of zinc chloride at 120° C. (248° F.) The hydrochlorate thus produced is dissolved, and the apomorphia precipitated by the careful addition of ammenia. It is a white crystalline powder, which turns green on contact with air. It differs from morphia in being soluble

in alcohol, ether, and chloroform. Potassium hichromate gives a deep orange-yellow coloration; potassium bichromate and strong sulphuric acid give a dark red; iron perchloride an amethyst colour. Its physiological action resembles that of tartar emetic, affecting the central nervons system. When injected, in doses of from 1-20th of a grain to 2 grains, subcutaneously, it produces in the course of a few minutes a sensation of weight in the stomach, followed by slight pain in the head, salivation, perspiration, and retching. At the third or fourth effort vomiting occurs, and is repeated several times, after which comes a period of calm, lasting for five minutes; vomiting then recurs, to be again followed by calm, till, in the course of half an hour, very quiet sleep sets in, lasting for an hour or less. Alarming effects follow the injection of an over-dose. In one case a fifteenth of a grain produced great prostration. It may be given whenever it is desired simply to empty the stomach; it has been used to prevent an epileptic fit, and as an expectorant.

A. hydrochlo'rate. (G. salzsaures Apomorphin.) A salt of apomorphia having similar properties to the base. Its mode of production is described under Apomorphia. It is a grevish powder, consisting of very minute six-sided prisms, slightly soluble in alcohol, readily in water; nitric acid and potassium bichromate, with strong sulphuric acid, turn it chestnut colour, and warm iron perchloride a bluish black.

Apomorphin. Same as Δροποτρίω.
Apomorpho'sis. (Λπό, from; μορφή, form.) A peculiar kind of organic metamorphosis in which a substance, in combining with another, takes something away. Thus oxidising agents, in attacking an organic substance, form water or carbonic acid gas; chlorine, bromine, the chlorides, and bromides, take up hydrogen to form hydrochloric or hydrobromic acids. (Gerhardt.)

Apomylinas. ('Απομυλλαίνω, to make a wry face.) One who shoots his lips forwards, pressing them against each other. An occasional

symptom in fevers. (Dunglison.)

Apomytto'sis. ('Απομύσσω, to blow the nose.) A kind of spasm, which consists in trembling of the head and sonorous respiration and agitation of the trunk, with the object of expelling muens or other irritating objects from the nose. It differs from sneezing in the stertorous respiration with which it is accompanied. (Sauvages.)

**Aponecro'sis.** ('Απονέκρωσις'; fi ἀπονεκρόω, to kill utterly.) Absolute death.

Aponeurog'raphy. (Aponeurosis; γράφω, to write. F. aponeurographie.) A treatise on the aponeuroses

**Aponeurol'ogy.** (Aponeurosis; λόγος, a discourse. F. aponeurology.) A description of the aponeuroses.

Aponeuro'ses. See Aponeurosis.
A., gen'eral. (F. aponeuroses generales.) Aponeuroses which cover a considerable surface, as of a limb; they lie beneath the skin; cover muscles, between which they send processes; their inner surface gives origin to muscular fibres; their edges arise from tendons, or unite with the periosteum; and they close in and support the muscles.

A. of inser'tion. (F. aponévroses d'insertion; 1. aponeurosi di inserzione.) A term applied to tendons which, at their insertion, become broad and flattened.

A. of intersection. (F. aponerroses

d'intersection.) Short tendinous or aponeurotic fibres forming a line across the belly of a muscle, us in the rectus abdominalis.

A., par'tial. (F. aponivroses partielles.) The same as A. of intersection.

Aponeurosiol'ogy. Same etymen and

Aponeurosay.

meaning as Aponeurology.

(Λπονεύρωσιε; from άπό, trom; νευρον, a tendon. F. aponevrose; J. aponeurosa, fascui; G. Flechsenhaut, Flechse.) A tibrous membrane enclosing or binding down muscles; also, an expansion of a tendon, or of tendons, into a fibrous membrane.

A., coro'nal. (L. corona, a crown. F. aponirrose coronale.) The A. cranii.
A., epicra'nial. ('Επί, upon; κρανίον, the upper part of the head.) The A. cranii.
A., in'rra-spi'nous. A strong fascia attached to the edges of the infra-spinous fossa of the seamly and enclosing the infra-spinous. the scapula and enclosing the infra-spinous muscle; it is continuous with the aponeurosis of the arm, and gives off processes from its inner surface to divide the muscle from the teres minor, and this from the teres major.

A., lum'bar. See Fascia, lumbar. A., occip'ito-fron'tal. The A. cranii.

A. of arm. An aponeurotic investment of the upper arm, composed mainly of transverse fibres; it is thickest behind and at its attachments to the condyles of the humerus and its shaft by means of the intermuscular septa. It is perforated below the middle of the inner side of the arm by the basilic vein and the internal cutaneous nerve.

A. of del'toid mus'cle. The deep fascia covering the deltoid muscle, into which it sends fibrous offshoots; it is continuous in front with the fascia covering the pectoralis major, and behind with the infra-spinous aponeurosis; above, it is

attached with the deltoid itself. A. of di'aphragm. The central tendon of

the diaphragm.

A. of external oblique muscle. A thin membranous aponeurosis covering the abdominal muscles, extending downwards and inwards from the pectoralis major to the middle line of the body; externally it has attachments to the deep layer of the superficial abdominal fascia; it forms part of the anterior layer of the sheath of the rectus; and at its lower border it is thickened and is attached to the spinous process of the ilium, the spine of the pubis, the pectineal line, and the body of the pubis. Above and to the outer side of the erest of the pubis is an oblique opening—the external abdominal ring. The part between the iliac and pubic spines is Poupart's ligament; the part attached to the pectineal line is Gimbernat's ligament.

A. of fore'arm. The fibrous investment of the forearm. It consists chiefly of circular fibres, with longitudinal and oblique additions from the condyles of the humerus, the olecranon, and the semilinar fascia of the biceps; it is attached along the subcutaneous margin of the ulna. The posterior part is the stronger; the anterior part is stronger at the lower end, where it joins the annular ligament of the wrist and forms a sheath for the palmaris longus muscle; from its under surface, at the inner and upper end, it affords attachment to fibres of the pronator radii teres, the flexor carpi radialis, and the flexor digitorum sublimis, and it sends septa between the muscles, which also give origin to muscular

filhres.

A. of internal oblique mus'cle. A term for the tendon of the internal oblique muscle.

A. of leg. The subcutaneous fibrous investment of the leg. It is attached to the head and spine of the tibia, the head of the fibula, the posterior margin of the tibia, and the inner mal-leolos. It is strongest in its upper and fore part and over the poplitcal space, at the lower part of which it gives passage to the external saphena vein; by the upper part of its under surface it gives origin to muscular fibres, and it supplies septa between the external and the anterior leg muscles.

of A. transversa'lis abdom'inis mus'cle, ante'rior. The flat tendon of the transversalis abdominis muscle, or fibrous insertion into the linea alba; except at the upper part, where the muscular fibre encroaches on it, and at the lower end, where it passes in front of the rectus, it commences on the outer border of the rectus abdominis, and unites with the aponeurosis of the internal oblique to form the posterior wall of the sheath of the rectus.

A. of transversa'lis abdom'inis mus'cle, poste'rior. The fascial origin of the transversalis abdominis, extending from the last rib to the iliac crest at the outer border of the erector spinæ, and running backwards to join the

lumbar fascia.

A., subscap'ular. (L. sub, under; scannla.) A thin fibrous structure attached to the edge of the subscapular fossa, and enclosing the subscapularis muscle; its inner surface gives origin to muscular fibres.

A., su'pra-spi'nous. A dense fascia attached to the edge of the supra-spinous fessa of the scapula, giving origin by its under surface to some fibres of the supra-spinous muscle and

binding it down.

A., ver'tebral. A thin sheet of fascia attached to the spinous processes of the dorsal vertebræ on the one side, and to the angles of the ribs on the other, thus enclosing an angular space for the erector muscles of the back; it joins the tendons of the latissimus dorsi and the serratus postions inferior muscles. See also Fascia lumbaris.

Aponeuro'sis bicip'itis. (L. biceps, having two heads.) The bicipital fascia; a process of tendinous tissue given off from the outer border of the biceps tendon just above the elbowjoint. The fibres run downwards and inwards to join the fascia of the forearm, where this covers

the pronator radii teres muscle.

A. cra'nii. (Kpavior, the vertex of the head. F. calotte aponevrotique; G. Schnenhaube, Schädelhaube.) A dense fascia covering the vault of the cranium, the fibres running for the most part longitudinally from before backwards. Postcriorly it is connected with the occipital portions of the eccipite-frontalis muscle, and is attached to the . posterior occipital protaberance and superior semicircular lines; anteriorly it is connected with the anterior bellies of the occipito-frontalis muscle; and laterally it becomes thinner and less defined, and is connected with the aural muscles. It is covered by the skin, and is itself continuous by its deep surface with the periostenm of the cranial bones.

A. cru'ris. (L. crus, the leg.) The Fascia

A. dorsa'lls. (L. dorsaalis, of, or on, the back. G. Rückenbinde.) See Fascia dorsalis.

A. epicra'nia. ('Επί, upon ; κρανίον, the top of the head.) The A. cranii.

A. femora'lis. (L. femur, the thigh.)

The Fascia lata.

A. fem'oris. (L. femur, the thigh.) The Fascia lata.

A. ili'aca. (Ilium, the bone of that name.) The Fascia iliaca.

A. latis'simi dor'si. (L. latissimus, very broad; dorsum, the back.) The superficial layer of the Fuscia lumbaris.

A.lumba'ris. (L. lumbus, the loin.) The Fascia lumbaris.

A. occip'ito-fronta'lis. (L. occiput, the back part of the head; frons, the forehead.) See A. cranii.

A. palma'ris. (L. palmaris, belonging to the palm of the hand.) See Fascia palmaris.

A. pharyng'is. (Φάουγξ, the throat.)

See Fascia pharyngis.

A. plantaris. (L. plantaris, of, or belonging to, the sole of the foot.) See Fascia plantaris.

A. tempora'lis. (L. temporalis, of, or belonging to, the temple.) See Fascia temporalis.

A. vertebra'lis. (L. vertebra, a joint, a bone of the spine.) See Fascia lumbaris, and Aponeurosis, vertebral.

A. vola'ris. (L. vola, the hollow of the hand.) Same as Fascia palmaris.

Aponeurosi'tis. ('Απονεύρωσις.) Inflammation of a fascia or tendon.

**Aponeurot'ic.** ('Απονεύρωσις. F. aponevrotique; G. flechsig.) Of, or pertaining to, a fascia or aponeurosis.

A. bone. Any ossification of aponeurotic tissue; extremely common in birds, as in the tendons of the leg and back, and in some of the smaller ruminants, as in the bony dorsal shield of Tragulus kanchil, and in the lumbar region

of some armadilloes. **A. cen'tre.** (F. centre aponévrotique.) The central tendon of the diaphragm.

A. mus'cle. (F. muscle aponévrotique.) The tensor vaginæ femoris.

Aponeu rotome. ('Απονεύρωσις; τομή, an incision. F. aponévrotome.) Au instrument employed to divide the abdominal aponeurosis in the operation of suprapuble cystotomy.

Aponeurot'omy, (Same etymon. F. aponerrotomie.) In Anatomy, the dissection of

aponeuroses.

In Surgery, section of aponeurotic parts.

Apon'ia. ('A, neg.; πόνος, suffering. G. Schmerzlosigkeit, Wohlbefinden.) A state of A state of painlessness.

Aponip'sis. ('Απόνιψις, a washing off; from  $\dot{\alpha}\pi\dot{o}$ , away;  $\nu i\pi\tau\omega$ , to wash.) Ablution.

Aponoge ton. (A corruption of ποτα-μογείτων, pond-weed; from ποταμός, a river; γείτων, a neighbour.) A Genus of the Nat. Order Juneaginaeeæ. Calyx and corolla absent; stamens 6-25; earpels 3-8, unilocular; placenta basilar, with from 3-50 anatropal ovules; seeds exalbuminous.

A. monostach'yon. (Móvos, solitary; στάχυς, an ear of corn. Hind. Ghechoo.) Perennial aquatic; roots tuberous; leaves radical, linear-oblong, entire; spikes single; capsules 3, smooth, 1-celled, 4—8 seeded. An aquatic Indian plant. The small tubers are consumed by the natives as potatoes.

Ap'onous, ('A, neg.; πόνος, labour or

suffering.) Causing no pain; applied to medicines which excite no suffering or uneasiness.

Apoo'der. Ashantee name for a Species of Leucas, the bruised leaves of which, with lime juice, are applied to inflamed parts. (Waring.)

**Apopale**'sis. ('Αποπάλησιs'; from άπο-πάλλω, to hurl.) Old term, nsed by Hippocrates, for expulsion or extrusion, as of the feetus in abortion. (Castellus.)

Apopal'sis. Same etymon and meaning as Apopulesis.

Apopate'ma. ('Αποπάτημα.) Term for ordure.

Apop'atus. Same as Apopatema.

**Apopet'alous.** (' $\lambda\pi\delta$ , away from;  $\pi\epsilon\tau a$ - $\lambda ov$ , a leaf. F. apopetale; G. getreentblatterig.) Term applied to the flower of an Angiosperm when the leaves of the perianth whorl are free from any adhesion to each other.

Apophlegmatic. ('Δπό, from; φλέγμα, phlegm. F. apophlegmatisant; I. apoplemma-tizzante; G. schleimausleerend, schleimabführend.) Old term applied to medicines which excite a discharge of mucus from any of the cavities of the head, as the nose, mouth, and larynx, including errhines, gargles, and masticatories.

Apophlegmatis mus. ( Αποφλεγματίσμος; from ἀποφλεγματίζω, to purge of phlegm. F. apophlegmatisme; G. Schleimabfuhrung.) Old term, used by Galen, de San. Tu. vi, 10, for the action of an apophlegmatic medi-

Apophlegmatison. Same as Apo-

phlegmatizans.

Apophlegmatizans. ('Αποφλεγματίζω, to cleanse from phlegm. F. apophlegmatisant; I. apoflemmatizzante; G. schlemauslei-rend.) Same as Apophelymatic.

A. per na'res. (L. nares, the nostrils.) An errhine.

A. per os. (L. os, the month.) A siala-20211e.

Apoph'rades. ('Απόφρας, not to be mentioned, unfortunate; from από, away; φραζω, to declare; αποφράδες ημέραι, were unlucky days, on which no causes were heard.) A term used by And. Laurentius, de Cris. ii, 1, and applied to days which were not critical, or on which no favorable change in a disease was expected to take place.

Apophrax'is. ('Απόφραξις, a blocking up; from ἀποφράσσω, to obstruct.) Amenor-

Apophthar'ma. ('Απόφθαρμα.) Old term for a medicine to induce abortion.

**Apoph'thora.** (`Αποφθορά; from ἀποφθείρω, to corrupt or destroy, to miscarry. **F**. apophthore.) Old term for abortion; the expulsion of a corrupted fœtus.

Apophtho'rious. (Same etymon.) Relating to, or producing, abortion.

Apophy'ades. ('Αποφυάς, an off-shoot.) The branches of the veins.

Apophy'as. ('Aποφύω, to send forth shoots.) An appendix or continuation; a branch, as of a vein, in Hippocrates, de Ven. xvii, S.

**Apophyl'lite.** (' $A\pi \circ \phi \circ \lambda \lambda i \zeta \omega$ , to strip a plant of its leaves.) A mineral of the zeolite family, so called from its exfoliation in leaf-like lamellæ when heated; it contains silica 52.7, lime 26, potash 4.4, water 16.7. Also called ichthyophthalmite.

**Apophyllous.** ('Aπό, away from ; φύλλον, a leaf. G. getrenntblatterig.) Term applied to the flowers of Angiosperms when the periantb whorl is single, and consists of separate leaves.

Apoph'ysar. (Same etymon as Apophysis.) Of, or pertaining to, an apophysis.

Apoph'ysate. (Same etymon as Apophysis. F. apophysi; G. mit Ansatz.) Having an apophysis.

Apophys'ial. (Same etymon as Apophysis.) Of, or belonging to, an apophysis.

A. point. (F. point apophysaire; G. apophysaire) The tender point over a vertebral spinous process which is next to the place of exit of a painful spinal nerve.

Apophys'iform. (F. apophysiforme.) Applied by Bridel to a swelling in the form of a receptacle which the extremity of the fructiferous branches of the Sphagnum presents, performing the office of a pedicle which does not exist in those mosses.

**Apoph'ysis.** ('Αποφύω, to put forth. F. apophyse; I. apofise; G. Fortsatz, Auswuchs.) Anything attached to, or growing from, another.

In Auatomy, a natural process or protuberance of bonc. Apophyses receive various names according to their shape, as articular, spinous, coracoid; they are most frequently called processes

Applied to a dilatation of the base of the sporangium found in certain of the Musei.

Alse, applied to any irregular swelling. A. grac'llis. (L. gracilis, slender.) The long process, processus gracilis, of the malleus.

A. mamilla'ris. (L. mamillaris, belonging to a breast.) The mastoid process of the temporal bene.

A. mastoï'dea. (Maστόs, the breast; ει̃δοs, form.) The mastoid process of the temporal bone.

A. of Ingras'sias. The small wing of the sphenoid bone.

A. of Rau. The processus gracilis of the malleus.

A., zygomatic. (F. apophyse zygoma-ce; G. Wangenfortsatz.) The zygomatic tique; G. Wangenfortsatz.) process of the temporal bone.

**Apopies ma.** (Αποπίεσμα; from ἀποπίζω, to press out.) Old term, used by Hippocrates, de Fract. iii, 31, for the pressing out of humours, by the use of bandages, in cases of wounds and fractures.

**Apoplane'sis.** ('Αποπλανάω, to lead astray. F. apoplanese.) Same as Error loci.

Apoplec'ta ve'na. (L. apoplectus, apoplectic; vena, a vein.) An old name for the

Apoplec'tic. ('Αποπληκτικός, apoplectic. F. apoplectique; I. and S. apoplectico; G. apoplectisch, schlauflussartig.) Of, or belonging te, apoplexy.

Also, used substantively to denote a person at-

tacked, or likely to be attacked, by apoplexy.

A. clot. (F. caillot apoplectique.) The mass of blood clot, in an organ, constituting the disease.

A. constitu'tion. (F. constitution apoplectique.) A term used to describe the habit and manner of persons predisposed to apeplexy; they are those of stout, plethoric build, with short neck, rosy face, and large head; but apoplexy occurs in far other persons also.

A. cyst. A term applied to the organised membrane found around the clot of blood in cases of hemorrhage into the brain-substance ore nto the arachnoid; it is sometimes developed as early as a fortnight after the seizure; it is the result of a slow inflammatory process in the neuroglia; during the absorption of the blood-elot, the cyst contracts and shrivels, and in time may be completely absorbed. Apoplectic cysts are not found in the cortical substance.

A. fo'cus. (F. foyer apoplectique; G. apoplektische Herde.) The extravasated blood in the interior of organs which is the centre of change; or, according to some, the circumscribed cavity produced in an organ by the effusion of blood which clots.

A. hab'it. Same as A. constitution. A. veins. (F. veines apoplectiques.) old name for the jugular yeins.

Apoplec'tica. (Same etymon) Medicines against apoplexy.

Also, an old term for fever following an apoplectic attack.

Apoplec'ticæ ve'næ. (L. apoplecticus; vena, a vein.) Old term for the jugular veins.
Apoplec'tiform. (L. apoplexia, apoplexy; forma, likeness. F. apoplectiforme.) Term applied to scizures resembling apoplexy.

**Apoplec'toid.** ( $\Lambda \pi \sigma \pi \lambda \eta \xi ia$ , apoplexy;  $\epsilon I \delta \sigma s$ , form.) Term applied by Marsball Hall to paralysis consequent on congestion of the nervous centres, with symptoms resembling those of apoplexy.

Apoplex'ia. (' $\Lambda \pi o \pi \lambda \eta \xi la$ .) See Apoplexy.

A. atrobilia'ria. (L. ater, black; bilis, bile.) Apoplexy in persons of a melaneholic tendency.

A. capilla'ris. See Apoplexy, capillary. A. catalep'tica. (Κατάληψις, a grasping catalepsy.) Cataleptic apoplexy. A term for entalepsy.

A. cerebra'lis. (L. cerebrum, the brain. F. apoplexie cerebrale.) Cerebral apoplexy, depending on extravasation of blood, or great congestion of blood-vessels, within the cranium.

A. cer'ebri. (L. cerebrum, the brain.)

Effusion of blood into the substance of the brain.

A. choroldea. (Choroid, the optic tunic of that name.) Effusion of blood between the retina and the choroid from the vessels of the latter structure.

A. cor'dis. (L. cor, the heart.) Effusion of blood into the muscular structure of the heart. A. exsanguin'ea. (L. exsanguis, bloodless,

powerless.) Apoplexy from exhaustion. A. fortis'sima. (L. sup. of fortis, strong.)

The same as A. fulminans.

A. ful'minans. (L. fulmino, to lighten. F. apoplexie foudroyante.) Apoplexy of a severe and sudden character, extinguishing hie at once or very rapidly.

A. hæmorrhag'ica. (Λίμορραγικός, liable to hæmorrhage.) Apoplexy depending on rupture of blood-vessel and consequent escape of blood.

A. hepatica. (L. hepaticus, one diseased in the liver.) Hamorrhage into the liver substance.

A. hydrocephal'ica. ('Υδωρ, water; κεφαλή, head.) A term for seute hydrocephalus;

кефал, пеан, hydrocephalic apoplexy. (L. infiens, an infant.) Term for a form of apoplexy occurring in children from teething, worms, or other cause.

A. interarachnoïdea'lis. (L. inter, between; arachnoid, the cerebral membrane of that name.) Apoplexy resulting from effusion of blood into the cavity of the arachnoid.

**A.** intermeningea'lis. (L. inter; μη̄-νιγξ, a membrane.) Apoplexy depending on hamorrhage among the membranes of the brain.

A. medulla'ris. (L. medulla, the spinal marrow.) Apoplexy of the spinal cord.

A. meninge'a. (Μῆνιγξ, a membrane.) Apoplexy depending on hamorrhage into the membranes of the brain. See Apoplexy, menin-

Same etymon and A. meningea'lis.

meaning as A. meningea.

A. menta'lis. (L. mens, the mind.) Apoplexy produced by the passions or emotions of the mind.

A. myelit'ica. (Μυελός, marrow, the spinal marrow.) Hæmorrhage into, or around,

the spinal cord.

A. neonato'rum. (Néos, young. L. natus, part. of naseor, to be born; F. apoplexie des nouveau-nés; I. apoplessia dei neonati.) Apoplexy of new-born children; an effusion of blood generally on the surface of the brain, caused by pressure during birth, whether of maternal structures or of forceps, and generally accompanied by a cephalhaematoma. It may be caused by severe labour pains, either spontaneous or excited by ergot.

Also, applied to the condition of a child stillborn, in which the circulation has been impeded from any cause, and so cerebral congestion has heen produced, with general surface-redness and swelling and violet colour of the face; under these circumstances it is well to let a little blood

flow from the umbilical cord.

A. nervo'sa. (L. nervosus, nervous. F. apoplexie nervouse; I. apoplessia nervosa; G. Nervensehlag.) A term for apoplexy, in which the cerebral congestion, which had evidently been present during life, leaves no appreciable lesiou after death.

By some authors nervous apoplexy is described as the effect of sudden anamia, the result of fright or shock. In these cases it is supposed that the effect on the vaso-motor nerves is such as to cause great and long-continued contraction of the minute vessels, and so vertigo, faintness, unconsciousness, and, if the contraction does not quickly relax, death.

A. nervo'sa traumat'ica. (L. nervosus; traumaticus, pertaining to wounds.) A synonym

of Concussion of the brain.

A. oc'uli. (L. oeulus, the eye.) Effusion of blood into some of the structures or cavities of

A. pituito'sa. (L. pituitosus, phlegmatic.) A synonym of Apoplexy, serous.

A. pulmona'lis. (L. pulmo, a lung.) See

Pulmonary apoplexy. A. pulmo'num vascula'ris. (L. pulmo, a lung; vasculum, a small vessel.) See Pulmonary apoplexy.

A. rachia'lis. (Páxis, the spine.) Spinal apoplexy; hæmorrhage into, or around, the spinal

A. rena'lis. (I. renalis, belonging to the kidneys.) Hamorrhage into the substance of the kidney.

A. sanguin'ea. (L. sanguineus, of blood. F. apoplexie sanguine; l. apoplessia sanguinea; G. Gehirnblutsehlag.) Apoplexy caused by effusion of blood into, or on, some part of the cerebral structures.

A. sero'sa. (L. scrum, the watery part of blood. F. apoplexie sercuse : I. apoplessia sierosa ;

G. Gehirnwasserguss.) Apoplexy from effusion of serum into, or around, some part of the cerebral structures. See Apoplexy, serous.

Also, applied to the coma of hydrocephalus. A. sim'plex. (L. simplex, simple.) Apoplexy in which, after death, no manifest change of structure or congestion is perceptible. See Apoplexy, simple.

A. spasmod'ica. (Σπασμός, a spasm.) A

synonym of A. simplex.

A. spinalis. (L. spinalis, of, or belonging to, the spine. F. apoplexic spinale; l. apoplessia spinale; G. Ruckenmarksblutschlag.) Harmorrhage or sudden effusion into, or around, the spinal cord, producing paralysis or anæsthesia.

(L. suffoco, to choke.) A. suffoca'ta. Apoplexy from hanging, drowning, and such

A. temulen'ta. (L. temulentia, drunkenness.) The coma of drunkenness.

A. traumat'ica. (Τραυματικός, of wounds. F. apoplexic traumatique.) Apoplexy depending on external injury to the head.

A. venena'ta. (L. venenatus, poisoned.)
Apoplexy caused by strong external or internal

sedatives, as sunstroke, coma from cold, opium. **Ap'oplexy**. (Αποπληξία; from ἀποπλήσοω, to cripple by a stroke; because persons seized with apoplexy fall suddenly, as if struck down. F. apoplexie; I. apoplessia; S. apoplegia; G. Schlagfluss, Hirnschlag, Hirnschlagfluss.) The term apoplexy is disused by some modern authors, and the disease is described, in accordance with the morbid appearances seen after death, as cerebral hamorrhage, cerebral effusion, and such like. But many consider that the series of well-marked symptoms which accompany certain lesions of the brain are better described under the old name; which furnishes also, in its adjectival form, a convenient heading under which to group the earlier symptoms which tell of the probable coming mischief. It is the sudden, more or less complete, arrest of the powers of sense and motion, the person lying as if asleep, respiration and the heart's action continuing, and dependent on intracranial mischief, such as congestiou, serous effusion, or hiemorrhage. These several conditions have given rise to the division of apoplexy into several varieties; but the symptoms of each are so similar to those of the others that the diagnosis of the morbid condition causing the disease is by no means easy. An apoplectic seizure is very often preceded by premonitory symptoms, such as giddiness, loss of memory, headaches, deficient sensibility, or tingling of some part of the body, or some local loss of muscular power. The attack itself is more or less sudden in its approach and more or less complete in its manifestation; the patient may fall down suddenly utterly motionless and unconscious, or he may feel slowly creeping over him powerlessness and lethargy; the muscles may be paralysed and flaceid, or they may be stiff or convulsed; the blow may fall chieffy on the mental faculties, or the main stroke may be felt in the muscles and the nerves of seusation; he may die at once, or he may more or less slowly recover with a lamed limb or damaged faculties; or the symptoms may entirely pass away, leaving only a shadow of evil to come. The cause of the attack is to be found within tho cranium, and consists of hyperæmia, which in the milder cases is doubtless only temporary, or serous effusion into the ventricles or on the periphery; but chiefly, and to this some confine the word, it

is to be found in hæmorrhage into some part of the cerebral structure. Other causes, such as sunstroke, uramia, poisoning by alcohol and some narcotics, may result in symptoms very similar to those of an apoplectic attack.

The term apoplexy is given to effusions of blood into other organs, and in these cases has reference to the rupture of a blood-vessel only, and not to

the symptoms.

A., arthrit'ie. (F. apoplexie arthritique.)

Same as A., rheumatic

**A., asthen'ic.** ('Ασθενικόs, weakly.) Term formerly employed to designate apoplexy resulting from depression, exhaustion, or abolition of the vital influence bestowed on the encephalic organs, occasionally giving rise to hamorrhage or to congestion of the cerebral vessels, and effusion of serum. (Copland.)

A., capillary. (Capillary, the blood-vessels of that name ; G. capillaren Apoplexie.) Minute clots of blood, resulting from rupture of, and very slight hemorrhagic effusion from the capillaries of the brain substance. A condition of this kind has been supposed to be the cause of certain forms

of chorea.

A., chor'oid. (Choroid, the membrane of the eye of that name.) Hemorrhage from the choroidal vessels. It may be the result of a wound or blow, er of congestion of the choroidal vessels from intraocular disease, or from severe use of the eye; and it may occur on either side of the choroid; if at all extensive from the inner surface, it may produce detachment or destruction of the retina; in process of time the blood is absorbed. At first the extravasated patches are seen by the ophthalmoscope as reddish unstricted patches, with non-serrated edges, which become paler as they undergo absorption, and surrounded by pigment granules. treatment advised is rest and quiet.

A., choroid'al. (F. apoplexic choroidienne.) Effusion of blood into, or on the surface of, the choroid membrane of the eye. Same as A.,

choroid.

A., com'plicated. (L. complicatus, part. of complice, to fold together.) Apoplexy supervening at the period of invasion, or during the advanced stages, of febrile diseases, of an asthenic

or adynamic type. (Copland.)

A., conges'tive. (L. congestio, a heaping up; from congero, to bring together.) Term formerly employed to designate apoplexy resulting from obstructed return of blood from the head, and frequently from the metastasis of gout, rhenmatism, or cruptive diseases.

A., consec'utive. (L. conscentio, a consequence; from consequer, to follow after.) Apoplexy caused by other diseases, as when it follows soppressed humorrhoids or epistaxis, the healing up of chronic ulcers, unusual continence and suppression of the menses or lochia.

A., cuta'neous. (L. cutis, the skin. F. apoplexic cutanée.) A term employed by certain French writers for a great and sudden determination of blood to the skin and adjacent cellular

membrane.

**A.**, embol'ic. (Έμβολισμα, a patch; cmbolism.) Apoplexy resulting from plugging of the cerebral arteries by a portion of detached blood clot.

A., gout'y. Apoplectic symptoms arising from a gouty condition of hody

A., heat. A synonym of Sunstroke. A., hepatic. (L. hepaticus, one diseased in the liver.) Circumseribed effusion of blood into the substance of the liver.

A., interlob'ular. A form of Pulmonary

anoplexy.

A., intrameninge'al. (L. intra, within; μήνιγξ, a membrane.) Apoplexy depending on a clot of blood, or on serons effusion, between the membranes of the brain.

**A., meninge'al.** (Μῆνιγξ, a membrane. F. apoplexic meningée.) Apoplexy resulting from a clot of blood, or serous effusion, in the membranes of the brain. It may be the result of external injury. See Cerebral hamorrhage.

A., metastat'ic. (Μετάστασις, a removal; from μεθίστημι, to set loose.) Apoplexy occurring as the result of a sudden shifting of the conges-

tion accompanying a gouty attack.

A., ner vous. (F. apoplexie nerveuse.) A synonym of A., simple. See Apoplexia nervosa and A., asthenic.

A. of beart. Hamorrhage into the muscular structure of the heart.

A. of liv'er. Extravasation of blood into the substance, or under the eapsule, of the liver. A. of lung. See Pulmonary apoplexy.

A. of ret'ina. See A., retinal.
A. of spi'nal cord. Hemorrhage into the substance of the spinal cord, producing paralysis and anaesthesia of the parts supplied by nerves arising from the cord below the injured spot. It is a rare occurrence, except as a result of injury.

A. of spi'nal menin'ges. Hamorrhage into the membranes of the spinal cord, producing violent convulsions; a very rare condition, except

as a result of injury.

A., ova'rian. Effusion, more or less rapid, of blood into the ovarian tissue, from rupture of a blood-vessel; sometimes the amount is so large that the tunica albuginea is ruptured, and pelvic hiematocele results. The symptoms are very obscure; there is usually local pain, great exhaustion or collapse, and vomiting; peritonitis is not an uncommon sequel.

It has also been used as a synonym of Hama-

tocele, pelvic.

A., placen'tary. (F. apoplexie placentaire.) A term employed by Cruveilhier to indicate hamorrhage into the substance of the placenta. It may result from syphilitic disease, or from torsion of the umbilical cord, or from uterine congestion, or from violence.

A., pul'monary. (L. pulmonarius, belonging to the lungs. F. apoplexie pulmonaire; G. Apoplexie der Lungen.) A term for extravasation of blood in the lungs from the rupture of

vessels. See Pulmonary apoplexy.

A., re'nal. (L. renalis, belonging to ren, the kidney.) A term formerly used to signify

haemorrhage into the substance of the kidney.

A., ret'inal. (Retinu, the membrane of the eye so called.) Effusion of blood into the retina from rupture of its vessels. The clots are usually striated with irregular edges; which form is determined by the course of the nervefibres, between which the blood runs. It is generally accompanied by, or is the result of, discase of the coats of the blood-vessels, and is regarded as often a premonitory sign of cerebral hemorrhage. It is a disease specially of advanced

A., rheumatic. (F. apoplexie rheumatismale.) The stupor or coma resulting from meningitis occurring during the course of acute rheumatism.

A., sanguin'eous. (L. sanguineus, of blood. F. apoplexie sanguine.) Apoplexy resulting from extravasation of blood in some part

within the eranium. See Cerebral hamorrhage.

A., se'rous. (L. serum, the watery part of anything, especially of the blood. F. apoplexie

sereuse.) A term given to those eases of apoplexy in which there is considerable serous effusion into the ventricles of the brain. Some authors deny the existence of such a disease, and there seems no reason to doubt that a large number of cases thus described are cases of uramic coma.

A., sim'ple. Apoplexy resulting, doubtless, from hyperæmia, but which, if it destroy life, leaves no visible morbid change. These cases are said to be distinguished by the general slowness of onset, by the absence of rigidity of muscles and couvulsion, by the quickness of the pulse, and by the steady rise of temperature from the commence-

ment of the attack.

A., splen'ic. (F. apoplexie de la rate.) A term signifying hæmorrhage into the tissue of

the spleen. See Splenic apoplexy.

A., subconjuncti'val. Subconjunctival effusion of blood from rupture of a blood-vessel, produced by a blow or straining, as in coughing or labour, or apparently spontaneously. lotions, or dilute arnica solution, or black bryony poultiée, are recommended.

A., subretinal. (F. apoplexic sousretinienne.) Effusion of blood under the retina.

A., tox'ic. (Τοξικόν, belonging to a bow, and so the poison for smearing arrows with.) Apoplexy resulting from the action of narcotic poisons or mephitic gases. (Copland.) **A., traumat'ie.** (Τρανματικός, belonging

to wounds.) Apoplexy resulting from external

injury.

**Apopneu'sis.** (' $A\pi \sigma \pi \nu \epsilon \omega$ , to breathe forth. G. Ausathmen.) A breathing out; ex-

piration.

Apopnix'is. ('Απόπνιξις; from ἀποπνίχω, to strangle or suffocate. F. apopnixie; G. Erstickung.) The term is used by Moschion, de Morb. Mul. c. 127, with the epithet της μήτρας, for suffocation of the womb.

**Apop'noë**. (' $\Lambda$ ποπνοή; from dπό, away; πνέω, to breathe.) Expiration. **Apopnoë**. Same as *Αρορnο*ë.

**Apopsych'ia.** ('Αποψυχία; from ἀπό-from; ψυχή, breath, the soul. F. apopsyche; G. tiefe Ohnmacht.) Old term, used by Galen, iii, in i, Prorrhet. 20, for complete syncope; also spelt Apsychia.

**Apopto'sis.** ( $\Lambda \pi o \pi i \pi \tau \omega$ , to fall down.)

A relaxation of bandages. (Dunglison.)

Apore tin. ('Aπό, from; ρητίνη, resin.)

A black resinous body obtained, together with phæoretin and erythroretin, by precipitating alcoholic solution of extract of rhubarb with ether.

**Apo'ria.** (' $\Lambda$ , neg.;  $\pi \delta \rho o s$ , a passage.) Restlessness or uneasiness, caused by arrest of perspiration or other natural secretion. (Parr.)

Also, a doubtful disease.

**Aporobranchia.** (Απορος. without passage; βράγχια, gills.) Applied by Blainville to an Order of Paracephalophora having the organs of respiration slightly evident. Synouymous with Podosomata.

Aporobranch'iæ. (Same etymon.) Applied by Latreille to an Order of Arachnides. having no apparent stigmata on the surface of the body.

Aporoceph'ala. (Απορος; ι εφαλή, the

head.) Applied by Blainville to an Order of Subannelidaria, the head of which is not always

distinct or separate from the body.

Aporo'sa. ('Λ, neg.; πόρος, a passage, a pore.) A Suborder or Group of the Order Sclero-dermata, Subclass Zoantharia. Corals having the corallum imperforate; septa constituting solid plates; theca generally without apertures. It includes the higher living corals. Fossil members of the group are found most freely in the mesozoie and kainozoic deposits.

By some described as a Group of the Suborder

Madreporaria, Order Zoantharia.

Aporrha'idæ. ('Απορραίs, a kind of Murex; from ἀπό, from; ρέω, to flow.) Spout shells. A Family of the Group Tenioglossa, Section Ctenobranchia, Order Prosobranchia. Molluses with a simple triangular foot, an enlarged external border, and a short canal.

Aporrhe'tin. The same as Aporetin.

**Aporrhino'sis.** ('Λπό, from; ρίε, the nose. F. aporrhinose; I. aporrinosi; G. Nasenfluss.) An effluvium or discharge from the

Aporrhip'sis. ('Απόρραψις, a throwing off.) A precipitate throwing off the clothes, as in a state of delirium. Hippoc. de Rat. Vic. Aporrhoe. ('Απορραή, an exhalation.)

Same meaning as Aporrhea.

**Aporrho'a.** ( $A\pi\delta\rho\rho\sigma a$ , an exhalation; from  $a\pi\sigma\rho\rho\delta a$ , to flow from. G. Ansfluss, Abfluss.) Term for a morbid expulsion, as of the faces or excrements; also, for contagion, effluvium, or miasm.

Old term for Deflucium capillorum, or falling

of the hair, according to Moschion.

Aporrho'sis. ('Δπό; orrhosis. G. Ver-molkung.) A passing into serum. Apor'rhysis. ('Δπόρροσις.) Same as

A norrh $\alpha a$ . Same etymon and meaning as Ap'ory.

Aporta.

Aposcem'ma. ('Απόσκημμα; from άπο-Term used  $\sigma \kappa \eta \pi \tau \omega$ , to recline upon, to settle.) by Galen, ad Glanc. ii, 7, for a translation of the humours from one part to another.

The transmutation or transit of a disease by

metastasis.

Term formerly used for the excrements or waste matters of the body, which are deposited in the belly or in the body generally.

Aposceno'sis. Same as Apocenosis. Aposceparnis'mus. ('Δποσκεπαρνισa hewing off with a hatchet. G. Abhiel.) Old term for a wound or fracture of the cranium or of any other bone, from which a fragment has been struck off by some sharp instrument. (Gorrams.)

**Aposcep'sis.** ('Αποσκήπτω, to fell down upon, to settle.) Old term, nearly synonymous

with Aposcemma; also, an eruption.

**Apos chasis.** ('Απόσχασις, a slight eutting, from ἀποσχάζω, to searify.) Old term employed by Hippocrates, Epid. xxvi, 12, xxvii, 1, &c., for scarification, or slight incision, of the skin; also, for venescetion.

(F. aposchasmie; G. Aposchas ma. Schropfen, Aderlassea.) Same derivation and

meaning as Aposchasis. **Aposep'alous.** (' $\Delta\pi\delta$ , away from ; sepal.)

Term applied to the flower of au Angiosperm when the leaves of the perianth whorl are not coherent.

**Aposep'idin.** (' $\Delta\pi\delta$ , from;  $\sigma\eta\pi\epsilon\delta\omega\nu$ ,

putridity. G. Kasefaulnissstoff.) Impure leucine obtained from the putrefaction of cheese.

Aposep'sia. ('Λπόσηψις, a rotting. aposepsic.) Putrefaction; fermentation.

Aposia. ('A, neg.; πόσις, a drinking; from πίνω, to drink. F. aposie; G. Durstmangel, Durstlosigkeit.) Term for the want or absence

Apositia. ('Αποσιτία; from ἀπό, from; σίτος, food. F. apositie; 1. aposizia; G. Widerwillen far Speizen.) Old term, used by Galen, C. i, in. i, Epid. t. 29, for abstinence from, or a loathing of, food, and so to be distinguished from anorexia, which is rather a distaste for food, or want of appetite, without uccessarily involving any degree of loathing.

Apositic. (Same etymon. F. apositique.) Of, or belonging to, apositia; applied to mediciues, or other substances, which cause a loathing

for food.

Aposmileu'sis. ('Αποσμιλεύω, to plane or shave off. G. Abmeiszeln.) The chiselling off, as the joint end of a bone.

Aposor bic acid. (F. acide aposorbique; G. Aposorbinsaure.) C5H8O7. A dibasic pentatomic acid of the methane derivatives; the only one known. It is produced, along with tartarie and paratartarie acids, by oxidising Sorbin by means of nitric acid; it crystallises in colourless, acute rhombohedral laminæ, easily soluble in water; it decomposes at 110° C. (230° F.)

Apospas'ma. ('Απόσπασμα; from ἀποσπάω, to draw from.) Term used hy Galen, de Constit. Art. c. vi, de Diff. Morb. c. ii, for a solution of continuity, particularly in divided tendons, the separated parts of which recede from each other.

Also, applied to metallic products, such as

Tutia, Misy.

('Aποσπάω, to draw Apospas'mus. from. G. Abstrennung, Losrvissung.) Tearing away or severing

Apospas'tic. (Same etymon. F. apospastique; G. wegreissend, wegziehend.) Having the power of drawing from; derivative; revul-

sory; applied to remedies. Aposphacel'isis. ('Αποσφακέλισις; from ἀποσφακελίζω, to have one's limbs frostbitten or mortified. G. Brandigwerden.) used by Hippocrates, de Artie. iv, 35, for the mortification of flesh in cases of wounds or fractures, induced by too tight bandaging.

Aposphacelis'mus. Same etymon and

meaning as Aposphacelisis. **Aposphag ma.** (Άποσφάζω, to cut the throat.) The blood of an animal when mixed with other ingredients for food.

Also, a term for the faces when strained through the anus. (Parr.)

**Aposphinx is.** ('Απόσφιγξις, constriction.) The action of a tight bandage.

Also  $(a\pi b, \text{neg.}; \sigma \phi i \gamma \gamma \omega, \text{ to bind})$ , the easing of a bandage. (Crahb.)

Aposphongis'mus. ('Αποσπογγισμός, a wiping away, as with a spouge; from aπό, away; σφογγος, a spongy substance.) Cleansing a wound or ulcer with a fungus, or sponge.

(Same etymon.) Apospongis'mus. (Same etymon.)
Wrining off with a sponge, or fungus.
Apostacie'æ. The same as Apostasi-

Apostacie a.

Apostag'ma. ('Λπόσταγμα, that which trickles down.) The must of the grape before fermentation.

**Apostalag ma.** ('Αποστάλαγμα, that which trickles down, from ἀπό, away; σταλάσσω, to drop.) Must; the unfermented juice of the

grape.

Apostasia ceæ. ('Απόστασις, a standing away from.) An Order of Subclass Petaloidea epigyne, Class Monocotyledones. Perennial herbaceous plants, with regular hermaphrodite flowers in simple or compound terminal racemes; calyx and corolla each consisting of three similar pieces; stamens 2 or 3, sessile on a short column, consisting of the lower part of the style and the filaments; ovary inferior, 3-celled; placenta axile; eapsule 3-celled, 3-valved.

Apos'tasis. ('Απόστασις; from άφίστημα, to put away. F. apostase; I. apostasi.) Term used by Hippocrates, de Fract. iii, 17, 20, for the resolution of a disease by exerction, that is, in moderu phrase, by a critical discharge. Applied generally to an abscess; also, more specially to an abscess arising from metastasis without previous inflammation in the part where it forms; it was likewise applied to the separa-

tion of a fragment of bone.

Iu Botany, used to denote the separation from each other of whorls by the increased size of internodes.

Apostax'is. ('Απόσταξις; from ἀποστάζω, to let fall drop by drop.) Ancient term ('Απόσταξις; from ἀποfor a distillation or dropping, small and inconsiderable, of blood from the nostrils.

Also, a distillation or defluxion of humours. Aposte ma. ( Απόστημα; from άφίστημι, to put away. F. apostème; G. Apostem, Geschwür, Eiterbeule, Eitergeschwür) Ancient term for an abscess, or any considerable swelling caused by an afflux of humours of whatever kind; now, however, it is limited to the former.

(L. cerebrum, the brain.) A. cer'ebri.

Abscess in the brain. **A. empye'ma.** ('Εμπύημα, suppuration, especially internal.) A synonym of *Επρηςτια*.

A. par'ulis. (Παρουλίε, a gumboil.) An abscess of the gums. (Φάλαγξ, a line of

A. phalan'gum. battle, a finger-bone.) A small abscess forming

ou the finger. A. psoat'ieum. (Ψόαι, the muscles of the loins.) Psoas abscess.

Apostema'cion. The same etymon and meaning as Apostematium. Apos'temate. (Same etymon.) To form

an aposteme; to suppurate. Apostema'tiæ. ('Αποστεματίαι.) Those

who discharge pus by the rectum.

Apostematic. ('Απόστημα, a large, deep-seated abseess. F. apostématique.) Relating to an apostema.

A. pharyngi'tis. (F. pharyngite apostématique.) A synonym of Abscess, retropharyngeal.

Apostema'tion. ('Απόστημα, an abscess.) The process of formation of an aposteme or abscess.

Apostema'tium. ('Αποστημάτιον, dim. of ἀπόστημα.) A little abseess.

Apostematoid'es. ('Αποστηματώδης, of the nature of an abscess. F. apostematoide; G. eiterbeulenartig.) Resembling an apostema. Having, or full of, abscesses.

Aposte matophthi'sis. (Apostema: phthisis.) Term for tabes or consumption arising from upostems or absecsses.

Apostem atous. ('Απόστημα, an ab-

seess.) Pertaining to, or resembling, an aposteme or abscess.

Ap'osteme. An Apostema.

**Aposterig ma.** ('Αποστήριγμα, a support, a determination, as of humours; from αποστηρίζω, to fix firmly, to settle. F. aposterigme.) A fulcrum or prop. A term used by Galen, Comm. iii, de iis quæ in Medic. 36, for a cushion, pad, or other soft support for a diseased limb or part; also used by some for pains in the bowels and for a fixed and inveterate disease.

**Apos'thia.** (' $\Lambda$ , neg.;  $\pi \delta \sigma \theta \eta$ , the penis, the prepute.) The state of a man without a the prepuce.)

penis, or without prepuce.

Aposthume. Same etymon and meaning as Apostema.

Apos'tola. (F. apostolé.) Generic name

of extracts.

Apostolo'rum unguen'tum. ('Λπόστολος, a messenger; L. unquentum, ointment.) The Cintment of the Apostles; a term for a preparation consisting of twelve ingredients and a little oil and vinegar; formerly used as detergent; otherwise called Dodecapharmicum.

One formula was Venice turpentine, yellow resin, yellow wax, ammoniacum, of each 3xiv; aristolochia root, olibanum, bdellium, of each 3vj; myrrh, galbanum, of each 3iv; opoponax, 3iij; verdigris, 3ij; litharge, 3ix; olive oil, lb.ij; vine-

gar, a sufficient quantity. **Apos'tracos.** ('Αποστρακύομαι, to become dry.) An epithet applied to a thoroughly

dry hone.

**Apos'trophe.** ('Αποστροφή; from  $\dot{a}$ ποστρέφω, to turn from. F. apostrophe; Ekcl vor Speisen.) A term used by Paulus Ægineta, iii, 37, for an aversion to, or loathing of, food.

Also, in Botany, the crowding together of granules on the adjoining walls of cells.

Ap'ostume. Same etymon and meaning

as Apostema. Also, used as a verb.

Aposu'ra. ('Από, away; πούs, a foot; οὐρά, a tail. F. aposure.) Applied by Cuvier to a Tribe of Lepidoptera, the eaterpillars of which have no anal pro-legs.

Aposyringe'sis. ('Από, from; σῦριγξ, pipe. F. aposyringose; G. Fistelbildung.)

The formation or progress of fistula.

Aposyr'ma. ('Απόσυρμα; from ἀποσύρω, to lay bare. F. aposyrme; I. aposirma; G. Abgeschabte.) Term used by Hippocrates, de Hum. us. V. 20, for an abrasion and laceration of the ortion providing to Catallia. of the entis, according to Castellus.

Apot'ecary. An old spelling of Apothe-

**Apoteles'ma.** (' $\Lambda \pi \sigma \tau \hat{\iota} \lambda \epsilon \sigma \mu a$ , completion. G. Vollendung.) The result or termination of a disease.

**Apotex'is.** ('Αποτήξις, a melting away; from ἀποτήκω, to pine away. G. Wegschmelzen, Auszehrung.) A melting away ; used for phthisis and tabes.

('Αποθνήσκω, to be Apothana'sia. ready to die. G. vollige Absterben, unzweifel-hafte Tod.) Actual death.

Apothe'ca. ('Αποθήκη a storehouse. G. Arzneiladen, Apotheke.) A shop where medicines are sold.

Apoth'ecaries' Com'pany. This Company obtained its Charter of Incorporation in the 15th year of James I. Their arms areargent, Apollo, armed with a bow and arrow, bestriding a Python; their supporters two Uni-

eorns; and the erest a Rhinoceros, surmounting a torse and helmet. The motto, "Opiferque per orbem dicor.

**A.** mea'sure. m60 = f51; m480 = f58= f31; m7680 = f5128 = f316 = 01; m61,440 = f31024 = f3128 = 08 = Cong. 1; <math>51 = .2256cubic inch.

**A. weight.** Gr. 20 = 31; gr. 60 = 33 = 51; gr. 480 = 324 = 58 = \$1; gr. 5760 = 3288 = 596 = \$12 = 101.

Apoth ecary. ('Αποθήκη, a repository, shop, or store. F. apothicaire, G. Apotheker, Arzuei-bereiter.) A compounder and dispenser of drugs; also one who dispenses drugs for patients whom he himself visits; in this sense the word has very generally been replaced by the term General Practitioner, although this latter by no means necessarily implies the supply of drugs to his own patients; a member of the Apothecaries' Society of London. The word Apotheca was first received, it is believed, into the medical language of the continent, as indicating a shop, warehouse, or cellar where medicines, simple and compound, were prepared and kept for sale, from whence the possessors of these shops came to be called *Apothecarii*, although previously the name Apotheca signified a wine-cellar. Its original signification was simply a store, magazine, or warehouse of any kind, and the proprietors of such were styled Apothecarii, without particular reference to the Pigmentarii (sellers of paints), Seplasiarii (sellers of powders and ointments), Pharmacopolae (quacks, or mountebanks), or the Medicamentarii (sellers of medicines), of the Romans. **Apothe**cium. ('Αποθήκη, a store, a case.

F. apothécie; G. Sporenlager.) Term applied to the fructification of those Lichens which develop their spores in the interior of thece; as a rule, the apothecia are situated on the upper surface of the thallus, but occasionally on the lower surface, or more or less embedded in its substance, the ostiole or epithecinm then traversing and opening on the surface. Apothecia present themselves under two principal forms—dises in the Lichenes discocarpi, and spheroidal bodies in the Lichenes pyrenocarpi. Apothecia present three parts—the conceptacle, which either constitutes the inferior layer, when it is known as the hypothecium, or surrounds the organ, when it is termed the margo proprius, or perithecium; the thalamium, which constitutes the middle layer, and is generally formed of distinct paraphyses: and the thecæ, asci, or sporangia, which are small sacs or cysts, situated in the thalamium between the paraphyses, and which contain the spores. The term epithecium is applied to the superficial layer of the apothecium, not always visible; that of thecium, or hymenium, to the middle layer of paraphyses and theeæ together; and hypothecium, to the inferior or conceptacula layer.

A. lecanori'num. Also called Scutellum. A form of discoid apothecium which is enclosed in a border formed by the thallns, as in Lecanora. The thallus sometimes, as in Parmelia, projects from the surface and forms a kind of capsule, named the receptaculum, for the apothecium.

A. lecidei'num. A form of discoid apothecium of which the border is formed by the peripheric part or perithecium of the conceptacle, and which is not surrounded by a thalline border.

A. lirelli'num. A form of discoid apothecium resembling the A. lecideinum, but of irregular form, usually elongated or branched.

A. patellifor'me. (L. patella, a small dish; forma, shape.) The same as A. lecideinum.

A. peltifor me. (L. pelta, a small light shield; forma, shape.) A form of discoid apotheeium, which is flat and does not possess a thalline border; as in Peltigera.

A. pyrenocar pum. (Πυρήν, the stone of fruit; Aupmos, a fruit.) This form of apothecium is spheroidal, and presents little variety.

Apoth'ema. ('Λπό, from; θέμα, a deposit. F. apotheme; G. Absatz, Rindstoff.) Term by Berzelius for the oxidated extractive of other authors, which is deposited in form of a brown powder, when a vegetable infusion or decoction is evaporated in the open air, and also when chlorine is passed through it. It had been supposed to be an ordinary extractive altered by the absorption of oxygen, but this view has not been generally accepted. It is in a very small degree soluble inwater, rather more so in alcohol; it is dissolved by alkalies, from which it is precipitated by acids. It is apt to carry down with it, in more or less intimate mnon, substances held in solution, and so, if formed in the preparation of an extract, it may remove some of the active principle of the drug. It is said to be slowly formed in wine as a product of the oxidation of tannic acid, and to give a certain tawny colour to old port wine, and the colour to the skins of raisins made from white grapes.

**Apotherapei'a.** (Αποθεραπεία; from αποθεραπεύω, to cure, or heal. F. apothérapie; G. Apotherapic, Ausheilung, Nachkur.) Oldterm, used by Hippocrates, Pracept. iv, 28, for an absolute or complete cure; also, a particular kind of exercise used after the fatigue of the gymnastic games, consisting in friction, unction, or the bath, according to Galeu, de San. Tu. e. 2, seq.

Apotherapeu'sis. Same etymon and meaning as Apotherapeia.

Apotherapeu'tica. (Same etymon. F. therapeutique; G. Therapeutik.) That branch of medicine which relates to the Apotherapeia.

Apotherapi'a. Same as Apotherapeia. **Apotherio'sis.** ('Λποθηρίοσις, a changing into a wild beast. F. apothénose.) The change or alteration of any substance to an animal form. (Littré and Robin.)

Apother mum. (' $\Lambda\pi\delta\theta\epsilon\rho\mu\sigma$ s.) A condiment, somewhat acrid, made of mustard, oil, and vinegar; a kind of drink given after the bath.

Apoth'esis. ('Απόθεσις; from ἀποτίθηαι, to replace. F. apothèse; G. die Wiedereinrenkung eines Knochens.) Used by Hippocrates, de its que in Medie. iii, 26, for the setting and disposition of a broken limb, or the reduction of a dislocation.

juice; also, the expressed juice itself. (Gorræus)

Apothrau'sis. ('Aπόθραυσις; from άποθρωύω, to ernsh or break. F. apothrause.) The removal of a part of a bone broken off from its surface.

Also, a comminuted fracture.

**Apothym'ia.** ('Απόθυμιος, hateful.) Hatred or aversion towards auything.

(Αποτιλμός; from απο-Apotil'mus.

τίλλω, to pluck out.) Evulsion. **Apotocus.** ('Απότοκος, sprung from; from αποτίκτω, to give birth, or bring forth.) Applied by Hippocrates, de Artic. iii, 54, to an aboutive or premature feetus.

Apot'ome. ('Αποτομή, a cutting off. G.

Apotomia. Same as Apotomë.

**Apotrep'sis.** ('Απότρεψις, aversion; from ἀποτρέπω, to turn away from.) An old term for the resolution of an abscess.

**Apotropæ'os.** ('Αποτρόπαιος. G. Schutzmittel.) Old term, used by Hippocrates, de Insomn. xi, 7, for the driving away of evils; applied to amulets, according to Foësius.

Apotropæ'us. Same as Apotropæos. Apot'rope. (Αποτροπή, a turning away.) Disgust : aversion.

Also, deviation, as of a limb. (Dunglison.)

Ap'otous. ('Aποτος, not drinkable, without drink, or the desire to drink. F. apote.) Without drink, or without the desire for drink.

**Apous.** (A, neg.;  $\pi o \tilde{v} s$ , foot. G. fussloss.) Destitute of foot or base; footless. Term applied in Botany to plants which continue to grow by their superior extremity when their base has long ceased to exist, as in the case of various polyporons agaries.

**Apoxys'mus.** ('Aποξύω, to shave off the surface.) Abrasion.

Apozem. Same as Apozema.

**Apozema.** ( $\Lambda\pi\circ\zeta i\omega$ , to boil till the scum is thrown off. G. Absud, Abkochung, Krautertrank.) A decection or aqueous infusion of one or several medicinal substances to which are added snudry other medicaments, simple or compound, such as salts and syrups. An apozema differs from a tisane in being composed of a larger number of ingredients, and in not serving as an ordinary drink; it should be prepared at the time of its use.

A. aceto'sa compos'itum, Fr. Codex. (F. apozème d'oscille composé, bouellon aux herbes.) Compound apozema of sorrel. Fresh leaves of rumex acetosa 40 parts, of lettuce 20, of beta cycla 10, of anthriscus cerefolium 10, sea-salt 2, fresh butter 5, water 1000. Boil the herbs in the water till they are cooked, add the salt and butter, and strain. Autiscorbutic.

A. al'bum. (L. albus, white. F. apozème blanc.) See Decoctum album Sydenhami.

A. antidiarrhœ'icum. (F. apozème antidiarrheique.) Antidiarrheic apozeme. Basic phosphate of lime 10 parts, crumb of wheaten bread 20, subnitrate of bismath 5, syrup of rhatany 60, tincture of canella 5, laudanum of Sydenham 1; mix.

A. antiicter'icum. ('Aντί, against; ἴκτερος, jaundice. F. upozème antictérique.) Root of strawberry 60 grms., of madder 45, of male fern 45, of elecampane 30, bitartrate of potash 8, water 1000. Boil the roots in the water for three quarters of an honr, strain and add the cream of tartar. To be drank in the course of a day. **A. antiscorbu'ticum**, Fr. Codex. ('Αντί.

against; scorbutus. F. apozème antiscorbutique.) Antiscorbutic apozema. Root of lappa major, minor, or tomentosa 10 parts, of rumex acutus 10, syrupus antiscorbutiens, Fr. Codex, 100, boiling water 1000. Bruise the roots, infuse them for two hours in the boiling water, strain, and add the syrup.

A. aperiti'va. (L. aperio, to open. apozème apéritif.) Root of ruscus aculeatus 15 grms., of asparagns 15, bark of elder S, bark of ash 8, leaves of chicory 20, of poterium sanguisorba 20, of scolopendrum vulgare 20, of agrimony 20, tops of asparagus 15, of hop 5, water sufficient to obtain, after boiling and straining, 250 grms.; to this add sirop des einq racines 23 grms., potassium carbonate 6, tineture of canella 1.2.

A. de cor'tice radicis pu'nicæ, Fr.

Codex. (L. cortex, bark; radix, root. F. apozème d'ecorce de racine de grenadier.) Apozema of the bark of pomegranate root. Dry brunsed pomegranate-root bark 60 parts, water 750; macerate for two hours, then boil down to two thirds; strain.

A. de cous'so, Fr. Codex. (F. apozème de cousso.) Apozema of kousso. Kousso in coarse coits.) Apozema of Rousso. Rousso in course powder 20 grms, boiling water 150; mix the powder in the boiling water, and administer without straining. Used in tape-worm.

A. helvet'ica. (L. helveticus, belouging to Switzerland. F. apozeme Swisse.) Fennel

water 50 grass, fresh urine of the cow 700. Even

now used in drops and liver diseases.

A. laxati'vum, Fr. Codex. (F. tisane royale.) Laxative apozema. Senna leaves 15 parts, sulphate of soda 15, anisced 5, coriander seed 5, fresh leaves of parsley 15, one sliced lemon, water 1000; macerate for twenty-four hours, strain

with expression, and filter.

A. pur'gans, Fr. Codex. (L. purgo, to purge. F. apozème purgatif. médecine poire) purge. F. apozème purgatif, mèdecine noire.) Purgative apozema. Senna leaves 10 parts, sulphate of soda 15, rhubarb 5, manna 60, boiling water 120. Infuse the senna and rhubarb in the water for half an hour; strain and express; dissolve the soda and manna, leave to settle, and decant.

A. sarsaparil'læ compos'itum, Fr. Codex. (F. tisane de Feltz.) Compound apozema of sarsaparilla. Sliced sarsaparilla 60 grms., isinglass 10, sulphuret of antimony 80, water 1000. Boil the antimony in a bag for an hour in two litres of water; reject the liquid; put the bag containing the sulphuret with the sarsaparilla and the isinglass into two other litres of water; boil gently till it is reduced to one half, strain,

leave to settle, and decant. Dose, 6—8 oz. daily.

A. sudato'rlum, Fr. Codex. (L. sudatorius, serving for sweating. F. apozeme sudo-rifique.) Sudorifie apozema, Guaiaeum wood, rasped, 60 grus., sliced sarsaparilla 30, sassafras root 10, liquorice root 20. Boil the gualacum and sarsaparilla in sufficient water for an hour; add the sassafras and liquorice, infuse for two hours, strain, leave to settle, and decant. The resultant should amount to one litre.

A. Sydenham'i. See Decoctum album

Sydenhami.

A. vermifu'gum. (L. vermis, a worm; fugo, to put to flight. F. apozème vermifuge.) A synonym of A. de cortice radicis punicæ.

Ap'ozeme. (Same etymon.) A decoction.

Apozymus. ('Απόζυμος, in a state of fermentation.) Swelling by fermentation; used by Hippocrates.

Appara'tus. (L. apparatus; from apparo, to arrange, or prepare. F. appareil; G. Geräthschaft, Zuruftung.) A term for the instruments, utensils, and mechanical arrangements used in experimenting or operating in any of the branches of science or art.

The word is also used in the sense of the manner of operating, especially in regard to litho-

tomy.

It is also applied to the system of organs which are combined to effect a common purpose, or by the combined and consecutive agency of which a special result is produced, as the digestive apparatus.

A., Ames'bury's. See Amesbury's apparatus.

A., Bar'ruel's. An apparatus for charging water with carbonic acid gas by the intermitteut or interrupted method.

A., Bau'den's. This was the same as A., Seutin's, except that he substituted a solution

of gum arabic for starch paste.

A., Be'ral's. An apparatus used in Pharmacy for effecting lixiviation, consisting of a cylinder terminating below in a cone, the narrow part of which has a stopcock, by which the flow of fluid through any substance placed on a diaphragm in the cylinder can be regulated. The passage of the fluid is aided by a force-

A., Boy'er's. An apparatus for the reduction of fractures of the humerus. Extension being made, a roller bandage was first applied as far as the axilla. Four splints were then adjusted to the arm, the internal one being sometimes omitted in thin people, on account of the pain given by its pressure on the nerves and vessels, and these were kept in position by a spiral bandage.

A., Bo'zeman's. A framework having a support for the shoulders and head, and splints for the leg and thigh, whereby a female may be kept in what is called the knee-elbow position for the performance of operations through the

A., Bra'mah's. An apparatus for charging water with carbonic acid gas by the continuous

A., Burg'grave's. The same as that of Seutin, except that a thick uniform layer of wool was placed round the limb before the application of the starched roller.

A., Carre's. A machine for making ice by

the evaporation of ether.

A., Casau'bon's. An apparatus for charging water with carbonic acid gas by the intermittent method.

A., contin'uous exten'sion. Apparatus with this end in view is adopted in the treatment of fractures and deformities, and must vary both in the material employed and in the mode of application in every instance. The most common means are, the firm application of a splint to one part of a limb, which is then extended and kept in position by counter-extension from some other part of the hody, as in Desault's method of treating fractures of the thigh; the application of a weight attached to a cord passing over a pulley, and firmly connected with a bandage surrounding the limb; india-rubber bands attached, ou the one hand, to some fixed point, and on the other, to the bandage around the limb; and lastly, the pressure which can be exerted by screws acting on splints accurately adapted to the limb.

A., filament'ous. (Low L. filamentum; from L. filum, a thread.) A term applied in Botany to a peculiar formation of frequent, but not constant, occurrence in Monocotyledons, which develops at the upper extremity of the embryonic vesicle a short time before fecundation occurs. When this organ is about to appear, the contents of the upper part of the vesicle become granular, and the granules assume a radiated disposition and filamentous aspect. They do not contract when treated with calcium chloride, like protoplasm, but become blue with odine.

A., Gene'ves. An apparatus for charging water with carbonic acid gas by the interrupted

or intermittent method.

A. immovable. A term for a plaster-of-

Paris, starch, or gum bandage, or any similar application.

A., Lan'gier's. In this apparatus the rollers employed by Sentin are replaced by strips of brown paper impregnated with starch teste.

A., Larrey's. This was the first attempt to treat injuries, such as fractures, with an immovable apparatus. The bandages were moistened with extract of lead, camphorated alcohol, and white of egg, and this was repeated for several days consecutively.

A., Math'ysen Van de Loo's. This is almost identical with that of Seutin, except that liquid plaster of Paris is substituted for starch paste.

A. of Nooth. See Nooth, apparatus of.
A. of Woolfe. See Woolfe, apparatus

A., O'zouf's. An apparatus for charging water with earbonic acid gas by the intermittent method.

A., pneumatic. See Pneumatic appara-

A., Romershaus'en's. An apparatus used in pharmacy for hviviation, and essentially resembling that of Béral's, except that a displacement cylinder replaces the force-pump.

A., Sav'aresse's. An apparatus for charging water with earbonic acid gas by the intermittent method.

A., Seulte'tus'. This apparatus for the treatment of fractures consisted of splints of wood or cardboard, that or hollowed to suit the conformation of the part, lined by pads to equalise the pressure, with compresses carefully adapted to the limb at the seat of the fracture, a number of strips of linen loug enough to pass one and a half times round the limb and applied

in an imbricated manner, and the whole invested by a piece of sheeting kept in place by a few threads or narrow ribbon.

A., Seu'tin's. This apparatus, which Seutin termed amoro-inamoroble, consisted of a compress, cardboard splints softened in hot water, and bandages impregnated with solution of starch in holling water. This rapidly hardens and forms a very perfect mould of the limb. After from one to four days, according to the amount of swelling, the apparatus is split from top to bottom, or a window can be made, and the wound be thus inspected. The edges of the mould generally require to be ent away, and the application of another roller impregnated with starch paste renders the whole again solid.

A., u'rinary. The organs concerned in the secretion and exerction of the urine.

A., Vel'peau's. This apparatus resembles Seutin's, except that Velpeau employed dextrin instead of starch. The solution of dextrin is made by mixing 100 parts of dextrin with 60 parts of camphorated brandy to the consistence of honey. To this is added 40 parts of hot water, drop by drop, the mixture being at the same time well-shaken.

A., Ver'naut's. An apparatus for charging water with carbonic acid gas by the intermittent method.

A., Viel-Ca'zal's. An apparatus for making aërated waters by what is termed the continuous process.

A., Zen'neck's. An apparatus used in pharmacy for lixiviation, and essentially resembling the apparatus of Béral, except that the force-pump is replaced by a displacement eylinder.

Appara'tus al'tus, (L. altus, high.) A method of performing lithotomy suggested by Peter Francus, a French surgeon, hence sometimes called Methodus Franconica. It was performed successfully by Bonetus, and also by Mr. Proby (Phil. Trans.; 1700, p. 455). The instruments required were only a sealpel, a dilator, and forceps. The incision was made in the middle line of the abdomen, just ahove the pulses; after the bladder had been filled with water, the lips of the wound were separated with a dilator, and the stone removed with forceps.

A. chylificatio'nis. (L. chylus, jnice, the chyle; facio, to make. G. Verdauungsapparat.) The alimentary canal with the glands and other organs in immediate connection with it.

A. digestio'nis. (L. digestio, the dissolving of food.) The same as A. chylificationis.

A. lateralis. (L. lateralis, helonging to the side.) The lateral operation of lithotomy.

A. ligamento'sus col'li. (L. ligamentum, a band; collum, the neck.) The occipito-axial

ligament.

**A. ma'jor.** (L. major, greater.) A method of performing lithotomy. The following instruments were required :- First, a set of catheters, both cylindrical and grooved; a double-edged lancet-shaped scalpel; two ensiform directors or conductors, one having a beak, and called male, the other being termed female, or a gorgeret, which was a concave or canulated conductor with a beak; forceps of various sizes and forms, straight and enrved; a hook; a kind of oblong spoon, furnished with a button, to be used as a probe as well as an extractor; this was sometimes termed a lapidillum or verriculum; lastly, a dilator. The apparatus for dressing was the same as in the apparatus minor. The patient was placed as in the modern operation of lithotomy, a grooved catheter introduced, and a median incision made, of from three to four fingers' breadth, with a scalpel, through all the tissnes to the groove in the catheter. The beak of the male conductor was now placed in the groove and pushed into the bladder, followed by the female conductor. The handles of these instruments were separated, and room thus afforded for the extraction of the stone with the aid of the forceps. Some, instead of using the two conductors, employed the gorgeret. The extent of the internal wound differed much with different operators, some, as Tolet, only dividing the nrethra, others, as Falconet, Noel, Rosa, and Schoefferns, opening the bladder rather freely.

A. mi'nor. (L. minor, less.) A method of performing lithotomy. The instruments required were—a strong, donble-edged, lancet-shaped, straight scalpel, the blade about two inches long and one broad, or a razor, a hook resembling a vectis, or a pair of pliers, and a pair of forceps, bent needles and thread; in addition, a T-bandage, a thick and square compress, some scraped lint and styptic powder, or rectified spirit, were kept at hand. The patient was placed in the ordinary position. The oiled forefinger of one hand of the surgeon was introduced into the anus, whilst with the other hand pressure was made on the lower part of the belly. The stone being felt, it was pushed with the finger to the left side of the perinacum till it formed a visible

tumour, when an incision was made and its re-

moval effected.

**Appen'dices epiplo'icæ.** (L. appendix, appendage;  $i\pi i\pi \lambda oo\nu$ , the membrane enclosing the intestine, the omentum.) Small projections of the serous or peritoneal covering of the large intestine, which enclose a certain amount of fat.

A. co'li adipo'sæ. (L. colon, the large intestine of that name; adeps, fat.) The A.

epiploica.

A. pingedino'sæ. (L. pinguedo, fatness.)

A synonym of the A. epiploica.

A. pylor'icae. Certain excal appendages to the pyloric orifices of fishes. See Caca, pyloric.

Appendic'iform. (L. appendix; forma, likeness. G. anhangformig.) Having the appearance of an appendage.

**Appendic'ula.** (L. appendicula, dim. of appendix, an appendage.) A little appendage. A. cerebri. (L. cerebrum, the brain.) The

pituitary hody A. vermifor'mis cæ'ci. (L. vermis, a worm; forma, shape: cæcum, the intestine of that name.) The Appendix cæci vermiformis.

Appendiculæ. (Same etymon.) A small appendage. Term applied to the teeth or needles situated at the inferior part of the pileus of Hydnum, and which are covered by the hyme-

**A. epiplo'icæ.** (' $E\pi i\pi\lambda oo\nu$ , the omentum.) The Appendices epiploica.

A. pinguedino'sæ. (L. pinguedo, fatness.) The Appendices epiploicæ.

Appendic'ular. (Same etymon.) Pertaining to, or of the nature of, an appendage. In Botany, this term is applied to organs growing

from, or supported by, axile organs.

A. mus'cles. The muscles of the limbs.

A. skel'eton. The bones of the limbs or appendages, as distinguished from those of the

trunk; the axial skeleton.

Appendicula'ria. (L. appendicula, a small appendage.) An Order of the Class Tunicata or Ascidioida. They are very simple, minute pelagic organisms, which are found in all latitudes, and are propelled, like tadpoles, by the flapping of a long caudal appendage at the surface of the sea. They are oval in form, having a rudimentary branchial sac, a nervous ganglion divisible into three parts, and surmounted by an auditory vesicle; testicles and ovaries, believed by some to be both present in the same individual, have no excretory tube; development unknown. These animals possess the faculty of exercting from the surface of the cetoderm a transparent gelatinons investment.

Appendic'ulate. (Same etymon. G. beanhangselt.) Having little appendages, or appendicles. In Botany, a term applied to an organ projecting from the surface of any part, whether this part be axile or appendicular.

Appendic'uli. (Same etymon.) Term

employed in Botany to designate the simple or ramified filaments which develop at the base of the conceptacle of Erysiphe.

Appendic'ulum. (Same etymon.) A small appendage, or slightly developed prolonga-

tion of any organ.

Appendic'ulus. (Same etymon.) In Botany, this term is applied, in the department of pteridography to the nervure which penetrates into the interior of the areola, and stops at this point without rejoining the walls. It may either be sterile or fertile.

Appendigas'ter. (L. appendix, an appendage; γάστηρ, the belly.) Applied to an insect, because of its long and slender pediele, which joins the abdomen or corselet, and forms an appendage to the latter.

Appen'dix. A thorny plant, probably the Berberis vulgaris, or Barberry (Fée), mentioned by Pliny (l. xxiv, c. 70), the red berries of which were used to arrest diarrhea, and dispel flatulent

colic. (Waring.)

Appen'dix. (L. appendix; from appendo, to hang up, to suspend. F. appendice; G. Anhang, Anhängsel, Zusatz, Beilage.) Term for a part of, or addition to, a thing; an appen-

In Botany, the term is applied to any organ growing from, or supported by, the parts termed axile. Also, to any accessory and projecting part of an organ.

A. ad cer'ebrum. (L. cerebrum, the brain.) A term given to the cerebellum.
A. auric'ulæ. The same as A. auricu-

A. auricula'ris. (L. auricularis, from auricula, the pavilion of the ear. F. oreillette; G. Herzohr.) The auricular appendage. This is a tongue-shaped process of each auricle of the heart, and is, indeed, itself the true and right anricular appendage projects from the anterior and upper angle of the right atrium, and terior and upper angle of the arch of the aorta. The passes to the left over the root of the aorta. left extends forward from the left side of the left atrium, and curves towards the right side, resting on the pulmonary artery; it is longer and nar-rower than the right. Both present musculi pectinati in their interior.

A. cæ'ci. (L. eæcum, the intestine thus named; from eæcus, blind.) A synonym of the

Appendix caci vermiformis.

A. cæ'ci vermifor'mis. (L. cæeum: vermis, a worm; forma, shape. F. appendice vermiform; G. Wurmfortsatz, Wurmanhung.) A slender, round, tapering process given off from the inner and back part of the ceeum. It is usually as thick as a large quill, and varies from three to six inches in length. It runs upwards and inwards between the exerum, and is retained in position by a small process of the mesentery. It is hollow, and the aperture by which its cavity communicates with the execum is narrow, and is sometimes gnarded by one, or even two, valvular folds of mucous membrane, which are most distinct in the young. The surface is smooth, the walls are thick, the glands large and compound. It contains meconium in the mature feetus. It is supplied by the ilio-colic artery. It is a rudimentary organ. It is found in man, the anthro-poid ages, and some lemms. Foreign bodies occasionally find entrance there, and setting up inflammation in the appendix and the surrounding connective tissue, frequently produce suppuration, and sometimes death.

A. cer'ebri. (L. cerebrum, the brain.)

The pituitary body.

A. cuta'nea sep'ti na'rium. (L. cutis, the skin; septum, a wall; naris, a nostril.) The cutaneous covering of the lower end of the septum of the nose.

A. ensifor mis. (L. ensis, a sword; forma, shape.) The metasternum or ensiform process of the sternum.

A. epidid'ymis. ('Επιδιδυμίς, the epi-

didymis; from  $\ell\pi\ell$ , upon;  $\delta\ell\delta\nu\mu\nu\ell$ , the testicles.) A synonym of the Vas aberrans.

A. glan'dulæ thyroï'dæ. The slender conical process which often rises from the upper surface of the istbmus, or from the neighbouring part of one or other lobe of the thyroid gland.

A. ventric'uli. (L. ventriculus, the stomach.) A synonym of the Duodenum.

A. vermicula'ris. (L. vermiculus, a little worm.) A synonym of the A. caci vermiformis.

A. vermifor'mis. (L. vermis, worm; forma, shape. G. Wurmfortsatz.) A synenym

of the Appendix eaci vermiformis.

A. vest'cæ. (L. vesica, a bladder.) hernia or protrusion of the mucous lining of the bladder through any weak spot between the museular bundles; when such protrusions are numerous, the bladder is said to be sacculated.

A. xy phoid. (Zicos, a sword. F. appendice xiphoide; G. Schwertfortsatz.) The sixth segment and lowest part of the sternum. It is cartilaginous up to the age of puberty, but undergoes more or less complete ossification with the advance of age, uniting with the body of the bone at about the 50th year.

Appenzell. Switzerland; a chief town of the Canton of that name; 2400 feet above sealevel. Near by is a mineral water, springing from the marl, and containing calcium and magnesium carbonate, with carbonic acid. It is generally drunk with milk or whey. There is a

whey-cure establishment here.

Apperception. (L. ad, to; percipio, to perceive. F. apperception; G. Anschanung, Antiassung, Inneverden.) An effort of the mind by which it considers itself as the subject which perceives or feels any impression. Term, suggested by Leibnitz, to designate perception eoujoined with consciousness or with reflection. Perception, he says, is the inter-nal condition of the mind representing external things, and apperception is the reflexive knowledge of this internal state which is not given to all minds, nor to the same mind at all times. It constitutes the essence of thought. Kant accepted the term with the same interpretation. According to him, our various representations, the intentions, or different impressions, made upon our sensibility would not exist for us without another element, which gives them unity and makes them an object of understanding. This element, which we express by the term "I think," is apperception. When this faculty is exerted on the impressions received by the sensory nerves, it is termed empirical apperception; when it is directed to the processes of thought without external excitation, it is termed pure apperception. There is a great difference, how-ever, between Leibnitz and Kant in regard to the nature and origin of apperception. The former does not hold it to be any special faculty, but only perception in its most perfect and exalted state, illuminating at one and the same time the ego and external objects. The latter considers it to be completely distinct from sensibility, and to be the fundamental act of thought only representing itself, and leaving us in complete ignorance of the reality of the ego and of external objects considered as substances. Maine de Beron terms the conscience immediate internal apperception. (Franck.)

Appetence. (L. appeto, to desire. F. appetence; I. appetenza; S. apetencia; G. Naturtricb.) A desire leading to the fulfilment or gratification of a natural function. The natural desire of organised beings to obtain sustenance.

Ap'petency. (L. appeto, to desire. G Begierde, Naturtrieb.) Ardent and passionate desire for some object.

Ap'petite. (L. appetitus; from appeto, to desire. F. appétit; G. Gelüsst, Esslust.) The natural desire for food at the proper time, and in moderate quantity.

Also, any natural inclination, or affection, of the mind by which we are incited to act; inordinate desire; lust.

A., cani'ne. (L. canis, a dog.) A term for the disease Bulimia.

A., depra'ved. (F. appétit dépravé.) A term applied to the disease Pica. A., insa'tiable. (F. appétit insatiable.)
A term for the disease Bulimia.

A., loss of. See Anepithymia.
A., mor'bid. Term for any deviation from the natural appetite caused by a diseased condition of the digestive organs.

(L. venereus, of, or be-A., vene'real. louging to, Venus.) The natural desire for sexual

intercourse.

A., vora'cious. Another term for the discase Bulimia.

Appetitive. (Same etymon; G. begehrend.) Causing desire.

Appetits. (Fr.) In authors of the Renaissance period this name was sometimes given to shallest because they share the specific to shallots, because they sharpen the appetite.

Appetitus. (L' appetitus ; from appeto, to desire.) A passionate longing; an eager desire; an appetite.

A. cani'nus. (L. caninus, belonging to a

dog.) A term for Bulimia.

A. defic'iens. (L. deficio, to fail.) Bad appetite for food.

Ap'planate. (L. ad, to; plano, to make level.) An organ which is flattened on the sur-

face; extended horizontally.

Apple. (Sax. apl, apl, probably from the root of ball. G. Apple; µ5\text{Nov}; L. malum; F. pomme; I. mela, pomo; S. manzana, pomo.) The fruit of the Tyrus malus and its varieties, According to Freschius, 100 parts contain 85° of water, 7.58 of sugar, 2.7 of pectous substances, and 1.04 of free acid. Apples are used raw and Roasted apples are slightly laxative.

A., Ad'am's. The Pomum Adami of the

thyroid eartilage.

A., al'ligator. An austere, narcotie fruit, yielded by the Anona palustris.

A., am'orous. The fruit of the tomato.

Lycopersicum esculentum.

A., bal'sam. The fruit of Momordica balsamina.

A., bit'ter. The Citrullus colocynthis. A., curasso'a. Immature oranges, the fruit of Citrus aurantium, or C. bigaradia; either plucked when they are of the size of a cherry or less, or having fallen off the tree when about that size. A stomachic tincture is made from them, and they are used, when small, as issue

A., cus'tard, net'ted. The succulent and edible fruit of Anona reticulata.

A., Dead Sea. The galls of the Quereus

infectoria; also called Mecca galls.

A., egg. The succulent fruit of Solanum melongena, the aubergine.

A. es'sence. An alcoholic solution of valerianate of amylic ether; used as a flavouring. A. eye. A term for Erophthalmia.

A., gol'den. The fruit of the tomato, Ly coper sieum esculentum.

A., In'dian el'ephant. The edible fruit of Feronia elephantum.

A., Kan. The edible fruit of the Euclea ovata.

A., kan'garoo. The edible fruit of Solanum laciniatum.

A., love. The tomato; the fruit of the  $Ly coper sicum\ esculentum.$ 

A., mad. The fruit of Solanum melongena.

Also, a term for Mecea galls. A., Malay'. The edible fruit of Jambosa malaccensis.

A., marvellous. The edible fruit of Luffa acutangula.

A., May. The Podophyllum peltatum. A. of eye. A term for the pupil of the

A. of Peru'. The Datura stramonium. A. of Sod'om. A name of Mecca galls.
A., Otahei'te. The edible fruit of Spondias duleis.

A., rage. The edible fruit of Solanum

melongena; the egg apple.

A. root. The Euphorbia corollata.

A., ser'vice. The fruit of the Pyrus do-

A. tea. Two or three apples sliced and infused for an hour in hoiling water. A pleasaut refreshing drink in febrile conditions, with or

without a little sugar.

A. tree. The Pyrus malus and its culti-

vated varieties.

A. whis'ky. A spirit distilled from eider. Ap'ples, ac'id of. Malic acid.

Ap'plicate. (L. applico, to apply to. F. applique; G. ancinandergelehnt, anliegend.) Applied to parts placed one against another, but without adhering together.

In Botany, applied to leaves which, in growing,

remain in confact with the stem.

Applica'tion. (L. applicatio; from applico, to lay unto. F. application; G. Auflegung.) Used as a term for remedial agents employed externally, as poultices and fomentations.

Used also to describe the act of applying ex-

ternal remedies.

In Botany (G. Auschluss), the close approxi-

mation of parts.

Applicati'vus. (Same etymon. anemandergefugt.) Applied to prefoliation when the leaves are placed face to face, one against the other, without bending in any manner, as those of Aloë linguiformis.

Ap'posite. (L. appono, to lay beside. F. apposé; G. nebeneinanderstehend.) A term in Botany, applied to an organ when it rests against or in contact with another. Thus it is applied to divisions of the anther when dehiscence occurs on the opposite surfaces.

Apposition. (Same etymon.) The act of supplying parts that are wanting, as a wooden

In Botany (G. Auflagerung), used to describe growth of cellules by deposit from without.

Appositional. (Same etymon.) Having nearness of position; used to describe two branches, as of an alga, lying side by side and partially united, so as to look like a compound Apprehen'sio. (L. apprehensio; from apprehendo, to take hold of. F. apprehension.) A kind of bandage for securing a part. Also, a therapentical indication.

A former term for catalepsy, used by P. Zacchias, Quæst. Medico-Leg. ii, i, q. 15, n, 9, 10.
Appres'sed. (L. apprimo, to press to.

G. angidruckt.) Near to; pressed close to, but not adherent; approximate.

Appressus. (F. apprime.) A term applied in Botany to hairs which lie at length and in contact with the epidermis from which they grow. Also, to leaves which grow up in contact with the stem.

Approx'imate. (L. ad, to: proximo, to approach close to. G. genahert.) Near or close

to each other, but not united.

See Measurement, A. measurement. approximate.

Approxima'tion. (Same etymon.) A name given by Ettmüller to a method of curing disease by bringing the sick person into actual contact with an animal or vegetable, into which the disease passed.

**Apractous.** (Απρακτος, ineffectual; from ἀπρακτέω, to do nothing.) Having no action; applied to the genitals when incapable of

generation.

Aprasi'idæ. A Family of the Suborder Cionocrania, Order Lacertilia. Lizards inhabiting Australia, having large fronto-nasal shields, no limbs, and no pre-anal pores; nostrils between the nasal and first labial shields.

**Aprax'ia.** ('A, neg.; πρᾶξις, a doing; from πράσσω, to achieve. F. apraxie.) A loss of knowledge of the use of things; the mistaking

of objects.

Aprication. (L. apricatio; from apricor, to bask one's self in the sun.) The treatment of sick persons by exposure to the direct rays of

A'pricot. (The whole history of this word points to either Persia or Armenia as the original country of this fruit. The Persian name was equivalent to yellow plum. In Greek and Latin it was the Armenian apple, i.e. wilov Appevianov and Malum Armeniacum. The Latins also called the apricot præcocia, early or premature. Besides this, the Arabic name for the plum was barkuk, and, with the definite article prefixed, abbarkuk. Sometimes it was called, in French, avant-perse, the forerunner of the peach, which agrees with the meaning of the Latin pracocia. The middle and modern Greek names are πραικόκκια, βρεκόκκια, and πρικόκκια; and then, in κοκκια, pperokkia, and πρικοκκια; and then, in Italian we get Albiricocca, and in Spanish Albaricoque. The older English form ended in k, as apricock. The newer form, in t, is from the French abricot. The Dutch and German forms are aprikoss, aprikose; Norse, aprikos. All this shows that the true meaning of the word has never been clearly understood; and whether the Arabirophia and t clearly understood; and whether the Arabic abbarkuk, or the Latin pracocia, give the best origin is disputed. The present writer is decidedly in favour of the Arabic, of which he believes the Latin and Greek forms, præcocia and πρεκόκκια, are themselves corruptions; the notion that precocia meant avant-perse being a mere fancy.) (Latham.)

The fruit of the Prunus armeniaca, or Armeniaca rulgaris; used fresh, cooked, and preserved. According to Fresenius, 100 parts contain 82-84 per cent. of water, 2-5 per cent. of sugar, 1 of free acid, and 6-11 of pectous substances.

A., Brian'con. The fruit of the Armeniaca brigantiaca; the seeds furnish a sweet oil, having a pleasant flavour of bitter almonds, known in Dauphiny, where the tree grows, as huile de marmotte.

Apri'cus. (L. apricus, contraction of ap. ricus, uncovered; exposed to the sun.) place much exposed to the sun and suitable to certain plants, hence called planta apricæ.

Aproc'ta. ('A, neg.; πρωκτός, the anus.) A Group of the Order Turbellaria, Class Scolecida, in which there is no anal aperture.

Approcthelmin thes. ('A, neg.;  $\pi \rho \omega \kappa$ τός, the anus; έλμινς, a worm. F. aprocthelminthes.) Applied to a kind of intestinal worms without anus.

**Aproc'tia.** ('Λ, neg.; πρωκτός, the anus. F. aproctie; G. Hinterlosigkeit.) Defect or absence of the anus.

Aprocto'sis. (Same etymon.) Progress or formation of the condition termed Aproetia.

Aproc'tous. (Same etymon.) Destitute of an anus.

Apro'nia. The Tamus communis, or black

bryony.

**Aproso'pia.** ('A, neg.; πρόσωπον, the face. F. aprosopie; G. Gesichtlosigkeit.) Partial agenesis, characterised by absence or extreme abnormality of the face, generally accompanied by absence of the organs of taste, smell, and sight.

**Aprosop'sous.** ('A, neg.; πρόσοψις, the aspect.) Destitute of a free. **Apselaphe'sia.** ('A, neg.; ψηλάφησις, a feeling, touching; from ψηλαφάω, to feel about.) Loss or diminution of the sense of touch, and of the painful sensations produced by burning, but the retention of the power of feeling those caused by pinching, pricking, and cutting.

Apsinthatum. (L. absinthium, wormwood.) Old term, used by Aëtius, for a kind of potion suited to the stomach, so called because composed in great part of Absinthium. (Gor-

Apsin'thites. ('Αψωθίτης.) Wine in which wormwood has been soaked; same as Ab-

sinthites.

Apsithu'ria. ('A, neg.; ψιθυρίζω, to whisper.) Incapability of whispering. A term, suggested by Cohen, in opposition to aphonia The patient, who is usually hysterical, is unable to produce the feeblest andible sound. It is generally accompanied by double paralysis of the vocal cords, but there is no paralysis of the tongue, lips,

or expiratory muscles. **Apsych'ia.** ('Λψυχία; from ά, neg.; ψυχή, breath, life, soul. F. apsychie; I. apsichia; G. Bewusstlosigkeit.) Old term, used by Hippocrates, L. i, de Morb. V. ix; Coac. Prenot. 226, for complete fainting; the same as Apopsy-

Apsyxia. (Same etymon) Syncope.
Aptera. (A, neg.; πτερον, a wing. F.
aptires.) A Suborder of the Order Hemiptera. Small wingless insects, with a short, fleshy, retractile proboscis, having large cutting setæ; sometimes with the buccal pieces of the masticatory type; thorax only indistinctly articulated; abdomen usually composed of nine rings; parasites on warm-blooded animals.

A Genus of the Nat. Order Apteria. Burmanniacea. Flowers trimerous; perianth tubular, campanulate; anthers inserted near the middle; filaments short, with a large orbicular membrane behind; ovary unilocular, with three bifid and multiovulated parietal placenta; fruit a capsule, with many ovoid seeds.

A. seta'cea. (L. seta, a bristle.) Hab. Asia; is slightly bitter and very astringent.

**Apte'ria.** ('A, neg.; πτερόν, a feather.) The spaces on the skin of a bird on which no strong or contour feathers grow, and which are

naked or covered only with down. **Apterich'thys.** ('A, neg.; πτίρυξ, a fin; ιχθύς, a fish.) Name by Duméril for a fish

without fins,
